20. ABSTRACT (Continued).

inflation actually experienced. A computer program is utilized to make the necessary mathematical calculations.

Data sources for this report were the Office of Personnel Management (OPM) and the Bureau of Labor Statistics (BLS). OPM supplied data on government salaries. BLS furnished data on industry salaries and thirteen (13) different materials.

The computer program prints the R&D historical inflation indices and subindices by fiscal year as shown in Appendices C through G of this report.

APPENDIX G - R&D Indices

ACKNOWLEDGEMENTS

This work is largely the product of Mr. Charles W. Lines, Jr., who has, in turn, given special recognition to Mr. Ralph W. Lilge and others for their assistance. Once again outstanding clerical support was provided by Mrs. Joan Kapp. I. INTRODUCTION AND APPLICABILITY.

A. This report is the third revision to the AVRADCOM Historical Research and Development Inflation Indices for Army Fixed and Rotary Winged Aircraft.

B. The Labor/Material Mix is not the same for all R&D program categories. Four different inflation indices have been constructed representing the most common Labor/Material Mixes.

C. New materials and new applications for existing materials are being continually developed and tested. The Bureau of Labor Statistics' Producer Prices and Price Indexes (PPI) data currently used represents these new materials and applications with varying degrees of accuracy. Research and analysis in this area, which is designed to insure the application of the most appropriate PPIs, is continuing. Fortunately, the material portion in R&D is low and changes in the material mix will not seriously effect the overall accuracy of the indices. Current research effort is aimed at isolating the overhead component in the R&D indices which have already been constructed. Preliminary results indicate that each of the R&D category indices will increase at faster rates when an overhead component is added using an appropriate weighted component of the Consumer Price Index.

D. Although the major portion of the AVRADCOM R&D effort is directed toward rotary wing aircraft, these historical R&D indices may be used for light fixed wing aircraft, also.

E. This report summarizes the efforts to develop necessary methodology to construct historical R&D indices relative to the Army Aviation Research and Development Program. Appendices C through G were developed from computer printouts that were utilized for the computation of the actual indices to be applied. F. These R&D historical indices are appropriate for updating statistical reports that formerly utilized the OSD forecasting indices; for initial use in bringing a cost in prior years to a present-year dollar value; and for evaluating inflation actually experienced in Army Aviation Research and Development.

G. In conjunction with the historical inflation indices, AVRADCOM develops program unique inflation indices. These latter indices allow increased accuracy in tracking that portion of specific program's cost impacts which can be attributed to past inflation. In February 1981, for example, a program unique inflation index was ieveloped for the Remotely Piloted Vehicle (RPV) Program. The RPV unique index is being used to accurately track inflation and was also made a part of the Baseline Cost Estimate (BCE) and Independent Cost Estimate (ICE). The R&D indices presented in this report, on the other hand, are intended for use by any or all Army aviation programs.

11. METHODOLOGY.

A. Labor Costs:

1. No clerical or unskilled labor was costed for either Industry or Government. This should not effect the relative costs.

2. The Industry Labor Index^{1/}was compiled by costing applicable professional people from the Bureau of Labor Statistics' Annual Bulletin <u>National Survey of Professional, Administrative, Technical, and Clerical</u> Pay, March 1981.

3. The Government Labor Index $\frac{2}{}$ was compiled by using the appropriate General Schedule Index received from the Office of Personnel Management.

4. Statistical analysis of the number of government and the number of contractual personnel engaged in Research and Development (R&D) indicates a ratio of 40 percent Government to 60 percent Contractual (Industry).

B. Material Costs:

1. A survey of Army Aviation R&D activities was made to determine materials utilized. The list contained aluminum, nickel, titanium, cobalt, steel, copper and iron alloys; fiberglass, plastics, natural rubber, butyl rubber, neoprene, teflon, tungsten-carbide, polyurethane, epoxy resin, Nomex and Kevlar.

2. This list of materials was then matched, as closely as possible, to a PPI series and weighted by the percent of total cost. The result is shown in the following table.

3

FOOTNOTES: 1/ Appendix A

2/ Appendix B

MATERIAL MIX

MATERIAL	PPI SERIES	PPI CODE	WEIGHTING FACTOR
Rubber	Rubber & Plastic Products	07	1%
Fiberglass	Rubber & Plastic Products	07	3%
Nomex	Paperboard, Container Board	09 14 01	10%
Steel Sheet, Flat	Steel Sheets, C.R., Carbon	10 13 02 62	12.5%
Steel Sheet, Stainless	Steel Sheetc, C.R., Stainless	10 13 02 64	12.5%
Closed Die Forgings	Closed Die Forgings, Alloy Steel	10 15 01 53	5%
Cobalt Alloy	Cobalt	10 22 01 05	4%
Aluminum Sheet	Aluminum Sheet, Flat 5052-H 32	10 25 01 01	13%
Aluminum Rod, Screw Machine Stock	Aluminum Rod, Screw Machine Stock, 2011-T3	10 25 01 13	3%
Aluminum Extrusion	Aluminum Extrusion, Solid, Circle Size, 4 to 5	10 25 01 17	10%
Copper	Copper & Brass Mill Shapes	10 25 02	1%
Nickel Alloy	Monel Sheet, CR 400 Alloy	10 25 04 63	23%
Titanium	Titanium Mill Shapes ^{3/} (From Dec 70)	10 25 05	2%
	Titanium Sponge (Before Dec 70)	10 22 01 56	!

C. Labor/Material Mix by RDT&E Program Category.

Generally speaking, the earlier the research in time, the less
materials are required. Although tables are provided for the four most common
Labor/Material Mixes, an index may be easily constructed for any Labor/
Material Mix by using the Weighted Labor^{4/} and the Weighted Material^{5/} Subindices.

FOOTNOTES: 3/ PPI Index multiplied by a factor of .955 to give continuity with titanium sponge before Dec 70.

4/ Appendix E.

5/ Appendix F.

2. The Research and Technology Laboratory Headquarters at Moffett Field, California, has determined that a mix of 95 percent labor and 5 percent material is appropriate for 6.1/6.2 program categories.^{6/}

3. Projects in the 6.3 program category have a mix of 90 percent labor and 10 percent material; and in the 6.4 program category, a mix of 85 percent labor and 15 percent material is normal. $\frac{6}{}$

4. Finally, an "Other" index is provided based on a mix of 75 percent labor and 25 percent material for those programs that produce a quantity of prototypes in the 6.4 program category. $\frac{6}{}$

5. If the use of only one index is desired, it is recommended that you use the index associated with the 6.4 RDT&E program category, or, if more accuracy is desired, a weighted 6.1 thru 6.4 index can be calculated using the percentages of the total R&D expenditure of a similar system as the weights. III. COMPARATIVE ANALYSIS.

A. In general, the R&D indices representing the early stages of the R&D life cycle increased at a faster rate in 1981 than during the previous year; primarily because of the high proportion of labor input relative to material input. Specifically, these categories are the 6.1/6.2 and 6.3 categories. The R&D index for 6.1/6.2 category increased 9.8 percent in FY 81, up from 9.06 of a year earlier. Similarly, the 6.3 R&D index rose 9.6 percent in FY81 after a 9.3 increase in FY80. Recalling that both the 6.1/6.2 and 6.3 categories have 95 percent and 90 percent, respectively, of their input provided as labor, it is not surprising that their index values are principally determined by the labor indices shown in Appendix C and whose weighted values increased approximately 10 percent in FY81, up almost two percent over FY80. On the other hand, the index for material input grew at a mere 4.8 percent rate

in FY81 as compared to 9.6 percent in the previous year.

B. All material commodities either decreased in cost during FY81 or advanced at a slower rate than that experienced in FY80. For example, the cost of steel sheet, stainless, fell three percent in FY81 while the price of titanium rose 27.7 percent in FY81 as compared to 39 percent in FY80.

C. Industry labor cost increased slightly faster than government labor cost during FY81, but the rate of this increase was somewhat faster for government labor than the rate of increase for industry labor. Industry labor cost increased 10.8 percent in FY81 and 9.9 percent in FY80. Government labor cost, however, increased 9.1 percent in FY81 and 7.02 percent in FY80.

IV. SUMMARY.

A. This third revision, to the AVRADCOM Historical Research and Development Inflation Indices for Army Fixed and Rotary Winged Aircraft, follows the same methodology used in the second revision dated January 1981. The assumptions and techniques remained the same, also.

B. The R&D indices appear in the last column of each of the four charts in Appendix H.

VII. DEFINITIONS.

Appropriation Pattern: The time-phased plan of a program's calendar year buys. (An Army-pattern usually covers a five (5) year period.) (Source: PRIMIR Guide from DARCOM, 1967.) Base Year: Period (e.g., fiscal year) selected as a reference for derivation of index numbers or escalation factors. Constant Year Always associated with a base year (e.g., FY 72 constant dollars). An estimate is Dollars: said to be in constant dollars if costs for all work are adjusted so that they reflect the level of prices of the base year. When prior or future costs are stated in constant dollars, the figures given are adjusted to presume that the buying power of the dollar was the same and will continue to remain the same as the base year. (DOD Economic Analysis Handbook.) Current Year or Current to the year the work is performed. "Then Year" When prior costs are stated in current year Dollars: dollars, the figures given are the actual amounts paid out. When future costs are stated in current year dollars, the figures given are the actual amounts which will be paid including any amount due to future price changes. When making future estimates, it is necessary to initially assume a base buying power for each dollar (constant dollars) and then apply an escalating factor for inflation which converts our estimate into current year dollars. The "current year" in "current year dollars" does not refer to the year in which the estimate is made or any other single year. (Source: TARADCOM Economic Analysis Handbook.) Deflator: A special case of an index. Used to convert current year dollars to the equivalent value of a given base year. (Source: TARADCOM/TARCOM Inflation/Price Escalation Instructions, DRDTA-VC, Jan 78.) Escalated Costs: Dollars adjusted by a price escalation factor (Inflated Costs) or a price level index.

Expenditure Profile: (Outlay Rate)	The time-phased estimate of a program's actual annual expenditures. Term may be applied to the expenditure of a given year's appropriation over time. (Source: TARADCOM/TARCOM Inflation/ Price Escalation Instructions, DRDTA-VC, Jan 78.)
Factor:	A price or cost relative derived from an index for the purpose of escalating or de-escalating costs (base year factor - 1.00).
Index:	A numerical procedure for tracking cost changes over time. (Source: Technical Report No. 77-1, "An Introduction to Basic Theory and Their Application, with Sample Problems, "U.S. Army TSARCOM, Oct 77.)
Inflator:	An index used to convert given base year dollars to the equivalent value of a current year. (Source: <u>USAF, Aeronautical Cost Indices,</u> May 77.)
Price Escalation	A number which converts prior year actual
Factor:	prices to base year prices through use of
(Inflation Index)	a price level index.
TOA:	Total Obligation Authority. (Source: AR 310-50, Nov 75, pg 74.)
Unescalated Costs:	Constant dollars unadjusted by a price escalation factor or a price level index.
Weighted Index:	An index reflecting the impact of an expendi- ture profile. (Source: <u>USAF, Aeronautical</u> <u>Cost Indices</u> , May 77.)
6.1 Research	Research includes all effort directed toward increased knowledge of natural phenomena and of the environment. The primary aim is to gain fuller knowledge and/or understanding of the hard sciences for example, physics, chemistry, biomedicine, engineering, and mathematics. It does not include the solving of behavioral and social science problems that have a clear direct military application, nor does it include the solving of human relations and factors which occur in conjunction with human use and acceptance in a man/group application to equipment, materiel, and/or systems. Research efforts result in an increased knowledge of natural phenomena and/or improved technology.

11

and the second second second

! **`**1

6.2 Exploratory Exploratory development includes all effort Development directed toward solving specific military problems short of major developments projects. It may vary from fairly fundamental applied research to quite sophisticated prototype hardware, study, programming, and planning efforts. It would thus include studies and minor development efforts. The dominant characteristic is that the effort is pointed toward specific miliary problem areas with a view toward developing and evaluating the feasibility and practicability of proposed solutions and determining their parameters. 6.3 Advanced Advanced development includes all projects Development that have progressed to developing hardware for experimental or operational test. It is characterized by line item projects, and program control is exercised on a project basis. Another descriptive characteristic is the design of the items being directed toward hardware for test or experimentation as opposed to items designed and engineered for eventual military service use, 6.4 Engineering Engineering development includes those develop-Development ment projects being engineered for military service use but which have not yet been approved for procurement or operation. It is characterized by major line item projects; program control is exercised by reviewing individual projects. (Source: Army Aviation RDT&E Plan, US Army Research and Technology Laboratories,

October 1977.)
