CALIBRATION REPORT No. 1856

Subj: Sangamo AN/SQS-23 transducer elements serials 223, 5426, 5636, A44-2, and T44-1; calibration of

Ref: (a) Sangamo ltr ECO320 of 22 Jan 1962

Encl: (1) Drawings USRL 27212 through 27236 and 20113
(2) Tables 1 and 2

D D C
R P R P M I P
APR 3 1979
R U S U L T I L F

1. Arrangements for the calibration of five AN/SQS-23 transducer elements, manufactured by the Sangamo Electric Company in connection with Bureau of Ships contracts NObsr-81532 and NObsr-85261, were made by reference (a). Measurements were made in accordance with the test program submitted as an enclosure to reference (a) and the oral requests of Mr. W. H. Benedict, Sangamo representative, who was present during the measurements.
2. Elements serials 223, 5426, and 5636 were production models and serials A44-2 and T44-1 were experimental models. Serials 5426 and 5636 contained transformers; the other elements did not.
3. The project was divided into three parts which consisted of measurements in the open water on the five elements; measurements in the anechoic tank on serials 223, 5426, and 5636, as a function of hydrostatic pressure at ambient temperature; and remeasurement of serials 223, 5426, and 5636 in the open water.
4. Measurements consisted of transmitting current and voltage responses and directivity patterns on all of the elements; equivalent series impedance on serials 5426 and 5636; and equivalent parallel admittance on serials 223, A44-2 and T44-1.
5. Transmitting current and voltage responses from the open-water measurements are shown on drawings USRL 27212, 27213, 27218, 27219, 27224, 27225, 27231, 27232, 27234, and 27235 of enclosure (1). Drawings USRL 27214, 27215, 27220, 27221, 27226, and 27227, enclosure (1) show the transmitting current and voltage responses for a hydrostatic pressure range from 0 to 500 psig. Directivity patterns for the operating frequency, 5 kc, are shown

DISTRIBUTION STATEMENT A

on drawings USRL 27216, 27217, 27222, 27223, 27228, 27229, 27233, and 27236 of enclosure (1). Directivity patterns were also taken at 4.0, 4.5, 5.5, and 6.0 kc, both in the open water and in the anechoic tank as a function of pressure. These patterns were supplied to the Sangamo Electric Company in preliminary form and are not included in this report. Drawing USRL 27230, enclosure (1), is a directivity pattern for element serial 5636 at 5.25 kc for the pressure 500 psig, under low and high power. The input was 1000 watts with a 6 per cent duty cycle.

6. Equivalent series impedance for element serial 5636 and equivalent parallel admittance for element serial 223 are shown on Tables 1 and 2 of enclosure (2). Impedance and admittance for the other elements were furnished to the Sangamo Electric Company in preliminary form and are not included in this report.

7. Orientation was according to the method described on drawing USRL 20113, enclosure (1), for a piston-type transducer, with the serial number in the +Z direction.

8. All measurements reported here were made in accordance with American Standard Procedures for Calibration of Electroacoustic Transducers Particularly Those for Use in Water, Z24.24-1957.

COORDINATE SYSTEM FOR TRANSDUCER ORIENTATION

The left-handed coordinate system of the American Standard Procedures for Calibration of Electroacoustic Transducers Particularly Those for Use in Water, Z24.24-1957, is used. The transducer is fixed with respect to the coordinate system and has its acoustic center at the origin. The angle ϕ is equivalent to the azimuth angle in sonar operation.

PLACEMENT OF TRANSDUCER IN COORDINATE SYSTEM

Transducer Type	Transducer Orientation in Coordinate System
Point, or Spherical	Points on surface that coincide with the X and Z axes shall be specified.
Cylindrical, or Line	The axis of the cylinder or line shall coincide with the Z axis. A reference mark in the XZ plane and in the direction of the positive X axis will be specified.
Plane, or Piston	The plane or piston face shall be in the YZ plane with the X axis normal to the face at its acoustic center. A reference mark in the XZ plane and in the direction of the positive Z axis will be specified.
Other Configurations	Orientation shall be shown by sketch or description. This category includes line and piston types of transducers operated in an orientation other than those specified above.

ORIENTATIONS FOR RESPONSE AND DIRECTIVITY MEASUREMENTS

Response. The calibration measurements are made for sound propagated parallel to the positive X axis ($\phi = 0$, $\theta = 90$), unless otherwise specified on the response curve.

Directivity. The plane of the pattern is specified, and the following conventions are observed, if another orientation is not specified on the pattern:

XY Plane: The positive X axis ($\phi = 0$, $\theta = 90$) coincides with the zero-degree direction on the pattern and the positive Y axis ($\phi = 90$, $\theta = 90$) is at 90 degrees measured in a clockwise direction. Rotation is around the Z axis; the positive Z axis is directed upward from the plane of the paper.

XZ Plane: The positive X axis coincides with the zero-degree direction and the positive Z axis ($\theta = 0$) is at 90 degrees measured in a clockwise direction. Rotation is around the Y axis; the negative Y axis is directed upward from the plane of the paper.

YZ Plane: The positive Y axis coincides with the zero-degree direction and the positive Z axis is at 90 degrees measured in a clockwise direction. Rotation is around the X axis; the positive X axis is directed upward from the plane of the paper.
