17 ABSTRACT (Continue on reverse if necessary and identify by block number) The Reserve Component Attitude Study (RCAS) is an annual series from 1978 to 1982 surveying the propensity of men and women to enlist in the Selected Reserve Forces (Guard/Reserve). The study is conducted through a random digit dialing telephone survey of the NPS respondents. The veterans sample was selected from listings provided by the Department of Defense. In 1983 RCAS underwent a reconfiguration and was renamed Veterans Attitude Tracking Study (VATS). The purpose of RCAS is to discover issues relevant to enhancing the number and quality of those enlisting in National Guard and Reserve Forces. Data was collected to determine individuals' reasons for wanting to enlist in the Guard/Reserve from samples of Prior service (PS) men and women and Non-prior (NPS) service men and women. Individuals sampled were divided into categories of those with a negative propensity to enlist and those with a positive propensity to enlist.

## INTRODUCTION

This is Volume IV of a report titled A Survey of Issues Related to Accession and Retention of Enlisted Personnel in the Reserve Components.

Volume I contains the major findings, the conclusions, and the recommendations.

Volume II contains the methodological appendices and supplementary and supporting analyses.

Volume III contains the responses to each question broken out by initial enlistment/extension of enlistment propensity, copies of the questionnaires used with each of the four major samples and a Table to Questionnaire Conversion Key.

This volume, Volume IV, contains the basic cross-tabulation tables. These tables present the responses to each question for each of the four major samples -- Non-Prior Service (Sample A), Veterans (Sample B), Army National Guard (Sample C), and Other Reserve Components (Sample D). This volume also contains cross-tabulation tables for each of the five Guard and Reserve components constituting the Other Reserve Components sample -- Air National Guard, Army Reserve, Navy Reserve, Marine Corps Reserve, Air Force Reserve.

### Description of Tables and Treatment of the Data

The "Sample N" given in each table is the number of respondents in the specified sample from whom reliable data were collected for that question. The "National N" refers to the population of the sample as of June 1976. Since not all questions were asked of all samples, some tables contain information from less than four samples.

Only percentages are shown in the tables in this volume. The conversion to sample frequencies for Samples A, B, and C can be made by multiplying the percentages by the "Sample N." Sample frequencies for Sample D cannot be computed by multiplying the percentages in the table by the "Sample N" because Sample D includes the responses of five subsamples which were weighted differentially to obtain a representative Sample D.

The data presented in this volume for Samples B, C and each component of Sample D were weighted to correct for error due to the interpenetrating block design<sup>1)</sup> used to select the samples and to adjust the sample sizes to the population sizes. The following formula was used to calculate the seven weights:

$$W = \frac{\text{Zone size}^{1)}}{\text{\# of blocks}} \times \frac{\text{\# in population}^{2)}}{\text{Total sample size}}$$

These were the only weights applied to the data for Samples B and C. The components of Sample D had a second set of weights applied to correct for disproportionality between subsample sizes and sample size. The second set of weights insured that each component of Sample D contributed its appropriate share to the "Total Sample D" value. To obtain the weight for each of the components, the following formula was used:

$$F = \frac{\text{National total of subsample of D}}{\text{National total of all D}}$$

The data reported for the total Sample D were determined using the following formula:

$$T_D = F_1 (R_{D1}) + F_2 (R_{D2}) + F_3 (R_{D3}) + F_4 (R_{D4}) + F_5 (R_{D5})$$

where:

$$T_D = \text{Total Sample D}$$

$F_1 - F_5$  = weights calculated for  $D_1 - D_5$  on the basis of the national population of each.

$R_{D1} - R_{D5}$  = the number of responses for any category of a question for each subsample of Sample D.

---

1) See Volume II for a description of sampling methodology and explanation of these terms.

2) Provided by DMDC and individual Guard and Reserve components.

Where appropriate, means, variances and standard deviations are given in the tables presented in this volume.

The reader can examine the exact wording of each question or the sequence in which the questions were asked in a particular questionnaire by referring to Sections B and C of Volume III.
