ABSTRACT

In November 1975, a group of sailors led by the ship's political officer took over the Soviet "Krivak" class destroyer "Storozhevoy" and attempted to sail to Sweden to seek asylum. They were attacked and turned back by Soviet naval and air units. Information of this dramatic event which has never been acknowledged by the Soviets, made it to the West only piece by piece. It was the intent of this study to assemble all available data for critical analysis to determine potential causes and implications.

This mutiny is not the only instance of dissent in the Soviet Navy nor will it be the last. Problems of alcoholism, officer-enlisted relations, food, hazing, habitability, desertion, ethnic friction and unhappiness over constant political indoctrination appear to be widespread.

The key question is: how important are these instances of dissent and how do we incorporate them into a framework for assessing Soviet military capability and performance?

In the past we have overemphasized quantitative aspects of assessing military and naval power. The factors which are less quantifiable such as "fighting spirit", unit cohesion and morale have made a greater difference historically. In the allocation of scarce resources for defense and other national priorities, it is essential to make intuitive

estimates of potential enemy capabilities as accurately as possible. In the case of the Soviet Navy, even planning for the worst case, it seems defense planners still have overestimated some of their strengths. The Soviet Navy has grown from a coastal defense force to a blue-water fleet capable of greater influence on the seas. They are not, however, "ten feet tall" as is emphasized currently in much of the literature.

I. INTRODUCTION

How is military power measured? In the West, generally, attempts to measure are done by numerically tabulating forces of various sorts: the numbers of men under arms, the number of weapons of a given type, etc. This is itself an evasion of the problem of estimating the more significant factors of military power, since it says nothing about the actual capabilities of the forces of one country to deal with another. These numerical counts of men and weapons do not include geographical constraints, natural resources, potential military capability and most importantly, the command style and will or fighting spirit of the soldiers or sailors of the respective nations. If one looks at battles in history, people and their nonquantifiable capabilities have been more important in battle than numbers or equipment capability. In World War II, German General Erich von Manstein was willing to accept an adverse one-to-nine ratio in division units when fighting the Soviets on the Eastern Front. He knew his forces were that much better.

This case study will focus on one dramatic incident which occurred in the Soviet Baltic Fleet. The author, in final analysis, will attempt to show that the Soviet Navy is not as overpowering as the numbers of ships and similar quantifiable factors would indicate. The ships may be bristling with

armament above decks while dissent is brewing below decks. This study attempts to assemble the facts about the mutiny and discuss the important aftermath for the crew and the vessel. The Soviet reaction or evidence of the reaction will be investigated through a number of Soviet public pronouncements. This study will cite a number of causes which could have led to the mutiny. In addition it will examine causes and effects of morale problems in general in the Soviet Armed Forces and specifically the Soviet Navy.

To assess the implications of this event and morale problems, one must focus on how military power and combat capability are most commonly measured. One must then generate an intuitive framework to include human factors in some sort of capability measure. This study, therefore, points to the conclusion that since the navy of the Soviet Union has extended itself to an active position in all the oceans and seas of the world, the personnel problems which may have been thought to be insignificant have been exacerbated and brought to the forefront. The Soviet Naval High Command has to realize that some scarce resources are going to have to be spent to improve morale, because Soviet weaknesses are becoming evident to the West. The Western military planners are beginning to realize that personnel problems may be the most important Soviet vulnerability that can be exploited.

II. DATA SOURCES

Assembling a study such as this is not without difficulties. Getting information out of the Soviet Union on military matters is always difficult and even more so about an event such as a mutiny. The Soviets have made a deliberate attempt to keep the mutiny a secret.

The research is based solely on secondary sources: either interviews by the author or press accounts of the mutiny. The author also interviewed two journalists who had researched the event and received a great deal of analysis and speculation from sources considered to be experts in Soviet Naval Affairs. As is the case with dramatic acts of violence whose accounts are prone to exaggeration, there was a great deal of conflicting data. The author many times had to choose one source over another as being more valid. Speculation, which is noted as such in the paper, was used to fill in the gaps between facts. The study presents the first compilation of facts, speculation, and analysis about an event which is important to Western military planners.

The author placed advertisements in three U.S. based emigré newspapers. They were Novoye Russkoye Slovo, Russian Life Daily and Laiks (the Latvian emigré newspaper). The advertisement stated: "Graduate scholar looking for persons who have served in the Soviet Navy since 1970 or those persons

who have any knowledge concerning the mutiny that occurred aboard a naval vessel in Riga in 1975." Five persons responded to the advertisement. Four chose to remain anonymous. The five are numbered 106 through 110 in the list of references. All were interviewed over the telephone; each interview taking at least an hour. The author has no knowledge about the reliability of the telephone interviewee's information and if the respondents are in fact who they claim they are except that their information was confirmed by other research. This author understands the problem of using information from emigré sources; that is using sources who have left the Soviet Union and are emotionally biased against the Soviet regime. In this case and in connection with general morale in the Soviet Navy, the author attempted to separate the facts from opinion.

Three human sources were particularly important to this research. Each had done some investigation into the mutiny on the Storozhevoy, but had not assembled enough information on his own. These people -- Alex Milits, a Swedish journalist, Mikhail Bernstam, a Soviet dissident now at the Hoover Institution and David Satter, the Moscow correspondent for the London-based Financial Times -- provided essential data. The compilation of information from these three sources, as well as the author's research, provided the facts necessary for an accurate evaluation of the mutiny.

III. PRELUDE

On the seventh of November 1975, the 58th anniversary of the Russian Revolution was being celebrated throughout the Soviet Union. To join in the celebration in the port city of Riga, capitol of the Latvian Soviet Socialist Republic, the destroyer "Storozhevoy" of the "Krivak" class had moved from its homeport of Bolderia to a pier in Riga 15 kilometers up the Daugava River. She was moored on the east banks of the Daugava (the Russian, rather than Latvian name, is Zapadnaya Dvina) at the customs pier. This area is near the center of this city of 650,000 people, near governmental buildings and near the narrow winding street of "old Riga." The ship had been open for tours by local citizens all day (see map Appendix C). Approximately one half of the Storozhevoy's crew of 250 men had been given shore leave to join in the anniversary festivities.

The Storozhevoy was one of then fifty-seven major surface combatants in the Soviet "Twice Honored Red Banner Baltic Fleet." Bolderia was smaller than the major fleet bases at Leningrad, Kaliningrad (Fleet Headquarters), Liyepaya and Talinn, but still supported a few destroyers, escorts, and diesel submarines [65].

The Krivak class first appeared in 1970, a product of the Baltysk shipyard near Kaliningrad. With 400 feet of

length and 3800 tons displacement, the Storozhevoy and her sister ships are handsome ships designed for both speed and seakeeping. Eight sets of gas turbines provide her with 112,000 pounds of shaft horsepower. An impressive assortment of armaments lines the decks. She has two twin 76mm guns aft, two twin 30mm guns and two quadmount torpedo launchers amidships. For air defense, the Krivak class has two SAN-4 surface-to-air missile launchers. Up front, she displays a quadlauncher for the SSN-14 anti-submarine warfare (ASW) rocket-assisted depth bomb [53:155]. (See photo and diagram Appendix D). The Soviets referred to the Krivak class as a "large ASW ship" (Bolshoi Protivolodocny Korabl) in 1975, but in 1977 redesignated it a patrol ship [31:113]. The Storozhevoy was one of six Krivaks in the Baltic fleet in 1975. The class now numbers twenty-six and more are still being built.

The Zampolit (political officer) of the Storozhevoy, a Captain Third Rank (Lieutenant Commander) by the name of Valery Mikhaylovich Sablin, had stayed aboard ship rather than venture into Riga with a number of his fellow officers. He had a great deal of planning to do.

The job of Zampolit is a descendant of the Pre-World War II political commissar. He is no longer of equal rank to the ship's commanding officer, but is subordinate to him. He does, however, have a completely separate chain-of-command within the military political directorate (GLAVPUR) headed by General Yepishev. Much has been done to improve the

traditional reputation of the Zampolit as the shipboard "informer." He now functions like a combined personnel officer, chaplain, and welfare and recreation officer in addition to removing the majority of the burden of political education from the other officers [48:20].

The old political commissars were drawn from the civilian populace directly and thus did not mesh well with the other members of the shipboard wardroom. The Zampolit of today on the other hand is frequently recruited from armed forces personnel who have shown promise as Communist Party activists. At a special school in Kiev, the prospective political officer not only receives extensive schooling for his primary mission of political enlightenment, but is also trained to fulfill a military function in his future unit as well. In a major combatant ship like Storozhevoy, the Zampolit is the third in command following the CO and his senior assistant (Scarpom) and is required to qualify as an underway watch officer [48:20].

The Zampolit thus sits in the unique position of being the one person to whom all sailors are encouraged to take their welfare problems, like an ombudsman, but still can command the ship and extract respect from the sailors. If he is sensitive to their problems and not just a "party hack" or informer, he is the one officer who could establish some sort of rapport with the sailors.

Other junior officers may have an interest in their subordinates, but do not have time to develop this interest due

to other responsibilities. Junior officers are not only the shipboard managers and military leaders but also the main technical specialists of their respective departments. They must supervise and often perform the major maintenance and repair functions. They still carry some burden of political work; they are the backbone of "socialist" competitions and fulfill their own responsibilities as candidate party members. Fully 80% of all Soviet officers are party or Komosomol members [11:114]. The Navy figure is 95% [22:54].

It is evident that Sablin, despite his upperclass upbringing, was able to establish a special rapport with the enlisted sailors. He was the son of a Soviet Colonel and had grown up a privileged member of Soviet society [99]. Sablin was born in Gorky in 1939. He was a descendant of the Decembrist N. S. Bestuzhev, who took part in the 1825 revolt against Czar Nicolas the First [60].

The twice weekly, two hour political lessons of Marxist-Lenninist theories aboard the Storozhevoy must have degenerated into the mere monotone reading of Pravda editorials, which the sailors looked upon as incursions into their very little free time. This was followed by the ratings expressing their dissatisfaction with food, living conditions, extra duties, limited leave and other usual sailor complaints. The unusual thing was that Sablin probably agreed with them rather than exhort the standard party line. One such meeting was taking

place with those remaining onboard the ship that afternoon in November 1975 [99].

The Storozhevoy had been very busy since its commissioning in early 1974. On the third of October 1974 the Soviet newspaper Izvestiya reported the arrival of a three ship Soviet Naval contingent in Rostock, German Democratic Republic (East Germany) for a five day visit. The Storozhevoy, the cruiser Sverdlov, and the destroyer Obraztsovoy were there to join in the celebration of the East German twenty-fifth anniversary. Vice Admiral V.V. Mikhaylin, Commander of the Baltic Fleet, led the group [82:2].

The Soviet Minister of Defense, Marshal Grechko, sailed onboard and "evaluated" highly the mastery of the anti-submariners in their firing of ASW missiles (either SSN-14 or RBU). He stated that the Storozhevoy "had all the requirements necessary to win first place in Socialist competition among outstanding ships." [35:211] This show must have been a "Potemkin Village" put on for the Defense Minister because on the 24th of December 1974 an article appeared at the top of page two of the Soviet military newspaper Krasnaya Zvezda (Red Star) which was very critical of the Storozhevoy by name. It cited the Grechko visit and went on to say that Storozhevoy had finished the training year in October 1974 very poorly. The article criticized the discipline onboard and some "comrades" were accused of lapses on "the ethical" front and "taking up the liberal position in the fight for purity of

the heart." [62] This jargon is usually translated to mean the officers were not very good at maintaining discipline and moreover were not particularly interested in being good party members.

The article compares the two gun batteries of Senior Lieutenants Dubov and Kolomnikov, saying that the subdivision of the former was always successful in competition where the latter lagged continuously behind. Kolomnikov was excused due to his youth and inexperience and lack of guidance he was given by the Communist Party organization of the ship.

The article went further to criticize the party organization on the ship mentioning party members Firsov, Sazhin, Potulny and finally Sablin for their inability to explain the ship's problems. The news account ended with the standard exhortation to do better and for the communists to "carry their party cards next to their hearts." [62] (See Appendix A for entire text of the Krasnaya Zvesda article.)

Only six days prior to this article the Storozhevoy had been mentioned in a positive light in another Krasnaya Zvesda article. She had participated in a coordinated ASW exercise with aircraft and submarines. The article praised the tactical competency of the commanding officer and praised the subunits of Captain Lieutenant Ivanov and Senior Lieutenant Vinogradov for "seizing the combat initiative." They were given an outstanding grade [86:2]. It is unknown if this is the same exercise that was discussed six days later. A later

article in Krasnaya Zvezda in early 1975 related another successful ASW exercise by the Storozhevoy but gave no indications that the ship had overcome her problems or would be classed with other outstanding ships [35:212].

The Storozhevoy had spent a great deal of 1975 at sea underway. Most notable was her participation in the "Okean" exercise of 16-27 April 1975. The Storozhevoy was one of 220 ships that participated. It joined in the Soviet show of force in the Atlantic and thus spent a good deal of time away from its Baltic homeport. In the December 1975 issue of the West German journal Marine Rundschau, the Storozhevoy was cited as a participant in a Baltic live missile exercise which included seven cruisers, two other destroyers and a number of OSA class patrol boats. The exercise took place in mid-October 1975.

At the shipboard meeting of certain crew members that afternoon of November 7, 1975, those Petty Officers and conscripts whom Sablin had been selecting and molding for months must have joined him in a crucial decision. They would lock the other officers in their cabins below decks that night and would sail to the Swedish island of Gotland and seek political asylum. At an average speed of 33 knots the journey of 175 nautical miles through the Irben Sound from Riga to freedom could take no more than five and one half hours.

Sablin was counting on the fact that the holiday would give them a head start. In addition, they counted on the

other officers sleeping more soundly than usual due to their celebrating during most of the last two days [80:13].

IV. THE MUTINY

At approximately 0200 hours on the eighth of November, the Storozhevoy slipped quietly from her berth in Riga to begin a dash across Riga Gulf. Course was set for the Irben Channel at the mouth of the Gulf between the Osel and the Courland Peninsula (See map Appendix B). It will probably never be known how many of the crew were loyal to Sablin and the other conspirators. Although gas turbine powered, the Krivak class is considerably less automated than the later American gas turbine powered "Spruance" class and would thus require a greater number of persons to man the engine room and the bridge. In addition, line handlers and persons in navigation and auxiliary spaces would be required. It would be possible to speculate that Sablin with one other known officer participant named Markov and a loyal following of a dozen petty officers, were able to order the remaining skeleton crew of unwary 18 and 19 year old conscripted sailors into manning their respective stations with tales of a national or naval emergency.

Storozhevoy means "watchful" or "on guard" and the ship and crew were being just that. The mutineers were sailing with lights out at 30 knots which is still short of the vessel's maximum speed. They were consciously avoiding other ships in the gulf.

Available evidence is not completely clear on how the alarm was actually sounded or what convinced the Baltic authorities that a mutiny was in progress. The harbormaster reported the ship's departure probably within about 30 minutes in accordance with standard regulations.

A single conscript not loyal to Sablin's cause jumped overboard before the ship reached the mouth of the Daugava River and the Gulf of Riga. This man caught his breath by clinging to a channel marker buoy before swimming to the west bank of the river. His attempt to inform Soviet authorities of the mutiny in progress was reported by two different accounts in the Soviet underground press, the Samizdat [111:2].

The sailor, cold and wet from his swim, first tried to flag down the few cars running at 3 A.M. No one stopped assuming he was just another sailor drunk from over-celebrating the holiday. Public transportation was not running due to the holiday. The young conscript finally reached a public phone and called the duty officer at the Bolderia Naval Base outside of Riga [104]. The sailor said he had something very important to say that he could not disclose over the phone. He asked the duty officer to send a car to pick him up. The duty officer refused again fearing another drunken sailor in the midst of a telephone prank. The sailor ended up making the distance to the Naval Headquarters on foot, thus giving the Storozhevoy a little over a two-hour headstart [111:2]. Disbelievers at the Riga Naval Headquarters attempted contact

but received only silence in return. Still there was no vigorous reaction by Rear Admiral I.I. Verenkin, Commander of Riga Naval area, to call in Moscow. It was only when the amazing message, "Mutiny onboard the Storozhevoy: we are heading for open sea" was received on an emergency frequency, that the Naval High Command and Soviet Defense Council, including Fleet Admiral Gorshkov (Commander-in-Chief of the Soviet Navy) were awakened and notified [66:65]. Chaos erupted at Naval Headquarters. The message was evidently sent by an officer who had surreptitiously freed himself and made his way to a radio undetected, although a conspirator who had changed his mind could have sent it. This particular message and all radio traffic that followed were received uncoded and in clear Russian by the Swedish Armed Forces.

Two naval reconnaissance aircraft were ordered off immediately on a locating mission from the Skirotava airfield on the Southeastern outskirts of Riga. Nine other Baltic fleet ships were also dispatched in the chase including another of the Krivak class, and a patrol boat from Riga [80].

Four hours had elapsed since their departure from Riga. Storozhevoy's new leaders were optimistic; the previous radio contact and the conscript who had jumped overboard were unknown to them. They had passed the Irben Scound and were out of the 12 nautical mile limit of the Soviet territorial waters into the Baltic Sea when the first of the now 10 aircraft in pursuit found them. Half the aircraft were "Bears"

from the Soviet Naval Air arm, and half were fighter-bombers from the Soviet Air Force. By all appearances, the pilots had been ordered not to sink the valuable ship if at all possible. From the air the ship was ordered to "lie dead in the water" and promises of non-punishment and pardons for their crimes if they would return to the Soviet Union were given over the radio, but Storozhevoy did not alter course or respond [52:13].

The order was given to attack, but some planes sent to quell the mutiny initially refused. The Swedes recorded "very stormy conversations" which revealed reluctance by the pilots to bomb their naval comrades. The planes eventually carried out the order, except for one who declined to take part and returned to base still carrying his ordnance [78].

The first shots were fired across the bow and then bombs were dropped to a circle still trying to avoid damaging the destroyer. No response came from the Storozhevoy. It remains unclear to this author whether it lacked the men and knowledge to man the anti-aircraft weapons, or the crew simply chose not to do so, feeling that to return the fire would be suicide. One source said that all the ammunition was secured and thus those involved in the rebellion were unable to get to it. Another source stated that Sablin gave orders that "no one was to suffer at their hands". [111:3] He did not want them to commit any violence in their quest to escape.

Evidence of the utter chaos and disarray is clear. As the Storozhevoy began evasive maneuvers to avoid the attacking aircraft, the pursuing Naval Forces closed the gap. The lead ship in this group, the sister ship of the Krivak class, came under attack by mistake in the early dawn light. Rockets hit on the deck and the bridge area of the pursuing ship. In the aftermath, this ship received more damage than the Storozhevoy. This ship was seen by many Latvian sources being repaired in Riga immediately following the incident [75:2].

On board the Storozhevoy the rudder had been hit making control difficult. Certainly by now those conscripts who had been unaware that a mutiny had occurred aboard were aware something was amiss. Also, borderline conspirators must have felt now that they had no chance of success at this point. Sablin and the few remaining zealots no longer had the numbers necessary to continue. The mutiny ended meekly and by 0800 the Storozhevoy had surrendered and been boarded by naval men from ships which had reached their position. She lay dead in the water only 30 nautical miles from Gotland [80].

The first ships to reach Storozhevoy were not those dispatched from Riga, but patrol ships and escorts which had come from Liyepaya. The boarding parties met no resistance; on the contrary they were met with appropriate salutes and normal military courtesies as if nothing had happened [111:2]. Sablin himself was on the bridge. He had received a minor wound in the bombardment. None of the crew members who had

been locked up were injured. The Captain's hands were bloodied either from trying to force his way out or from his attempts to signal his predicament to others [104].

An emigré interviewed by this author who was on the staff of Krasnaya Zvezda in the Baltic Military District at that time heard through his superiors about the event. He stated that the crew of the Storozhevoy was removed on the spot and taken to Riga. The numbers of killed and wounded vary dramatically in the press but this same source stated that his superiors told him that the killed and wounded on the Storozhevoy were "less than fifteen" but thirty-five received the same fate on the accidentally attacked sister ship [108].

The Storozhevoy itself was towed to Liyepaya, a Latvian city on the Baltic for repairs. Being a closed city, (Soviet citizens may not even visit there without special permission) Liyepaya provided the Soviets with the necessary security to accomplish the minor repairs in secret [104].

V. AFTERMATH

Shortly after the drama, a Krivak class destroyer in perfect condition bearing the Storozhevoy's number made a conspicuous cruise along the Soviet Baltic Coast participating in a number of official celebrations in order to quell the rumors and accounts that had begun to emanate from that area [75:2]. It is of course possible that it was another ship where name and number had been switched. The Storozhevoy had appeared with different numbers prior to the mutiny -- both 203 and 626. Having different numbers, which was a common practice in the Soviet Navy at that time, has been stopped lately. Many Western analysts feel that in order to instill more pride in crew members, the Soviets now paint the ship's name prominently on the stern. Changing numbers randomly, therefore, would no longer confuse western intelligence.

On the twelfth of November 1975, articles in the Swedish press appeared saying that the wreck of a Soviet target ship was found abandoned in Swedish territorial waters off of Gotland. The Soviets apologized shortly thereafter and retrieved the hulk saying it had been used for target practice on the eighth of November in the Baltic and had drifted away. A fisherman from Gotland was quoted as saying that it did not appear in the waters off Gotland until the eleventh of November. At this time very few people knew anything about the attempted

mutiny. The connection was not made until a few years later that the Soviets deliberately set the target ship adrift there to provide an explanation to anyone who had monitored the event [104].

On the eleventh of April 1976 with a new crew, Storozhevoy sailed from the Baltic with a Ropoucha class LST and an oiler, passed through the Mediterranean Sea and Suez Canal, entering the Indian Ocean on the twenty-fifth of April [34:208]. The Storozhevoy operated there for two months before transiting first to Vladivostok then on to Petroparlovsk where it is now homeported with the Kamchatka Flotilla of the Soviet Pacific Fleet. Like many Soviet dissidents before, the Storozhevoy was banished to Siberia. It appears that the continued presence of the ship in the Baltic would only fuel the mutiny accounts that were then circulating. The Storozhevoy has been photographed by Japanese reconnaissance aircraft from Okinawa wearing a distinguished citation award that had not been present before the mutiny. It is not known if the citation award is a result of the mutiny. "Dentology" of these photos revealed no trace of any damage from the attack. The number was again changed and in 1980 Storozhevoy bore the number 682 [103].

The fate of the conspirators and the rest of the crew is not nearly so clear. Military discipline in the Soviet Navy is much more stringent than in the U.S. Naval Service. Great stress is put on "exactingness" which means a detailed devotion

to all military rules and regulations. In the case of mutiny, however, U.S. and Soviet Naval regulations parallel--the death penalty is prescribed.

In general, one facet of Soviet military justice, to ensure compliance with regulations, is to make an example of offenders. When a Soviet sailor is inducted, he recites a military oath of strict obedience and states that should he break his vow, he should be subject "to the severe punishment of Soviet law and the general hatred and contempt of the workers." [42:52] To see that this hatred comes about, Soviet military journals and newspapers often run stories of malefactors complete with actual names and units. It is assumed that such public humiliation will induce the guilty person to see his errors and prevent others from similar conduct. In the case of the Storozhevoy, the potential for national humiliation or evidence of military weakness overrode the need to make an example of the conspirators. The mutiny, the resulting trial, and punishment have been kept a fairly well-guarded secret.

On the morning of the ninth of November, Sablin and some of his co-conspirators appeared before the procurator (prosecutor) of the Court of the Baltic Military District in Riga as required by Soviet law. Due to the nature and severity of the crime they were flown to Moscow later that day and interned at the GAPTVAK (short-term military prison) of the Moscow Military District [99].

The Chief procurator from Moscow, Anatoli Rudenko, arrived within a week to lead the investigation [74]. Initially the investigation consisted of routine discussions at all levels of the Baltic Fleet by commanders, political officers and representatives of Yepishev's political staff from Moscow. Once this was complete however, the order was issued that no information or any responses concerning the mutiny would be released. All discussion was to cease. Not even closed letters from one local party central committee to another would mention the Storozhevoy's attempt to flee [111:3].

The trial of 15 of the mutineers, including Sablin, took place in May of 1976 before the Military Division of the Supreme Court of the USSR [99]. Because of the nature of the crime and the potential for capital punishment the two lower courts, the Military Tribunal of the Baltic Fleet and the Military Tribunal of the Navy, were bypassed. Under normal circumstances less severe crimes committed by Communist party members or political officers are tried outside the military system by Party Commissioners at each level [17:155].

Captain Third Rank V. M. Sablin was given the death penalty and the sentence was carried out by a firing squad soon after the 3-day trial. On the eve of the execution, Sablin's father was granted a twenty minute meeting with his son. The meeting took place in the presence of a large group of KGB officials. Sablin and his father were permitted to talk on "personal themes". [60] The account of this meeting was published by the Soviet underground.

Sablin's family did not escape the wrath of the Soviet regime. One of his brothers, who worked on the General Staff, was transferred to eastern Siberia. Another, who was a teacher in an institution in Moscow, was moved east to Ivanovo [60].

The second mutinous officer was sentenced to 15 years in a labor camp. The fate of the enlisted conspirators is unknown, but one less reliable source stated that overall 82 crew members were executed [68]. This very high figure is possible due to the fact that no primary source for the mutiny has come forward in the following six years and that the suppression of information concerning the mutineers has been so successful. This author is still inclined to believe the number executed was considerably less because far more sources have testified to fewer resulting deaths. The remainder of the crew, including the Captain, were dispersed to various locations throughout the Soviet Navy. Underground sources stated that even these officers who did not participate in the mutiny were reduced in rank by one grade [111:3].

VI. REACTIONS

A. SOVIET REACTIONS

The Soviet government has yet to admit that a mutiny ever took place aboard the Storozhevoy, and it is doubtful at this point that it ever will. The only official pronouncement on the mutiny, a denial, was made by Vice Admiral V. V. Sidorov, First Deputy Commander of the Baltic Fleet, at a press conference on 10 August 1976 in Copenhagen, Denmark. The Admiral was there commanding a five day diplomatic port call of two older Soviet naval vessels; a Kotlin class destroyer "Nastoychivy" and a Mirka class Corvette. Sidorov in reply to the question of mutiny stated:

Mutiny on a Soviet Naval Ship in the Baltic--unthinkable! It must be a hoax played by organs established for this purpose which pursue their thwarting aims in the West. Stories of that sort, which appear in the Western world, can only invite ridicule among us. We do not believe we even have to comment on that sort of thing [89].

Despite not admitting to the mutiny explicitly, the Soviets have, by the change in the content of certain public pronouncements, all but acknowledge it occurred. Soviet Communist Party Secretary General Brezhnev at the 25th Party Congress in February 1976 discussed military leadership specifically in sophisticated terms. Military leadership had not been mentioned by Brezhnev in his address to the 24th Congress nor was it mentioned at his most recent speech before the 26th Congress. He pointed out that:

The modern leader must combine within himself the party-mindedness and profound competence, discipline and initiative, and he must take a creative approach to matters. At the same time, on any issue the leader is obligated to take account of the socio-political and educational aspects, to be tactful toward people and their needs and aspirations, and to set an example at work and in his daily life [34:211].

Admiral Gorshkov referred to these comments in his Navy Day interview, "these high party demands apply in full to commanders of ships, units and formations." These words suggest that the time has come in the Soviet Armed Forces, and the Navy in particular, when a commander must understand and relate to his men and not just follow orders and perform "by the book" as has been traditionally preached.

In an article in Krasnaya Zvezda on 11 February 1976, Gorshkov discussed shortcomings in the work of some Party organizations in the Soviet Fleets and criticized the level of efficiency attained by engineering officers. He stated:

Ship commanders and Party organizations had to pay particular attention to the ideological education of junior officers. We must study in greater depth, and seek to influence the formation of the ideological and moral potential of the future commander's personality, weighing up strictly whether the officer is ready to be a military leader in the era of the scientific-technical revolution, to be genuine innovator, whether he is capable of taking firm, scientifically-based decisions from party and state positions [54:16].

The Admiral, in the past, had very seldom mentioned discipline in such specific terms, especially in terms of the "ideological commitment" of some of the officers. Such criticisms were either avoided or left for comment by lesser

officials. These comments and many others reflect the frequently recurring themes in professional Naval writings of discipline or ideological fervor in the time immediately following the mutiny. (Such comments increased after the flight of Victor Belenko in September 1976.)

In the February 1976 edition of Morskoy Sbornik (the Soviet Naval Digest), Admiral Gorshkov again stressed the importance of command emphasizing discipline. This February issue would probably be the first one appearing whose content could have been affected due to the mutiny, given the 50-56 days of preparation for each issue (Typesetting and printing dates are given in each issue) [38:335]. This author performed a content analysis of Morskoy Sbornik from the January 1975 issue through the January 1977 issue to determine if the percentage of articles dealing with the topics of political indoctrination, political training or military discipline had increased from the year prior to the mutiny to the year following the mutiny. The January issue was eliminated from the comparison for two reasons. First, since the 25th Communist Party Congress was convening the next month, there was an unusually high number of politically related articles (eight of thirty-five). Second, with minor fluctuations in the printing dates, the January issue could have been written either before or after the mutiny. Thus, the comparison of post-mutiny articles began with the February 1976 issue. The resulting analysis shows a 5 percent increase (from 11 percent

to 16 percent) in articles dealing with discipline, morale and political indoctrination. Certainly there are myriad other factors which could have influenced this increase of political articles but the fact that there was an increase points towards evidence of the mutiny. (See Appendix F)

In the research for this study, translations of the Soviet military and civilian press, as well as the Soviet Naval Digest and other military journals, were searched for references to the Storozhevoy. Although this search was certainly not exhaustive, it is still important to note that five articles mentioning this ship were found in the two years prior to the mutiny and none were found in the seven years following the event.

Late in 1978, the Soviet Navy promulgated new shipboard regulations. This was the first major overhaul of these regulations since 1959 although minor revisions occurred in 1967. The new regulations added two new shipboard departments to cope with the advancing technology of the fleet, but more importantly, the regulations increased the role of the commanding officer in political indoctrination. The revised shipboard regulations "place emphasis on the duties of the commanding officers to direct the work of the political apparatus toward successful accomplishment of tasks assigned to the ship, and to strengthening the military discipline and increasing the political morale of personnel." [26] The new revised regulations place greater responsibility on the

ship's commanding officer for the overall direction of political work, including more supervision of the Zampolit. It would seem that the ability of the ship's political officer to be a rival to this commanding officer's authority has been greatly reduced under the new regulations. Commanding officers are expected now to increase readiness and combat capability by supervising a thorough political and ideological indoctrination of their crew, both officers and enlisted men. The new regulations continue to exhort the need for "exactingness" in performance of duties on now longer voyages and thereby develop a more harmonious shipboard "collective."

The most dramatic Soviet reaction to the mutiny was the leadership shake-up which occurred in the Baltic Fleet immediately following the incident. Admiral Vladimir Vasilyevich Mikhaylin was relieved as commander of the Baltic Fleet within three weeks of the mutiny [34:209]. He had served that post since 1968, having served as First Deputy Commander of the Baltic Fleet for the four years prior to that [12:78]. Mikhaylin was moved to Moscow to be Deputy Commander-in-Chief for Naval Educational Establishments. According to William Manthorpe, former U.S. Naval Attaché to the Soviet Union, this job is not befitting a former fleet commander [103]. He had been awarded the Order of the October Revolution on the occasion of his sixtieth birthday in July 1975. Mikhaylin's departure certainly was not in line with the timing of the normal Soviet Navy practice of serving as First Deputy

Commander before moving up to Fleet Commander because Mikhaylin's First Deputy, Vice-Admiral V.V. Sidorov (mentioned earlier), had been on the job only a few months and could not be promoted [41:101]. Mikhaylin was therefore replaced by the Baltic Fleet Chief-of-Staff Vice-Admiral Anatoliy Mikhaylovich Kosov, who had served in that capacity since 1972.

The Baltic Fleet Political Directorate Chief escaped the purge. Vice-Admiral Nikolay Ivanovich Shabilikov has served in that position from 1972 until the present time. The Commander of the Riga Naval Base, Rear Admiral I.I. Verenkin must have been thought to be too new to receive any of the blame. He arrived at that post in May 1975, six months before the attempted mutiny [41:299].

It would certainly seem that if the blame for this event had to be placed anywhere outside of the mutineers, it belonged with the Political Directorates of the Baltic Fleet and of the Navy. The fact that Shabilikov remained in office, given the fact that the mutiny was led by a political officer, sheds an interesting light on the power balance between the political Directorate and the Naval High Command.

B. SWEDISH REACTIONS

The events in Sweden after the mutiny are especially pertinent since a great deal of what is known about the mutiny originated there. The majority of what occurred from

the time the Storozhevoy departed the Gulf of Riga until the ship surrendered was monitored by the Swedes on either radio or the radar of Swedish Patrol aircraft. The Swedes did not, however, reveal publicly what they had monitored. The first press account of the mutiny appeared on the 23rd of January 1976 in the Stockholm Daily, Expressen, and carried the byline of Alex Milits, journalist of Estonian origin living in Sweden. The majority of other news accounts used quotations from this report or from later accounts Milits would write. How he came upon the story and how it later unfolded to some degree are important to mention.

In late November 1975 Milits was visited by a Latvian emigré who had just returned from a visit to Riga. The emigré asked, "Why has no one written anything about the mutiny that occurred in Riga?" The emigré then said that six different people had talked about the mutiny while he was in Riga. He had been told that it was a large ship, "possibly a destroyer or cruiser". [104]

Being unwilling to write about such an important event with only one source, Milits visited the port area in Stockholm and inquired among Soviet merchant sailors from various Baltic ports including Riga. Most had not been home for some time and knew nothing of an alleged mutiny. A few sailors promised to inquire about the mutiny and contact Milits when they returned to Stockholm [104]. One week later, Alex Milits received a phone call. A Russian voice asked if he were the

one inquiring about the mutiny. The caller sounded very nervous and refused to give his name. He told Milits that he had just returned from Riga and had seen a naval vessel damaged by bombing. This damaged vessel, the caller said, had participated in the chase for the mutinous ship. When asked by Milits what sort of ship had tried to escape, the caller replied in Russian, "Storozhevoy." He then suddenly hung up [104].

Milits admits he misunderstood the size of the ship involved in the mutiny at this time. The Russian words "Storozhevoy korabl" referred to a small coastal escort ship. He therefore thought the mutiny had occurred aboard that type of ship rather than the much larger Krivak class ship named Storozhevoy. It was with this information that he published the first account in Expressen of a mutiny on a Soviet escort ship.

Four days later Milits was called by another seaman who had been read the article in the paper by a Swedish shopkeeper. The sailor told him he was in error. The mutiny took place on a destroyer. The Russian also told him to read a certain issue of Krasnaya Zvesda. He also hurriedly hung up stating that "someone was coming." The issue he was referring to was the December 24, 1974 issue that was cited earlier in this study. With the information provided in that article, Milits found that research became easier and through interviews with tourists, Lithuanian fishermen, and merchant

sailors, he published a much more accurate account in Expressen in May of 1976 [104].

Other newspapers in competition for the story and any information about the mutiny found information hard to obtain. In retrospect it is evident they often used less than reliable sources and produced wildly exaggerated accounts. The Daily Telegraph of London reported that the Storozhevoy actually reached Sweden, but was denied asylum by the Swedish Government. The report said sailors jumped overboard and were machine-gunned in the water by Soviet aircraft while the Political Officer and five co-conspirators committed suicide aboard [76]. The Latvian Information Bulletin quite understandably reported the crew was a majority of Latvian nationals and the mutiny was part of a larger nationalist uprising in Riga.

The Swedish Military High Command initially said nothing about what they knew concerning the mutiny but when reporters began their inquiries in February, they did very little to dispell the rumors. Reporters who questioned the High Command about the incident received only a very diplomatic response: "...the command staff confirms that during routine monitoring of radio traffic in this time frame activity that deviated from the norm was noted." [75:2] The spokesman "absolutely" declined, however, to confirm that the Soviet radio traffic had pointed to a mutiny. "On the other hand, neither could he deny this supposition." [71] This author feels from the

research, that the Swedes made a concerted effort to get the actual information distributed, off the record, to various journalists. The Swedes' reluctance to make an official statement could be explained by their sensitive neutral position or the need to protect intelligence collection capabilities. The most important reason, however, was not made public until September of 1976 when a leftist Swedish fortnightly journal Folket i Bild-Kulturfront accused the former Swedish Defense Minister, Sven Anderson, of paying a one million dollar bribe to U.S. Air Force General Rocky Triantafellu, head of Air Force Intelligence, over the period of 1970-1973 [104]. The Swedish military was forced to explain that the four \$250,000 payments were not a bribe but a perfectly legitimate business transaction to purchase electronic equipment used to listen to Soviet Bloc military communication traffic. Sweden's Baltic neighbors and some domestic public opinion were horrified over the disclosure of the classified deal with the Pentagon, since it was too naked a breach of Swedish neutrality [38]. Stig Synnergren, the Commander of the Swedish Armed Forces, confirmed at a press conference that the equipment had been used to monitor messages sent by Moscow to Soviet bombers pursuing a runaway Soviet frigate. He acknowledged that the money laundered through commercial banks, came from a secret Defense Ministry fund [88].

Captain Thomas Wheeler, USN, who was the Naval Attache' in Sweden at that time stated that Swedish government officials

with whom he had spoken were actually very glad that the Storozhevcy did not reach Sweden and that they were not faced with the question of granting asylum to the mutineers. The officials stated that they had always granted asylum on an individual basis to Soviet defectors but mutiny, a serious crime in any Navy, in the face of Soviet pressure was a potentially different matter. In light of Swedish reaction to the Soviet submarine which ran aground near the Karlskrona Naval Base in October 1981, it appears the Swedes have taken a tougher stand against Soviet pressure.

C. U.S. REACTIONS

The American reaction was even more muted than the Swedish one. Again, Captain Wheeler told of several State Department messages which instructed U.S. Embassy personnel to "keep the lid" on the incident [105]. The explanation for this is probably found in the fact that the U.S. was still attempting to maintain some sort of détente with the Soviets and did not wish to embarrass them on the international scene.

A second possible explanation was that the U.S. needed to protect its own intelligence capabilities. This, however, is refuted in that U.S. intelligence personnel have said that "the incident was over before we knew what was happening" and "we had nothing focused to gather any information." So, it appears the U.S. Government, like the press, was at the mercy of the Swedes for accurate information.

Another possible explanation is that at the time of this incident the Ford/Kissinger Administration was locked in battle with Congress to appropriate funds to support the FNLA/UNITA factions in the Angolan Civil War. The Soviets and their Cuban proxies were heavily supporting the MPLA faction. The administration certainly would not have wanted to amplify or confirm an event which might show weakness in the Soviet military machine at a time when they are trying to get funds to oppose it.

The only semi-official U.S. Government statement at all was by Representative Larry McDonald (D., Georgia) who, on June 9, 1976 after being told the same exaggerated information cited earlier, offered a resolution condemning Sweden for their refusal to grant asylum to the crew of the Storozhevoy [27:12]. The U.S. Government historically has not commented on instances such as this mutiny and with the lack of concrete data at the highest levels and the foresighted reasons, the lack of comment here is understandable.

VII. POTENTIAL CAUSES

Until one of Storozhevoy's ex-crew members is allowed to speak, the world will probably never know the actual cause of the mutiny. There are, however, a number of potential factors which must have contributed to the reason for the few crew members to try such a desperate act.

The most significant possible explanation will not be covered in this study. The dissatisfaction in general with the Soviet government and life under its totalitarian rule has been written about in countless books. As an explanation for dissent, such dissatisfaction must be implicit in any work about the Soviet Union. In addition, a number of causes that will be cited pertain to problems in all of the Soviet society. This study focuses on those causes only as they relate to the Soviet Armed Forces or more specifically the Soviet Navy.

A. ANGOLAN CIVIL WAR

Until the U.S. Congress refused support for the opposition factions in the Angolan Civil War on December 9, 1975, the Soviets certainly feared that this West African conflict could spread into a superpower confrontation. Their Naval build-up in the area attests to this fact. The Soviets also cancelled all Navy leaves at this time. Finally, those conscripts who were due to muster out of the Navy in early

autumn of 1975 were extended indefinitely. Normally the old ones would depart once they trained their replacement. (This would apply to one-sixth of the conscripts onboard the Storozhevoy, since they serve a 3-year tour of duty and are released only twice a year--in the Spring and Fall.) [53:38] One sailor on another ship was quoted as saying: "What do we have to do with the fact that some black apes in Africa want to cut each other's throats? We want to go home!" [104] Any military man in any country would agree that to hold any sailor past his obligated service, when a national emergency is not apparent, is grounds for potential dissent.

B. ETHNIC CONFLICT

A second potential cause is the nationalities issue. This factor has received considerable attention lately with the increase in Central Asian population in the Soviet Union. The Soviet Navy, however, takes only eight percent of the men conscripted annually and can thus be selective [93:60]. Along with the Strategic Rocket Forces, the Navy gets the cream-of-the-crop. It is estimated that Slavic nationalities comprise over 90 percent of the enlisted ranks and virtually all of the officer corps [98]. Ethnic friction is an admitted fact of Soviet military life in the army, but Soviet authorities admit that the Armed Forces are their best instrument of national integration to deal with the ethnic diversity [53:34].

It would seem that at first glance those who cited Latvian nationalism as a potential cause for the mutiny should be discounted. The Soviet policy of "extraterritoriality" means preventing any Baltic conscripts or other minorities from being stationed in their homeland [54:10]. In addition, since Baltic peoples are generally considered "less than reliable," they would probably not serve in the Navy at all but in construction battalions in Siberia [11:107]. Interviews conducted by this author indicate in fact that there are sailors of the Baltic nationalities serving in the Baltic fleet. One former sailor who served in Talinn said that anyone with any connections or money can get his son to serve out his conscripted time close to home. He said this was especially common in Latvia and Estonia [106]. Russians historically have had a continental focus and have not been the greatest sailors, where the Baltic peoples, Latvians included, possess the skills from a very long fishing and seafaring tradition. In addition, the Baltic nationalities are highly educated and technically-oriented. These two factors make them ideal for Naval service and thus a nationalist cause for the mutiny does exist for those still chafing over Latvian incorporation in the USSR.

Some of the press reports said that disaffected Jews led the mutiny [73:4]. This is not likely due to the fact that Jews at this time could emigrate relatively easily. Why should they risk their lives to do it? The opposite effect

may be more important. The relative ease with which Jews could emigrate could have added to the frustration that non-Jewish Russian sailors felt in not being able to do so, thus forcing them to more violent measures.

The Russian military is regarded by many Baltic peoples as an occupation force. Fights between Baltic citizens and Russian servicemen stationed in the Baltic states are often reported [106]. This kind of atmosphere cannot be conducive to good morale among Soviet sailors.

There are over 100 different nationalities in the Soviet Union. The Navy, as stated, takes only a few minorities but they do exist. Central Asian peoples are found in many assignments, but in small numbers and usually in lower ranks. Jews are more common in the medical and technical fields and serve in the fleet in both the officer and enlisted capacity. The Naval reserve in the Baltic area is comprised primarily of Baltic peoples, but the commanders are still Russian. Few minorities get advanced assignment and even fewer become officers [93:27]. One sailor interviewed said he never saw an officer of any other nationality other than Russian, Belorussian or Ukrainian [106].

The race-conscious Russians have been successful at their attempts to "colonize" the non-Russian nations. Russian migration throughout the country has ensured domination by the Russians in key leadership positions. This "Russification" has caused considerable resentment in many minorities

particularly Baltic people. Balts, thus are often thought to be security risks. On one occasion, the Estonians on the crew of a Kresta 1 class cruiser were removed prior to a cruise to the Mediterranean [107].

Ethnic frictions exist, but they are something that has to be dealt with in the multi-national Soviet society. These frictions tend to be less in the Navy than in the other services due to the closeness of shipboard life.

C. LIVING CONDITIONS

Morale problems associated with harsh living conditions can be particularly significant for naval personnel. The habitability of Soviet ships is substantially lower than that of corresponding Western vessels. Reports of poor conditions are substantiated by Western observers after visiting Soviet ships. Soviet ships are much more heavily armed than Western units of similar tonnage, and that has to be accomplished at the expense of the crew's comfort.

There is a great deal of difference between conditions on older ships and those recently built. Soviets have realized that living conditions, especially on the now more common longer voyages, have a great effect on morale. The greatest change is air-conditioning in the crew's quarters since more and more cruises are going to tropical climates.

The overall impression one receives when visiting a Soviet ship is that it is far from luxurious, cramped, drab

but clean. On the older "Kotlin" class the berthing spaces are dimly lit and crowded. (Although one source said "crowded makes for better cooperation"). [107] Bunks are three-tiered with a 2 foot by 2 foot non-lockable box for each sailor. The spaces are not air-conditioned although space air-conditioners are carried on voyages to the tropical climates [107]. There are no water fountains in the living areas. Drinking water is available from a portable metal barrel with a community drinking cup [106]. On older ships, food is carried from the central galley and consumed in berthing spaces [35:212].

In contrast the Smolnyy, a Soviet midshipman training ship that was put into service in 1976, is centrally air-conditioned. It has a comfortably furnished officer's mess, and three dining rooms for the enlisted. The Smolnyy, in addition, has a "Lenin room" in which political instruction is given, which accommodates forty men. The ship also has facilities for movie projection and a 6,000 book library [52].

Visitors aboard the helicopter carrier Moskva described their impressions as: limited space, spartan living conditions, rudimentary equipment and one unusual condition-- the presence of Russian girls (nurses) in their white uniforms. It seems nurses are not uncommon on the largest ships. The all pervasive smell aboard Moskva was described as "a mixture of cabbage soup, bacon fat, and that black, slightly rancid typically Russian tobacco." [2]

The Northern Fleet sailor who served on the Kresta I class ship "Admiral Drozd" described major morale problems in association with Soviet Naval inability to get mail to ships on long cruises distant to the Soviet Union [107]. This was in 1970. It is unknown if this situation is any better today.

The Navy exists ashore as well as afloat and accommodations on land appear to be worse than those at sea, particularly in such inhospitable areas such as Polyarnyy in the Arctic, Vladivostok or Petroparlovsk. Victor Belenko, at a MIG-25 base in the maritime provinces of the Russian Far East, lived in a two room apartment just prior to his defection. With him were his wife, a flight engineer, the engineer's wife and their two children. They considered themselves lucky. Other apartments were packed with three and four families [5:97].

The Soviets, it seems, are aware of these problems and write about them, but according to Belenko and others, do not give it the priority it deserves. In Krasnaya Zvezda in 1974, Rear Admiral N. Sidorchuk (Chief of the Fleet Rear Services) discussed the housing situation for Navy men in the Pacific Fleet in fairly frank terms. He stated:

...the Party and the government are showing consistent concern with regard to improving the housing and living conditions for service families...In the Pacific Fleet in the last three years alone, thousands of families have received new living quarters. There is a problem of maintenance, however. In isolated far-off garrisons there is often a lack of trained maintenance specialists....In some areas house

maintenance committees exist solely on paper and actually do nothing. This had resulted in problems which can affect the serviceman in the performance of his regular duties [72].

Housing for servicemen in other areas of the Soviet Union is better but not without problems. Members of the military, particularly officers, are given priority on the list to receive new housing in urban areas where a shortage exists. Victor Belenko, as a newly reported aviation instructor in the Western Soviet Union, related his excitement over getting a new apartment in a building only one month old:

To be promised an apartment was one thing, but to be given an apartment as promised, quite another. Eagerly and expectantly, I unlocked the door and smelled dampness. The floor, built with green lumber, already was warped and wavy. Plaster was peeling off the walls. The windowpane in the kitchen was broken and no water poured from the faucet. The bath tub leaked; the toilet did not flush. None of the electrical outlets worked....Another lieutenant and I confronted the first party representative we could find, a young political officer in the same building. He was cynical yet truthful. The building had not been inspected as they had been told. The military builders sold substantial quantities of allotted materials on the black market, then bribed the chairman of the acceptance commission and took the whole commission to dinner. There the acceptance papers were drunkenly signed without any commission member ever having been inside the building [5:79].

The Krivak class, of which the Storozhevoy is a member, possesses the same shipboard habitability problems as other Soviet combatants. It is cramped and spartan. Morale problems due to the poor habitability would therefore be understandable. Those Storozhevoy sailors living ashore in barracks or with their families were not faced with the grim

conditions that existed in the Soviet far east. Riga is a large and relatively modern Soviet city. Housing is still scarce, however, and newer housing has quality problems due to corruption in the construction industry. Living conditions should be considered as a probable cause for the mutiny.

D. FOOD

In the Soviet Union where military power is so extremely important you might expect the consumers to suffer somewhat so that the military soldier and sailor might eat very well. It seems that this is not the case. Food certainly could be a cause of low morale, but how bad can the food be? Sailors in every navy complain about the food. In the Soviet Union food consumption has doubled from 1950-1974 [50:74], but it appears there are still a large number of problems in getting adequate food to the sailors.

The Soviets, in their regulations, appear to be very concerned that the troops in the military are well fed. Rations are provided free of charge to all soldiers, sailors, cadets and reserves when on active duty. Soviet authorities often boast about their ability to provide the troops with adequate rations. It is also official policy to see that elite forces receive better food than regular line forces [15:51].

Officers, if they serve in the elite Strategic Rocket Forces, receive free rations. Pilots receive four meals a

day, also free. Sailors and flying personnel receive 4,692 calories per day where soldiers receive only 3,547 [47:81]. Officers who serve in certain isolated regions of the USSR or abroad either get free rations or pay only half the cost. Strangely enough, officers who serve above the altitude of 3,500 meters get free rations as well.

Servicemen abroad get a tobacco ration. Nonsmokers may opt for 700 grams of sugar instead. Within the USSR, soldiers, sailors and cadets get eighty kopeks a month for tobacco [47:81].

The Soviet regulations do not specify anything concerning the quality of the food. An average daily menu paints a somewhat different picture. Soldiers are fed breakfast from 0730 to 0800. The morning meal generally consists of a bowl of kasha (a barley or oat mush cooked with flour) with 150 grams of bread, 10 grams of butter, 20 grams of sugar and a mug of tea [5:97].

Lunch is the main meal. Soldiers and sailors are given forty minutes to eat followed by thirty minutes rest. Lunch consists of a thin potato or cabbage soup, sometimes thickened with buckwheat groats. If they get any meat at all during the day it will be included in this soup; either a piece of cod, herring or a hunk of pork fatback. On special occasions, a mug of kissel (a kind of starchy gelatin) will be added along with more bread [40:46].

In the thirty minutes allotted for supper, servicemen are served many times the same meal of kasha and bread they had for breakfast. If they get any fresh vegetables it will be at this meal in the form of cooked cabbage or mashed potatoes [106]. Finally, they receive more bread. A Soviet serviceman consumes an average of one and a half pounds of bread per day [40:46]. Primarily due to this excess starch, he manages to gain six to eight pounds during his conscripted service. In the West, the average weight gain for young men in the age period of 18-20 years is almost double that.

Servicemen can try to supplement their diet at their unit's "bufet" (snack bar), but a conscript's salary of 3-5 rubles per month (approximately four dollars), cannot really buy too many of the cookies and candies sold there [90:9]. Thereby, only those sailors who receive money from home and can buy other food on the civilian economy are able to eat any better.

It appears in terms of calorie intake, the diet is sufficient. It is, however, dull and without certain essential vitamins. A former sailor interviewed by this author stated: "It filled you up but made you feel sluggish all day." [106]

The conditions under which servicemen are forced to eat do not add to the enjoyment of their food. Victor Belenko described conditions at an air base in the Soviet Far East:

Between 180 and 200 men were jammed into barracks marginally adequate for 40. Comparable congestion in the mess hall made cleanliness impossible, and the place smelled like a garbage pit. While one section of 40 men ate, another 40 stood behind them waiting to take their places and plates. If they chose, they could wait in line to dip the used plate in a pan of cold water containing no soap. Usually they elected simply to brush the plate off with their hands and sit down due to the short time for eating [5:99].

In the Navy, as mentioned earlier, there is no general crew's mess aboard the older Soviet ships. The food prepared in the galley is carried to the crew's berthing spaces to be consumed. This is not only cramped and unsanitary, but dangerous since fires due to heating elements have been reported [35:212]. When the heat below deck becomes intolerable sailors eat on deck on oilcloths with no tables or chairs [97:85].

Former members of both the Army and Navy agreed that food in the Navy was better in both quantity and quality. In addition, Navy personnel stated despite how bad their food was, they were fed better than the civilians in the surrounding communities. Naval personnel received some meat almost every day. In addition, they were the only ones to respond that they received coffee.

The army infantry and construction troops receive the worst rations of all. A Soviet army unit subsisted on kasha and codfish alone for thirty days without any variety [14:32]. Complaints about food often follows ethnic lines. The only meat one army unit ever received was pork, something Moslem Central Asians refused to eat [14:39].

There is some evidence that Soviet soldiers in the field often suffer from various illnesses related to vitamin deficiencies. One soldier who was stationed with an air defense battery near Murmansk reported that troops in his unit often developed sores and skin ulcers, sometimes accompanied by eye infections and night blindness [15:52]. These and other illnesses, such as severe acne, rapid tooth decay and chronic sore throats, all of which plague Soviet soldiers, are traceable in many instances to vitamin deficiencies. In some areas troops were given vitamin pills to supplement their diet, but one soldier testified that they were not taken in his unit under the suspicion that they contained saltpeter! [15:52]

Fresh fruit is unheard of in the Soviet Armed Forces. A sailor who served on a cruiser out of Murmansk never saw fresh fruit in his three years of conscripted service [107].

Soldiers' feelings about food are very strong. A former private who, during his service in the early seventies was quartered for some time near a military installation in an area where servicemen from other Warsaw Pact countries were training, said in reference to the Warsaw Pact allies:

They had an excellent mess. Soldiers from our battalion were twice sent on kitchen duty to their messes. They came back bringing pancakes! They brought sour cream! My friends were among them, so they brought some to me. It seemed like a miracle. We remembered it to the end of our service [90:9].

Dissatisfaction of soldiers with food has led to open protest, usually refusal to eat. A former paratrooper told how, after a year of particularly bad harvest, each soldier's ration of butter, bread and sugar was reduced. The soldiers after a brief organizational meeting, refused to eat. Half an hour later the division political officer appeared and ordered rations increased to their old levels. They were never reduced again and no one was punished for his disobedience [90:9].

In interviews with former soldiers, Dr. Robert Bathurst reported that a majority feel that their food situation is worsened by dishonesty on the part of the NCO's responsible for the galley. In addition, senior conscripts often extort food from junior conscripts as part of a general policy of hazing (discussed at length in the next section) which is overlooked by senior enlisted personnel and officers. The fact that everyone steals food, particularly meat, is widely recognized and accepted.

It must be stated that the Soviet soldier is quite accurate when he complains about the quality of food available to him. Even with the low standards of Soviet society, the majority of soldiers in the regular units believe that food is worse than that found in civilian life. Military rations are monotonous, poorly prepared and inadequate in terms of vitamin content. Although the number of calories appears sufficient due to the high starch content, it still does not appear to

be a diet adequate enough to sustain a young man through the rigorous Soviet military day.

When one looks, however, at how this impacts the combat ability of Soviet soldiers and sailors one must be careful to look at it with a Russian mindset. Certainly if volunteer American soldiers were fed in the same fashion as conscripted Soviet troops, an open revolt would occur. Many Russian peasants have eaten boring, untasty food all their lives and their short stay in the military is little different.

It is the style of every soldier in the world to complain about his food, but the Soviet Union might be the place where the serviceman has a real reason to do so. It is said that "an army moves on its stomach," if so, the Soviet military is not going very far. Today's relatively more urban, well-educated Soviet draftee is apparently less willing to accept the material hardships of military life. Moreover none of the current conscripts have had first-hand experience of the trying years of World War II, an experience which is viewed by the Soviet leadership as an important source of Soviet patriotism.

The author has no testimony concerning the quality or quantity of food onboard the Storozhevoy. One can only infer that it was very similar to that in the rest of the Soviet navy. Poor food can therefore be cited as one potential cause of the mutiny.

E. HAZING

One of the characteristics of Russian society is its harsh stratification. This stratification is carried over into the military service. Russians subordinate themselves, at least on the surface, to those above them in the hierarchy. They also tend to distrust and abuse those below them on that same ladder. In the Soviet military this is translated into "hazing." Second and third-year conscripts have long enjoyed seniority over younger draftees, claiming special privileges with the unit and channeling the undesirable duties to the new men. Emigré sources indicate that moderate hazing is accepted by the conscripts and tolerated by officers and petty officers because it provides a convenient way of maintaining unit control. Excessive hazing, however, can lead to low morale of the younger draftees and less solidarity of the unit as a whole.

The soldiers and sailors are generally divided into two groups: the "young ones" (Molodye) and the "old men" (Stariki) [90:4]. The former are the conscripts in their first year of service and the latter are those in their second or final year of service.

Before the 1967 Law of Universal Military Service reduced the length of time served in all Soviet land forces from three to two years, there had been an intermediate group in their second year of military service. This group of course is still present in the Navy where sailors have the three year conscripted obligation.

The "Stariki" rate a number of privileges at the expense of the "Salaga" (a derisive nickname for first-year sailors) [107]. When new conscripts arrive at their unit, one of the first orders of business is the uniform exchange. The "old men" exchange their worn uniforms for the new ones of the young first-year conscripts. The "Stariki" generally want to return home after demobilization in brand new uniforms [106]. A sailor who served on the minesweepers in the Baltic Fleet sold the new uniforms to Central Asian army troops who found it more prestigious to go home in a navy uniform [106].

All of the heavy work and menial chores such as cleaning and kitchen work are done by the "Molodye." A source in a Riga signal battalion had to shine boots for the second-year men (He was a shore-based sailor and thus only served two years). First-year sailors in his unit had to give up parts of their ration of sugar and butter to the "Stariki." The "old men" also demand a share of each food parcel or money gift received from home by the "young ones." [110]

This system does not appear to meet with a great deal of resistance. The conscripts are probably away from home for the first time at age eighteen and giving one "old man" what he wants without any fuss seems to provide the new conscript with protection from the other "old men." Another explanation for the passive acceptance of this hazing is that in the two or three years of arduous military life, most of the conscripts become considerably stronger, particularly in the

army. The threat of physical harm is often used as inducement for compliance. A recent study emphasized that attempts were being made to reduce physical violence used by the "old men" against the new recruits [90:5].

An emigré now in West Germany corresponded that when he became a "Stariki," he and a few of his comrades were determined to treat the first-year men better and with dignity. This worked satisfactorily for a few weeks until a senior enlisted man discovered that the source and his comrades were being too easy on the "young ones." The lenient "old men" were ordered to dump thirty buckets of water in their barracks and clean it up with small rags. While these "Stariki" were cleaning up the mess the "Molodye" were given free time. After this incident, the senior NCO had a meeting with the "Stariki" and told them to put more pressure on the first-year sailors or this incident would repeat itself [110].

Fist fights broke out often between junior and senior conscripts, particularly over the uniform exchange. Most of these fights go unreported or are overlooked by senior enlisted personnel and officers in all the services. This episode told by a former private in the Air Defense forces illustrates this:

...during dinner an "old man" received a slightly yellowish enameled cup (Usually the "Stariki" received only the new white cups). The "old man" without looking back threw the cup with all his strength into the open kitchen door and hit a young Kirghiz soldier who was on kitchen duty directly on the forehead.

The "young one" was in great pain, but he did not dare to complain or seek revenge. The onlookers took the whole episode as no more than part of the army life. They all said, "That's the way things are." [90:5]

It is apparent that the officers not only know about the privileged position of the "old men" but readily encourage it. An army NCO stated that the officers for whom he worked did not find it unreasonable when a "Stariki" complained about too much work to do. Officers said that the "old men" deserve some privileges because they already know their jobs and besides everybody gets to be an "old man" eventually [90:6].

The emigré who served on a cruiser out of Murmansk said this conflict between junior and senior conscripts was the worst single cause of problems aboard his ship. He said authorities were attempting to deal with the ethnic problem but the disruption caused by hazing was being overlooked [107]. Hazing is a navywide Soviet problem and was a morale problem on the Sorozhevoy.

F. ALCOHOLISM

Prince Vladimir of Kiev is said to have made Russia Christian rather than Moslem because, as he put it, "It is impossible to be happy in Russia without strong drink." Alcoholism is a national malady which permeates the military forces. Alcohol consumption among Soviet citizens accounts for over a third of all consumer spending in food stores [13:44]. The situation in the armed forces shows that servicemen are not exempt from the disease afflicting society as a whole.

Alcoholism is both a cause and effect of low morale. Alcohol represents an easy escape from the pressures and hardships of military service in the USSR; conscripts, senior enlisted men and officers use it extensively for this purpose. The scope of the problem created by alcoholism is evident in the press reports reflecting high-level concern with the extent and impact of excessive drinking within the armed forces. One article in Krasnaya Zvezda pointed out that more than one-third of all military infractions are caused by personnel under the influence of alcohol [42:52]. In the same journal on August 17, 1974 an article proclaimed that the Officers Club of the Baltic Fleet had made a training film to strengthen military discipline to combat drunkenness.

Soviet regulations permit officers and NCO's to drink in their off-duty hours. The conscripts, in theory, are not allowed to drink at all, but the famous ingenuity of the Russian soldier which has been lauded in Soviet propaganda since World War II proves itself when it comes to the problem of getting a drink [90:13]. Strict discipline does not appear to be an effective deterrent.

It appears this problem is more widespread in the army rather than the navy, simply given the difficulty in smuggling alcohol aboard ship (Alcohol is not officially allowed aboard Soviet naval vessels). Sailors who served at sea said alcohol abuse was rare but occurred whenever alcohol became available. Senior petty officers seem to be the greatest abusers of

alcohol. One emigré reported that to be allowed to go on leave, a conscript had to promise the First Sergeant a bottle of vodka upon returning from home [110].

The Soviet version of moonshine is "samogan," which is often produced on the farm in family-run stills. The military is a great consumer of this "home brew." In the Naval Signal Battalion outside Riga, the "Samogan" supply came from a collective-farm woman who visited the mess hall once a week to pick up leftovers for her pigs [110]. Other than some hashish smoked by Central Asian soldiers in construction battalions, alcohol appears to be the only drug in use, but determined soldiers and sailors have resorted to drinking cologne and alcohol used for cleaning.

Lieutenant Victor Belenko who flew his MIG-25 to Japan only 10 months after the Storozhevoy mutiny told tales of the problems of the drinking and black market sale of the grain alcohol used in hydraulics and de-icers of the MIG-25. He said fuel was often dumped to insure that statistics sent to Moscow show the proper fuel to alcohol proportions was used [5:82].

A sailor who served on K-8 class minesweepers from 1968 to 1971 told this author that on two different occasions he could remember that sailors standing guard duty on the boats were drunk. One fired his AK-47 into the air saying he thought there was an air raid. Another lost his Kalasnikov and himself over the side in a drunken stupor. The interviewed

sailor was the diver that pulled the body and weapon out of the water [106]. Both of these incidents were hushed-up by local commanders.

The mutineers evidently counted on the drunken sleep of some of their officers to aid in their escape to Sweden. Alcohol problems, thus, not necessarily a direct cause of the mutiny, apparently were taken into account by the conspirators. Alcohol is said to be more valuable than Soviet currency. "Anything can be bought with a bottle of vodka." [106] There is certainly the potential that in the prelude to their escape, the mutineers might have bought aid or silence with alcohol. Indeed, they could have been drinking themselves.

G. OFFICER MORALE PROBLEMS

The discussions of morale problems and discontent thus far have focused primarily upon the conscript ranks. Junior officers have special morale problems in the Soviet Navy as well. Since Sablin was joined by one other officer in the conspiracy, it is important to examine the shipboard officer's career and officer morale problems that may cause dissent.

The officer probably began his "selection" process at a very early age. A great number are sons of naval officers and party officials which leads to an inbred officer corps which is often plagued by nepotism. The officer is supposed to be politically reliable. This means he participated in the "Little Octoberist" group from ages six through nine, the

"All Union Pioneer Organization" from ten to fourteen and probably joined the "All Union Lenin Communist Youth League (Komosomol)" at fifteen; which leads to party affiliation at 28 years of age. Communist Party membership is not required but there is certainly perceived pressure to join. As mentioned earlier, 95 percent of all naval officers are party or Komosomol members [22:54].

As youths, many participated in activities under the guise of "The All Union Voluntary Society for Cooperation With the Army, Air Force and Navy (DOSAAF)." This volunteer organization, under the jurisdiction of the Ministry of Defense, provides 140 hours of premilitary training during the last two years of secondary school to a majority of Soviet males. The 1967 Universal Military Service Law required all male citizens to join a local DOSAAF unit two years prior to the conscription age of 18 [22:52]. Although DOSAAF engages in military related sports, civil defense, and Soviet nationalism, its primary purpose is to prepare youth to serve in the military.

A majority of these youths enter the prestigious Nakhimov Prep School in Leningrad at age 13 which substitutes for normal secondary school. Approximately 50 percent of all Soviet naval officers are graduates of Nakhimov. This school, in addition to status benefits, allows graduates automatic entry into one of the eleven Higher Naval Schools (HNS) which produce officers in a similar fashion to our Naval Academy.

Five of these schools educate surface line officers, two are dedicated to line-engineering and one each to shore engineering, submarines, radio-electronics and political affairs. Curricula are five years duration and graduates are awarded baccalaureate degrees. Eighty-five percent of the Soviet naval officer corps are procured from one of these institutions. The remainder come from civilian universities and technical schools followed by ten weeks of Officer Candidate School [22:52]. The future navy line officers receive technical training in a narrow specialty under old-fashioned rote techniques and strict discipline. Naval pilots, doctors, civil engineers and many other shore specialists come from universities run by the other armed services and not one of the HNS's.

Graduates are commissioned in the rank of lieutenant upon graduation. The rank of junior-lieutenant, seldom used, is reserved for marginal graduates and some direct commissions from the enlisted ranks. They report aboard ship and begin immediately to work in one of the five departments for which they were educated: Navigation, Weapons, Engineering, Anti-submarine Warfare (ASW), or Communication/Electronics [33:135].

Approximately 1500-2000 new officers enter the fleet each year from the Higher Naval Schools. The top graduates get their choice of fleet and ship type. North and Pacific Fleet, due to the higher pay and higher tempo of operations, are the most popular choices.

The Soviet naval officer is a "specialist" and a "technician" foremost where his American counterpart is a "generalist" and a "manager" first. Some of this difference is driven by necessity and some by choice. The large, uneducated conscript force requires that the officers be more technically proficient. Creation of the "Michman" rank (Warrant Officer) was an attempt to retain more enlisted personnel by giving them more prestige thus relieving some of the "hands-on" maintenance and repair function of the officers [33:135].

Before a new shipboard officer begins his officer-of-the-deck qualifications or becomes a division officer, he must first qualify in his specialty as a third class, second class, first class and master specialist just like enlisted personnel. A great many Soviet officers feel that overstressing technical competence erodes traditional values of military leadership [50:97].

The pay system is too complex to explain in terms of dollars or roubles. Primarily rank and time-in-service determine pay with extra money given for housing and travel. Pilots, submariners and remotely assigned personnel receive more money due to their longevity credits. The most important extra pay factor is position pay. This can be up to 100 percent more money if you are assigned to an important staff or job. The officer's pay is quite good when compared with many other occupations in Soviet life [47:77].

Soviet officers accrue 30 days leave per year. Those with more than 25 years of service, along with pilots, divers, submariners and those in remote sites are allotted 45 days [22:58].

Ninety percent of the Soviet officers stay until pension at 25 years. This includes five years at the Higher Naval School for most. Time spent in submarines or remote areas like Petropavlovsk count as double time in service. Since very few leave the service prior to retirement, the Officer Corps is trapezoidal rather than triangular as in the U.S. Navy. There is no "up-or-out" promotion system. Not being selected for command or being passed over for promotion does not end a man's career in the Soviet Navy.

The crucial point in the shipboard officer's career is at the assistant-commander point (department head) probably at the rank of captain-lieutenant. Here a decision is made by the ship's commanding officer to determine if each officer remains in the specialist career path or makes the lateral transition over to executive officer (Starpom) and the command path [30:98]. The specialist will continue to be promoted and will serve on staffs, shore billets and in some cases stay aboard ship in his speciality despite the fact that he outranks the ship's commanding officer. This rank inversion is commonplace in many areas of the Soviet Armed Forces and causes complexities in the promotion system. Engineering and Communications/Electronics specialists are not often considered

for command leaving the officers in Navigation, ASW and Weapons the best chance to be selected. Normally these officers at the captain-lieutenant level are given a couple of chances for executive officer (XO) selection before becoming career specialists.

As one can see, the shipboard CO holds a great deal of sway over the careers of the officers in his wardroom. He promotes the majority of his officers and selects his own executive officer (Starpom) as previously cited. There also is evidence that Soviet admirals can promote anyone merely by decree for a number of reasons [103].

Upon completion of qualification as a master specialist, the young junior officer undertakes both bridge watch qualification and grouphead (division head) responsibilities. Like most Soviet policies of more control from the top, the XO or CO must be on the bridge of a Soviet ship at all times. This puts a great deal of pressure on the qualifying junior officer. He is constantly being quizzed by the qualified officer-of-the-deck and either the CO or the XO. Although he starts later in his qualification than his American counterpart, the Soviet process certainly aids him in catching up with his western counterpart.

It is possible for an officer to rise to command-at-sea in approximately 16 years and spend all that time, if not on the same ship, at least on the same ship type. Transfers very seldom occur between fleets. A Pacific Fleet Officer

who has been on "kashin" class destroyers will stay there. Changes of specialty are almost unheard of since they require extensive retraining [22:58].

There is a great deal of verbiage in Krasnaya Zvesda and other journals concerning the importance and prestige of commanders-at-sea. Fleet Admiral Gorshkov has stressed many times that a CO must be a manager, able seaman, technician and proponent of Marxism/Leninism [30:97]. The CO can also "make or break" the careers of the rest of the officers in his wardrooms. Many destroyers and cruisers are captained by fairly junior officers; captains third or second rank (LCDRS/CDRS). There are documented cases of a Krivak class ship being commanded by a senior lieutenant [30:98]. Despite his junior rank, he has probably been at sea as much as an American commander whose tours have been interrupted by shore duty.

Captain William Manthorpe, in a Naval Institute Proceedings article, cites that there is a great deal of propaganda concerning the young CO's. The literature is quoted as saying that the system puts the best in command no matter the rank and that this process is warmly received by all. Captain Manthorpe contends that there is a great deal of friction, particularly from the engineer staff specialist who outrank the captain a majority of the time [30:97].

Evidence in literature points to central control in the Navy being "destalinized." Admiral Gorshkov states the aim

of trying to get commanding officers with more initiative and giving them more responsibility. Such initiative, however is often damaged by the Soviet style of command. When an admiral is embarked on a Soviet ship, for example, he often rides the bridge and commands the ship when entering or leaving port and during channel transits [33:137].

Those officers who do not make command selection rotate to afloat staffs or shore stations after completion of their department head tour. These staff specialists go afloat with an admiral but not always on the flagship. The destroyer squadron staff engineer may spend a whole deployment aboard a ship with a particularly junior engineer or one with engineering problems. The staff engineer would run the department while he was aboard. The U.S. Navy would call that excessive oversight; the Soviets call it efficient use of trained assets. Although Soviet propaganda says specialists have equal chance for promotion, interviews appear to indicate that this is not so [103]. Just as they do with their ships, planes, and other military hardware, however, the Soviets squeeze all they can out of these specialist before they are retired.

Like all Soviet decision-making, naval command is highly centralized, carefully limited and closely monitored by the organs of the party. It shares with the rest of the system the relationship in which the senior officer is reluctant to delegate authority and the subordinate is unwilling to accept

responsibility. Articles in open sources criticize both senior officers for not permitting subordinates more leeway and junior officers for not delegating more responsibility to Michmen (Warrant Officers) and enlisted men. Articles also repeatedly stress the need for decisiveness, initiative and innovation on the part of junior commanders. Not wanting to "stick out" and wanting to just be part of the group are a part of Russian and Soviet culture. There is evidence that points to a reluctance on the part of junior officers to operate beyond the letter of the orders received or to act in the absence of orders. It, seems, however, that the Soviets have decentralized enough such that field commanders can make decisions when necessary.

In summary, Soviet naval officers are highly trained volunteers, frequently drawn from relatives of party members or of other naval officers. Soviet naval officers are expected to be political and military leaders and "hands on" technical experts, familiar with every task in their division. Promotion is based upon vacancies and the CO's recommendation rather than annual promotion boards [33:135]. A few officers rise very rapidly based on this somewhat subjective selection for command. The many officers not selected for command positions remain as technical experts for many years after their contemporaries have advanced to positions of great responsibility in higher commands.

Although officers have far more privileges than enlisted personnel and receive much more pay, the hardships associated with sea duty weigh also on the officers. Junior officers have morale problems as well. In being assigned to the same job and ship for up to six years, they may have a chance to be judged by only one or two commanding officers. If they escape notice, they may remain technicians for the rest of their careers. There is frequently the feeling that advancement requires friends in Moscow [103]. Junior officers are frequently overburdened with additional duties and various political committee assignments and find it often difficult to perform normal military duties.

Junior Soviet naval officers resent seniors who dominate and do not decentralize, and yet among all officers, there is a pervasive fear of making a wrong decision and being reprimanded to the detriment of their careers. Soviet naval doctrine recognizes the need for decisive initiative at all levels, but it seems higher ranking officers interfere in even the most insignificant decisions, thus stifling initiative at lower levels. Most officers decide to stay in the Navy because they perceive they are better off than most Soviet civilians. This is not an indicator, however, that they are satisfied with Soviet society and would not participate in a mutiny.

H. OTHER FACTORS AND CONCLUSIONS

All of the interviewees and open source literature cite many instances of absenteeism. Unauthorized absence (AWOL) and desertion would be effects of low morale rather than causes. They will not therefore be discussed in the causes of the Storozhevoy mutiny. The author realizes, however, that high desertion rates and high AWOL rates which are prevalent in some Soviet units, lead to further unrest and other problems.

Political education is a source of some dissatisfaction among enlisted personnel, especially because there are many new enlistees who were not formerly Komoscmol members and who now find that they must join and pay dues [110]. Sailors resent the large amount of time consumed by tedious political education classes. They recognize the disputes between political officers and professional military officers; disputes which sometimes disrupt an orderly chain-of-command. One former conscript described the weekly political meeting as boring with the same contents week after week [110].

Suicide may be viewed as among the most drastic responses to the prolonged frustration of military life. Dr. Richard Gabriel, in his studies of moral in the Soviet Army, found suicide prevalent enough to be significantly alarming [13:29]. This author, through his research and his interviews, has not found the same to be true in the Soviet Navy.

On cruises it is normal for Soviet ships to be at sea or at anchor for six months at a time. Shore leave in foreign countries is restricted to those considered to be "ideologically safe" and even then sailors go ashore in supervised groups [103]. At home, liberty is granted three evenings a week to one-third of the crew until 11 P.M. One sailor stayed out all night by buying vodka and other favors for the chief petty officer in charge of his section [106]. Leave to go home is not an entitlement for the conscripts. The conscript may be awarded 10 days in his second or third year if his supervisors feel he has earned it [11:105].

From 1964 to 1975 the number of days that Soviet ships have operated away from the Soviet Union has risen from 4,000 to close to 48,000 [10:42]. Consequently, leave and time with families has been reduced accordingly. For those senior petty officers who had been in the Navy since the early sixties, this drastic change in operating pattern must have seemed like a violation of the contract that they agreed to when they decided to make the Navy a career. Even when docked at their homeport, sailors have spoken of the rigors of the training day which preclude any leave or liberty. Leave is often used as an indictment to get conscripts to join in denunciation of a fellow conscript and come forward with various crimes of others voluntarily. The schedule of the Storozhevoy in the year prior to the mutiny included a great deal of at sea time as mentioned earlier. That long time at

sea, plus the fact that all leaves were cancelled due to the Angola period, would lead one to believe that sailors could be very frustrated and overworked.

If one looks at the potential causes cited thus far, one can see ample reason for dissent, but not necessarily enough for mutiny. The one cause that seems to have tied the others together was the obvious frustration that Comrade Captain Third Rank Sablin must have felt with the Soviet System. He had been awarded two Orders of Lenin during his Naval service [60]. As a Naval officer, he was in a privileged class in a "classless" society. Officers receive special privileges for certain sanatariums (resorts). They have a well-stocked "voentorg" (Soviet PX) which carries many hard to get imported goods. The most important factor however is the status the Soviet officer holds in the Soviet society. They are continuously praised in both civilian and military press. Soviet officers are always looked upon with high regard and esteem. They are the "elite of the elites." They are allowed to travel. Some current authors see a change in this, but for the present this status attracts many men into the officer corps. Sablin enjoyed benefits far in excess of the civilian population and yet he still chose to lead a mutiny against his homeland.

In his role as chief political teacher, Sablin's lack of ideological zeal was passed on to the crew of the Storozhevoy. This lack of "Party consciousness" was singled out by the

military hierarchy a year before the mutiny. In the 1974 article in Krasnaya Zvezda discussed at length earlier, it was cited that the crew had the technical expertise to do well but lacked the commitment to the "Communist collective" to become an outstanding ship. This article, appearing one year prior to the mutiny, is evidence that trouble had been brewing for some time. Such evidence supports a view that the mutiny was not a spontaneous uprising.

The Captain apparently was not aware of the problems on his own ship, since the person designated to keep him abreast of crew morale was his Zampolit, in this case the person who was fueling the dissent. One might speculate how someone with Sablin's views could get to the job of political officer on a major Soviet combatant ship? Certainly there was a breakdown in the selection process. In this case it must be evident that the military background of his family and his ability as a leader got him the job. Sablin probably did not want the job, but numerous sources have said that to turn down a political officer job, if it is offered to you, is career suicide [108].

Enough evidence has been put forth to show that the mutiny aboard the Storozhevoy was not a spontaneous uprising but a well thought-out conspiracy. The timing is certainly a major indicator. The rapport that Sablin must have established with crewmen to even divulge such a plot to them required months of planning. In a society where distrust is the norm

and friendships take years to build, this rapport had to be monumental.

Some might question Sablin's ability to get petty officers and conscripts to go along with his plan either willingly or even unwillingly, but passive submission to any authority has been inbred in the Russian population for centuries. The Russians have "created a tendency to avoid the exercise of initiative and an unwillingness, even inability to undertake a task without constant supervision." [33:130] The passive acceptance of the Stalinist terror is a prime example. The small size of the dissident movement, especially the Russian participation in it, attests to this passive acceptance of authority. Russian people desire both control and freedom. This paradox in their personalities is apparent in many instances.

VIII. ISOLATED INSTANCE OR TIP OF THE ICEBERG

This study has focused on one dramatic incident. One key question remains: was this an isolated incident or merely the tip of an iceberg of dissent and unrest in the Soviet Navy? Are there other instances of unrest to which one might point?

The Soviet Navy and the Czarist-Russian Navy before it have had repeated instances of unrest. In 1905, sailors aboard the battleship, Potemkin, enraged over maggot-ridden meat which the ship's surgeon declared fit for consumption, killed their officers and took over the ship. They attempted to join striking workers in Odessa but were forced to abandon their revolt in Romania. This ending was not shown in Eisenstein's classic Soviet film "Potemkin." [19]

This author realized the difficulty in using a 70-year-old Czarist mutiny which occurred just after the Russian defeat in the Russo-Japanese War to show evidence that there are other examples of mutiny in the Soviet Navy. It is important to note that many Czarist traditions and training programs were carried forward into the Soviet Army and Navy. Between 1918 and 1929, 48,109 ex-imperial officers were taken into the Red Army and Navy [12:82].

The Baltic Fleet was heavily involved in the Bolshevik revolution in 1917. The 60,000 sailors had importance out of all proportion with their numbers. The most violent

episodes of the February revolution took place at the Kronstadt and Helsingfors Naval bases. A shot fired from the cruiser Aurora is part of the legend of the October Revolution. The crew members of an earlier destroyer named "Storozhevoy" were active participants.

Sailors at the Kronstadt Naval Base in the Gulf of Finland revolted against the new Bolshevik government in February 1921. Shouting slogans of "Free Soviets" and "Down with the Commissarocracy", they held out for two weeks before they were bloodily suppressed by Lenin's Red Guards [80:8]. After this uprising, Lenin almost disbanded the Fleet.

In the spring of 1959, a large contingent of Soviet Naval personnel was stationed in Gdynia, Poland to train members of the Indonesian Navy in destroyer tactics and the use of their Soviet equipment. Commanding a "SKORY" class destroyer of the contingent was Captain Nikolai Fedorovich Artamonov. He was the youngest commanding officer in Soviet history at the age of twenty-seven. Artamonov seemed a brilliant product of the Soviet system. He exemplified the concept of the "New Soviet Man". He had been lauded by name in Krasnaya Zvezda and Morskoy Sbornik (Soviet Naval Digest). Artamonov had also been praised for his proficiency in propagandizing Communist Party decisions among his officers and men [20:59].

In July 1959, Captain Artamonov gave up his brilliant future in the Soviet Navy by fleeing across the Baltic to neutral Sweden. He escaped with his twenty-one year old

fiancé, Eva Gora. He gave up his chauffeured limosine and other countless privileges to settle in the United States under the name Nicolas George Shadrin. His reasons for defecting came out later in his debrief and testimony before the House Un-American Activities Committee on September 13, 1960. Underneath his "good communist" exterior had boiled a deep hatred of the Soviet system which he had kept well hidden. He testified that he was not alone with these feelings in the Soviet Navy.

Shadrin, after years of work for the Defense Intelligence Agency and Naval War College, disappeared in Vienna around Christmas 1975. He had been recruited to work for the CIA in the counter-intelligence field. He was presumably kidnapped by the Soviets. The death sentence he was given in absentia for his defection in 1959 was presumably put into effect [20:180].

Vladimar Gavrilov was a Soviet sailor from 1960 to 1964 and later emigrated to West Germany. In 1963, as a radio operator aboard a radar patrol ship in the Pechanga area of the Soviet northern fleet, he organized a group of sailors who met during movie showings. Under the guise of studying Marxism-Leninism they clandestinely concerned themselves with criticizing the Soviet government and unifying the disaffected [16:2]. They met in the engine-room, so that no one else could hear their dangerous deliberations. The group wrote a letter to the Central Committee of the Albanian Labor Party expressing their dissatisfaction with Soviet socialism and

the government's disregard for the working man. They had planned to send the letter through a friend at the Czechoslovakian embassy. Other Czechs forwarded the letter to the KGB [16:3]. Gav ilov spent three years in a labor camp prior to being allowed to emigrate.

In June 1969, three Soviet Naval officers, also of the Baltic fleet, were arrested in Paldiski for alleged anti-Soviet activities. They were planning to circulate documents urging liberalization and democratization of the Soviet society. They had also signed their names to an essay by well-known dissident Andrei Sakharov critical of the Soviet Union. The three officers, Captain-Lieutenant Gavrilov, Lieutenant Paramonov and a third Kosyrev were believed to have been assigned aboard a nuclear submarine in Talinn [44:175]. Sources quoted in the New York Times said that "One of the three had been engaged in political work." [87]

In 1970 a Soviet sailor went berserk aboard a Kotlin class destroyer in the Mediterranean. He wounded four other sailors with an automatic weapon before being shot and killed himself [45:185].

These cases are well-documented. There are rumors of mutinies that were spread throughout the Soviet Navy. Reports of an attempted mutiny aboard a nuclear submarine in the Baltic in 1969 and another aboard a diesel submarine in a Norwegian Fjord in 1972 were both related to this author [107]. A shorebased conscript in an interview remembered a story of two

Warrant Officers who in 1974 killed an officer and attempted to desert in the Valga area. They were both apprehended and shot [109].

A recent dramatic episode leads this author to speculate that violent dissent continues to be a problem. The incident involving the Echo class nuclear submarine which surfaced disabled east of Okinawa in August, 1980, still requires a satisfactory explanation. The three Soviet officers who boarded a British tanker for help reported there had been a fire. While officers radioed for help, men from the tanker took 55 persons off the submarine. They estimated that nine crewmen had died. The Captain of the tanker found no evidence of fire on the men, the bodies, or the deck of the submarine. The Captain's analysis was confirmed by infrared photography by Japanese reconnaissance planes [8:146]. The theory held by many that a nuclear accident had occurred was also held inconsistent by Japanese planes when no abnormal radiation level was discovered. Had another mutiny been attempted? We will probably never know but certainly the basis for dissent was there.

These examples of unrest cited are few and far between. One must assume that in a closed society such as the Soviet Union, that those things which are public are only examples of more which are hidden under the cloak of information suppression.

The fact that an article in the military newspaper was critical of Storozhevoy for its lack of ideological commitment, could be indicative in itself that the problem is not on that ship alone. Many analysts of the Soviet press, including Hedrick Smith in The Russians, state that there is a policy to "criticize but don't generalize." In other words, it is all right to find fault in a particular situation but don't write general conclusions because that is politically dangerous. Smith states:

Each case of corruption or mismanagement in some distant city or province is treated in print as an isolated shortcoming, and yet by giving it prominence in the national press, the Party bosses are signalling their nationwide apparatus that this is a general problem to be dealt with forthwith [50:194].

There has been a great deal of writing about the nature and problems of unrest in the Soviet Army. Since most of the emigrés to the West served in the Army, getting data is much easier. To simply say that the problems of the Army apply to the Navy would be a mistake. The Navy is small, elite, more technically-oriented, more ethnically Slavic than the Army. It receives the best of the conscripts. It doesn't have the language reliability problem associated with large numbers of Central Asians in its ranks. It is just these factors that make mutiny all the more important. If the Soviet Navy High Command cannot trust the crew of one of its front-line ships, other units are suspect if not of mutiny possibly of the debilitating problems.

IX. THE IMPORTANT OF HUMAN FACTORS IN ASSESSING MILITARY CAPABILITY

This study has focused on a number of instances where dissent and unrest in the Voyenno Morskoy Flot (Soviet Navy) have erupted into violence, mutiny or peaceful protest. This study has also discussed current morale conditions, both cause and effect, which appear to point to continued unrest and dissent. They may not indicate a disintegration of the Voyenno Morskoy Flot (VMF) as a viable force, but they make it evident that we must incorporate these human factors into some conceptual framework for gauging the military power of the Soviet Navy. Defense planners must have some net assessment of the comparable naval strengths based on both quantifiable and nonquantifiable factors.

Current literature contains numerous comparisons of the seagoing armed forces of the Soviet Union and the United States. In a 1981 Department of Defense document, Soviet Military Power, the buildup of the VMF was described as follows:

Over the last two decades the Soviet Navy has been transformed from a basically coastal defense force into an ocean-going force designed to extend the military capability (emphasis added) of the USSR well out to sea and to perform the functions of tactical, theater, and strategic naval power in waters distant from the Soviet Union. The Soviets have a larger array of general purpose submarines, surface warships and combat naval aircraft than any other nation [94:39]

Admiral Stansfield Turner described the naval balance this way in 1977:

As a seagoing power, the U.S. is moving into a shrinking range of political options and a higher level of risk. For this there are two reasons: a major industrial power, the Soviet Union, is building up a navy with dogged determination, reacting to its perception of a threat from our once overwhelming armed superiority at sea.... [58:339].

In 1979 the Soviets were considered to have 560 major surface combatants compared with only 350 for the U.S. Navy. Another study had a major U.S. Naval surface combatant force exceeding that of the Soviets in ship tonnage 2.6 million to 2.4 million tons [63:30]. Both of these figures are correct yet neither figure gives any indication of which means greater military capability.

There are many shortcomings in the way military power is assessed today, yet policy-makers continue to make budget decisions based on drastically simplified numerical estimates. Such emphasis on quantification is due to the difficulty in measuring human factors and other subjective indicators.

What is military power or capability? Is it the ability to achieve certain desired missions in light of enemy capability or is it an absolute which exists without relative comparison? Evidently it is a little of both. Examining and measuring military power and combat effectiveness are difficult and complex, mainly because they are based in no small part on political-psychological factors that are in turn influenced by a variety of forces that are subjective and vary from one situation to another. The situation is compounded by the difficulties in relating objective and subjective criteria,

questions of validity of data, the different perspectives from which the problem of peacetime naval balance is viewed and the ambiguity of methodology.

There are a number of ways which a country's military power is currently being estimated; all are fraught with problems and inaccuracies. The majority of these methods rely on those indicators of military power which are quantifiable and disregard other elements. There is a great reliance on objective criteria and the collection of empirical data. Understandably these are easier to collect, measure, and analyze.

The trend to attempt to quantify military power and reduce war to mathematical patterns is not a new one. References to such attempts are found in the notebooks of Leonardo da Vinci, in the ballistics studies of Galileo, in the works of Machiavelli, Vauban and Jomini. The application of statistical techniques to tactics is a major subtheme in military historiography. From the seventeenth century onward, mathematics became a major component of officer education in the West, a trend which has increased steadily up to today. Operations research is now an important part of any military curriculum.

How useful then are quantified approaches in the search for measurement of military power and capability? Operational research in World War II clearly enhanced fighting capacity in a number of areas, but has it aided planners in assessing

enemy or friendly force capabilities? The McNamera era of the 1960's brought systems analysis and operations research to the forefront in all areas of military analysis. This trend was admittedly under way but dramatically accelerated by McNamera's accession to the office of Secretary of Defense.

Although operational research and its descendants have had their successes, many have expressed skepticism regarding such rigorously quantified approaches. One of the most ardent critics is Hyman Rickover: "I have no more faith in the ability of social scientists to quantify military effectiveness than I do numerologists to calculate the future." [46:29] Edward Luttwak, a Georgetown scholar and Reagan advisor stated "Logic and calculation are no substitute for military instinct. Military professionals have abandoned the study of history and opted for untested models." [46:30]

The most commonly used quantifiable measure of military power is comparison of defense expenditures. The rationale for using this technique to measure capability lies in the belief that weapons capability is related to cost. It is evident that this indicator is really peripheral to the assessment of military effectiveness. For many nations, military spending is not related to capability at all because of the complex interplay of military aid, regular arms procurement, gifts and nonmaterial forms of payment to arms donors and the like. Nations may misrepresent their defense budgets for security reasons. Budget figures for defense spending do not

necessarily reveal where the money is spent. High defense spending may be an indicator of reliance on the military to maintain domestic order. Inflation means that it takes more and more money to buy fewer and fewer weapons. Since inflation rates vary from country to country and international exchange rates are often arbitrary, equating monetary units across national boundaries becomes extremely tenuous. Even if one could equate budgetary data it would still be difficult to define military capability on the basis of defense expenditures. While price and weapons sophistication are closely correlated, price and capability are not. Certainly comparing the cost of a C-5A transport and the F-111 fighter doesn't give one an accurate comparison of capability. Some analysts have, in a related methodology, attempted to measure capability by the dollar valuation of weapon production costs. In other words, what would be the cost of producing some system in the U.S.? This would give us some sense of a weapons true economic value but not of its capability.

A very common method of measuring military power is the inventory technique. With this approach countries are compared in terms of their respective inventories ie. the number of Migs and Phantoms or surface, combatant ships. In some respects this numerical inventory approach is more reliable than the budgetary approach, particularly since highly visible weapons, such as airplanes and tanks are difficult to hide and many countries' supplies of arms are known. Even though

major weapon systems can be counted easily, correlating inventories with capability is difficult because qualitative differences exist among individual weapons and among countries respective skill in their utilization. Experiences in the past Middle East wars, where the outnumbered Israeli forces triumphed, show how combatants with smaller and presumably less potent arms inventories can win major victories. Nevertheless, national weapons inventories are often tallied under the wrongful assumption that the greater the arms stockpile, the more powerful it is.

Implicitly when numbers are used one tends to be led to expect that equal forces lead to equal power. The whole history of military engagements tends to indicate that this is far from the case. One has only to cite the extremely successful German attack in 1940 on the combined French and British armies to indicate that equality of forces and equipment does not lead to a stalemated outcome. The greatest danger of numerical comparisons is the unwarranted sense of surety and completeness that these methods suggest.

Superior numbers in just troops have not always produced victories either. Fredrick the Great beat 80,000 Austrians at Leuthen with only 30,000 men. Napoleon emerged victorious at Dresden with 100,000 fewer troops than his opponents [59:199] The earlier cited example of Germany accepting an adverse one-to-nine ratio in division strength on the eastern front in World War II is but another example of where numbers of troops and weapons were not the leading factor in the outcome.

At another level of comparing the numbers within military forces to determine relative military power, most analysts avoid judgement as to the circumstances under which these numbers of forces might meet. For example, historically the rule-of-thumb that the offense needs a three-to-one advantage to defeat the defense is not brought in to force comparisons. In addition, no numerical figure is given to the value of strategic surprise.

Even if one could calculate the combat capability of individual ships or units, the capability of two or more of these groups operating together is not necessarily the sum of the capabilities of the parts. The capability of a U.S. carrier task force is not the sum of the power of each individual ship or aircraft.

A military unit may perform extremely well under certain conditions and poorly under others. Adverse conditions may drive one unit to greater capability and another to less than optimal performance. For example, in Vietnam, units which performed well against North Vietnamese regulars did not do so well against women and children armed with satchel charges.

Weapon number comparisons overlook technological factors. A highly sophisticated plane flown by a pilot from a less developed country may not be as militarily capable as a less sophisticated plane flown by a more proficient pilot. In addition, where technology is equal, specific weapons are often designed for specific purposes rendering a weapon's relative

capability dependent on what circumstance it is used. Further complicating the matter of measuring capability in terms of weapon system inventories are the effects of additional situational variables such as user training, tactics, and a factor which has been found to be most important - logistics.

It is evident that merely adding up all U.S. Naval forces and comparing them with Soviet Naval forces, actual or potential does not really tell one very much. One has to predict the conditions under which two forces might engage before such listings develop even the slightest significance. We must develop some subjective notions as to the likelihood of certain contingencies before we can begin to compare force levels.

Quantitative measures of military power avoid these subjective and intuitive considerations. In the final analysis these subjective factors may be the most indicative of military capability and the ones which should be focused on more closely in the assessment of our adversaries. This author recognizes the historical difficulty in trying to measure subjective factors and attempt to account for the variety of imponderables that are characteristic of any military conflict situation. The battle environment of the 1980's may confront the individual soldier or sailor with a greater degree of stress, contradictions and ambiguity than in the past, which brings us to the most important group of subjective factors in assessing military power and capability - the human factors.

It is even difficult to come up with some sort of consensus of what these human factors consist of, and a prioritization of their relative importance. The factors include domestic value systems, the will to fight, ideological commitment, leadership style and ability, unit cohesion, domestic support for the military and its mission and military or fighting spirit.

General Carl von Clausewitz, the most important classical military theorist referred to these same human factors as "moral elements." In On War he said:

Moral forces are amongst the most important subjects in war. They form the spirit which permeates the whole being of war. These forces fasten themselves soonest and with the greatest affinity on to the will which puts in motion and guides the whole mass of power, uniting with it as it were in one stream, because this is a moral force itself [59:177].

In reference to the difficulty in dealing with these subjective factors he stated:

Unfortunately they will escape from all book analysis, for they will neither be brought into numbers nor classes, they must be seen or felt... Although little or nothing can be said about these things in books still they belong in the theory of the Art of War, as much as everything else which constitutes war.... I must repeat that it is a miserable philosophy if we establish rules and principles wholly regardless of all moral forces, and then as soon as the forces make their appearance we begin to count exceptions [59:177].

Clausewitz found that the importance of human factors was best exemplified by history where they were the greatest single important factor in battle. He said the chief moral powers were; "...the talents of the commander, the military virtue of

the army and its national feeling." [49:181] He defined military virtue as; "...bravery, aptitude for military service, powers of endurance and enthusiasm. [49:181]

Lewis Sorley defined those moral forces to be morale, discipline, commitment, leadership and cohesion. He states that these factors, although difficult to measure, are the crucial determinants of military effectiveness [46:48].

Morale factors historically have been perceived as more important by some combatants than others. In World War II when faced with the situation of only a dwindling limited air evacuation of his surrounded 6th Army at Stalingrad, the German commander, General Friedrich Paulus, felt evacuation of the most able-bodied and best commanders would be the most effective course of action so they they could be used elsewhere in the German war effort. The German high command determined this would have severe detrimental effects on morale of the whole army. The commander was overruled and the wounded were brought out instead [46:40].

It appears that morale and human factors were not held to be as important by some U.S. military leaders in Vietnam. The pattern to rotate individuals in and out rather than rotating entire units in and out is considered not to enhance unit cohesion and fighting spirit. Leaders are now beginning to realize the importance of domestic support for the military abroad to enhance morale.

The Soviets, after devastating losses early in World War II, reinstated military ranks and returned czarist uniforms to the armed forces. This was evidently an attempt to restore "fighting spirit" to the purged and war decimated army, since it appeared Marxist-Leninist rhetoric was not effective in enhancing fighting spirit.

The Soviets today write a great deal about human factors and the psychology of the soldier. An article in the July 1977 edition of Morskoy Sbornik criticized the division officer of a young sailor who had continuously been a discipline problem. The officer was criticized for only monitoring the technical progress of his subordinates and not their commitments to the party and "socialist competition." [25:34]

The same article went on to laud another young officer who kept in the Soviet equivalent of the division officer's notebook a record of not only his sailors' technical prowess, but each sailor's "socialist commitment on the ideological-political level and their progress in developing moral-combat and psychological qualities." [25:34]

In the final analysis the only sure measure of military power is the performance of the military in actual combat. Obviously one cannot wait for wars to ascertain the combat state of the military. Some measure of effectiveness, imperfect as it may be, is necessary. A realistic measure of combat capability therefore, must include a mix of objective and subjective factors. It must accept intuitive assessments and allow for imponderables.

This study addresses primarily the ability to assess one's own or one's adversaries military power as it relates to war winning. Military power has different dimensions in regard to deterrence and the political benefits gained or lost by the threat of armed conflict. Perception of credibility, national will and an opponent's capabilities enter into deterrence and threats of armed conflict where perception of capability is not necessarily a factor in the outcome of war at sea or on the battlefield. It is actual capability, not perception, that effects the outcome of battle. Human factors have less impact in terms of peacetime balance than they do in wartime. Morale of the forces may not affect deterrence of war to the extent that it affects the outcome of a war.

To more accurately estimate military capability, this author proposes dividing the indicators into three areas: quantifiable, partly-quantifiable and non-quantifiable. Those quantifiable measures of numbers of ships, weapons and troops, allocation of resources for defense, and weapons firing tests could be put together by the best operations research analyst to give one a military balance from which to begin analysis. The partly-quantifiable factors include first, the strategic framework of the conflict which entails geography and climate of combattants and area of operations. Strategic surprise and offense versus defense can be partially quantified along with technological quality and maintenance of arms, extent of training and combat experience. These factors through

"subjective measurement techniques" like Delphi method and multi-attribute utility theory could give us numerical values through "expert generated data." This data, in turn, could be incorporated with earlier quantitative military balance data to increase the understanding of relative military power.

Finally those indicators which cannot be quantified, the moral factors which include leadership, morale, fighting spirit, ideological commitment, unit cohesion, synergism (the ability of a force to produce an effect greater than the sum of its parts), staying power, discipline, commitment and probably other related values should be considered by the analyst. Only after careful analysis and study and a prioritization of these human factors in one's own mind, can one then make a relative intuitive judgement as to their impact on the estimate of overall military power. The one factor which is most important will vary from one scenario to the next.

The key when combining the estimates from each area is that the effects are multiplicative not additive. One nation might have the greatest number of technologically superior ships with the best trained crews in the world, but if the morale and unit cohesion are zero the whole equation would go to zero.

How then do the morale problems of the Soviet Navy effect the estimate of its combat capability. The closed society of the Soviet Union filters what we know of morale in their navy. The scope and severity of morale problems remain

largely hidden from view. Even in units that we can observe from emigré reports, an unknown portion of the morale problem remains latent. These morale problems are effectively suppressed by a harsh totalitarian system of physical controls.

In conclusion, we cannot quantify the morale problem in the Soviet Navy or define with numerical precision its impact on readiness during peacetime or its potential for degrading war fighting capability. Intuitively, however, one must say the aforementioned problems and instances of dissent could have a significant impact on the abilities of naval crews to fight as effectively as they otherwise could have. Many Soviet citizens, especially ethnic Russians have a deep-seated basic loyalty to "Mother Russia." Many also have some commitment to socialism. Despite internal opposition to the regime, the majority of the Soviet population including the Navy will rally against a perceived threat to the survival of the nation. The Soviet Navy now is engaging in power projection and "sabre-rattling" at points distant from the Soviet Union. A threat far from the homeland would have to be great indeed to threaten the survival of the state. War is violent business. The pressure of combat may be the spark to turn passive acceptance into rebellion as Captain Valery Mikhaylovich Sablin was the spark for the crew of the Storozhevoy.

It is understood that military decision-makers, out of necessity need to plan for the worst-case enemy, but there is little evidence that the Soviet military could reverse or

overturn the negative effect morale would have on the VMF's war at sea capability. Thus by incorporation of these human factors in their assessment, the Soviet Navy is not as powerful as other estimates would lead one to believe.

The U.S. Navy is not without morale problems. Dissent erupted into small scale insurrections aboard the aircraft carriers Kitty Hawk and Constellation. These instances in the late sixties and early seventies were reflective of U.S. societal problems at the time. The racial tensions, drug problems and Vietnam War were brought to the forefront under the adversity of shipboard life. Although these problems have been cured somewhat in the U.S. Navy, Admiral Elmo Zumwalt in On Watch, admitted that he felt these problems were reducing the effectiveness of carriers on the line in Vietnam.

These problems the U.S. Navy faced were known to all due to the news media in the American "open society." It was recognized that these tensions were limiting the effectiveness of the Navy, and steps were immediately taken, and are still in progress, to combat and eliminate the causal problems. It is only logical to assume that the morale problems facing the VMF about which we have only limited knowledge, problems so great as to incite a mutiny, are also limiting their effectiveness.

IX. CONCLUSION

This author is certainly not saying that mutiny is about to occur in all Soviet Naval vessels, because in the case of the Storozhevoy all the conditions were just right with the political officer acting as the catalyst. There must be, however, other Sablins and Belenkos waiting for the right time to make their respective moves.

A relatively grim picture has been painted about morale in the Soviet Navy. The study has looked at the problems, causes and effects of low morale, but there are a few counter-vailing factors. These factors don't eliminate the problems but are important to any accurate analysis. Morale in some Soviet units is good. Exceptional individual leaders can overcome a great deal of other factors. In addition morale of a combat unit is heavily dependent on the course of events in wartime. Peacetime morale problems do not always translate into unwillingness to fight in wartime, but certainly there is a correlation.

A life of exposure to propaganda and political indoctrination has conditioned the average Soviet sailor to accept government claims of the threat of aggression from the West and from China. Many sailors also share a commitment to socialism, even if not the Soviet version. These factors may lead a sailor to believe there is a threat to "Mother Russia" even if no actual one exists.

The Soviet Navy has grown from a coastal defense force to an awesome "blue-water" fleet. The Storozhevoy incident does not mean that the Navy is weak or is not a threat, but it does mean that it is vulnerable. The discontent in the ranks of Soviet soldiers and sailors may be a chink in the armor of the Soviet military machine that can be exploited by the West.

There is no doubt that the Soviet Navy would fight to defend "Mother Russia" as did its forebears, but this one vulnerability, morale problems, may help to offset the growing disadvantage in numbers of weapons platforms that the West faces.

If the Soviet Naval High Command is to learn anything from the incident, it would be that people count more than ships. The Soviets always pay lip service to this fact, but if they want to prevent the next Sablin on board the next Storozhevoy, something tangible must be done. Perhaps mutiny was the wrong word to use in this instance, since the only use the mutineers intended to make of the ship was to use it as a vehicle of illegal emigration. To go to the extremes of such a desperate act, risking the ultimate consequences, must be evidence of at least some failure of Soviet Communist society.

APPENDIX A

AN ACTIVE POSITION

(Article by Captain 2nd rank I LYSENKO, a regular correspondent, after a visit to BPK STOROZHEVOY probably in November 1974. Krasnaya Zvezda (Red Star) 24 December 1974)

1. On being detailed off the BPK "Storozhevoy" I went happily; I had my reasons. First of all, I knew the crew well, and a meeting with people with whom I had done more than one ocean voyage and for whose returns I'd waited is always desirable. Besides this there was to be in the ship a party election meeting and I expected some serious discussion on the work of the communists on board. In the past training year, the crew of the "Storozhevoy" had made a new step forward in combat improvement, to which the crew's successful missile firings and gun shoots bear witness. The Minister of Defense, Marshal Grechko, went to sea on board this ship and evaluated highly the mastery of the anti-submariners who destroyed the targets with the first missiles. In a word the "Storozhevoy" had all the requirements necessary to win first place in the ranks of outstanding ships.
2. But at the end of the training year it became clear that the ship could not do better than 4th place. I surmised that the ship's communists at their party meeting, would try to fathom out where and in what circumstances the necessary winning points were lost. I was not mistaken.
3. One example was brought out in a speech. Senior Lieutenants I. Dubov and S. Kolomnikov command batteries in the missile/gunnery department of the ship. For the former, things are going well. His subdivision is outstanding and has a reputation for great naval know-how. Conversely, the latter of officer's service has not always been successful. In competition with near neighbours his anti-aircraft battery lagged behind for a long time even though the "gunners" in this battery yielded nothing in combat mastery to Dubov's subordinates. They know very well how to destroy targets in the air and yet non-the-less the battery didn't show up against the other outstanding subdivisions. So what was the matter?
4. The speaker, this ship's organization secretary, senior Lieutenant V. Firsov, tried to answer this question. He drew attention to one particular detail. It has today become a rule that every sailor persistently struggles to decrease the time taken to accomplish combat norms. In this field of

crew training the C.O. and party organization of the "Storozhevoy" were interested not in minutes but in seconds, in as much as these affected the crew's combat readiness. But had the communists of the ship, and particularly those in the AA battery, always paid such great attention to another facet of the competition the moral ethical one? But the speaker and others who spoke at the meeting, such as communists V. Sablin, N. Sazhin, V. Potulny, analyzing the training results, were unable to give a positive answer. It appeared that this factor frequently remained unconsidered in even the outstanding collectives.

5. In an interval, I was told of the following episode. A sailor once returned from the guard-room. He had only taken a couple of steps along the deck when he hears: "Hey fellows Petrov's come back home". And a minute later the "fellows" were hugging this man, who had broken discipline. And do you know who you could see among them. Outstanding sailors, class-rated specialists; ie. men esteemed in the collective. They know how to attain complex norms and carry out (print not legible). Everybody can see this and values their worth. But the fact that these same comrades have fallen down on the ethical front and have taken up a liberal position in the fight for purity of heart frequently can be laid at the door of the "cadre".

6. It is true that the sailor who slipped behind in his service should have had the attention of the collective. But how? Clapping him on the shoulder doesn't help. He was returning from being under arrest. And, having arrived on deck, he should have said to his colleagues "Comrades, I stand guilty before you. But I ask you to trust..." And then to show by diligent service that he was not trusted in vain. But if the (battery) commander and communists didn't create such circumstances in the battery, then even the strictest rebuke loses half its force.

7. Public statement of one's attitude to a comrade's behaviour is the starting point for creating a climate of opinion which will support a man's good name and preserve him from mistaken actions. Just such a micro-climate has been created in communist Dubov's battery. Here if a sailor has serious pretensions he will certainly be made to feel the sharp indignation and genuine irreconciliability of his colleagues, their interest in his redirection, and in the final instance in improving affairs in the collective as a whole.

8. In this same AA battery, as communists noted in their speeches, the required atmosphere was not immediately created. One can understand Kolomnikov's difficulties. He is a young officer to be in command of the battery. He doesn't have

great instructional experience. This is understandable too; instructors experience doesn't come in one day. Therefore the young officer needs help. But before he was given it, Kolomnikov managed to make a mistake and this naturally reflected negatively on the crew's final results in the competition.

9. A year of strenuous training has passed. One more page in the biography of the party organization of the "Storozhevoy" has been turned over. Every line of it tells of the deeds in which the communists were closely involved. The majority of them played an active role in the life of the crew. I remember the words of communist N. Sazhin spoken at the meeting: "If you are a party member when it is a good thing to start off each working day by bothering about people. One should feel required to go to people and actively support all that is new and first-rate in the service and training, and battle decisively against the outdated opinions and left-overs from the past which are in the minds of some comrades". That is, one shouldn't have a passive attitude in the process of education and training, but strenuously affirm in comrades the communist attitude to work and high moral relationships with each other. Thus is one of the party's important requirements, laid down in the decrees of the Central Committee of the CPSU "On work in educating the ideological cadres in the Belorussian Party Organization".

10. With the requirements of this decree in mind the ship's party organization makes great demands on the communists, aiming at their being active and spirited in their work. But what actually happened? One party member couldn't find the time from one month to another to go to the crew's quarters to have a talk with the sailors. When somebody reminded him he just clutched his hand and rushed down to the sailors with the first arbitrary theme he thought of. Naturally a talk, born at the rush, doesn't always achieve its object.

11. The speaker, and others taking part in the proceedings, observed that a communist's authority is directly dependent on his deeds and on his attitude to service duties. He should inspire the sailors by personal example to overcome the difficulties encountered on long cruises. He has one privilege above all to be in front. To be first is more difficult, but it will be easier for those behind him. On the "Storozhevoy" they speak with esteem of Engineer Captain Lieutenant A. Ivanov. This communist takes an active part in party political work. He often gives lectures, carries on conversations and leads a political study group which is, incidentally, the best in the ship. This party fighter is always to be found wherever the sailors' communists outlook

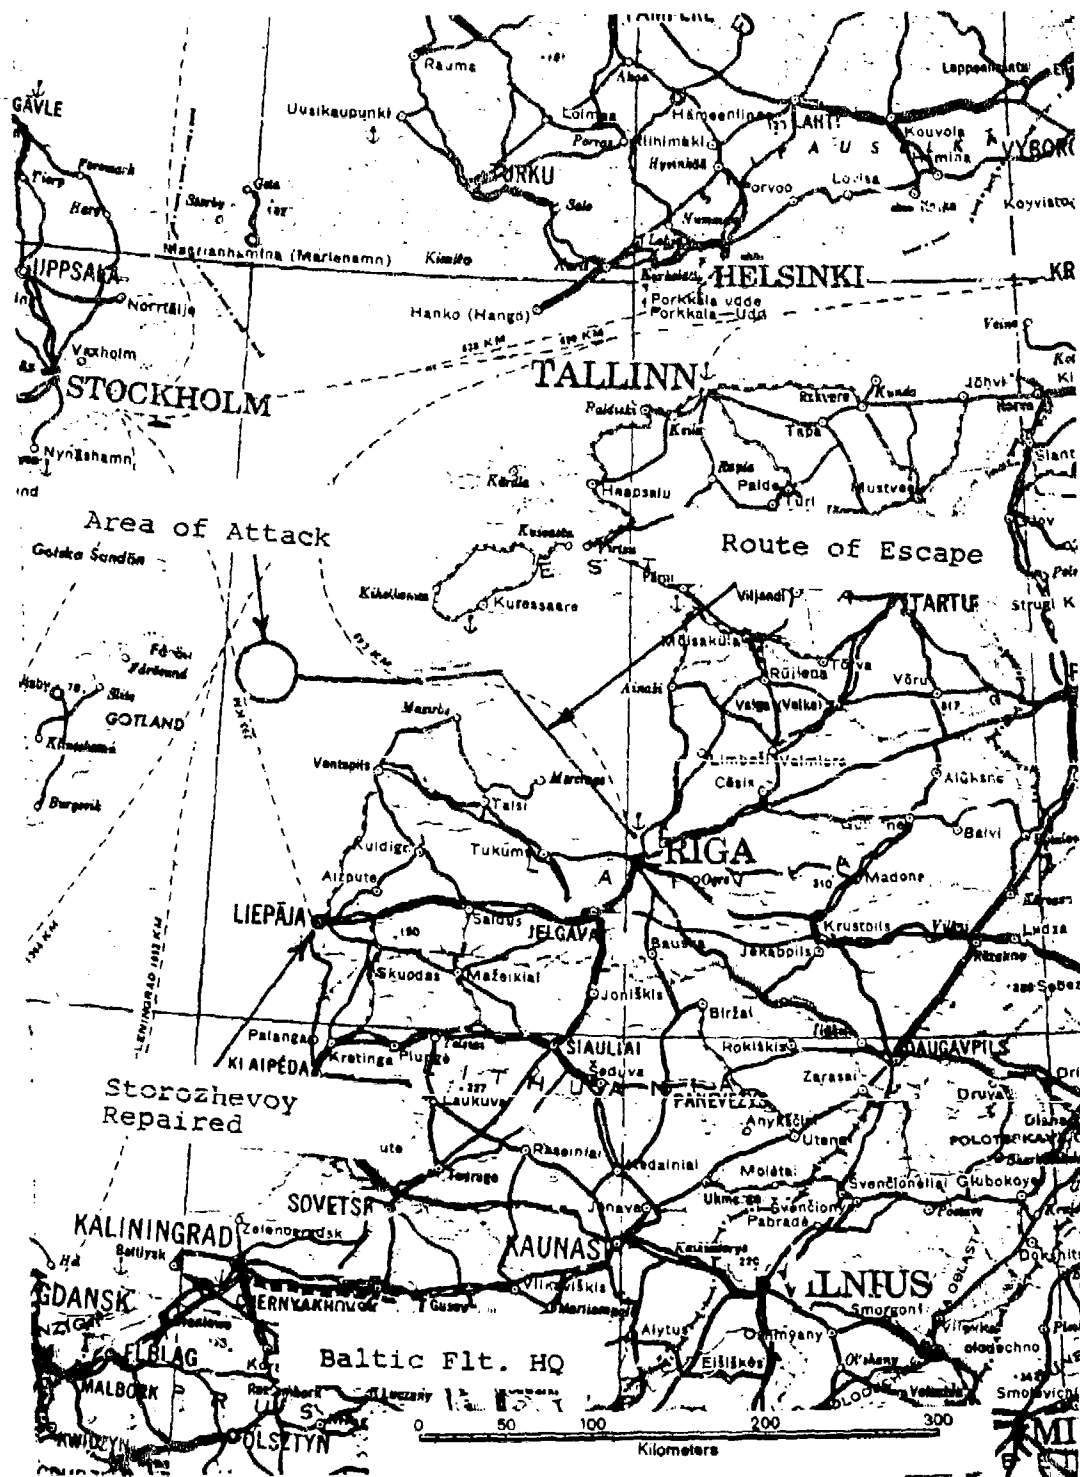

is being formulated. It is praiseworthy that the party organization studied the experience of Ivanov on the ideological front and acquainted the crew with it.

12. But is this style of work inherent to Ivanov alone? Certainly not. "Storozhevoy's" party organization is sufficiently strong that its communists for the most part love, and are good at, carrying out educative work in the collective.

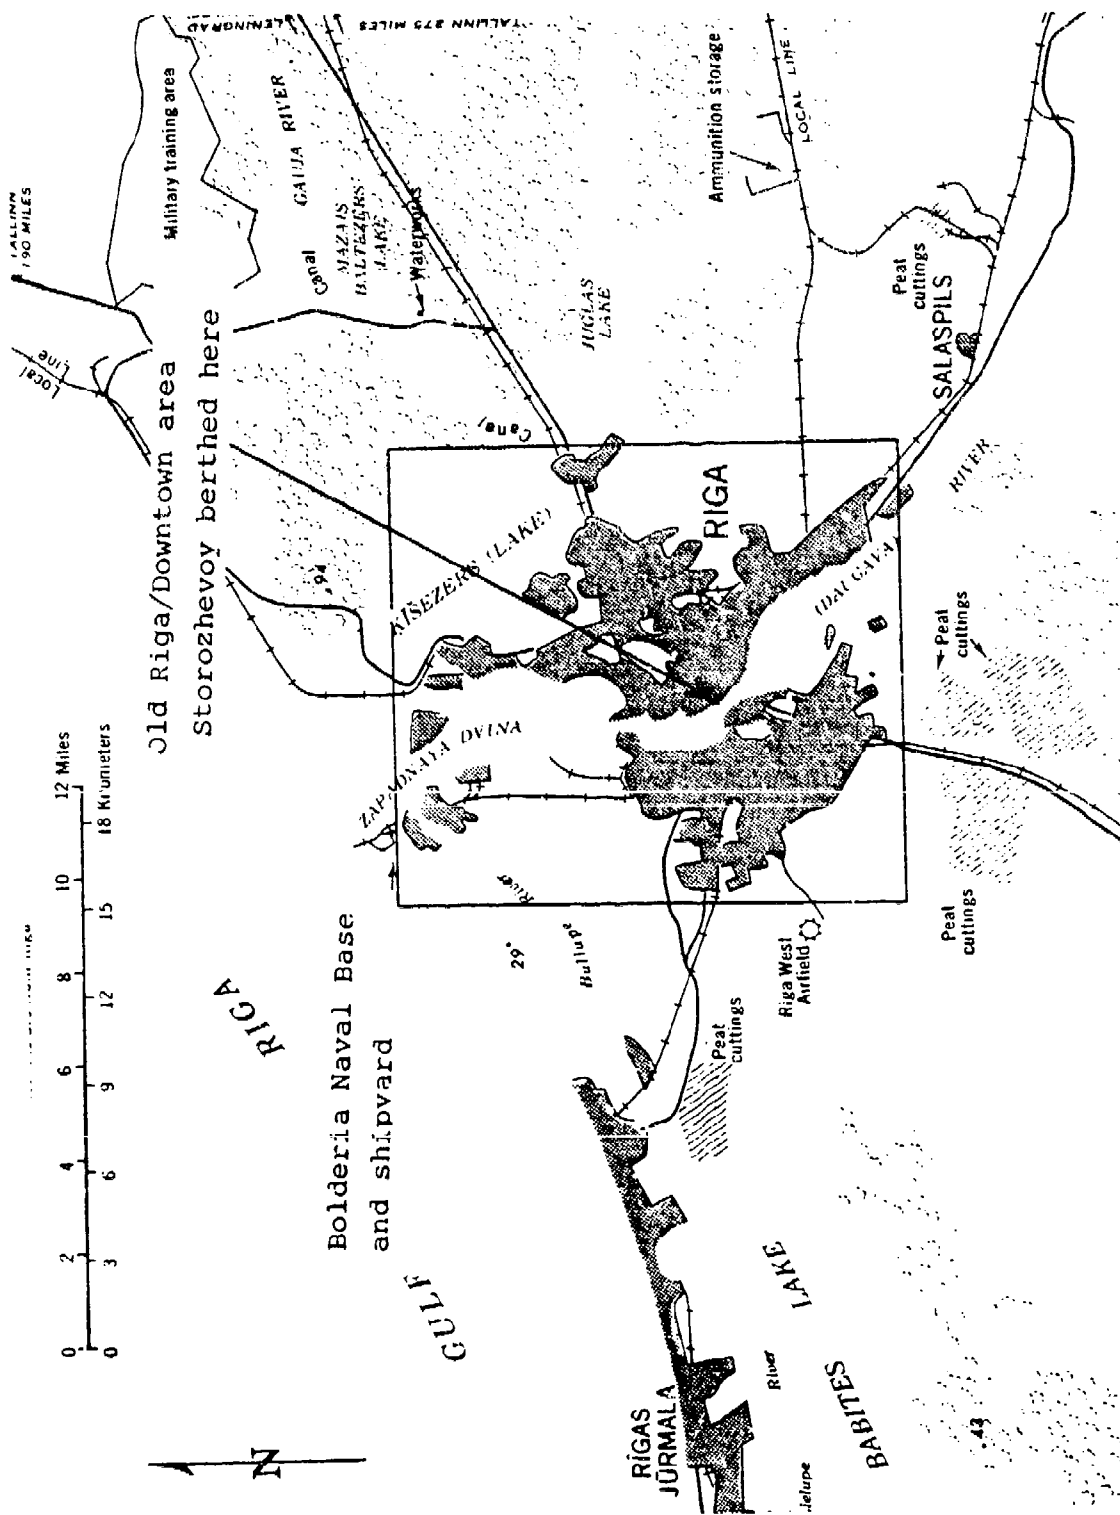

13. In the ship there are now more outstanding men and class-rated anti-submariners. The crew has sailed thousands of miles over the world's oceans. These and other meritorious facts were announced at the meeting. Behind them are a vast amount of work and indefatigable people with the party card at their hearts. At their election meeting, they talked of many things, understood much, saw clearly what they had achieved as well as their omissions. They observed, for example, that it was necessary for the party organization secretary to bring the problems of educating the sailors before the tribunal of the party collective more frequently and more often meet and consult the party and Komosomel "aktivs". There is, in a word, much to take into account and lessons to be learned.

14. Directly after the meeting the communists stepped forward to meet the tasks of the new training year. I want to say to them "Don't dally on the way, comrades!"

Photo taken February 1975

APPENDIX D

1. Towed sonar fittings -- 2: 76-mm (11 x 2) -- 3: SA-N-4 -- 4: Owl Search -- 5: Pop Group -- 6: TT (IV x 2) -- 7: Head Net-C -- 8: Eye Bow -- 9: MBU 2500A -- 10: SS-N-14.

Krivak Class BPK

APPENDIX E

Comparison of Soviet and U.S. Naval Grades and Ranks
Officer Grades

Rank*	Approximate U.S. Equivalent
Admiral of the Fleet of the Soviet Union	Fleet Admiral
Admiral of the Fleet	Fleet Admiral
Admiral	Admiral
Vice Admiral	Vice Admiral
Rear Admiral	Rear Admiral
Captain 1st Rank	Captain
Captain 2nd Rank	Commander
Captain 3rd Rank	Lieutenant Commander
Captain Lieutenant	Lieutenant
Senior Lieutenant	Lieutenant (junior grade)
Lieutenant	Ensign
Junior Lieutenant	Ensign
WARRANT GRADES	
Warrant Officer (Michman)	Chief Warrant Officer Warrant Officer
NON-COMMISSIONED RANKS	
Chief Ship's Petty Officer	Master Chief Petty Officer Senior Chief Petty Officer
Chief Petty Officer	Chief Petty Officer
Petty Officer First Class	Petty Officer First Class

NON-COMMISSIONED RANKS (continued)

Petty Officer Second Class	Petty Officer Second Class
Petty Officer Third Class	Petty Officer Third Class
Senior Seaman	Seaman
Seaman	Seaman Apprentice/Recruit

*Naval aviation, naval infantry, and coastal defense personnel, although an integral part of the Navy, have "military" ranks, such as general, major, and sergeant.

APPENDIX F

Morskoy Sbornik Content Analysis

(Articles dealing with discipline, morale or political indoctrination)

<u>I. Before Mutiny</u>		<u>II. After Mutiny</u>	
<u>Issue #</u>	<u>Ratio to total</u>	<u>Issue #</u>	<u>Ratio to Total</u>
1/75	6/31	2/76	5/26
2/75	4/34	3/76	6/31
3/75	2/29	4/76	4/32
4/75	6/30	5/76	7/29
5/75	1/35	6/76	6/39
6/75	2/29	7/76	7/33
7/75	3/29	8/76	6/34
8/75	4/31	9/76	5/31
9/75	4/32	10/76	6/35
10/75	4/31	11/76	4/32
11/75	4/37	12/76	5/36
<u>12/75</u>	<u>4/20</u>	<u>1/77</u>	<u>4/35</u>
Total	43/375=11.5%		64/395=16%

*Issue Number 1, 1976 not included in analysis due to high number of articles (8/35) because of the Communist Party Congress beginning the next month. In addition it is difficult to determine if this issue went to press before or after the mutiny.
