INSTRUCTIONS FOR PREPARATION OF REPORT DOCUMENTATION PAGE

RESPONSIBILITY. The controlling DoD office will be responsible for completion of the Report Documentation Page, DD Form 1473, in all technical reports prepared by or for DoD organizations.

CI **DEFICATION.** Since this Report Documentation Page, DD Form 1473, is used in preparing announcements, bibliographies, and data it should be unclassified if possible. If a classification is required, identify the classified items on the page by the appropriate symbol.

COMPLETION GUIDE

General. Make Blocks 1, 4, 5, 6, 7, 11, 13, 15, and 16 agree with the corresponding information on the report cover. Leave Blocks 2 and 3 blank.

Block 1. Report Number. Enter the unique alphanumeric report number shown on the cover.

Block 2. Government Accession No. Leave Blank. This space is for use by the Defense Documentation Center,

Block 3. Recipient's Catalog Number. Leave blank. This space is for the use of the report recipient to assist in future retrieval of the document.

Block 4, Title and Subtitle. Enter the title in all capital letters exactly as it appears on the publication. Titles should be unclassified whenever possible. Write out the English equivalent for Greek letters and mathematical symbols in the title (see "Abstracting Scientific and Technical Reports of Defense-sponsored RDT/E,"AD-667 000). If the report has a subtitle, this subtitle should follow the main title, be separated by a comma or semicolon if appropriate, and be initially capitalized. If a publication has a title in a foreign language, translate the title into English and follow the English translation with the title in the original language. Make every effort to simplify the title before publication.

Block 5. Type of Report and Period Covered. Indicate here whether report is interim, final, etc., and, if applicable, inclusive dates of period covered, such as the life of a contract covered in a final contractor report.

<u>Block 6.</u> Performing Organization Report Number. Only numbers other than the official report number shown in Block 1, such as series numbers for in-house reports or a contractor/grantee number assigned by him, will be placed in this space. If no such numbers are used, leave this space blank.

Block 7. Author(s). Include corresponding information from the report cover. Give the name(s) of the author(s) in conventional order (for example, John R. Doe or, if author prefers, J. Robert Doe). In addition, list the affiliation of an author if it differs from that of the performing organization.

Block 8. Contract or Grant Number(s). For a contractor or grantee report, enter the complete contract or grant number(s) under which the work reported was accomplished. Leave blank in in-house reports.

<u>Block 9.</u> Performing Organization Name and Address. For in-house reports enter the name and address, including office symbol, of the performing activity. For contractor or grantee reports enter the name and address of the contractor or grantee who prepared the report and identify the appropriate corporate division, achool, laboratory, etc., of the author. List city, state, and ZIP Code.

Block 10, Program Element, Project, Task Area, and Work Unit Numbers. Enter here the number code from the applicable Department of Defense form, such as the DD Form 1498, "Research and Technology Work Unit Summary" or the DD Form 1634. "Research and Development Planning Summary," which identifies the program element, project, task area, and work unit or equivalent under which the work was authorized.

Block 11. Controlling Office Name and Address. Enter the full, official name and address, including office symbol, of the controlling office. (Equates to funding/aponeoring agency. For definition see DoD Directive 5200.20, "Distribution Statements on Technical Documents.")

Block 12. Report Date. Enter here the day, month, and year or ponth and year as shown on the cover.

Block 13. Number of Pages. Enter the total number of pages

Block 14, Monitoring Agency Name and Address (if different from Controlling Office). For use when the controlling or funding office does not directly administer a project, contract, or grant, but pelegates the administrative responsibility to another organization.

Blocks 15 & 15s. Security Classification of the Report: Declassification/Downgrading Schedule of the Report. Enter in 15 the highest classification of the report. If appropriate, enter in 15a the declassification/downgrading schedule of the report, using the abbreviations for declassification/downgrading schedules listed in paragraph 4-207 of DoD 5200.1-R.

Block 16. Distribution Statement of the Report. Insert here the applicable distribution statement of the report from DoD Directive 5200.20, "Distribution Statements on Technical Documents."

Block 17. Distribution Statement (of the abstract entered in Block 20, if different from the distribution statement of the report). Insert here the applicable distribution statement of the abstract from DoD Directive 5200.20, "Distribution Statements on Technical Documents."

Block 18. Supplementary Notes. Enter information not included elsewhere but useful, such as: Prepared in cooperation with ... Translation of (or by)... Presented at conference of ... To be published in ...

Block 19. Key Words. Select terms or short phrases that identify the principal subjects covered in the report, and are sufficiently specific and precise to be used as index entries for cataloging, conforming to standard terminology. The DoD "Thesaurus of Engineering and Scientific Terms" (TEST), AD-672 000, can be helpful.

Block 20: Abstract. The abstract should be a brief (not to exceed 200 words) factual summary of the most significant information tained in the report. If possible, the abstract of a classified report should be unclassified and the abstract to an unclassified report should consist of publicly- releasable information. If the report contains a significant bibliography or literature survey, mention it here. For information on preparing abstracts see "Abstracting Scientific and Technical Reports of Defense-Sponsored RDT&E," AD-657 000.

PREPARED BY: ST. LOUIS DISTRICT CORPS OF ENGINEERS FOR: GOVERNOR OF MISSOURI

MAY 1978

Phase I Report National Dam Safety Program

Chain of Lakes Dams (also known as Shy Dams and/or Seven (7) NAME: Lakes Dams)

LOCATION: Wayne County, Missouri

STREAM: Goose Creek

(°, *, <

DATE OF INSPECTION: 4 April 1978

Dams No. 1 (Mo30347), 2 (Mo30348), and 3 (Mo31032) at the "Chain of Lakes" were inspected using the "Recommended Guidelines for Safety Inspection of Dams." These guidelines were developed by the Chief of Engineers, U.S. Army, Washington D.C., with the help of Federal and State agencies, professional engineering organizations, and private engineers. The resulting guidelines are considered to represent a consensus of the engineering profession.

Based on the criteria in the guidelines, the dams acting as a system are in the high hazard potential classification, which means that loss of more than a few lives and appreciable property loss could occur in the event of failure of the dams. Over 30 structures would be subjected to flooding with possible damage and /or destruction and possible loss of life. The dams are in the small size classification because they are less than 40 feet high and impound less than 1000 acre-feet of water.

Our evaluation of the spillways' size indicates that they do not meet the criteria in the guidelines. The spillways of dams No. 2 and 3 are of inadequate size to pass the one percent chance flood (100-year flood) without overtopping. The spillway of dam No. 1 is just adequate to pass the one percent chance flood; but if either dam No. 2 or No. 3 failed due to overtopping, dam No. 1 would overtop also. The one percent chance flood is a flood that would have a one perdent chance of being exceeded in any given year. The guidelines recommend dams of this size and hazard classification have spillways capable of passing from one-half to all of the Probable Maximum Flood, an event with greater flow and a less frequent chance of occurrence than a one percent chance flood.

The inspection team observed trees and bushes growing in the three dams inspected, particularly dam No. 3. These root systems are a potential seepage hazard. Localized areas of the embankment slopes are exceptionally steep. Steady seepage conditions exist through dam No. 1 and a localized seepage area was found downstream of dam No. 2. The pool of dam No. 2 was on the downstream slope of dam No. 3 and seepage could not be evaluated. Cont Von Par

The three spillways do not appear sufficiently resistant to prevent embankment erosion at high flows for an indefinite time. Stilling basins are needed below each spillway. Seepage and stability analyses are not on record as recommended in the guidelines.

We recommend action be taken by the owner to correct the deficiencies listed herein in the near future. Corrective works should be in accordance with analyses and design performed by an engineer experienced in the design of dams. These conclusions were reached by the undersigned inprection team members.

PHASE I INSPECTION REPORT NATIONAL DAM SAFETY PROGRAM CHAIN OF LAKES DAMS ID NOS. 30347, 30348, 31032

Section 1 - Project Information

1.1 GENERAL.

a. <u>Authority</u>: The National Dam Inspection Act, Public Law 92-367, authorized the Secretary of the Army, through the Corps of Engineers, to initiate a program of safety inspection of dams throughout the United States. Pursuant to the above, the St. Louis District, Corps of Engineers, District Engineer directed that a safety inspection of the Chain of Lakes Dams be made.

b. <u>Purpose of Inspection</u>: The purpose of the inspection was to make an assessment of the general condition of the dams with respect to safety, based upon available data and visual inspection, in order to determine if the dams pose hazards to human life or property.

c. Evaluation Guidelines: The inspection was accomplished using the "Recommended Guidelines for Safety Inspection of Dams." These guidelines were developed by the Chief of Engineers, U.S. Army, Washington D.C., with the help of Federal and State agencies, professional engineering organizations, and private engineers. The resulting guidelines are considered to represent a consensus of the engineering profession.

1.2 DESCRIPTION OF PROJECT.

a. <u>Description of Dams and Appurtenances</u>: These are earthfill dams. The appurtenant structures at each dam consist of a spillway. In addition, Dam No. 2 is reported to have an 8-inch diameter pipe through it, capped underwater on the upstream side.

b. Location: Section 20 and 29, Township 30 North, Range 4 East

- c. Size Classification: Small
- d. Hazard Classification: High
- e. <u>Ownership</u>: Mr. Paul Shy Route 3 DeSoto, Missouri 63020
- f. Purpose of Dams: Recreation Resort Area

g. Design and Construction History: The three (3) dams were reportedly constructed 34 years ago (1944+) by the present owner. The dams were reportedly constructed using borrow material from the lake area placed in lifts and compacted by tracking with a rubber-tired scraper. The dams reportedly have a clay cutoff trench to rock about eight feet wide.

h. <u>Normal Operational Procedure</u>: No operating records exist. At all three (3) dams, outflow passes over uncontrolled spillways.

- 1.3 PERTINENT DATA Dam #1 (Inventory No. 30347)
 - a. Drainage Areas: 1326 Acres
 - b. Discharge at Damsite: Not known

Maximum known flood at damsite - 1 to 2 feet depth over spillway reported

Spillway capacity at maximum pool elevation - 1940 cfs @ el 646 ft. msl

c. Elevation (ft. above MSL):

Top of dam - 646.0

Flood control pool - 646.0

Recreation pool - 640.5

Streambed - 615+

Maximum tailwater - Not known

d. Reservoir:

Length of maximum pool - Approximately 2000 feet

Length of recreation pool - Approximately 1600 fest

e. Storage (acre-feet):

Recreation pool - 183

Flood control pool - 144

Design surcharge - 0

Top of dam - 327

- f. Reservoir Storage (acres): Top of dam - 32.7Maximum pool - 32.7 Flood-control pool - 32.7 Recreation pool - 22.3 Spillway crest - 22.3 g. Dam: Type - Earth fill Length - 569 feet Height - 30+ feet Top width - 8 feet Side slopes - Varies, 1 vertical on 2.6 horizontal at maximum downstream section Zoning - Not known Impervious core - Not known Cutoff - Reportedly has 8 ft. wide clay cutoff Grout curtain - Reportedly none h. Diversion and Regulating Tunnel: None i. Spillway: Type - Earth/rock/concrete Length of weir - 40 feet Crest elevation - 640.6 Gates - None
- j. Regulating Outlets: None

PERTINENT DATA - Dam #2 (Inventory No. 30348)

- a. Drainage Areas: 558 Acres
- b. Discharge at Damsite: Unknown

Maximum known flood at damsite - Unknown - 1 to 2 feet depth over spillway reported

Spillway capacity st maximum pool elevation - 659 cfs @ el 669 ft. msl

c. Elevation (ft. above MSL):

Top dam - 670+ feet

Flood control pool - 669

Recreation pool - 665.5

Streambed - 645+ feet

Maximum tailwater - Not known

d. <u>Reservoir</u>:

Length of maximum pool - 1100 ft.

Length of recreation pool - 1100 ft.

e. Storage (acre-feet):

Recreation pool - 82

Flood control pool - 43

Design surcharge - 13

Top of dam - 138

Section 2 - Engineering Data

2.1 DESIGN. No design drawings or computations exist.

2.2 CONSTRUCTION. The three dams were reportedly constructed 34 years ago (1944+) by the present owner. The dams were reportedly constructed using borrow material from the lake area placed in lifts and compacted by tracking with a rubber-tired scraper. The dams reportedly have a clay cutoff trench to rock about eight feet wide.

2.3 OPERATION. No operating records exist. At all three dams, outflow passes over uncontrolled spillways.

2.4 EVALUATION.

Sal Calledon

a. <u>Availability</u>: The only available engineering data is the personal recollections of the owner.

b. <u>Adequacy</u>: The field surveys and visual inspections presented herein are considered adequate to support the conclusions of this report.

c. Validity: Not applicable.

Section 3 - Visual Inspection

3.1 FINDINGS.

a. <u>General</u>: The owner accompanied the inspection team. For purposes of discussion herein, the downstream-most lake is referred to as No. 1, the next upstream lake is No. 2, and the next, No. 3. A fourth lake, also known as Michael's Lake and upstream of No. 3, was found to be less than 25 feet high and to impound less than 50 acre-feet of water and does not fall under the inspection program. At least three additional small dams on the property form lakes or ponds which likewise are too small to require inspection under the program.

b. <u>Project Geology</u>: Field investigations indicated bedrock at the left abutment (northwestern portion) of the No. 1 (lowest) dam, EL 630-660 feet, is a tan to light brown, fine to medium grained, massively bedded, moderately hard, calcareous dolomite with localized calcite. This dolomite exposure of Upper Cambrian Age weathers to a gray to black, arenaceous textured dolomite which ultimately degrades to a red clayey silt. This outcrop indicates that this dolomite is the Eminence or Potosi formation of the Cambrian System. Both of these formations are bounded above and below by dolomite formations. No other outcrops were observed at the project.

One small spring was noted along the eastern shore of No. 2 lake. Field evidence and information from the owner reveal that the three larger lakes inspected are supplemented by spring flow directly into the lakes. No springs were found which apparently remove water from any of these lakes.

c. <u>Dams</u>: No detrimental settlement, cracking, or sinkholes were observed in or near the earth embankments.

Embankment cross-sections at the maximum height section for each dam are shown on Plates 2 through 4. In a few areas, the embankment slopes are considerably steeper than the section shown. One animal burrow was noted near the crown of dam No. 2. No burrows were noted below pool level at any of the dams but some could be present and masked by vegetation.

All three dams have brush and scattered trees growing on them and dam No. 3, in particular, has a dense covering of brush preventing detailed inspection. Most of the trees at all three dams are less than eight inches in diameter. These root systems constitute a potential seepage hazard. The vegetation also provides animal habitat which increases the likelihood of animal burrows. Based on surface observations, the dams are composed of reddish brown, very sandy, gravelly clay.

Some riprap exists on the upstream slopes underwater but no riprap was found above the water line at any of the dams.

Marshy areas with standing water were observed downstream of dams No. 1 and No. 2. Since lake No. 2 covers the toe of dam No. 3, the dam toe could not be observed. The lower portion of the embankment of dam No. 1 was saturated, indicating a steady seepage condition exists; but only a "trickle" flow was observed. A clear running seepage area with an estimated flow of less than 20 gallons per minute and covering an area approximately 100 feet square was found at the toe of dam No. 2 near the left abutment. Ground in this area is soft and spongy due to the upward force of the seeping water.

Some erosion, apparently from wave action, was noted in unvegetated areas of the upstream crown, particularly at dam No. 2. Gully erosion was observed at the downstream left abutment of dam No. 1.

d. <u>Appurtemant Structures</u>: Appurtemant structures at each dam consist of a spillway. In addition, dam No. 2 is reported to have an 8-inch diameter pipe through it, capped underwater on the upstream side.

The spillway at dam No. 1 is approximately 40 feet long by 5.4 feet high with a concrete bottom and mortared stone sidewalls. A portion of the left (facing downstream) side of the spillway floor and underlying earth is missing (see photo 4). This damage is reportedly the result of a dynamite blast. About 100 feet downstream of the spillway is a broken concrete apron over which water flows (see photo 3). At both locations, water flows over exposed embankment or foundation material.

The spillway of dam No. 2 is approximately 35 feet long and 3.5 feet high, and is constructed of concrete and stone (see photo 8). In some areas, the sandy, gravelly clay embankment is exposed, Large brush and/or small trees are growing in the spillway.

The spillway of dam No. 3 is a near-vertical formed concrete spillway 45 feet long and 2.5 feet high with a thin, horizontal concrete apron (see photo 14). Part of the apron and underlying embankment have eroded away. Some water is getting through cracks in the concrete apron and running under the concrete (see photo 15). The embankment is exposed to lake No. 2 in the outlet channel (see photo 16). e. <u>Reservoir Area</u>: No pertinent problems were noted in any of the reservoir areas.

f. <u>Downstream Channels</u>: Downstream channels of dams No. 1 and 2 have some trees, logs, and debris in them. Since lake No. 2 extends to dam No. 3, that dam has no downstream channel.

3.2 EVALUATION. Trees and bushes on the embankments, insufficient erosion protection on the upstream faces of the embankments, the lack of stilling basins, and insufficient erosion protection in the spillways are all serious deficiencies which should be corrected. Soft, spongy ground conditions due to seepage at dams No. 1 and No. 2 could lead to instability of the embankment if uncorrected. The seepage in itself need not be stopped but the resulting upward seepage forces should be counterbalanced. A similar condition likely exists underwater, downstream of dam No. 3. Seepage control measures should be based upon analysis of the stability and seepage conditions by a professional engineer experienced in the design and construction of dams.

Section 4 - Operational Procedures

4.1 PROCEDURES. Operational procedures are essentially nonexistent since the dams have uncontrolled spillways and water passes freely over the spillways.

4.2 MAINTENANCE OF DAM. Little maintenance is apparent as evidenced by the vegetative cover, particularly on dam No. 3. the missing area of the spillway concrete on dam No. 1, reportedly dynamited a year ago, has not been repaired. Brush and small trees are growing through and near the spillways, particularly at dam No. 3.

4.3 MAINTENANCE OF OPERATING FACILITIES. Not applicable.

4.4 WARNING SYSTEM. No warning system is known to exist.

Circle Co

4.5 EVALUATION. Additional maintenance in the form of repairing spillways and clearing and mowing the embankments is recommended.

Section 5 - Hydraulic/Hydrologic

5.1 EVALUATION OF FEATURES

a. <u>Design Data</u>: No design data were made available to the inspection team. All releases are non-regulated, with the exception of a reported 8-inch diameter pipe through dam No. 2. This pipe is capped below the water surface in Lake No. 2.

b. Experience Data: All of the pertinent data furnished in this report were derived from U.S. Geological Survey 7¹/₂ minute quadrangle sheets or of measurements and surveys made during the inspection.

c. <u>Visual Observations</u>: None of the three dams inspected in the "Chain of Lakes" appear to be in immediate danger of failing, but the following deficiencies were noted:

(1) No stilling basins are present and as a result, significant scour holes exist below all three dams. See Photos 3, 8, 16, and 17.

(2) Portions of the masonry spillway side walls downstream of the crest have failed at all dams and erosion is occurring. See Photos 1, 4, 8, 15, and 16.

(3) Erosion on the upstream portion of dam No. 2 was noted in at least two locations. No protection exists on any upstream embankments.

(4) Trees and bushes are growing on all dam embankments.

(5) A section of the downstream spillway nappe of dam No. 1 is missing. The owner reported this was the result of vandalism. See Photos No. 2 and 4.

(6) The exit channel below dam No. 2 cuts across the downstream toe of the embankment resulting in erosion. See Photo No. 9.

d. Overtopping Potential: Portions of dams No. 2 and 3 would be overtopped between ½ and 2 feet if the 100-year frequency flood occurred. While the duration of flow over the embankments would be relatively short, the embankment's resistance to erosive attack of this magnitude is unreliable and, therefore, either or both dams could fail. Dam No. 1's spillway has just the capacity to pass the 100-year frequency flood without overtopping the dam, but if either or both of the upstream dams failed, dam No. 1 would overtop also. All three dams were, therefore, analyzed using the Probable Maximum Flood as the design storm for the reason stated above and the proximity of houses in the town of Des Arc located below dam No. 1. Routing the PMF through the three spillways reveals all three dams

would be overtopped for approximately four to six hours. This duration and the depth of flow over the dams greatly increases the potential for dam No. 1 to fail. A failure of dam No. 1 would probably result in several homes in the Goose Creek flood plain being destroyed with possible loss of life and significant flooding of structures located in the Black Creek and Big Creek flood plains within the town of Des Arc (See PLATE 1). No effective warning system could be implemented because of the proximity of the town to the dam and the lack of residential development near the dams.

Section 6 - Structural Stability

6.1 EVALUATION OF STRUCTURAL STABILITY.

a. <u>Visual Observations</u>: Visual observations of the dams and spillway are discussed and evaluated in Section 3 and 5. The dams have no other appurtenant structures.

b. Design and Construction Data: As discussed in Section 2, no significant design data are available. No stability analyses or seepage analyses have been performed. Construction data is based on the personal recollections of the owner, who was also the builder.

c. Operating Records: No operating records were available.

d. Post-Construction Changes: According to the owner, no post-construction changes have occurred.

e. <u>Seismic Stability</u>: The Chain of Lakes dams are located in seismic zone 2, for which the recommended guidelines for inspection assign a "moderate" damage probability. Since neither original design analyses nor strengths of embankment or foundation materials are available, an accurate seismic analysis cannot be made.

Section 7 - Assessment/Remedial Measures

7.1 DAM ASSESSMENT.

a. <u>Safety</u>: Several items are deficient which should be corrected. No erosion protection exists on upstream slopes of the dams. Spillways and exit channels are not sufficiently protected against erosion. Spillway walls do not extend to top of dam embankments. Spillway walls and invert have deteriorated. No stilling basins are present and scour holes exist below each spillway. Spillway capacities and/or height of dams are insufficient to pass design floods without overtopping dams. Trees and bushes on the embankments provide a potential seepage hazard and animal habitat.

b. Adequacy of Information: The statements and recommendations in this report are based on visual observations and verbal discussions. Seepage and stability analyses are not on record as prescribed in the recommended guidelines. The downstream embankment toe of dam No. 3 is covered by Lake No. 2 and an assessment of seepage conditions could not be made.

c. <u>Urgency</u>: We recommend the remedial measures listed in Section 7.2 be accomplished in the near future.

d. <u>Necessity for Phase II</u>: No Phase II inspection is recommended. Action should begin on the remedial actions discussed in this report.

7.2 REMEDIAL MEASURES.

The following remedial measures are recommended:

a. Remove trees and bushes; however, this should not be done on the upstream slopes until riprap placement can follow immediately thereafter.

b. Fill any animal burrows found during clearing.

c. Establish and maintain a grass cover on the embankment.

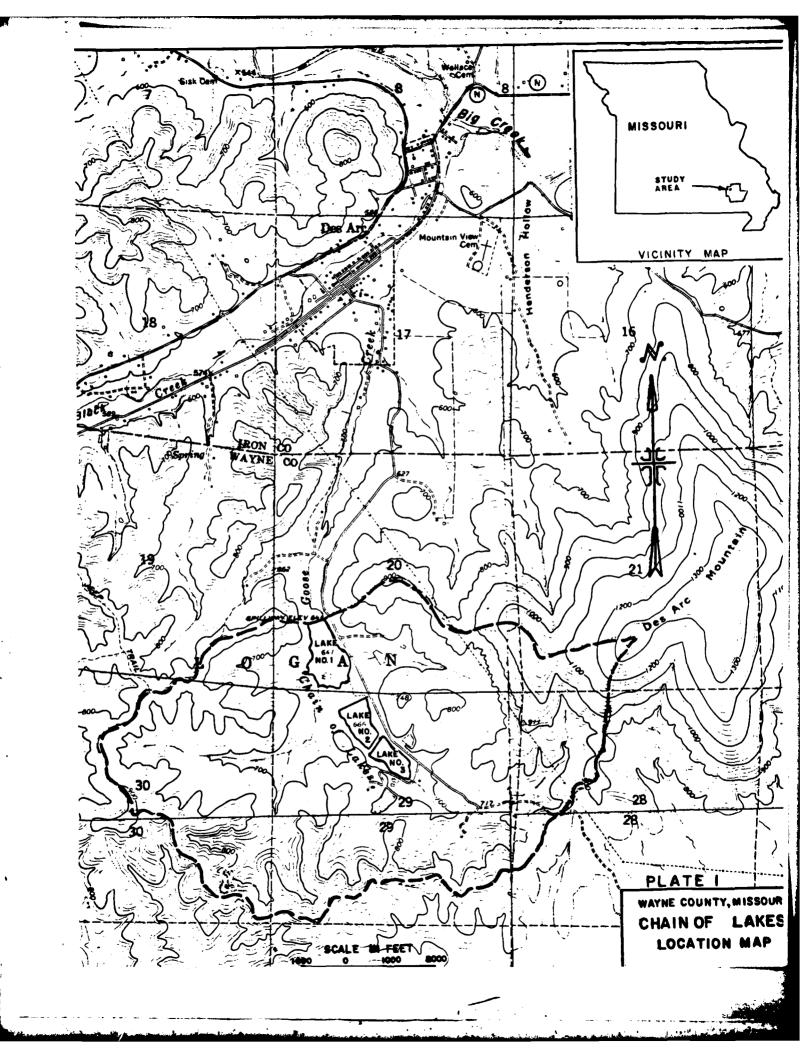

d. Provide adequately sized, erosion-resistant spillways, stilling basins, and exit channels. Spillways should be designed and constructed to pass the peak outflow of the Probable Maximum Flood with adequate freeboard, or the present spillway capacities could be maintained and the top of the dams raised to contain the PMF with adequate freeboard.

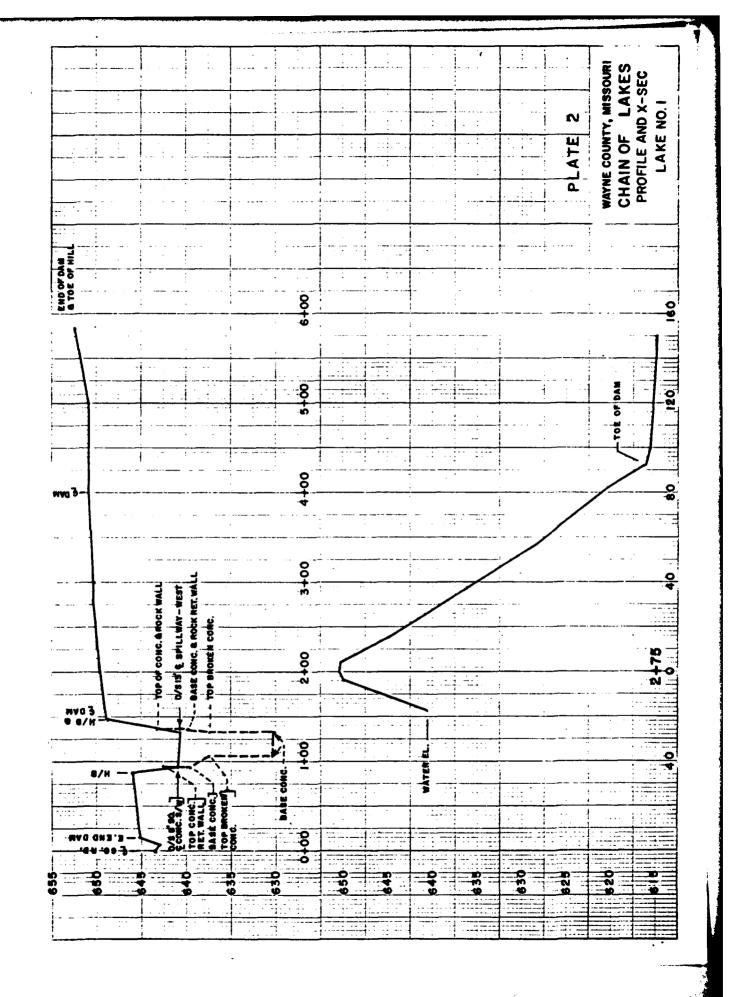

e. Realign the exit channel below dam No. 2 to direct flow away from the toe of the embankment.

f. A stability and seepage analysis of the dams should be performed by a professional engineer experienced in the design and construction of dams. These analyses should provide a design of seepage control works and other remedial measures related to embankment stability and erosion protection.

g. A detailed inspection of the dams and spillways should be made every two to five years by a professional engineer experienced in the design and construction of dams.

h. The residents near Des Arc should be advised of the flooding potential from overtopping or failure of the Chain of Lakes Dams.
