Purpose

In recent years, the United States Army has undergone major changes in its selection of personnel. The Modern Volunteer Army Concept has been successful in providing the manpower needed to field an Army but numerous questions have been asked about the population characteristics of the United States Army as of 30 November 1975. Data is also provided for demographic indicators from the 1973 and 1974 Army Personnel Composites. Individuals who desire a more detailed report on 1973 and 1974 data should consult DAPC-PMP Report No. 4-74-S, Army Personnel Composite as of 30 November 1973 and DAPC-PMP Report No. 3-75-S Army Personnel Composite as of 30 November 1974.

Method

The Army Sample Survey is a multipurpose instrument administered worldwide on a quarterly basis. The major portion of the data in this report was collected as part of the 30 November 1975 Army Sample Survey. Statistics from any other sources besides the 30 November 1975 Army Sample Survey are noted on the particular tables.

Sample Population

The sample population for the November 1974 and November 1975 surveys consisted of a randomly selected group of officer and enlisted personnel, both male and female.

Reliability

The overall level of confidence for this report is 95% ± 5%. This means that it is reasonably sure (95% confidence level) that if a larger number of samples were drawn from the same population, 95% of the ranges (confidence intervals) would include the population values.

Columns with an asterisk (*) indicate a reliability level between 95% ± 6% and 95% ± 9%. No data shown when reliability falls below 95% ± 9%.

Comments or Information Request

Comments on this report or requests for other reports cited within should be forwarded to:
