This Technical Information Memorandum (AFFTC-TIM-81-2), Aerodynamic Characteristics of the AFFTC Noseboom Instrumentation Unit, Volume II of II, was submitted under Job Order Number SC6342 by the Commander, 6520 Test Group, Edwards AFB, California 93523.

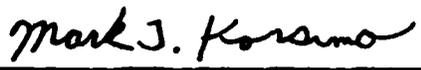

This report has been reviewed and cleared for open publication and/or public release by the AFFTC Office of Public Affairs in accordance with AFR 190-17 and DODD 5230.9. There is no objection to unlimited distribution of this report to the public at large, or by DDC to the National Technical Information Service (NTIS). At NTIS, it will be available to the general public including foreign nationals.

This report has been reviewed and is approved for publication:

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This technical information memorandum presents the results and data from wind tunnel calibration of the flow-angle sensing portion of the Air Force Flight Test Center noseboom instrumentation unit. Analysis of the data from the NASA/Ames Research Center 11- by 11-foot and 9- by 7-foot wind tunnels is presented along with fairings resulting from the analysis. The data fairings, which present error in sensed angle of attack and sensed angle of sideslip as a function of Mach number, angle of attack, and angle of sideslip, are

20. summarized and compared extensively with the data. Computer software incorporating the data fairings in a concise form for data reduction routines and the software documentation are included. Volume I of this memorandum includes discussion of the analysis, data fairings, fairing-to-data comparisons, software and software documentation. Volume II is a run schedule and complete listing of the NASA/ARC original wind tunnel data.

## PREFACE

Wind tunnel calibration of the Air Force Flight Test Center (AFFTC) noseboom instrumentation unit (NBIU) was undertaken as part of a joint USAF/NASA research program called the Transonic Aircraft Technology (TACT) program. The wind tunnel test was planned and supported by numerous individuals from NASA/Dryden Flight Research Center (NASA/DFRC) and NASA/Ames Research Center (NASA/ARC) as well as AFFTC. The test was conducted by personnel from NASA/ARC who obtained the data and applied normal wind tunnel corrections. Since the purpose of the calibration was TACT project support, no formal report was written, and data was transferred informally to project personnel from AFFTC and NASA/DFRC. The data was transmitted as "preliminary and subject to further checks" and there is no intent by the authors or any of the involved organizations to upgrade the status of this data. The digital data is summarized in this memorandum as a means of preserving and disseminating the data for those whose knowledge of the test hardware, test facility, and use of this type of data will allow meaningful interpretation and use.

## DISCUSSION

The Air Force Flight Test Center (AFFTC) noseboom instrumentation unit (NBIU) was tested in the NASA/Ames Research Center (NASA/ARC) Unitary facility as part of the Transonic Aircraft Technology (TACT) program. The test was conducted by NASA/ARC, Aeronautics Division, Experimental Investigation Branch as test number 11/97-731 between February 25, 1973, and March 12, 1973. Notes, installation photographs, and schlieren photographs of the test were transmitted shortly after the test to AFFTC and NASA/Dryden Flight Research Center (NASA/DFRC). Digital data containing final corrections were transmitted to AFFTC and subsequently to NASA/DFRC on two reels of magnetic tape numbered 11-731-PH1-R1 (Copy 1) and 97-731-PH1-R1 (Copy 1) on or about May 1, 1973. A letter report containing the notation and data identification, key to configurations, key to installation photographs, and run schedule completed data transmittal on October 29, 1973. The results of this test are "preliminary and subject to further check" as specified by NASA/ARC. Data consistency and comparisons with flight acquired data, however, have given us confidence that all but a few runs were valid for the purposes of this memorandum.

Volume II of this report is a summary of the NASA/ARC data used in analysis and interpretation of the wind tunnel test and development of the NBIU calibration for angle of attack and angle of sideslip. Table 1 is the run schedule for the 11- x 11-foot wind tunnel tests and Table 2 is the run schedule for the 9- x 7-foot wind tunnel tests. These tables concisely present the data which was obtained and available for analysis. Figure 1 is a listing of the digital data from the 11- x 11-foot wind tunnel tests and figure 2 is a listing from the 9- x 7-foot wind tunnel tests. The scope of the data in both figures has been reduced to include only those parameters dealing with test conditions, angle of attack, and angle of sideslip; pressure and pitot-static data is not presented. Although the scope of data has been reduced and the data reformatted, the data values presented are those received from NASA/ARC. The data in figures 1 and 2 has also been reordered to facilitate data retrieval. The data was ordered in ascending Mach number with each Mach grouping ordered in ascending run number.

A thorough check of the flow angularity corrections applied to the data was made prior to development of the NBIU calibration. A discussion of the flow angularity correction and the check plots for this set of data are presented in Appendix A of Volume II.

FIGURE 2: SUMMARY OF NASA/ARC 9- X 7-FOOT WIND TUNNEL DATA (CONCLUDED)

## Appendix A

### Flow Angularity Corrections/Checks

The data from the NASA/ARC test of the AFFTC NBIU were checked to determine that flow angularity corrections had been made correctly. As is standard with NASA/ARC data, the true angle of attack,  $\alpha$ , and true angle of sideslip,  $\beta$ , were determined from the geometric angle, A, and geometric angle, B, measured on the model support hardware in the A-plane and B-plane respectively. The true values were calculated by adding "delta" values for stream angle to the geometric values as shown in equations (A1) and (A2).

$$\alpha = A + \Delta A_{SA} \quad (A1)$$

$$\beta = B + \Delta B_{SA} \quad (A2)$$

Both tunnels used for the NBIU tests had model support hardware which had center-of-rotation in the A-plane located on the model. Because the model did not translate in the A-plane, the corrections for stream angle were a function only the B-plane geometric angle and an intercept (variable with Mach number) as shown in equations (A3) and (A4).

$$\Delta A_{SA} = (\partial \Delta A_{SA} / \partial B) B + \Delta A_{SA}^{\circ} \quad (A3)$$

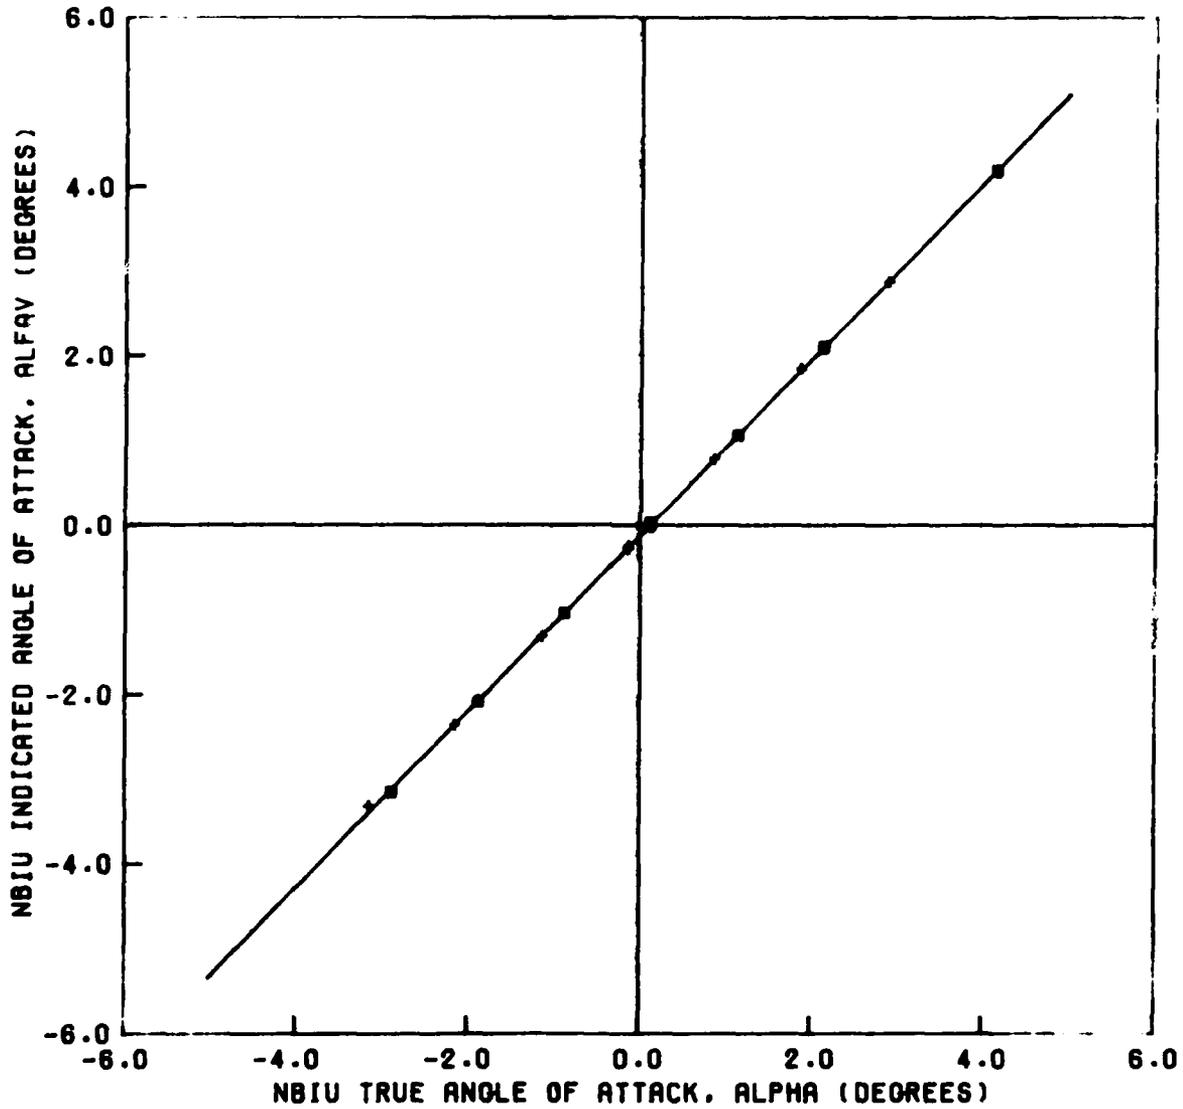

$$\Delta B_{SA} = (\partial \Delta B_{SA} / \partial B) B + \Delta B_{SA}^{\circ} \quad (A4)$$

The intercepts and partial derivations in equations (A3) and (A4) were determined by the test engineer based on knowledge of the system and special test data taken especially for flow angularity corrections. The intercepts were determined from some assumed physical property; for instance at zero angle of sideslip the side force should be zero or at zero lift coefficient the angle of attack should be equal on upright and inverted runs. For the NBIU test specifically, it was assumed that the error in indicated angle of attack or indicated angle of sideslip should be independent of roll orientation at zero angles of attack and sideslip.  $\Delta A_{SA}^{\circ}$  and  $\Delta B_{SA}^{\circ}$  were adjusted until assumption was verified. The partial derivatives were evaluated based on the assumption that the error in indicated angle of attack or indicated angle of sideslip were not affected by rolling the NBIU  $\pm 90^{\circ}$  with  $\alpha$  and  $\beta$  maintained at  $0^{\circ}$ .

The flow-angularity-test data, procedures, and corrections were investigated extensively to evaluate the effectiveness of the corrections and impact on test data. NASA/ARC had obtained data from

upright, inverted, and  $+90^\circ$  roll orientations at 14 Mach numbers to determine flow angularity corrections. The corrections determined from these tests were entered into data reduction procedures in terms of a "table look-up" as opposed to the usual procedure of determining an average number for the test. The NBIU calibration data resulting from application of all corrections were plotted for angle of attack in figure A1 and for angle of sideslip in figure A2. Conclusions from the entire analysis of flow angularity corrections were executed with great care. With the exception of a few unexpected runs, the data were highly consistent and within specified accuracy.
