INTRODUCTION

This data report gives the raw data and preliminary flux calculations for the experiments referred to in the paper "Silica 'Apparent' Solubilities and Rates of Dissolution and Precipitation for ca. 25 Common Minerals at 1-2°C, pH 7.5-8.5 in Seawater", by David C. Hurd, Charles Fraley, and James K. Fugate, to be published in the volume "Proceedings from Symposium on Chemical Modeling--Speciation Sorption, Solubility, and Kinetics in Aqueous Systems", American Chemical Society Symposium Series, 1979.

In these experiments approximately 25 common minerals were allowed to react with 1-2°C, pH 7.5-8.5 seawater having different dissolved silica concentrations, and the increase or decrease in dissolved silica was monitored with time. What makes these experiments unique is that they were done at low temperature (1-2°C) and that the solutions were periodically centrifuged and a new solution having the original dissolved silica concentration was re-introduced. In addition, specific surface areas of the minerals were determined before and after the experiment to monitor whatever changes might have occurred and to allow for these changes in the ensuing calculations.

The report is divided into two sections; the first gives the raw data and preliminary calculations and the second gives elemental analyses of each mineral and references to analogous analyses by other workers. X-ray diffraction analyses were done on all samples, and listings of the positions of the major peaks are available upon request.

Explanation of symbols and abbreviations:

- 1) Den. = Density of mineral
- 2) FORM. WT. = Formula weight of mineral
- 3) # Si Atoms/FORM. = Number of Si atoms per formula
- 4) Spec. S.A. = Specific surface area in m^2/gram
- 5) Total S.A. = Total surface area of sample in m^2 =
Spec. S.A. \times sample wt
- 6) Mol. Vol. = Molar volume in cm^3/mol

$$= \frac{\text{FORMULA WEIGHT } \left(\frac{\text{gr}}{\text{Mol}} \right)}{\text{Density } \left(\frac{\text{gr}}{\text{cm}^3} \right)}$$

- 7) L Thickness = Layer thickness, where the thickness is calculated as the edge of a unit cell whose volume contains one formula weight of the mineral and which is assumed to be cubical.

$$\text{Volume unit cell} = 6.02 \times 10^{23} \left(\frac{\text{Molecular units}}{\text{Mole}} \right)$$
$$\text{Molar Volume } \left(\frac{\text{cm}^3}{\text{Mole}} \right)$$

$$\text{L Thickness} = \sqrt[3]{\text{Volume molecular unit}}$$

L Thickness measured in cm.

- 8) Vol./L = Volume per layer. This is calculated by assuming that the total surface area of the mineral can be regarded as a planar surface. This surface is multiplied by the layer thickness to arrive at a volume which represents the amount of the mineral to a depth of one layer thickness.

$$\text{Vol./L.} = \text{Layer thickness (cm)} \times \text{Total S.A. } (\text{cm}^2)$$

Vol./L. measured in cm^3 .

9) Mol./L = Moles per layer.

$$\text{Mol./L.} = \frac{\text{Vol./L. (cm}^3\text{)}}{\text{Molar Volume } \left(\frac{\text{cm}^3}{\text{Mole}}\right)}$$

10) Mol. Si/L = Moles Si per layer

$$\text{Mol. Si/L.} = (\# \text{ Si Atoms/FORM}) \left(\frac{\text{Mol}}{\text{Layer}} \right)$$

11) S.A./cc = Total surface area m^2 per cm^3 of solution. The amount of solution for each sample was 75 cm^3 so that

$$\text{S.A./cm}^3 = \text{Total S.A./75 cm}^3$$

12) Part. Rad. = Average particle radius of the particle in the sample assuming that all are spherical.

$$\text{Part. Rad.} = \frac{3 \times \text{Weight of Sample (gr)}}{\text{Total S.A. } (\text{cm}^2) \times \text{Density } \left(\frac{\text{gr}}{\text{cm}^3}\right)}$$

Part. Rad. is measured in cm.

13) pH is the range of pH values for a given solution.

14) MicroM Dis. Si is the initial concentration of dissolved silica in solution measured in 10^{-6} Moles/l.

15) Mol./Area (0-6) is the number of moles either dissolved from or precipitated by the sample per cm^2 of area of the sample in the time interval from the start of the experiment to six weeks. It is calculated by summing the changes in concentration, multiplying this figure by 7.5×10^{-8} to convert changes in concentration in solution to silica lost or gained by the sample, and dividing by the total surface area of the sample.

16) Mol./Area (2-6). Same as above except only the changes in concentration from 14 days to 42 days are summed. The following are the left-hand labels that appear with each new value of pH, μM dissolved Si, and new specific surface area. The data appearing beside these labels are based on the new specific surface area.

17) DELTA CONC. = the change in concentration of silica in micromoles.

18) Layers Lost - Assuming that the surface area of the mineral sample is a planar surface, a layer is defined to be this surface area multiplied by the thickness defined in (7) to give a volume. Layers lost up to each time value is computed by adding the changes in concentration up to that time; this is multiplied by 7.5×10^{-8} to concentrations in micromolar in 75 ml of fluid to moles of silica. The complete formula is

$$\text{Layers Lost} = \frac{(\sum \Delta C \times 7.5 \times 10^{-8})}{\text{Moles/layer}}$$

If the changes in concentration are negative, this calculation gives layers precipitated by the mineral. If some changes are positive and some negative, the calculation gives the net effect.

19) % Vol. Lost = % volume lost. This is the % of the mineral sample that is lost (by dissolution) over the time interval indicated.

$$\% \text{ Vol. Lost} = \frac{\text{Layers lost} \times \text{Vol/layer}}{\text{Volume of Sample}}$$

20) AVG FLUX = Average flux of silica from mineral sample.

$$\text{AVG FLUX} = \frac{\Sigma \Delta C \times 7.5 \times 10^{-8}}{\text{Total S.A.} \times \text{TIME INTERVALS}}$$

The units of AVG FLUX are ($\frac{\text{Moles}}{\text{cm}^2 \cdot \text{sec}}$).

21) Ins. FLUX = Instantaneous flux of silica from mineral sample
or the flux during only one interval of time in the experiment.

$$\text{Ins. FLUX} = \frac{\Delta C \times 7.5 \times 10^{-8}}{\text{Total S.A.} \times \text{TIME INTERVAL}}$$

The units are the same as in (20).
