1. Introduction

In this paper we shall deal with a subset of stationary (wide sense) processes with absolutely continuous spectral distributions which are rational functions of the two quantities  $e^{i\theta_1}, e^{i\theta_2}$ . More precisely we shall study the process  $X_{[m,n]} \in \mathbb{R}^d, [m,n] \in \mathbb{Z} \times \mathbb{Z}$  on an infinite lattice, with covariance structure

$$E(X_{[m+s,n+t]} X_{[m,n]}^*) = \frac{1}{4\pi^2} \int_{-\pi}^{\pi} \int_{-\pi}^{\pi} e^{-is\theta_1 - it\theta_2} f(\theta_1, \theta_2) d\theta_1 d\theta_2, \quad (1.1)$$

and zero mean.

We assume  $f(\theta_1, \theta_2)^{-1}$  exists and is finite at every  $(\theta_1, \theta_2)$ , and

$$f(\theta_1, \theta_2)^{-1} = (a_{[0,0]} + \sum_{[m_1, m_2] \in N^p} a_{[m_1, m_2]} \cos(m_1\theta_1 + m_2\theta_2)) \quad (1.2)$$

$a_{[0,0]}, a_{[m_1, m_2]}$  are  $p \times p$  matrices satisfying  $a_{[s,t]}^* = a_{[-s,-t]}$ .  $V^*$  is the complex conjugate transpose of the vector  $V$ .  $N^p$  denotes the deleted  $p \times p$  neighborhood of  $[0,0]$ , that is,

$$\{[m_1, m_2] : |m_1| \leq p, |m_2| \leq p, [m_1, m_2] \neq [0,0]\}.$$

Models of this type have been used as models of texture images [1,2]. In the case where  $X_{[...]}$  is a Gaussian process, it can be shown [3] that  $X_{[...]}$  is a Gauss-Markov process with respect to  $N^p$ ; that is,

$$\begin{aligned} \text{Prob}(X_{[m,n]} | X_{[s,t]}, [s,t] \neq [m,n]) = \\ \text{Prob}(X_{[m,n]} | X_{[s,t]}, [s,t] \in [m,n] + \mathbb{N}^p) \end{aligned} \quad (1.3)$$

In fact, the process with spectral density  $f(\theta_1, \theta_2)$  satisfies the conditional model

$$\begin{aligned} E(X_{[m,n]} | X_{[s,t]}, [s,t] \neq [m,n]) = \\ -a_{[0,0]}^{-1} \left( \sum_{[m_1, m_2] \in \mathbb{N}^p} a_{[m_1, m_2]} X_{[m-m_1, n-m_2]} \right) \end{aligned} \quad (1.4)$$

Conditional models of this type have been found useful in the modeling of spatial patterns [7]. It is also known (see, for example, page 26 of [7]) that no finite one-sided representation for this model exists of the type (with  $S$  finite subset of  $\mathbb{Z} \times \mathbb{Z}$ )

$$b_{[0,0]} X_{[m,n]} + \sum_{[m_1, m_2] \in S} b_{[m_1, m_2]} X_{[m-m_1, n-m_2]} = Z_{[m,n]}$$

where  $Z_{[m,n]}$  is a process of uncorrelated noise.

The purpose of this paper is to show that the collection of spectral representations of the process  $X_{[.,.]}$  along one of the coordinates is representable as a one-sided finite order "time series" model along the other coordinate. Thus, in this sense it is seen that all ARF's have a "causal" representation.

This method of producing a one-sided representation can be contrasted with the so-called NSHP (non-symmetric half plane) representation of [3] and [6].

## 2. A Unilateral Representation

We consider the process  $X_{[...]}$  with spectral density

$$f(\theta_1, \theta_2) = [a_{[0,0]} + \sum_{[m_1, m_2] \in \mathbb{N}^p} a_{[m_1, m_2]} \cos(m_1 \theta_1 + m_2 \theta_2)]^{-1}, \quad (2.1)$$

which is a  $p$ -th order autoregressive process.

Let  $z = e^{-i\theta_1}$ ,  $w = e^{-i\theta_2}$ , and rewrite the above equality as

$$f(\theta_1, \theta_2)^{-1} = a_0(w) + a_1(w)z + \dots + a_p(w)z^p \\ + a_1^*(w)z^{-1} + \dots + a_p^*(w)z^{-p}.$$

For each fixed  $w$  we can consider  $f(\theta_1, \theta_2)$  as a spectral density in  $\theta_1$ . We next produce a causal factorization of  $f(\theta_1, \theta_2)$  in the form

$$f(\theta_1, \theta_2)^{-1} = [c_0^*(w) + c_1^*(w)z^{-1} + \dots + c_p^*(w)z^{-p}] [c_0(w) + c_1(w)z + \dots + c_p(w)z^p], \quad (2.2)$$

where, for each  $w = e^{-i\theta_2}$ ,  $c_0(w) + c_1(w)\xi + \dots + c_p(w)\xi^p$  has no roots inside and on the complex unit circle  $|\xi|=1$ . ([4], page 65).

We next consider the spectral representation of the process  $X_{[...]}$  along the second coordinate:

$$X_{[n,m]} = \int_{-\pi}^{\pi} c^{im\theta} dY_n(\theta), \quad (2.3)$$

where  $Y_n(\theta)$  is the spectral representation of the process  $X_{[n,.]}$ . ([5], page 481).

Next expand each of  $c_0(w), \dots, c_p(w)$  in a Fourier expansion

$$c_j(w) = \sum_{k=-\infty}^{\infty} e^{ik\theta} \sum_{j=0}^p c_{[j,k]}^{\wedge}.$$

Then ([4], page 61) the process satisfies the autoregression

$$\sum_{j=0}^p \sum_{k=-\infty}^{\infty} c_{[j,k]}^{\wedge} X_{[n-j, m+k]} = Z_{[n, m]} \quad (2.4)$$

where  $Z_{[.,.]}$  is an uncorrelated white noise process. Let  $W_n(\theta)$  be the spectral representation of the process  $Z_{[n,.]}$ :

$$Z_{[n, m]} = \int_{-\pi}^{\pi} e^{im\theta} dW_n(\theta). \quad (2.5)$$

We conclude with the following

Theorem: Let  $\{Y_n(\theta)\}$ ,  $\{W_n(\theta)\}$  be the spectral representations of the processes defined above. They satisfy the stochastic differential equation

$$\sum_{k=0}^p c_k(e^{-i\theta}) dY_{n-k}(\theta) = dW_n(\theta) \quad (2.6)$$

Proof: In the above autoregressive representation we substitute the spectral integrals and get (after combining terms)

$$\forall m: \int_{-\pi}^{\pi} \left\{ \sum_{j=0}^p \sum_{k=-\infty}^{\infty} c_{[j,k]}^{\wedge} e^{i(m+k)\theta} dY_{n-j}(\theta) - e^{im\theta} dW_n(\theta) \right\} = 0$$

Factoring out  $e^{im\theta}$  we have

$$\forall m: \int_{-\pi}^{\pi} e^{im\theta} \left\{ \sum_{j=0}^p \sum_{k=-\infty}^{\infty} c_{[j,k]}^{\wedge} e^{ik\theta} dY_{n-j}(\theta) - dW_n(\theta) \right\} = 0$$

As any continuous function  $f(\theta)$ ,  $\theta \in [-\pi, \pi]$  can be approximated in mean square by linear combinations of  $e^{im\theta}$ , the result follows.

### 3. The finite version.

The above calculation can be carried out in the case where we have a finite number of values

$$X_{[n,0]}, \dots, X_{[n,M-1]}$$

in the vertical direction.

Let  $\psi_M = e^{2\pi i/M}$ . The finite versions of the above spectral representations are as follows:

$$X_{[n,m]} = \sum_{k=0}^{M-1} \psi_M^{km} Y(n,k) \quad (3.1)$$

or

$$\Delta Y(n,k) = \frac{1}{M} \sum_{j=0}^{M-1} \psi_M^{-km} X_{[n,j]}. \quad (3.2)$$

That is,  $\Delta Y(n, \cdot)$  is the finite Fourier transform of the data  $X_{[n, \cdot]}$ . Similarly

$$\Delta W(n,k) = \frac{1}{M} \sum_{j=0}^{M-1} \psi_M^{-km} Z_{[n,j]}. \quad (3.3)$$

The finite analogue of the above Theorem is

$$\sum_{k=0}^{M-1} \psi_M^{mk} \left\{ \sum_{j=0}^p b_j (\psi_M^{-k}) \Delta Y(n-j,k) - \Delta W(n,k) \right\} = 0$$

concluding with

$$\sum_{j=0}^p b_j (\psi_M^{-k}) \Delta Y(n-j,k) = \Delta W(n,k). \quad (3.4)$$
