PREFACE

This report presents the results of a detailed Air Force occupational survey of the Precision Imagery and Audiovisual Media Maintenance (AFS 404X0) career ladder. This Occupational Survey Report (OSR) was requested by the AFSC 404X0 Training Staff Officer (TSO), Air Training Command/Technical Training (HQ ATC/TTQ). Information in this report will be used to evaluate training and to consider a possible shredout for the seemingly divergent Defense Audiovisual Agency (DAVA) and Aerospace Audiovisual Service (AAVS) group at Norton AFB CA. Authority for conducting occupational surveys is contained in AFR 35-2. Computer outputs from which this report was produced are available for use by operating and training officials.

The Air Force occupational analysis program has been in existence since 1956 when initial research was undertaken by Air Force Human Resources Laboratory (AFHRL) to develop a methodology for gathering and analyzing occupational information. In 1967, an operational occupational analysis program was established within the Air Training Command and surveys were produced annually for 12 enlisted specialties. In 1972, the program was expanded to conduct occupational surveys covering 51 career fields annually. In late 1976, the program was again expanded to include the survey of officer utilization fields, to permit special management applications projects, and to support interservice or joint service occupational analysis.

The survey instrument used in the present project was developed by Second Lieutenant Kevin F. Morefield, Inventory Development Specialist. Second Lieutenant Carlton F. Middleton analyzed the survey data and wrote the final report. This report has been reviewed and approved by Lieutenant Colonel Jimmy L. Mitchell, Chief, Airman Career Ladders Analysis Section, Occupational Analysis Branch, USAF Occupational Measurement Center, Randolph AFB, Texas 78150.

Copies of this report are available to air staff sections, major commands, and other interested training and management personnel upon request to the USAF Occupational Measurement Center, attention to the Chief, Occupational Analysis Branch (OMY), Randolph AFB, Texas 78150.

This report has been reviewed and is approved.

SUMMARY OF RESULTS

1. Survey Coverage: Inventory booklets were administered to all AFS 404X0 Precision Imagery and Audiovisual Media Maintenance personnel. Survey results are based on the responses from 279 incumbents or 79 percent of the total assigned members.

2. Career Ladder Structure: Incumbents were found to be performing a wide variety of jobs differing primarily on the basis of equipment maintained. Major groupings identified included: (1) Supervisors; (2) Camera Maintenance Personnel; (3) Photographic Support Systems and Audiovisual Equipment Maintenance Personnel; and (4) Photographic Support Systems and Processor/Printer Maintenance Personnel.

3. Career Ladder Progression: Three-skill level personnel perform a strictly technical job, with a higher percentage of group members performing camera maintenance tasks than any other group. Five-skill level personnel also perform primarily a technically-oriented job, with some supervisory and more administrative responsibilities being picked up. Also, a higher percentage of 5-skill level incumbents perform maintenance on processors and mobility laboratories than any other group. At the 7-skill level, both technical and supervisory functions are being performed, with roughly half the time being spent in each area. At the 9-skill and CEM Code 40400 level, incumbents become managers of the career ladder and perform strictly supervisory and managerial type functions. Similar trends were noted for TAFMS groups.

4. Training Review: The AFR 39-1 specialty descriptions were found to be an accurate representation of the overall job performed by career ladder personnel. No major changes were recommended. Analysis of the 404X0 Specialty Training Standard (STS), dated July 1977, revealed the document to be accurate overall, with only minor changes suggested. The Plan of Instruction (POI) for course G3ABR40430, dated June 1980, was also analyzed and found to provide comprehensive and appropriate training to personnel entering the 404X0 career ladder.

5. Analysis of CONUS versus Overseas Groups: Only minor differences were noted in terms of tasks performed. However, overseas personnel performed a somewhat broader job, with more time spent by these individuals in the areas of processor and mobile facility maintenance.

6. Major Command Comparison: Differences were found across the five major using commands in terms of jobs and tasks performed, equipment maintained, and job satisfaction. MAC and ATC personnel spent more time than the other commands maintaining camera systems. USAFE and TAC personnel spent the most time maintaining processors and printers. USAFE personnel also spent the most time maintaining mobile facilities.

7. DAVA/AAVS: Possibly due to its recent creation, no respondent reported being assigned to the DAVA; however, 10 respondents were assigned to the AAVS and they were all stationed at Norton AFB, CA. Unexpectedly, these incumbents did not group together on the basis of the tasks they perform. Rather, they were spread throughout the career ladder structure.

This leads to the conclusion that the AAVS group at Norton does not perform a job that is substantially different from that of other 404X0 incumbents. Consequently, no classification action seems warranted in terms of a shred for these incumbents.

8. Implications: Overall, the 404X0 career ladder is fairly heterogeneous, with personnel reporting maintenance on an extensive amount of equipment. Individuals perform distinctly different jobs in the career ladder based on the equipment systems they maintain. These systems tend to be used by some MAJCOMs more than others.

OCCUPATIONAL SURVEY REPORT
PRECISION IMAGERY AND AUDIOVISUAL MEDIA MAINTENANCE
(AFSC 404X0)

INTRODUCTION

This is a report of an occupational survey of the Precision Imagery and Audiovisual Media Maintenance career ladder (AFSC 404X0) completed by the Occupational Analysis Branch, USAF Occupational Measurement Center, in February 1981. A previous survey of the 404X0 career ladder was published in November 1976 as part of a combined report with the Aerospace Photographic Systems career ladder (404X1).

Background

The 404X0 career ladder was created on 30 September 1964 from the 402X0 Photographic Repairman specialty. Originally, the career ladder title was called the Precision Photographic Systems specialty. This title remained with the career ladder until 30 April 1978 when it was changed to the Precision Imagery and Audiovisual Media Maintenance specialty, still with the AFSC designation of 404X0. Originally, the 9-skill level for the 404X0 career ladder was designated as 40490; however, on 30 April 1978, the 9-skill levels for the 404X0 and the 404X1 career ladders were merged to form a single 9-skill level designation of 40499 for both fields. On 31 October 1978, the Chief Enlisted Manager (CEM) Code 40400 was created from the 40499 DAFSC.

As described by AFR 39-1, the basic job of 404X0 personnel consists of maintaining, inspecting, and testing ground electronic precision imagery and audiovisual systems and associated electronic test equipment. Generally, this includes adjusting subsystems, lubricating and cleaning equipment, operating equipment, troubleshooting malfunctioning equipment, repairing or replacing defective components, and maintaining relocatable facilities. Some of the common equipment maintained are cameras, flash units, film processors, printers, densitometers, color analyzers, PA systems, audio recorders, thermofax and other graphics equipment, PH meters, and others. Power tools, such as drill presses, drills, grinders, torches, and soldering irons are commonly used in this work. To aid in the performance of these services, a mandatory basic technical training course is offered at Lowry AFB CO. This course lasts 78 days and graduates approximately eight personnel each class.

Objectives

The current project was requested by the 404X0 Training Staff Officer, HQ ATC/TTQ. It is designed to determine whether a seemingly unique job is being performed by the DAVA/AAVS personnel at Norton AFB CA and, if so, whether or not they should be trained separately. Another issue which was of interest to requesting officials was the possibility of a merger of the 404X0 personnel into the 23XXX career field; however, answers to this issue could not be addressed in this study since only the 404X0 ladder was surveyed.

To better deal with the issue of merger, a combined survey of the 23XXX and 404X0 ladders together would be required. Topics discussed in this report include: (1) survey methodology; (2) job structure within the ladder; (3) an analysis of skill level and MAJCOM groups; (4) an analysis of experience groups; and (5) a comparison of the results of the current survey with the previous survey.

SURVEY METHODOLOGY

Inventory Development

Data collection for this Occupational Survey Report was accomplished using USAF Job Inventory AFPT 90-404-423. As a starting point, tasks listed in the 1975 inventory were reviewed for currency. Next, pertinent career ladder publications and directives were reviewed for additional tasks. From this process, a new tentative task list was developed. The tentative inventory was then taken into the field for validation by subject matter specialists working in operational units, and by personnel at the Technical Training school located at Lowry AFB. From this review process, a final inventory was developed consisting of 831 tasks grouped under 13 duty headings. Also included was an extensive background section that included questions regarding work location, mobile facility maintained, and still cameras, copy cameras, motion picture cameras, aerial cameras, processors, printers, audiovisual equipment, photographic support equipment, and photographic editing equipment maintained. Other items included test equipment and shop equipment used in the job.

Survey Administration

During the period from July to October 1980, local consolidated base personnel offices (CBPOs) administered job inventories to all DAFSC 404X0 and 40499 personnel at operational units both in the continental United States (CONUS) and overseas. Personnel were selected from Uniform Airman Record (UAR) data tapes generated by the Air Force Manpower and Personnel Center (AFMPC) and maintained by the Air Force Human Resources Laboratory (AFHRL).

The 404X0 job inventory consisted of two sections: (1) a background section which included questions about such items as job satisfaction, equipment used, and (2) a task section listing all tasks which could be performed by career ladder personnel. Incumbents first checked the tasks they performed and then rated each task on a nine-point scale showing time spent on that task as compared to all other tasks checked. The rating scale ranged from one (very small amount of time spent) to nine (very large amount of time spent), with a rating of five representing an average amount of time spent performing a task.

To determine the relative amount of time an incumbent spends on each task, all of the incumbent's ratings are assumed to account for 100 percent of his or her time spent on the job. The ratings are then summed and each task rating is then divided by the total number of task responses and the

quotient is multiplied by 100. This procedure provides a basis for comparing tasks not only in terms of percent members performing, but also in terms of average percent time spent.

Data Processing and Analysis

Once job inventories are returned from the field, they are prepared so that task responses and background information can be optically scanned. Other biographical information (such as name, base, AUTOVON extension) are keypunched onto disks and entered directly into the computer. Once both sets of data are entered into the computer, the task, background, and biographical information are merged to form a complete case record for each respondent. Computer generated programs using Comprehensive Occupational Data Analysis Programs (CODAP) techniques are then applied to the data.

CODAP produces job descriptions for respondents based on their responses to specific inventory tasks. Computer generated job descriptions are available for DAFSC, TAFMS, and MAJCOM groups, and include such information as percent members performing each task, the average percent time spent performing each task, the percent members utilizing various pieces of equipment, and the cumulative average percent time spent by all members for each task in the inventory.

A key aspect of the USAF occupational analysis program is to examine the structure of career ladders in terms of what people are actually doing in the field, rather than how official career ladder documents say they are organized. This is accomplished by performing a cluster analysis on the task responses of 404X0 respondents. Those incumbents who perform similar tasks and who spend similar amounts of time on those tasks will normally group together.

Survey Sample

One hundred percent of the 404X0/99 population was solicited to participate in this survey so as to insure a representative sample across all segments of the career ladder. Table 1 reflects the major command distribution of personnel assigned to the 404X0/99 career field as of October 1980. Table 2 reflects the percentage distribution by paygrade. Table 3 reflects the distribution of the survey sample in terms of TAFMS. Overall, useable returned inventories were received from 279 out of the 354 total assigned or 79 percent of the total assigned population.

Task Factor Administration

In addition to completing a job inventory booklet, selected senior 404X0 personnel were also asked to complete a second booklet for either task difficulty or training emphasis. The task difficulty and training emphasis booklets were processed separately from the job inventories. The task difficulty ratings were then used in a number of different analyses discussed in more detail within the report.

Task Difficulty. Each senior NCO completing a task difficulty booklet was asked to rate all of the tasks on a nine-point scale from extremely low to extremely high difficulty, with difficulty defined as the length of time it takes an average incumbent to learn to do the task. Ratings were then adjusted so that tasks of average difficulty reflect a rating of 5.00.

Task difficulty data were independently collected from 30 experienced 7-skill level personnel assigned to a number of different major commands. The interrater reliability (as assessed through components of variance of standard group means) of .92 for these 404X0 raters reflected acceptable agreement and was considered useable by normal reliability criterion. The resulting data was a rank ordering of tasks indicating a relative degree of difficulty for each task in the inventory.

Job Difficulty Index (JDI). After computing a task difficulty value for each task item, it was then possible to compute a Job Difficulty Index (JDI) for the groups identified in the job structure analysis. This index provided a relative measure of which jobs, when compared to other jobs identified, were more or less difficult. An equation using the number of tasks performed and the average difficulty per unit time spent as variables was the basis for the JDI. The index ranges from one for very easy jobs to 25 for very difficult jobs. The indices were adjusted so that the average job difficulty index was 13.00. Thus, the more time a group spends on difficult tasks, and the more tasks they perform, the higher their job difficulty index.

Training Emphasis. Individuals completing training emphasis booklets were asked to rate all of the tasks on a ten-point scale from no training required to extremely heavy training required. Training emphasis yields a rating of tasks indicating where the emphasis should be placed on structured training for first-term personnel. Unfortunately, training emphasis ratings by 404X0 subject matter specialists showed high disagreement among raters. As a result of this, interrater reliability was too low to allow utilization of training emphasis data. Consequently, Training Emphasis is not addressed in this report.

CAREER LADDER STRUCTURE

One of the most important aspects of the USAF occupational analysis program is the career ladder structure analysis. This analysis examines the diversity of the jobs being performed by career ladder incumbents on the basis of the similarity of tasks performed and the percent time spent on tasks, independent of classification, grade, rank, or other background information.

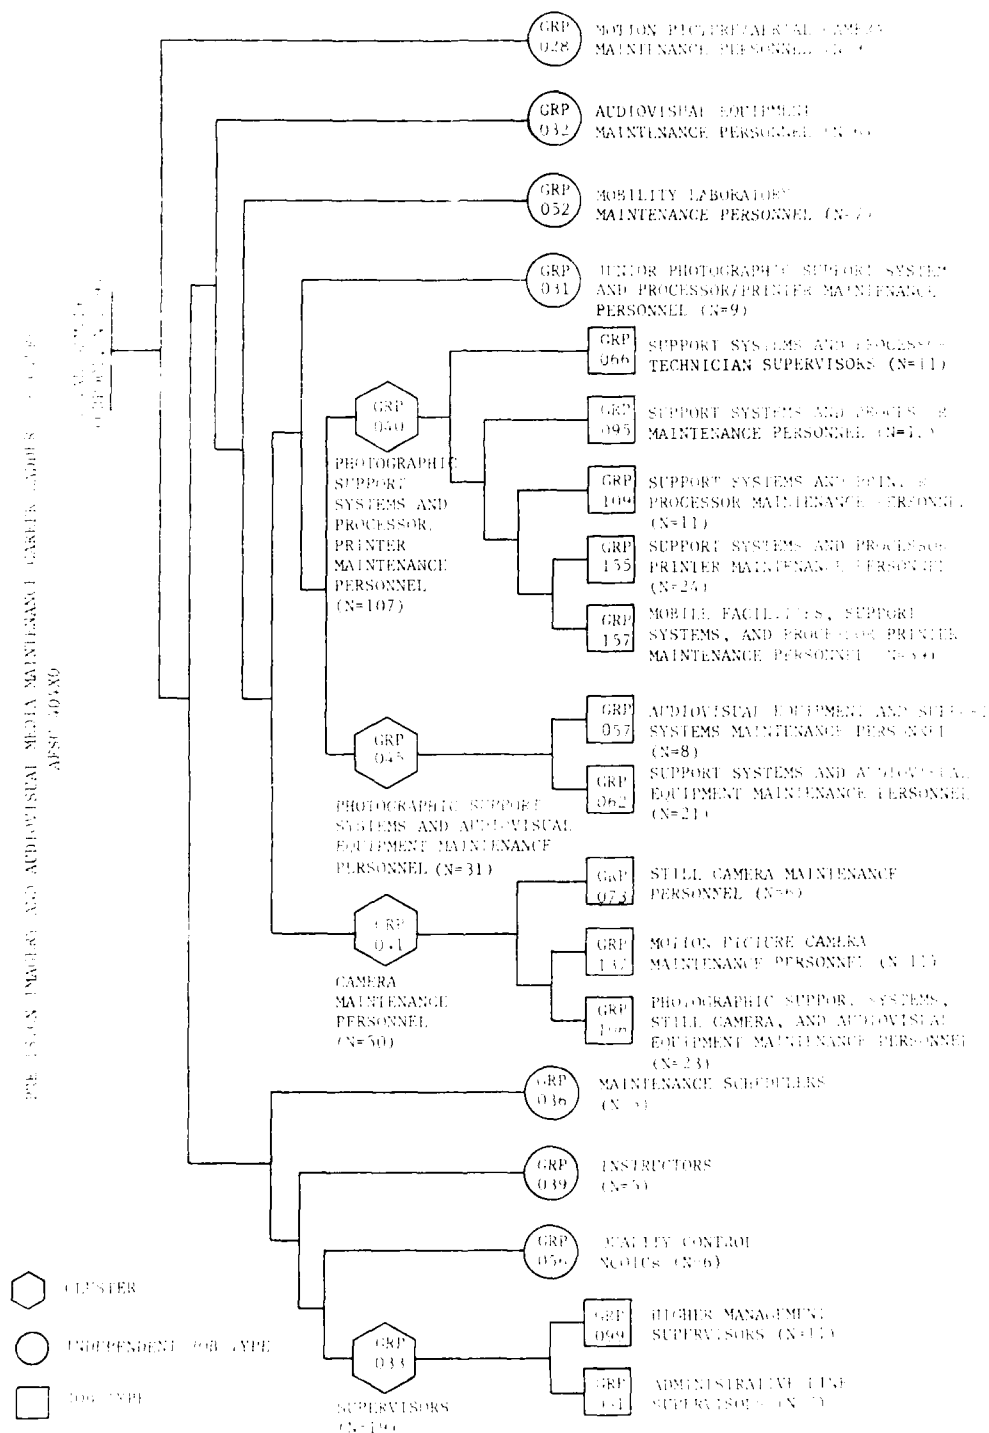

The Comprehensive Occupational Data Analysis Program (CODAP) provides a hierarchical grouping in which each individual job description in the sample is compared to every other job description in terms of tasks performed and the relative amount of time spent on each task in the job inventory. The automated system locates the two job descriptions with the most similar tasks and percent time ratings and combines them to form a composite job description. Then, in successive stages, new members are added to initial groups or new groups are formed based on their task and time rating similarities. This procedure continues until all members of the sample have been included and combined into a single composite group. The end-product of this procedure is a computer printout displaying each group as it relates to all other groups. This display is then analyzed using a variety of supporting computer products. This analysis serves to identify: (1) the number and characteristics of the different jobs which exist within the career ladder; (2) the tasks which tend to be performed together by the same respondents; and (3) the breadth of the jobs which exist within the career ladder.

The basic identifying group used in the hierarchical job structuring process is the job type. A job type is a group of individuals who perform many of the same tasks and spend similar amounts of time performing them. When there is a substantial degree of similarity between different job types, they are grouped together and labeled as clusters. In many career ladders, there are specialized job types that are too dissimilar to be grouped into any cluster. These unique groups are labeled independent job types.

Based on task similarity, the division of actual jobs performed in the 404X0 career ladder is illustrated in Figure 1. The seven independent job types and four clusters with component job types are listed below. (The GRP number shown beside each title is a reference to computer printed information included for use by classification and training officials.)

- I. SUPERVISORS (GRP033, N=19)
 - a. Administrative Line Supervisors (GRP051, N=7)
 - b. Higher Management Supervisors (GRP099, N=11)
- II. QUALITY CONTROL (QC) NCOICs (GRP056, N=6)
- III. INSTRUCTORS (GRP039, N=5)
- IV. MAINTENANCE SCHEDULERS (GRP036, N=5)

FIGURE 1
THE IS-A-ON IMAGE AND AUDIOVISUAL MEDIA MAINTENANCE CAREER LADDER
AFSC 40X80

- V. CAMERA MAINTENANCE PERSONNEL (GRP041, N=50)
 - a. Photographic Support Systems, Still Camera, and Audiovisual Equipment Maintenance Personnel (GRP106, N=23)
 - b. Motion Picture Camera Maintenance Personnel (GRP137, N=11)
 - c. Still Camera Maintenance Personnel (GRP073, N=6)
- VI. PHOTOGRAPHIC SUPPORT SYSTEMS AND AUDIOVISUAL EQUIPMENT MAINTENANCE PERSONNEL (GRP045, N=31)
 - a. Support Systems and Audiovisual Equipment Maintenance Personnel (GRP062, N=21)
 - b. Audiovisual Equipment and Support Systems Maintenance Personnel (GRP057, N=8)
- VII. PHOTOGRAPHIC SUPPORT SYSTEMS AND PROCESSOR/PRINTER MAINTENANCE PERSONNEL (GRP040, N=107)
 - a. Mobile Facilities, Support Systems, and Processor/Printer Maintenance Personnel (GRP157, N=39)
 - b. Support Systems and Processor/Printer Maintenance Personnel (GRP155, N=24)
 - c. Support Systems and Printer/Processor Maintenance Personnel (GRP109, N=11)
 - d. Support Systems and Processor Maintenance Personnel (GRP095, N=12)
 - e. Support Systems and Processor Technician Supervisors (GRP066, N=11)
- VIII. JUNIOR PHOTOGRAPHIC SUPPORT SYSTEMS AND PROCESSOR/PRINTER MAINTENANCE PERSONNEL (GRP031, N=9)
- IX. MOBILITY LABORATORY MAINTENANCE PERSONNEL (GRP052, N=7)
- X. AUDIOVISUAL EQUIPMENT MAINTENANCE PERSONNEL (GRP032, N=6)
- XI. MOTION PICTURE/AERIAL CAMERA MAINTENANCE PERSONNEL (GRP028, N=9)

Overall, the 404X0 career ladder was found to be fairly heterogeneous in nature. Little overlap in terms of tasks performed was found between the separate clusters and independent job types. Although the maintenance of photographic support and processing systems was performed by a substantial number of incumbents across most groups, no set of general tasks common to all members of the career ladder was found. The major differentiating factor between job groups was the equipment maintained, with most groups concentrating on the maintenance of a specific precision imagery or audiovisual media equipment system or set of systems.

The clusters and independent job types listed above comprised 91 percent of the total sample. The remaining nine percent of the sample was comprised of individuals who reported performing a job too dissimilar to be grouped with any of the identified groups. These incumbents were scattered across the various jobs identified in the cluster-merger diagram. Computer

programed calculations of job similarity indicated that, on the basis of the tasks that these personnel reported performing, they could not be included in any of the already identified groups nor could they be grouped together as a separate group of their own.

Job Group Descriptions

A brief description of each of the four clusters and seven independent job types is given below. Job types which combined to form each cluster are discussed in detail in Appendix A. Tables 4 through 9 list pertinent information relating to the clusters and independent job types. Table 4 and 5 reflect the relative time spent by incumbents on the various duties listed in the job inventory. Tables 6 and 7 list demographic background information for the clusters and independent job types, while Tables 8 and 9 reflect job satisfaction data. Representative duties and tasks, as well as equipment maintained, are listed in more detail for each group in Appendix B.

I. SUPERVISORS (GRP033). This cluster of 19 members spent 91 percent of their job time on managerial and supervisory functions. None of the members reported maintaining any still cameras, and only one member reported maintaining motion picture cameras. Common tasks performed included:

- counsel personnel
- assign personnel to duty positions
- determine requirements for space, personnel, equipment, or supplies
- prepare APRs
- determine work priorities
- plan work assignments

As could be expected, the Supervisors cluster was one of the more senior groups in the study, with members averaging 160 months in the career field. Members reported a limited job, with an average of only 64 tasks being performed, the majority of which were nontechnical in nature. Job satisfaction was not diminished, however, by the narrow focus of their job, with 84 percent of the supervisors finding their job interesting.

II. QUALITY CONTROL NCOICs (GRP056). These six personnel are responsible for inspecting equipment and evaluating procedures to determine compliance with standards. Five of the six members indicated their work area as the base photo lab. Very little actual maintenance is performed. Job time for the six individuals in this independent job type was moderately dispersed across different duty areas, with administrative and inspecting/evaluating duties leading all others in time consumption (see Table 5 and Appendix B). Incumbents performed such tasks as:

- make entries on quality control forms
- evaluate corrosion control programs
- evaluate compliance with performance standards
- inspect compliance with performance standards
- inspect processors
- inspect densitometers
- update local operating instructions

As Table 7 illustrates, all of the Quality Control NCOICs were 7-skill level personnel, with half of them stationed overseas. These personnel were the most senior respondents in the study, with an average time in career field of 180 months and an average time in service of 193 months. Members of this group performed an average of 122 tasks. Four members (67 percent) were assigned to MAC.

III. INSTRUCTORS (GRP039). Classroom instruction and training of 404X0 personnel best describes the job of these incumbents. The five respondents in this independent job type had responsibilities covering such areas as testing and demonstrating maintenance methodology, counseling, and administrative functions. Common tasks performed by these individuals included:

- conduct resident course classroom training
- administer tests
- score tests
- develop training aids
- develop tests
- counsel trainees on training progress

Instructors reported performing an average of only 51 tasks. However, 100 percent of the sample reported their job as being interesting (see Table 9). All members of this group were 7-skill level personnel assigned to the Air Training Command (ATC). All of these individuals were assigned to Lowry AFB, CO which is the location of the 404X0 Technical School. All members of this group stated their job title as that of instructor, but only one member listed a T prefix DAFSC.

IV. MAINTENANCE SCHEDULERS (GRP036). The five incumbents in this independent job type take orders for maintenance from diverse requesters and send the equipment and a work order to the shop. They do no "hands-on" work themselves; rather, they schedule work and keep a list of equipment with a monthly maintenance plan. The technical order (TO) files for the 404X0 career ladder are also maintained by these personnel. Common tasks of this group include:

- coordinate maintenance or repair
- maintain maintenance record files
- determine work priorities
- direct maintenance of status boards
- make entries on forms
- prepare maintenance analysis reports

Eighty percent of these respondents found their job interesting, even though they spent their time performing an average of only 16 tasks. All of these individuals were 5-skill level personnel reporting no personnel under their supervision. Four of these members (80 percent) were assigned to MAC. There were no maintenance schedulers reporting assignments overseas. Of the CONUS assignments, 60 percent were located at Vandenberg AFB, CA.

V. CAMERA MAINTENANCE PERSONNEL (GRP041). These 50 respondents comprised the second largest group in this study (18 percent of the total sample). These members were concerned primarily with the maintenance and repair of still and motion picture cameras although they did perform maintenance on other systems, such as audiovisual equipment and photographic support systems. Primary work areas indicated were the base photo lab and audiovisual library. These incumbents focused on three areas which were identified as job types within the cluster-- (1) support systems, still camera, and audiovisual equipment maintenance; (2) motion picture camera maintenance; and (3) still camera maintenance. Typical tasks performed included:

- isolate malfunctions in film advance mechanisms
- isolate malfunctions in electrical systems
- isolate malfunctions in focal plane shutters
- inspect lenses
- inspect range finders
- isolate malfunctions in electronic flash units
- isolate malfunctions in lens assemblies

This cluster of incumbents had the broadest range of tasks in the career ladder, with members performing an average of 291 tasks. In addition, their job was found to be the most difficult, with a JDI of 18.0 (see discussion of JDI in Task Factor Administration section). This high a JDI is most likely due to the high number of tasks performed by these individuals, since the average difficulty per unit time spent (ATDPUTS) was not the highest of any group. Eighty-eight percent of these personnel found their job interesting and felt their talents were utilized fairly well.

VI. PHOTOGRAPHIC SUPPORT SYSTEMS AND AUDIOVISUAL EQUIPMENT MAINTENANCE PERSONNEL (GRP045). Like personnel in the Camera Maintenance cluster above (V), these 31 members also maintain a diverse number of equipment and systems, primarily in base photo labs and audiovisual libraries. However, they concentrate primarily on the maintenance of photographic support systems, such as print washers and dryers, and audiovisual equipment, such as projectors. Representative tasks include:

- isolate malfunctions in print dryers
- inspect print dryers
- isolate malfunctions in slide projectors
- isolate malfunctions in sound motion picture projectors
- adjust print dryers
- inspect print washers
- adjust slide projectors
- perform operational checks on print dryers
- inspect projection printers
- inspect sound motion picture projectors

This cluster was subdivided into two job types, one emphasizing the audiovisual equipment maintenance aspect of the job and the other emphasizing the support systems maintenance aspect.

The average number of tasks performed by individuals in this group was 137. Job satisfaction for these personnel was the lowest of any cluster or independent job type, with only 61 percent of the incumbents finding their job interesting.

VII. PHOTOGRAPHIC SUPPORT SYSTEMS AND PROCESSOR/PRINTER MAINTENANCE PERSONNEL (GRP040). The 107 members of this, the largest cluster of the career ladder, are involved with maintaining support systems, processors, and printers. However, the main concentration of their job time is spent on the maintenance of processors and related support systems. Printer systems are also maintained but to a lesser degree. Personnel within this cluster fall into five separate job types depending on the area of concentration of their job. These areas include: (1) mobile facilities maintenance, (2) processor/printer maintenance, (3) printer/processor maintenance, (4) processor maintenance, and (5) processor technician-supervisors. Work areas indicated by members varied considerably. Four of the five groups worked at mobile reconnaissance labs and nonmobile facilities at reconnaissance technical squadrons. The fifth job type group worked more at base photo labs and audiovisual libraries. Typical tasks of incumbents in this cluster are:

- inspect processors
- perform corrosion control on processor systems
- perform operational checks on processors
- isolate malfunctions in densitometers
- isolate malfunctions in titlers
- isolate malfunctions in continuous contact printers

Comprising 38 percent of the sample, these personnel reported performing an average of 169 tasks. Seventy-one percent found their job interesting and 73 percent felt their talents were utilized fairly well or better.

VIII. JUNIOR PHOTOGRAPHIC SUPPORT SYSTEMS AND PROCESSOR/PRINTER MAINTENANCE PERSONNEL (GRP031). This nine member independent job type is very similar to the previous group in that these personnel also work primarily with processors and their related support systems and, to a lesser degree, printers. However, they spend more time on processor and support system maintenance than the previous group (79 percent versus 60 percent) and perform fewer tasks (61 versus 169). Seven of the nine members indicated their work area as the base photo lab. Common tasks performed by these personnel include:

- inspect processor pumps or filters
- isolate malfunctions in electrical systems
- inspect print dryers
- connect or disconnect plumbing
- connect or disconnect heat exchange devices
- connect or disconnect water mixing valves

Having an average time in service of only 27 months, these personnel are the most junior in the study. Average grade for the group was E-3, with none of the personnel reporting that they supervise others. As might

be expected from the limited nature of the job, only 56 percent of these personnel felt their talents were utilized fairly well or better. Job satisfaction, however, was not as low, with 78 percent finding their job interesting.

IX. MOBILITY LABORATORY MAINTENANCE PERSONNEL (GRP052). The seven members of this independent job type are largely responsible for maintaining mobile facilities, primarily at overseas locations. For the most part, group members did not specialize in any single type of mobile facility; rather, they worked with several different facilities. These primarily include the WS-430 mobile facility (57 percent) and the ES-85 mobile facility (29 percent). Typical tasks performed by these incumbents include:

- position relocatable facilities
- maintain leveling jack heights
- level relocatable facilities
- locate part or stock numbers
- inspect hydraulic systems on transporters
- inspect mechanical brakes on transporters
- secure relocatable facility equipment for transportation

Performing an average of 65 tasks, most of these members were fairly experienced, having an average of 98 months in the career field and an average paygrade of E-5. Only 14 percent were in their first enlistment. Job satisfaction for these incumbents was also quite high (see Table 9).

X. AUDIOVISUAL EQUIPMENT MAINTENANCE PERSONNEL (GRP032). The six members of this independent job type specialize in maintaining audiovisual equipment and multimedia sound equipment, primarily at base photo labs and audiovisual libraries. Common tasks include:

- clean and lubricate slide projectors
- adjust slide projectors
- inspect sound motion picture projectors
- isolate malfunctions in slide projectors
- adjust sound motion picture projectors

Performing an average of 137 tasks, these exclusively CONUS personnel were fairly junior incumbents, averaging only 37 months in the career field. Average paygrade was 3.7. However, job satisfaction with their work was high. All six members reported their job as being interesting and their talents and training as being utilized at least fairly well.

XI. MOTION PICTURE/AERIAL CAMERA MAINTENANCE PERSONNEL (GRP028). This independent job type is composed of nine members who specialize in working with motion picture cameras. Seven of the nine also reported maintaining aerial cameras. Although a few isolated individuals throughout the career ladder structure indicated maintaining aerial cameras, this was the only group where this maintenance was common across most members. Common tasks performed by this group include:

- perform operational checks on film takeup assemblies
- inspect housings
- clean and lubricate film takeup-assemblies
- adjust film takeup assemblies
- inspect external magazines

Averaging only 29 months in the service, this was the second most junior group in the career ladder structure. All members were stationed in the CONUS, and performed an average of 107 tasks. All members found their job interesting; however, possibly due to work on aerial cameras, only 56 percent felt that their training was being utilized at least fairly well or better.

Summary

Overall, the 404X0 career ladder was found to be fairly heterogeneous. Seven major technical areas were identified which related primarily to equipment maintained. These included: (1) still cameras, (2) processors, (3) printers, (4) audiovisual equipment, (5) mobile facilities, (6) motion picture cameras, and (7) aerial cameras. Most of these areas had a group of personnel whose primary function was the maintenance of this equipment; however, many incumbents also worked in other areas as well. Thus, based on this analysis, the present classification structure is well supported by the survey data.

ANALYSIS OF DAFSC GROUPS

As personnel progress in a career ladder, many times the job they perform changes. An analysis of the DAFSC groups and a comparison of these groups with the career ladder structure can reveal many of these possible changes. This information can then be compared to career ladder documents such as the AFR 39-1 specialty descriptions and the Specialty Training Standard (STS) in order to measure their accuracy.

Table 10 presents the relative percent time spent on duties by skill level groups. As is the case in most career ladders, the management, supervision, and training duties (A, B, C, and D) accounted for increasing proportions of time with skill level advancement. Lower skill level personnel tended to spend more time on the technical aspects of the job, with the 7-skill level personnel providing a smooth transition by spending time in both the technical and supervisory areas.

Advancement in skill level in the 404X0 career ladder also tended to be correlated with time spent on the various equipment maintained. As shown in Table 10, 3-skill level personnel spend more time maintaining still and motion picture cameras than any other skill level group. Five-skill level personnel spent more time performing maintenance on processors and mobility laboratory equipment. However, these percentages may be misleading. Considering the substantially larger number of 5-skill level personnel as compared to other DAFSCs, the jobs performed by 3-skill level incumbents may well be a matter of filling the needs of the career ladder at the time and not a case of changing the equipment maintained with advancement in skill levels.

Skill Level Descriptions

DAFSC 40430. Three-skill level personnel performed an almost exclusively technical job, spending 88 percent of their time on technical tasks. The largest percent of their time (29 percent) was spent maintaining photographic support systems. However, 3-skill level individuals also spent the most time of any DAFSC in the maintenance of still, motion picture, and general camera equipment.

In terms of job group distribution (see Table 11), 3-skill level personnel were primarily found in the Photographic Support Systems and Processor/Printer Maintenance Personnel cluster (25 percent), the Camera Maintenance Personnel cluster (22 percent), and the Photographic Support Systems and Audiovisual Equipment Maintenance Personnel cluster (19 percent).

Table 12 presents representative tasks performed by 3-skill level personnel. Performance of maintenance tasks involving adjusting, inspecting, and isolating malfunctions was typical of the technical tasks listed. As the table illustrates, the task with the highest percentage of 3-skill level members performing had only 72 percent of the members performing it. This highlights the fact that 40430 personnel do not have much of a common core of tasks performed by almost all members; rather, different areas of maintenance emphasis require somewhat different tasks among incumbents.

DAFSC 40450. Five-skill level personnel performed a job similar to that performed by 3-skill level airmen (see Table 13 for a list of representative tasks). However, 5-skill level members performed more supervision and administrative tasks. Emphasis of the 5-skill level job was more in the areas of processor, support systems, and mobility laboratory maintenance and performing administrative functions (see Table 10).

As Table 11 illustrates, the greatest concentration of 5-skill level personnel was in the Photographic Support Systems and Processor/Printer Maintenance Personnel cluster (44 percent). However, 5-skill level respondents were found across most of the job groups. Other major job groups of 5-skill level members included the Camera Maintenance Personnel, and Photographic Support Systems and Audiovisual Equipment Maintenance Personnel clusters which contained 19 percent and 12 percent respectively of all 5-skill level personnel. In addition, all but one member of the Audiovisual Equipment Maintenance Personnel independent job type was a 5-skill level incumbent and all of the Maintenance Schedulers independent job type was 5-skill level personnel.

Table 14 lists those tasks which best differentiate 3- and 5-skill level personnel. As illustrated, a higher percentage of 3-skill level personnel maintained camera equipment than 5-skill level incumbents, while a somewhat higher percentage of 5-skill levels performed processor maintenance tasks. In addition, the job of a 5-skill level incumbent was much broader, performing an average of 165 tasks as compared to an average of 131 for 40430 incumbents.

DAFSC 40470. At the 7-skill level, the job was still largely technical in nature, with over 50 percent of the total job time spent on technical functions (see Table 10). However, the most common tasks being performed were largely supervisory and administrative in nature (see Table 15).

In terms of job groups, 7-skill level respondents were found across many groups, both supervisory and technical (see Table 11). Over a third were found in the Photographic Support Systems and Processor/Printer Maintenance Personnel cluster. In addition, the Camera Maintenance Personnel cluster and the Supervisors cluster each contained 14 percent of all 7-skill levels. Also, the Quality Control NCOIC and Instructors independent job types were exclusively 7-skill level.

As depicted in Table 16, those tasks which best differentiated 5-skill level personnel from the 7-skill level personnel reflected more managerial and supervisory tasks for the 7-skill level personnel and more technical tasks, especially processor maintenance, for the 5-skill level incumbents.

DAFSC 40499 and CEM Code 40400. These individuals performed exclusively supervisory, managerial, and administrative functions (see Table 17 for a list of representative tasks). None of these individuals reported performing technical aspects of the job to any noticeable degree. Table 10 reveals the obvious lack of time spent by these individuals on any technical aspect of the job. Only one percent of their time was spent in technical duties; however, this time was diffused across all duties. The difference

between these incumbents and the 7-skill level personnel is the total supervisory and higher management job of the 9- and CEM Code skill level personnel whereas the 7-skill level personnel still perform technical tasks to a substantial degree.

Only one major career ladder structure grouping contained these individuals: the Supervisors cluster (see Table 11). Six of the seven incumbents grouped here and one incumbent did not group in any identifiable cluster or independent job type. Consequently, as could be expected, these members are the higher level managers and supervisors of the career ladder.

Summary

The DAFSC analysis reveals a heterogeneous career ladder, with the lower skill level personnel (3- and 5-skill levels) performing primarily technical tasks, the 7-skill level personnel providing both technical and supervisory tasks almost equally, and the 9-skill level and CEM code personnel performing exclusively supervisory and higher managerial tasks. Three-skill level personnel spend more time maintaining camera equipment than any other DAFSC and 5-skill level personnel spend more time maintaining processors and mobile facilities than the other DAFSCs. Seven-skill level personnel perform diverse technical tasks involving a spectrum of equipment, and 40499/00 personnel do not work with precision imagery and audiovisual media equipment to any appreciable extent.

COMPARISON OF AFR 39-1 SPECIALTY DESCRIPTIONS TO SURVEY DATA

A comparison of survey data to the April 1978 404X0 AFR 39-1 specialty descriptions found the present AFR 39-1 to be an accurate representation of the tasks and jobs being performed across the different skill levels. Although some of the jobs and equipment listed in the AFR 39-1 Specialty Descriptions were not used by a majority of the incumbents, the descriptions did give a good representation of the overall spectrum of the job for each skill level. No changes are recommended.

ANALYSIS OF EXPERIENCE (TAFMS) GROUPS

In addition to analyzing the differences in the job performed across skill level groups, it is also necessary to examine the jobs performed by personnel according to their experience in the career ladder. This is accomplished by comparing the different TAFMS groups - the most extensive analysis being between the first, second, and career enlistment groups.

Table 18 displays the percent time spent on duties by incumbents in the various enlistment groups. As can be seen, with increasing time in the service, more time is spent in the supervisory and managerial areas, but less time is spent in technical areas. Administrative duties tend to peak at the fourth enlistment. This trend is similar to that noted for DAFSC groups and is typical of most career fields.

As revealed in Table 19, the more junior personnel are concentrated in the Photographic Support Systems and Processor/Printer Maintenance Personnel cluster (39 percent), the Camera Maintenance cluster (17 percent), and the Photographic Support Systems and Audiovisual Equipment Maintenance cluster (15 percent). The Junior Photographic Support Systems and Processor/Printer Maintenance Personnel independent job type is comprised almost exclusively of first enlistment personnel. More senior personnel did not show any noticeable trends, as they tended to spread out over both technical and supervisory job groups. Those with over 240 months TAFMS were almost exclusively found in supervisory job groups.

Table 30 in the Equipment Section of this report provides a more complete listing of the equipment maintained by 404X0 personnel according to their experience level. In conjunction with the present TAFMS analysis, this information could be of use to training officials.

First Enlistment Personnel

Individuals in their first enlistment (1-48 months TAFMS) performed an almost totally technical maintenance job, with less than five percent of their job time being spent on supervisory functions (see Table 18). Common tasks performed by these personnel (see Table 20) were concentrated in the areas

of processor and support systems maintenance. However, first enlistment incumbents also reported working on the full spectrum of equipment in the field (see Table 21). TAC, SAC, and MAC had the largest concentrations of first enlistment personnel. Only 19 percent of the 1-48 months TAFMS group reported assignments overseas. Figure 2 displays the distribution of first enlistment personnel across the major job groups.

Job Satisfaction Analysis

Indices of job satisfaction were also examined for 404X0 first, second, and career enlistment groups. These data were compared with job satisfaction data from a group of Mission Equipment Maintenance personnel who were surveyed in 1980. As Table 22 shows, for all enlistment groups, 404X0 personnel found their job more interesting and their talents better utilized. Reported satisfaction with training for both the 404X0 and the comparative personnel were similar.

In summary, it can be said that first enlistment personnel perform a mostly technical job concerned with equipment maintenance. As experience level increases, more time is spent in managerial and supervisory areas. In general, 404X0 personnel find their job more interesting and their talents better utilized than personnel in similar career fields.

ANALYSIS OF MAJOR COMMAND DIFFERENCES

Another possible dimension along which the jobs performed by individuals may vary is Major Command (MAJCOM). Consequently, an examination of the tasks and duties performed by incumbents in each major command is necessary to see if differences exist. Five major commands, comprising 90 percent of the 404X0 sample, were examined. These commands were: 1) Air Training Command (ATC); 2) Military Airlift Command (MAC); 3) Strategic Air Command (SAC); 4) Tactical Air Command (TAC); and 5) United States Air Forces Europe (USAFE). Some notable job differences were discovered between personnel in different major commands.

Tables 23 through 27 at the end of this section provide job and background information for these MAJCOM groups. The reader should refer to these tables when reading the individual MAJCOM narratives which follow. For an overall view of how the jobs vary among MAJCOM groups, Table 23 lists the MAJCOM distribution across the job groups identified in the career ladder structure. Table 24 reflects the relative time spent performing duties by personnel in each MAJCOM. As can be seen, all MAJCOM groups spend substantial time maintaining photographic support systems and performing administrative functions; however, other duty areas provide some differentiation between groups. Further discussion of these differences follows in the specific MAJCOM descriptions. Table 25 reflects a summary of background data for the MAJCOM's involved. Of significant importance on Table 25 is the listing of equipment and the percentage of each MAJCOM's 404X0 member who reported maintaining that equipment. Table 26 lists representative tasks which differentiate the MAJCOM groups. Table 27 aids further in the differentiation by giving job satisfaction data for the major commands and Table 31 in the Equipment section of this report provides a more detailed listing of equipment maintained according to MAJCOM.

ATC

The 32 personnel in the Air Training Command formed the most heterogeneous group of the five. There was no single set of tasks best describing the job of these individuals. Rather, they performed a wide range of tasks, with usually less than half of the members performing any single task. ATC personnel did concentrate more time on training duties than any other MAJCOM and more time was spent maintaining still and motion picture cameras than any other MAJCOM except MAC. As Table 25 illustrates, the KS-99 Canon still camera, the ME-4 color processor, the Versmat 1811 CM color processor, reel-to-reel tape recorders, public address systems, and motion picture cameras in general were maintained to a substantially greater degree by ATC personnel than any other MAJCOM. It is also important to note that ATC incumbents found their job less interesting than any other major command (see Table 27). None of these individuals were assigned overseas.

MAC

Fifty-three 404X0 personnel are assigned to this major command and form a moderately homogeneous group, with common tasks performed by a majority of the incumbents. These individuals had the broadest job, with an average number of tasks performed of 195. The diversity of their job is also manifest by the distribution of job time across duties. As Table 24 reveals, MAC personnel do not concentrate their job time in any one duty area; rather, they spend their time across the full spectrum of duties. There is, however, certain equipment maintained which distinguishes MAC incumbents from other MAJCOMs. Table 25 illustrates that still cameras, such as the Nikon F-2, the MP-3 4X5 Polaroid copy camera, aerial cameras, audiovisual equipment, and other items are maintained to the greatest degree by MAC personnel. Table 26 shows that the tasks which separate MAC personnel from the other MAJCOMs are mostly concentrated in the still and motion picture camera areas. This is also supported by the fact that the largest concentration of the Camera Maintenance Personnel and the Motion Picture/Aerial Camera Maintenance Personnel clusters are MAC personnel (see Table 23). Job satisfaction data for these incumbents, 32 percent of whom were assigned overseas, reveals that they find their job the most interesting and their talents the most well utilized but their training the least utilized of any of the major commands.

SAC

This MAJCOM has the largest concentration of 404X0 personnel of any major command (60). Performing an average of 129 tasks, these individuals have the narrowest job reported by any major command. Support systems, such as print dryers and light tables are maintained by a moderately high percentage of SAC incumbents, making this a fairly homogeneous group. Processor maintenance also consumed a lot of SAC personnel's time. However, no equipment was found which was exclusively maintained by SAC personnel. This could possibly be due to classified equipment maintained by some SAC personnel which was not included in this survey. Concerning the area of differentiating tasks, there were no tasks performed to a substantially higher degree by SAC incumbents as compared to the other MAJCOMs. Job satisfaction information for SAC personnel is displayed in Table 27.

TAC

The 58 incumbents in the Tactical Air Command spent the most job time of any major command on the maintenance of processors. With an even higher percentage of their time spent on support systems maintenance, these individuals constitute a fairly homogeneous grouping. Mobile facilities are also a concern of TAC personnel; as illustrated in Table 26, mobile facilities are maintained to a higher degree by these individuals than any other MAJCOM excepting USAFE. Table 24 also supports this contention, with TAC spending much more time on mobile facilities in general and with processors being maintained by a high percentage of TAC personnel. TAC personnel do not, however, feel their talents are utilized as well as other MAJCOM personnel do, as revealed in Table 27.

USAFE

The 47 404X0 personnel in this major command formed a very homogeneous group, with a high percentage of the incumbents maintaining processors and maintaining support systems such as light tables and titlers. Table 26 shows that the tasks which best differentiate USAFE are in the areas of processor and mobile facility maintenance. This is also confirmed by Table 25, with mobile facilities and processors in general both being maintained by a high percentage of USAFE incumbents. Table 23 further supports this by revealing that the highest concentration of the Photographic Support Systems and Processor/Printer Maintenance Personnel cluster and the Mobile Laboratory Maintenance Personnel cluster are in USAFE. Individuals in USAFE felt that their training was utilized better than did any other major command. Seventy-five percent of these incumbents found their job interesting.

Summary

The jobs performed by 404X0 personnel were found to vary according to major command. Differences were noted in such areas as time spent on duties, equipment maintained, and tasks performed. Job satisfaction indices also varied as well. ATC incumbents were a fairly heterogeneous group, performing diverse duties and tasks with little commonality. MAC personnel had the broadest job of any command group and spent considerable job time in the areas of still and motion picture camera maintenance. SAC personnel were somewhat homogeneous in nature; however, these incumbents had no special area of expertise that they performed to a much greater extent than any other MAJCOM. TAC and USAFE personnel both worked a great deal with support systems, processors, and mobile facilities.

ANALYSIS OF CONUS VERSUS OVERSEAS GROUPS

A comparison of the 404X0 personnel assigned within the continental United States (CONUS) with those 404X0 personnel assigned overseas was performed on the basis of task and background survey data. Analysis revealed differences between the groups to be minor. Overall, both groups performed essentially the same job, with some minor background variations. Table 28 lists those tasks which best differentiate these groups. There were no areas in which over 10 percent more CONUS personnel performed a task as compared to overseas personnel.

As can be seen in Table 29, there were some differences, however, in background data between these groups. Overseas personnel averaged a greater number of tasks and a greater average time in the career field and time in the service. Overseas personnel also reported maintaining more mobile facilities and working with more processors, printers, manual densitometers, sensitometers, and photographic editing equipment. Comparatively, CONUS personnel reported working more in Base Photolab/Maintenance areas, whereas more Overseas personnel reported working in mobile reconnaissance laboratories. No other substantial differences were noted between the CONUS and Overseas personnel.

Consequently, it can be said that the differences between 404X0 CONUS and Overseas personnel lie in the areas of processor maintenance, mobile facility work, and other background information. Otherwise, these two groups perform essentially the same job.

ANALYSIS OF DAVA AND AAVA PERSONNEL

Since the similarity or difference in jobs or tasks performed by Defense Audiovisual Agency (DAVA) and Aerospace Audiovisual Agency (AAVS) personnel as compared to the rest of the 404X0 field was a major issue to be addressed in this study, the responses of these personnel were closely examined. Only 10 incumbents assigned to Norton AFB were included in the final sample. All 10 reported their organization as AAVS. No other AAVS personnel were found in the sample, and no respondents reported the DAVA as their organization (possibly due to its recent creation as a split from the AAVS).

Overall, the 10 respondents from Norton AFB performed no job that is substantially different from that performed by other 404X0 personnel. No thread of commonality was noted for the personnel assigned to Norton, other than the base to which they were assigned. Consequently, a shredout for the AAVS 404X0 personnel seems unnecessary in light of the 404X0 jobs they reported performing.

EQUIPMENT MAINTAINED

In order to assist the technical training school at Lowry AFB and MAJCOM functional managers in evaluating training needs and requirements, an extensive analysis of equipment maintained was conducted. Tables 30 and 31 highlight those items of equipment which are maintained by various AFMS and MAJCOM groups respectively. Table 32 lists those items of equipment which are maintained by very few career ladder incumbents.

TRAINING ANALYSIS

One of the most important uses of occupational survey data is in the area of training. Survey data which is useful to 404X0 training development personnel include: (1) percentage of first enlistment members performing task(s), (2) utilization of equipment by incumbents, and (3) task difficulty ratings. These data can be used in evaluating the Specialty Training Standard (STS) and Plan of Instruction (POI) for the 404X0 specialty. Technical school personnel at Lowry AFB, CO matched inventory tasks to areas of instruction outlined in the STS, dated July 1977 and the POI for course G3ABR40430, dated June 1980. A complete computer listing of the percent members performing and task difficulty ratings along with the STS and POI matching has been forwarded to the technical school for their use in reviewing training documents. That information is summarized below.

Analysis of Task Difficulty

The relative difficulty of each task in the job inventory was assessed through ratings by 30 experienced 7- and 9-skill level 404X0 NCOs. These tasks were processed to produce an ordered listing of all tasks in terms of their relative difficulty and were standardized to have an average difficulty of 5.0 (standard deviation equals 1.0). (For a more detailed description of these ratings, see the Task Factor Administration section in the INTRODUCTION.)

Table 33 lists those tasks rated most difficult by the experienced 404X0 raters. Most of the tasks are technical in nature and involve maintaining camera systems. This finding is consistent with the fact that the Camera Maintenance cluster in the career ladder structure had the highest Job Difficulty Index (JDI) of all the groups. Also included are several supervisory tasks; overall, however, very few of the most difficult tasks are performed by more than 25 percent of the total 404X0 sample.

Most of the tasks rated average in difficulty are also technical in nature; however, as Table 34 displays, these tasks covered a wider spectrum of the different 404X0 jobs. Typical average difficulty tasks include tasks such as isolating malfunctions in speaker systems, inspecting prism assemblies, and performing corrosion control on relocatable facilities.

Table 35 lists those tasks rated the least difficult by senior 404X0 personnel. Generally, these tasks were concerned with routine simple maintenance of equipment. Many of these tasks dealt with general camera equipment. As could be expected, a larger percentage of 404X0 incumbents perform these less difficult tasks.

Job Difficulty Index (JDI)

Table 36 lists the 11 major job groups identified in the job structure analysis section. The job groups are listed in order from the most to the least difficult job according to their computed job difficulty index (JDI). (The Administration section in the INTRODUCTION of this report gives a more detailed description of the job difficulty index). Overall, there was not an

extreme variation in the difficulty of the jobs, with the exception of the Camera Maintenance Personnel cluster and the Maintenance Schedulers Independent Job Type.

As depicted, the Camera Maintenance Personnel cluster reports the most difficult job of any group. This is not surprising considering the large number of tasks performed by this group. Even though the Average Task Difficulty Per Unit Time Spent (ATDPUTS) for this group is comparatively about average, the extreme number of tasks performed by these individuals makes their job the hardest of any group.

The Supervisors cluster performed the hardest tasks on the average (as revealed by the ATDPUTS ratings), but the smaller number of tasks performed by this group made their job slightly easier than the average. The Maintenance Schedulers Independent Job Type is similar in that the incumbents perform somewhat more difficult tasks than average, but they perform such a small number of tasks that their job is rated the easiest of all groups.

The Junior Photographic Support Systems and Processor/Printer Maintenance Personnel and the Mobility Laboratory Maintenance Personnel Independent Job Types held the next easiest jobs to that of the Maintenance Schedulers. The rest of the clusters and independent job types were of near average difficulty ranging from 11.0 to 13.7 on the JDI scale.

As a result of this job difficulty analysis then, it can be said that increasing experience leads to the performance of harder tasks, but not necessarily a harder job overall. Consequently, the number of tasks performed seems to be the determining factor in deciding the difficulty of the jobs in the 404X0 career ladder.

Analysis of the 404X0 Specialty Training Standard (STS)

The 404X0 Specialty Training Standard, dated July 1977, was reviewed against survey data for first job and first enlistment Precision Imagery and Audiovisual Media Maintenance personnel. Subject matter specialists at the Lowry Technical Training Center assisted in the analysis by matching job inventory tasks to specific paragraphs in the STS. Each paragraph in the STS was analyzed using task difficulty and percent members performing vectors to determine if the paragraph had job inventory justification for inclusion in the STS. Overall, the STS gave a good representation of the equipment maintained and corresponding proficiency requirements. However, some possible improvements were noted.

The STS showed an adequate representation of the test equipment used; however, two pieces of test equipment--strobotacs and lens collimators--were used by less than 15 percent of all 404X0 personnel. The knowledge requirement for the strobotac was for partial proficiency with procedural task knowledge. This could possibly be reduced to a less proficient level. The proficiency level for the lens collimators was slightly lower and could conceivably be reduced further. Ammeters and Volt-Ohmmeters (VOM) were both used by over 40 percent of the sample, but were not included at all in the STS. Inclusion of these might enhance the accuracy of the document.

STS areas with few members reporting the performance of tasks included audiovisual production systems, audio amplifiers, microphones, record players, and electronic/digital directed programmers. These areas could possibly have proficiency requirements reduced. Otherwise, no major revisions are recommended.

Analysis of the G3ABR40430 Plan of Instruction (POI)

The Plan of Instruction (POI) for course G3ABR40430, dated June 1980, was reviewed for first job and first enlistment 404X0 personnel. Subject matter specialists at the Lowry Technical Training Center matched the job inventory tasks to specific criterion objectives in the POI. Also, each criterion objective was examined based on task difficulty and percent members performing vectors to determine if the survey data supports the major aspects of the basic 404X0 course. Analysis resulted in a conclusion that the G3ABR40430 course provides comprehensive and accurate training for personnel entering the 404X0 career ladder. However, school personnel should closely examine the POI-matched printouts and other pertinent survey data to determine if any minor changes in the course may be needed.

* RELATIVE JOB DIFFICULTY OF SPECIALTY JOBS AS PREDICTED USING A FORMULA DEVELOPED BY RESEARCH OF THE AIR FORCE HUMAN RESOURCES LABORATORY. AVERAGE JOB DIFFICULTY (MEAN) IS SET AT 13.0

** AVERAGE TASK DIFFICULTY PER UNIT TIME SPENT (ATDPUTS) IS CALCULATED USING A FORMULA DEVELOPED BY RESEARCH OF THE AIR FORCE HUMAN RESOURCES LABORATORY.

COMPARISON TO PREVIOUS SURVEY

A comparison was made between the results of this survey analysis and the results of the previous Occupational Survey Report, AFPT 90-404-206 dated November 1976. The previous report was a combined report of the 404X0 and 404X1 career fields. The 404X1 career field is not addressed in the present report and no comparison can be made for these personnel.

In comparing DAFSC analyses, it was noted that the 1976 report did not have 40499 or CEM Code 40400 personnel included. As a result of this, comparison can only be made up to the 7-skill level. As could be expected, similar trends were noted concerning supervisory and managerial work, with both reports confirming an increasing amount of job time spent in these areas with advancement beyond the 5-skill level. One difference noted between the two reports concerns the maintenance of still and motion picture cameras. The 1976 report displayed the 5-skill level incumbents as the major still and motion picture camera maintenance personnel, whereas in the present analysis the 3-skill level personnel maintain this equipment to a noticeably higher degree.

Comparison of the career ladder structures found a few additional jobs identified in the present report. These additional job groups were the: 1) Quality Control NCOICs, 2) Instructors, 3) Maintenance Schedulers, and 4) Photographic Support Systems and Audiovisual Equipment Maintenance Personnel. The other job groups roughly corresponded to the job groups identified in the 1976 report.

As illustrated in Table 37, job satisfaction indices revealed somewhat higher satisfaction for personnel in the 1980 data. Whereas only 40 percent of the Audiovisual Equipment Technicians in the 1976 report found their job interesting, 100 percent of the Audiovisual Equipment Maintenance Personnel independent job type in the present report found their job interesting. This difference could be explained by the broader nature of the present Audiovisual Maintenance job with members performing an average of 137 tasks as compared to only 49 for the 1976 Audiovisual Equipment Technicians. Mobility Laboratory Maintenance Personnel in the present survey were another group who described their job as more interesting than a similar group in the previous survey. As did most of the job groups, the 1980 sample of 404X0 personnel in various enlistment groups found their job more interesting than did the 1976 sample. This is evidenced by 70 percent of the 1980 first enlistment personnel in the sample as compared to only 59 percent in the 1976 sample finding their job interesting. In general, 404X0 incumbents express greater satisfaction with their job presently than they did in 1976.

TABLE 37
COMPARISON OF JOB SATISFACTION BETWEEN 1976 AND
1981 404X0 RESPONDENTS

<u>PERCENT FINDING JOB INTERESTING</u>	<u>1976 REPORT</u>	<u>1981 REPORT</u>
TOTAL SAMPLE:	71%	77%
3-SKILL LEVEL PERSONNEL:	50%	81%
5-SKILL LEVEL PERSONNEL:	69%	73%
7-SKILL LEVEL PERSONNEL:	83%	90%
FIRST ENLISTMENT PERSONNEL:	59%	70%
AUDIOVISUAL EQUIPMENT MAINTENANCE GROUP:	40%	100%
MOBILITY LABORATORY MAINTENANCE GROUP:	40%	86%

IMPLICATIONS

The Precision Imagery and Audiovisual Media Maintenance career ladder is heterogeneous in nature, with a spectrum of diverse jobs differing mainly in the area of equipment maintained. The major types of equipment which distinguished job groups were cameras, audiovisual systems, processors, printers, support systems, and mobility laboratories. Overall, individuals clustered into different job groups and could be differentiated according to the equipment maintained.

There were some differences found in the area of equipment maintained according to major command. While all MAJCOMs spent the greatest amount of their time maintaining support systems, there was command specific emphasis in other duty areas. SAC, TAC, and USAFE led the other commands in support systems and processor maintenance; ATC and MAC maintained camera systems to a higher degree than the other MAJCOMs; TAC and USAFE spent the only significant amount of time maintaining relocatable facilities; and ATC spent noticeably more time in the area of training. The MAJCOM differences are supported as well by the composition of the job groups (see Table 24), with the systems maintained by the job groups correlating with MAJCOM concentrations in that job group. Job satisfaction indices also revealed some differences between these MAJCOM groups with ATC personnel finding their job the least interesting.

Concerning the DAVA/AAVS issue, survey data suggests that personnel in the AAVS stationed at Norton who participated in the survey do not perform a unique job from other 404X0 personnel. This is manifest by the fact that the Norton AAVS personnel did not form a single job group but were scattered among the different job groups. The DAVA issue could not be properly addressed since no respondents in the survey reported the DAVA as their organization.

Generally, incumbents in the present 404X0 career ladder find their job more interesting than they did in 1976. Some of the jobs in the career field were broadened, which could account for some increased job interest. Some new jobs were also identified from the 1980 data which were not identified in the previous report. These new jobs could possibly be a factor in the increased job interest reported.

APPENDIX A

Job Type Descriptions

Listed below are brief descriptions of the job types identified in the Precision Imagery and Audiovisual Media Maintenance career ladder structure. Generally, the job types within each cluster vary according to the emphasis placed on the maintenance of the systems which characterize the cluster. The Supervisors cluster is an exception, with job types differentiating on the basis of the supervisory responsibilities. The job types within the Camera Maintenance Personnel cluster are fairly heterogeneous, with the main differentiating factor being the type of camera maintained. Job types comprising the Photographic Support Systems and Audiovisual Equipment Maintenance Personnel cluster were more homogeneous, with the major difference being the area of maintenance emphasis. The Photographic Support Systems and Processor/Printer Maintenance Personnel cluster, on the other hand, has two distinctly different job types and three job types that differ mostly due to different areas of maintenance emphasis. For additional information, the tables in Appendix A reveal various duty, background, and job satisfaction data for all of the job types identified. Appendix B contains a listing of representative tasks for these job types.

Supervisors Cluster

Two job types were identified in this cluster: Administrative Line Supervisors and Higher Management Supervisors. Brief descriptions of each job type are presented below. For further information, reference Tables A2, A4, and A6 in Appendix A. Tables B2 and B3 give representative tasks for these job types respectively.

1a. ADMINISTRATIVE LINE SUPERVISORS (GRP051). Comprised of 7- and 5-skill level personnel, this group has responsibilities in the supervisory and administrative areas, with administrative duties absorbing 32 percent of their time. Fifteen percent of the job time of these incumbents was spent on technical duties. Supervision was their main concern however, with 81 percent of these individuals reporting that they supervise others. Eighty-six percent of this group found their job interesting, and 100 percent felt their training was well utilized.

1b. MANAGERS (GRP099). With 11 members, this was the largest of the two job types within this cluster. These individuals are the higher level managers of their organizations, with almost none of their time spent on technical aspects of the job. With an average grade of E-7 and an average time in service of 214 months, these personnel are the most senior in the career ladder. Eighty-two percent of these incumbents found their job interesting.

Camera Maintenance Personnel Cluster

This cluster contains three job types: Photographic Support Systems, Still Camera and Audiovisual Equipment Maintenance Personnel; Motion Picture Camera Maintenance Personnel; and Still Camera Maintenance Personnel. As the job type names suggest, the main differentiating factor in these job types is the type of camera(s) maintained. Tables A2, A4, and A6 in Appendix A give more information about these groups.

IIa. PHOTOGRAPHIC SUPPORT SYSTEMS, STILL CAMERA, AND AUDIOVISUAL EQUIPMENT MAINTENANCE PERSONNEL (GRP106). The 23 incumbents making up this job type maintain support systems such as print washers and dryers as well as audiovisual systems and still camera systems. They perform an average of 311 tasks, the second largest average number of tasks performed by any group in the career ladder. Fifty-seven percent of these individuals were assigned to overseas locations. None of the members of this group found their job dull, with 96 percent reporting that their talents were utilized fairly well or better. See Table B8 for a listing of representative tasks for this group.

IIb. MOTION PICTURE CAMERA MAINTENANCE PERSONNEL (GRP137). The maintenance of general and motion picture camera systems is the concern of the 11 individuals in this job type. These incumbents have the broadest job in the career ladder, with members performing an average of 377 tasks. Table B9 gives a listing of representative tasks for these personnel, 73 percent of whom described their job as interesting. As a possible result of the extent of their job, this group had the highest job difficulty index (JDI) of any group in the career ladder. The average Task Difficulty per unit time spent (ATDPUTS) was not the highest, however, leading to a possible conclusion that the wide range of the job is what makes it so difficult.

IIc. STILL CAMERA MAINTENANCE PERSONNEL (GRP073). The six members of this group specialize in the maintenance of still camera systems. With 83 percent of the individuals in their first enlistment and members averaging only 40 months in the service, this is one of the most junior groups in the career ladder. Eighty-three percent describe their job as interesting, but only 67 percent feel their talents and training are utilized. Table B10 gives a list of representative tasks for these personnel.

Photographic Support Systems and Audiovisual Equipment Maintenance Personnel Cluster

This cluster was comprised of two job types: the Support Systems and Audiovisual Equipment Maintenance Personnel, and the Audiovisual Equipment and Support Systems Maintenance Personnel. As could be inferred from the job type names, the major difference between these job types was the emphasis placed on the two major areas of maintenance. The Support Systems and Audiovisual Equipment Maintenance Personnel spent more time on Support Systems; whereas the Audiovisual Equipment and Support Systems Maintenance Personnel concentrated more on Audiovisual Systems Maintenance. Tables A2, A4, and A6 in Appendix A provides information on these job types. Tables B12 and B13 give representative tasks for these groups respectively.

IIIa. SUPPORT SYSTEMS AND AUDIOVISUAL EQUIPMENT MAINTENANCE PERSONNEL (GRP062). The 21 members of this job type concentrate on the maintenance of support systems such as print washers and dryers. Audiovisual systems such as projectors are also maintained by these personnel, but to a lesser degree. Fifty-two percent of these individuals were in their first enlistment and only 57 percent of them found their job interesting. Forty-three percent were unsatisfied with the utilization of their

training and only 62 percent felt their talents were utilized fairly well or better.

IIIb. AUDIOVISUAL EQUIPMENT AND SUPPORT SYSTEMS MAINTENANCE PERSONNEL (GRP057). The maintenance of audiovisual systems, especially projectors, is the main focus of these personnel, with support systems maintained to a lesser extent. Four of the eight members in this group, or 50 percent, were in their first enlistment. All members were stationed within the CONUS and had either a 3- or 5-skill level DAFSC. Seventy-five percent of these individuals found their job interesting. The maintenance of support systems as well as the broader nature of the job, this group performed an average of 100 tasks, differentiated these personnel from the Audiovisual Maintenance Independent Job Type (see Career Ladder Structure of this report).

Photographic Support Systems and Processor/Printer
Maintenance Personnel Cluster

This cluster had five job types in it: Mobile Facilities, Support Systems, Processor/Printer Maintenance Personnel; Support Systems and Processor/Printer Maintenance Personnel; Support Systems and Printer/Processor Maintenance Personnel; Support Systems and Processor Maintenance Personnel; and Support Systems and Processor Technician-Supervisors. All job types within this cluster had a common core of Support Systems and Processor maintenance. Printer maintenance and emphasis on the maintenance of certain areas over others provided the basis for differentiation. Tables A1, A3, and A5 provide information about the job types in this cluster.

IVa. MOBILE FACILITIES, SUPPORT SYSTEMS, AND PROCESSOR/PRINTER MAINTENANCE PERSONNEL (GRP157). With 39 members, this is the largest job type that was identified in the career ladder. Processor Maintenance is a major part of this job, as is the maintenance of mobile facilities; and many of the support systems maintained are closely tied to processors. Unlike the Mobile Laboratory Maintenance Personnel Independent Job Type discussed in the CAREER LADDER STRUCTURE section of this report, individuals in this job type worked almost exclusively on WS 430 mobile facilities. Most members reported working with Delaware Titlers and Richards Light Tables and many of the individuals were also members of a TRS organization. Job satisfaction information was not impressive for these personnel with 64 percent finding their job interesting, 62 percent feeling their talents were utilized, and only 59 percent feeling their training was utilized fairly well or better. Fifty-six percent of these personnel were in their first enlistment and 49 percent were stationed overseas. Thirty-six of the individuals reported a 5-skill level DAFSC. Table B15 gives representative tasks for this job type.

IVb. SUPPORT SYSTEMS AND PROCESSOR/PRINTER MAINTENANCE PERSONNEL (GRP155). The 24 members of this job type concentrated on processor and printer maintenance with most of the support systems maintained being related to processors. These individuals performed an average of 211 tasks and had an average time in service of 83 months; these factors differentiated this group from the more limited job of the Junior Photographic

Support Systems and Processor/Printer Maintenance Personnel Independent Job Type (see CAREER LADDER STRUCTURE SECTION of this report). Eighty-eight percent of these individuals reported their job as interesting and 100 percent reported their talents as being utilized fairly well or better. Ninety-two percent also felt their training was being fairly well or better utilized. Representative tasks for this group are displayed in Table B16.

IVc. SUPPORT SYSTEMS AND PRINTER/PROCESSOR MAINTENANCE (GRP109). The 11 personnel comprising this group primarily maintained printers, with processors maintained to a lesser extent and many of the support systems maintained relating to processors. Fifty-five percent of these incumbents reported assignments overseas. Seventy-three percent of the group found their job interesting, but only 64 percent felt their talents were utilized fairly well or better. Table B17 gives representative tasks for the group.

IVd. SUPPORT SYSTEMS AND PROCESSOR MAINTENANCE PERSONNEL (GRP095). This 12 member job type emphasized mainly Processor maintenance. Printers were maintained to a lesser degree and many of the support systems maintained were related to processor systems. Mobility laboratories were also maintained to a noticeable degree by these personnel, but no single facility of specialization was noted. Ninety-two percent of these individuals found their job interesting, with 67 percent of the personnel assigned overseas. With a Job Difficulty Index (JDI) of 10.0 and an Average Task Difficulty per unit time spent (ATPUTS) of 4.6, these individuals had the job rated the easiest of all job types. Fifty percent of these individuals were in their first enlistment. Table B18 gives representative tasks for this job type.

IVe. SUPPORT SYSTEMS AND PROCESSOR TECHNICIAN-SUPERVISORS (GRP066). The 11 members of this group had a job consisting of a combined emphasis on both supervisory and technical functions. These individuals function at a firstline supervisory level with a lot of concentration on administrative functions and lower-level supervisory duties. The technical aspect of their job deals mainly with the maintenance of processors and processor-related support systems. None of these individuals are in their first enlistment and 82 percent of them report supervising other personnel. Fifty-five percent of these incumbents were stationed overseas. Seventy-three percent of this group found their job interesting. Table B19 displays the representative tasks of this job type.
