I. Summary of Progress and Continuing Research

The over-all objective in this research program is to develop a step-by-step identification-control strategy for time varying dynamical systems which utilizes input-output data in block data form over short time intervals. Hence, the identification portion of this objective is to obtain computationally feasible algorithms for parameter identification which can work with strictly time limited data. The publications and papers listed in Section II, Ref. [1]-[5], are concerned in one way or another with this objective. Two fundamentally different approaches to this problem are used in these references; specifically, Ref. [1] and [3]-[5] utilize a projected integral equation error technique as an underlying means of converting a parametrized equation error model in differential operator format to integral equation format while obviating the necessity to deal with all unknown initial conditions for the time limited data. This is especially noteworthy for the identification of differential-delay equation (DDE) models, the subject of Ref. [3] and [4], since the state of a DDE system is essentially infinite dimensional. Here it is shown how the estimation of pure time delay can be decoupled from the estimation of the remaining system parameters for a class of DDE models using time limited input-output data. The formulation illustrates the use of the variable projection functional in nonlineer least squares theory.

The results in [3] and [4] are adapted in [1] to the classic problem of estimating time delay in two reveived signals when the

- 1 -

transmitting media are characterized by unknown transfer functions. Comparisons are also made with the Generalized Cross Correlation method, both with respect to analyses and simulation results, with the conclusion that the simple cross correlation method works at least as well as the parameter estimation or phase data methods when the transmitting media possess zero memory. However, the cross correlation method breaks down, as would be expected, when the media possess dynamical (nonzero memory) characteristics. Simulation results are presented which illustrate the superiority of the projected integral equation error technique in this case, although the computational requirements are understandably much more demanding than the cross correlation method.

The results to be published in [5] represents work in progress on the problem of estimating the target acceleration parameter in a two dimensional pursuit-evasion model when the range coordinate data is given over short time intervals. Here again the projected integral equation error technique is used along with a second order differential operator model for the equation error over each short time interval.

The results published in Ref. [2] stand in contrast with those represented by [1] and [3]-[5] in that the classical method of Shinbrot* is used to convert a linear differential equation to an algebraic equation involving integral-type functionals on the

* Shinbrot, M. "On the Analysis of Linear and Monlinear Systems", Trans. of the AMME, pp. 547-552, April 1957.

- 2 -

time limited input-output data. These functionals are characterized by a set of so called "modulating functions", and the main contribution in [2] is to show how trigometric functions can be used to define an appropriate set of modulating functions so that the functionals correspond to coefficients in a finite Fourier series of the data. This implies that a discretized approximation to these integrals can be made which points toward the use of the computationally efficient Fast Fourier Transform algorithm. The formulation can be extended to include the parameter identification of a class of linear time varying differential systems with periodic coefficients modeled by parametrized linear combinations of commensurable sinusoids. Preliminary simulation results indicate that this approach is surprisingly immune to random measurement noise. Further investigations are underway to analyze the effects of random measurement noise on the estimation accuracy.
