NUSL Technical Memorandum No. 2211-10-70

16 Jan 1970

NUSL-7M-

14 p.

INTRODUCTION

The program is called "ATTENLOSS" and assumes a table (RANGE) is filled in core with values of range and propagation loss in sets of two. The program then works on this table to calculate the attenuation coefficient (COEFF), the transitional range (INTERCEPT), a table of ranges (RANGE 1), and a table of adjusted propagation loss (ADJPRO). Additionally, the standard error of estimate (SEE) and the standard error of the regression coefficient (SERC) are calculated.

MATH MODEL

The equations in this program are essentially derived from the propagation loss equation of the following form:

$$PL - 10 \log R = \alpha R + H_0$$

where: PL = propagation loss in DB.

R = range in yards.

$H_0 = 10 \log R_0$  = the transitional range in DB or the point at which cylindrical rather than spherical spreading becomes the dominant loss mode.

$\alpha$  = attenuation coefficient in DB/yard.

DISTRIBUTION STATEMENT A

Approved for public release;  
Distribution Unlimited

This document is subject to special export controls and each transmittal to foreign governments or foreign nationals may be made only with prior approval of the Navy Underwater Sound Laboratory.

The loss equation written in the above fashion is simply the equation for a straight line where  $Y = PL - 10 \log R$ , the adjusted propagation loss (ADJPRO), and  $X = R$ , the range. The transitional range  $H_0$  is simply the  $Y$  intercept and  $\alpha$ , which is the attenuation coefficient, is the slope of the line. The solution for  $\alpha$  can then be written as:

$$\alpha = \frac{n \sum XY - \sum X \sum Y}{n(\sum X^2) - (\sum X)^2} \text{ in DB/yard}$$

where  $n$  = number of data points

Similarly:

$$H_0 = \frac{(\sum X^2) \sum Y - \sum X \sum XY}{n(\sum X^2) - (\sum X)^2} \text{ in DB}$$

An estimate of the "goodness of fit" of the data points to a straight line approximation may be made by calculating the standard error of estimate of the data points about the straight line which is given by:

$$SEE = \sqrt{\frac{\sum (\alpha R + H_0 - PL + 10 \log R)^2}{n-2}} \text{ in DB}$$

and the standard error of the regression coefficient, which tests the variability of the attenuation coefficient, and is given by:

$$SERC = \frac{SEE}{\sqrt{R^2}} \text{ in DB}$$

MATH DEVELOPMENT

The following statements list the solutions to the above equations in the manner in which they are solved in the program.

- 1)  $\sum R$
- 2)  $\sum R^2$
- 3)  $10 \log R$
- 4)  $PL - 10 \log R$
- 5)  $R (PL - 10 \log R)$
- 6)  $\sum R (PL - 10 \log R)$
- ADJPRO 7)  $PL - 10 \log R$
- 8)  $\sum (PL - 10 \log R)$

- 9)  $(\Sigma R)^2$   
 10)  $n(\Sigma R^2)$   
 11)  $n(\Sigma R^2) - (\Sigma R)^2$   
 12)  $\Sigma R \Sigma (PL - 10 \log R)$   
 13)  $n \Sigma R (PL - 10 \log R)$   
 14)  $n \Sigma R (PL - 10 \log R) - \Sigma R \Sigma (PL - 10 \log R)$   
 COEFF 15)  $n \Sigma R (PL - 10 \log R) - \Sigma R \Sigma (PL - 10 \log R) / n(\Sigma R^2) - (\Sigma R)^2$   
 16)  $\Sigma R \Sigma R (PL - 10 \log R)$   
 17)  $\Sigma R^2 \Sigma (PL - 10 \log R)$   
 18)  $\Sigma R^2 \Sigma (PL - 10 \log R) - \Sigma R \Sigma R (PL - 10 \log R)$   
 INTERCEPT 19)  $\Sigma R^2 \Sigma (PL - 10 \log R) - \Sigma R \Sigma R (PL - 10 \log R) / n(\Sigma R^2) - (\Sigma R)^2$   
 20)  $\alpha R$   
 21)  $\alpha R + H_0$   
 22)  $\alpha R + H_0 - PL + 10 \log R$   
 23)  $(\alpha R + H_0 - PL + 10 \log R)^2$   
 24)  $\Sigma (\alpha R + H_0 - PL + 10 \log R)^2$   
 25)  $\Sigma (\alpha R + H_0 - PL + 10 \log R)^2 / n - 2$   
 SEE 26)  $\sqrt{\Sigma (\alpha R + H_0 - PL + 10 \log R)^2 / n - 2}$   
 27)  $\sqrt{\Sigma R^2}$   
 SERC 28)  $SEE / \sqrt{\Sigma R^2}$

PROGRAM INPUTS

The program computes only one coefficient per pass or one frequency at a time. An area of core called "RANGE" must be set aside and filled in the following manner:

Table "RANGE"

Cell 1 Range (1) in hundreds of yards, scaled 0 bits  
Cell 2 Propagation Loss (1) in DB, scaled 3 bits  
Cell 3 Range (2)  
Cell 4 Propagation Loss (2)  
Cell 5 Range (3) etc.

The range and propagation loss sets do not have to be in any particular order and the range may be either positive or negative, indicating an opening or closing run. The total number of cells used for Table "RANGE" is set into cell "LIMIT", scaled 0 bits.

PROGRAM OUTPUTS

The following are program outputs (which remain in core):

COEFF = Attenuation coefficient in DB, scaled 15D bits.  
INTERCEPT = Transitional range in DB, scaled 9D bits.  
SEE = Standard error of estimate in DB, scaled 9D bits.  
SERC = Standard error of the regression coefficient in DB/unit range, scaled 9D bits.

Table ADJPRO, adjusted propagation loss and range in the following form:

Cell 1 Range (1) in kyds, scaled 3 bits  
Cell 2 PL  $-10\log R(1)$  in DB, scaled 3 bits  
Cell 3 Range (2)  
Cell 4 PL  $-10\log R(2)$ .  
Cell 5 Range (3) etc.

OPERATING INSTRUCTIONS

- 1) Load Table "RANGE"
- 2) Set "LIMIT" to number of values in table "RANGE"
- 3) RJP \* ATTENLOSS

OTHER PROGRAMS REQUIRED FOR COMPILATION

CONLOGIT - Decibel conversion routine  
FLPARITH - Floating point package

CORE REQUIREMENTS

214<sub>10</sub> cells for ATTENLOSS minus tables  
96<sub>10</sub> cells for CONLOGIT  
650<sub>10</sub> cells for FLPARITH  

---

960<sub>10</sub> Total cells

Definition of Terms

NUSL Tech Memo  
2211-10-70

1. RANGE1 - Table - Range values in kiloyards, scaled 3 bits.
2. QSUMR2 - Variable - Q register portion of floating point number for  $\Sigma R^2$ .
3. ASUMR2 - Variable - A register portion of floating point number for  $\Sigma R^2$ .
4. RANGE3 - Table - Range-propagation loss values. Range in hundreds of yards, propagation loss in DB. Range, unscaled; PL, scaled 3 bits.
5. SUMR - Variable - Sum of range values in kyds., scaled 3 bits.
6. LIMIT - Variable - Total number of values to be processed (range plus propagation loss), scaled 0 bits.
7. NOP - Variable - Holds count of total number of values processed, scaled 0 bits.
8. MTEMP - Variable - Temporary storage.
9. ASUMRNW - Variable - A register portion of floating point quantity for  $\Sigma R(PL - 10 \log R)$ .
10. QSUMRNW - Variable - Q register portion of floating point quantity for  $\Sigma R(PL - 10 \log R)$ .
11. ADJPRO - Table - Adjusted propagation loss  $(PL - 10 \log R)$  in DB, scaled 3 bits.
12. NW - Variable - Sum of adjusted propagation loss  $\Sigma(PL - 10 \log R)$  in DB, scaled 3 bits.
13. ASUMR - Variable - A register portion of floating point number for  $(\Sigma R)^2$ .
14. QSUMR - Variable - Q register portion of floating point number for  $(\Sigma R)^2$ .
15. ADIVISOR - Variable - A register portion of floating point number for  $n(\Sigma R^2) - (\Sigma R)^2$ .
16. QDIVISOR - Variable - Q register portion of floating point number for  $n(\Sigma R^2) - (\Sigma R)^2$ .
17. ANOP - Variable - A register portion of floating point number for n.
18. QNOP - Variable - Q register portion of floating point number for n.
19. ASUMR1 - Variable - A register portion of floating point number for  $\Sigma R$ .
20. QSUMR1 - Variable - Q register portion of floating point number for  $\Sigma R$ .
21. ASUMR - Variable - A register portion of floating point number for  $\Sigma R(PL - 10 \log R)$ .

Definition of Terms (cont.)

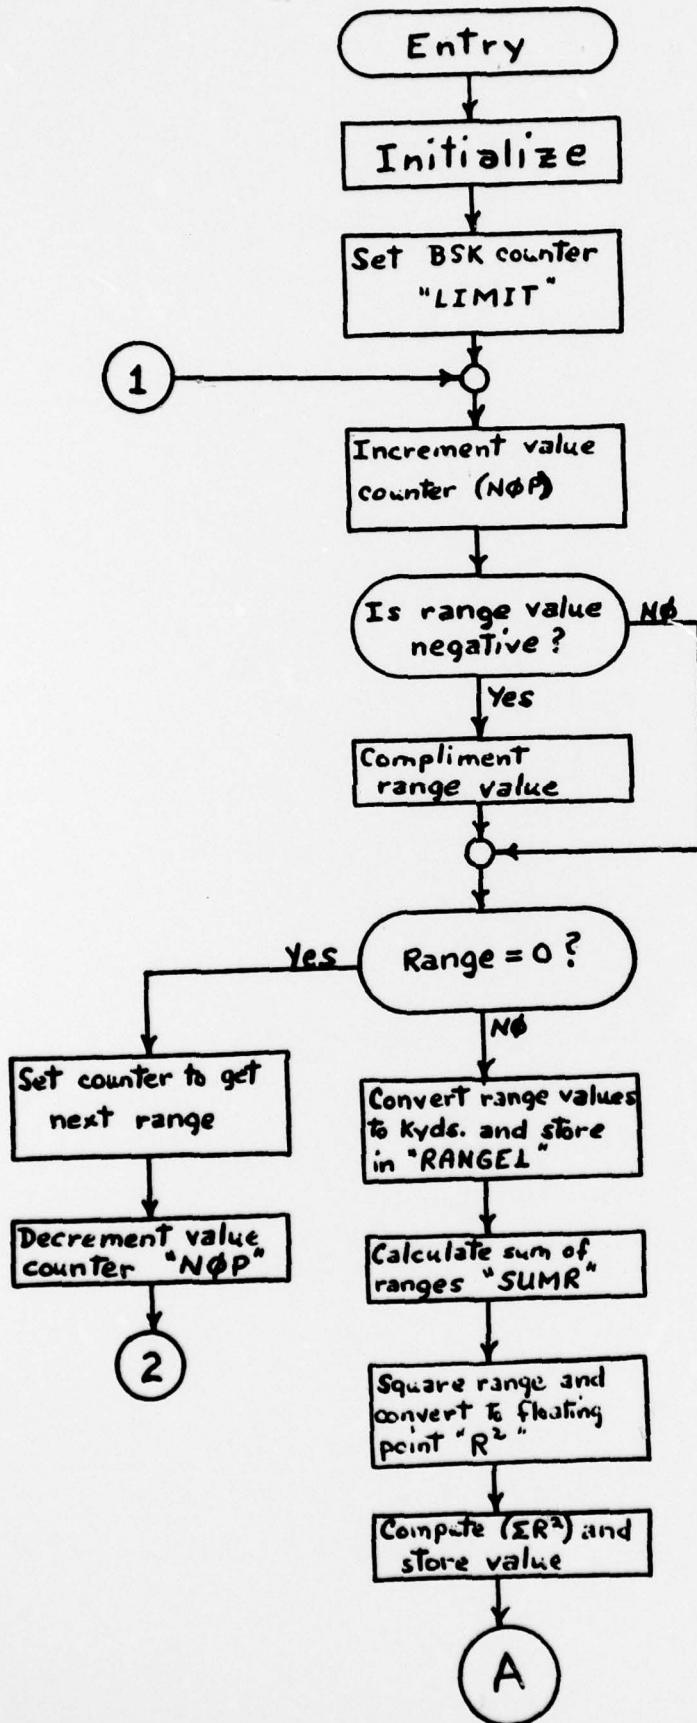

22. QSUBT - Variable - Q register portion of floating point number for  $\Sigma R \Sigma (PL - 10 \log R)$ .
23. COEFF - Variable - Attenuation coefficient in DB/yd., scaled 15D.
24. QRRNW - Variable - Q register portion of floating point number for  $\Sigma R \Sigma (PL - 10 \log R)$ .
25. ARRNW - Variable - A register portion of floating point number for  $\Sigma R \Sigma (PL - 10 \log R)$ .
26. INTERCEPT - Variable - Transitional range in DB, scaled 9D.
27. DIF - Variable -  $\Sigma (\alpha R + H_0 - PL + 10 \log R)^2$ , scaled 3 bits.
28. LIMIT2 - Variable - Total number of range (only) values, scaled 0 bits.
29. SYN - Variable -  $\Sigma (\alpha R + H_0 - PL + 10 \log R)^2 / n - 2$ , scaled 3 bits.
30. SEE - Variable - Standard error of estimate in DB, scaled 9D.
31. SERC - Variable - Standard error of the regression coefficient in DB/unit range, scaled 9D.

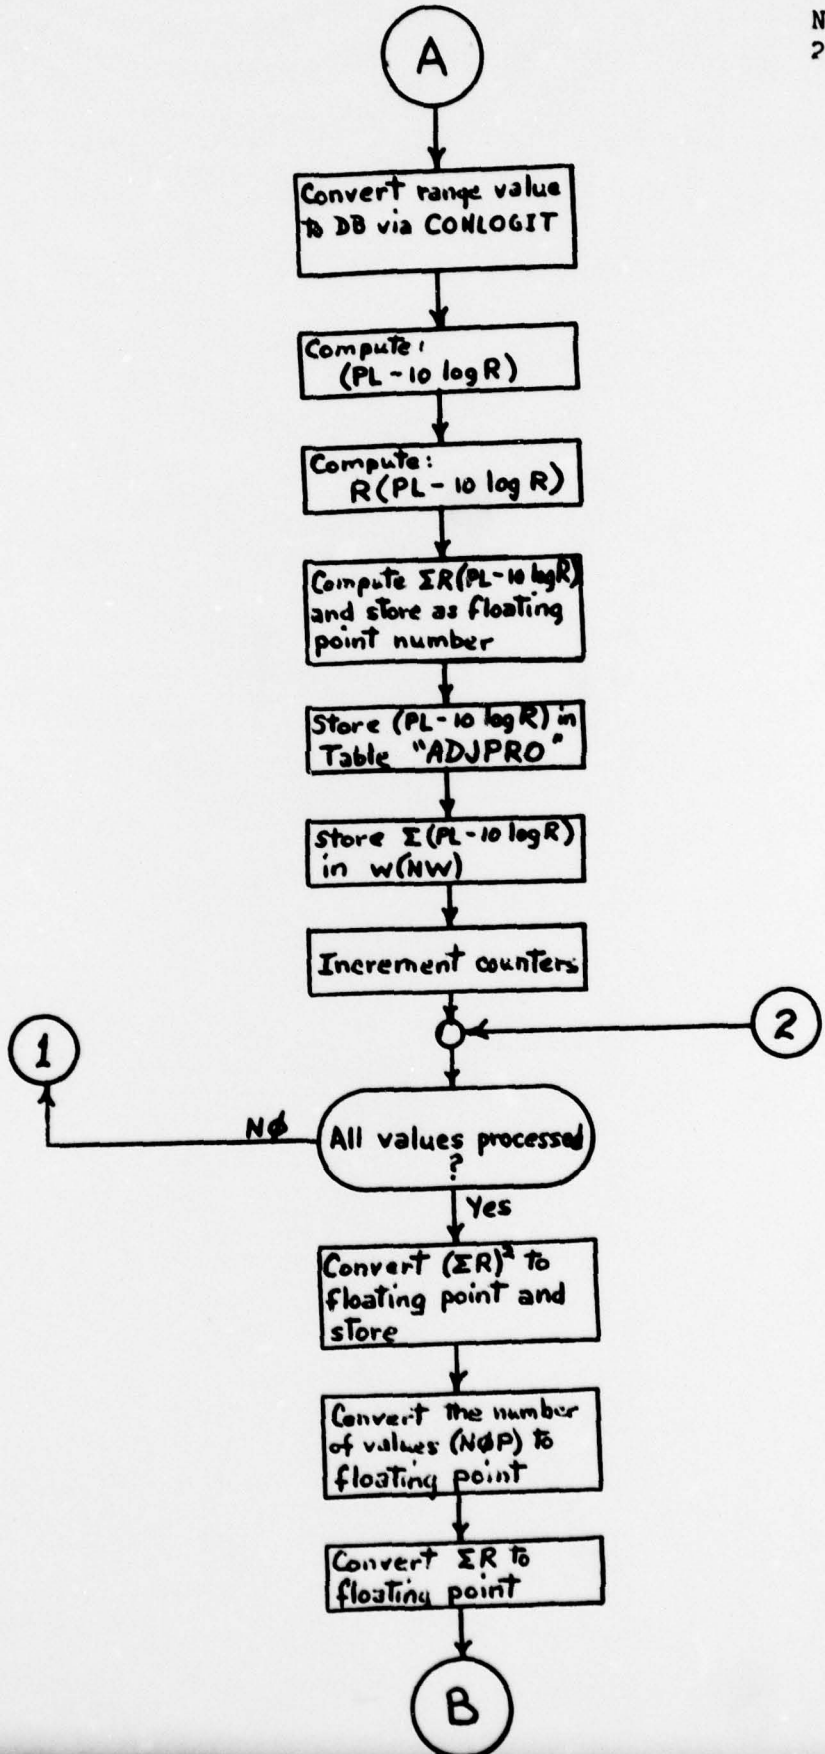

Floating Point Arithmetic Terms (FLPARITH)

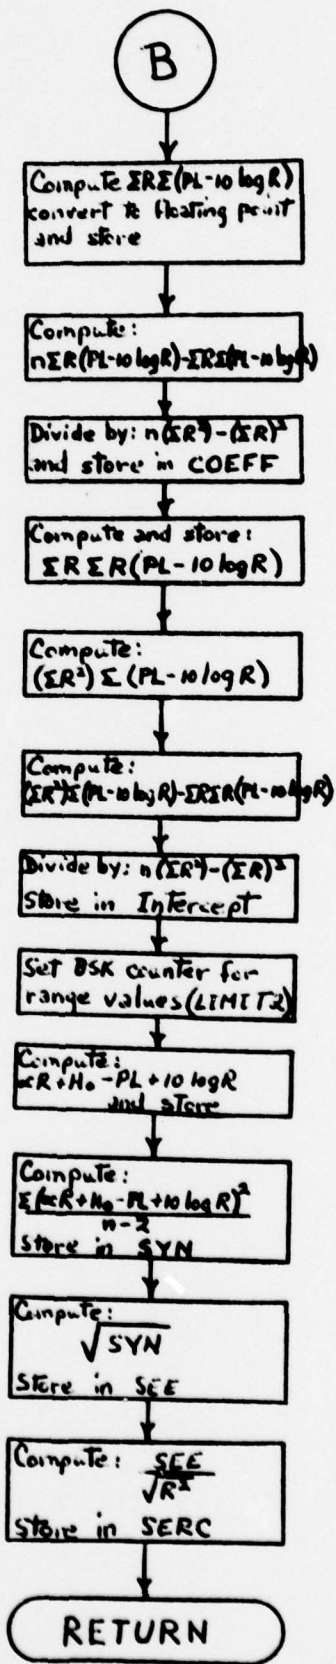

1. FLENT - Enter floating point accumulator.
2. FLAD - Floating point add.
3. FLSE - Floating point subtract.
4. FLMP - Floating point multiply.
5. FLDV - Floating point divide.
6. FLSTR - Floating point store.
7. FIDFLT - Fixed point to floating point conversion.
8. FLTFLX - Floating point to fixed point conversion.
