APPENDIX G - TEKREC Source Listing.....120

INTRODUCTION

The purpose of this volume of the Final Report is to update Final Technical Report RADC-TR-81-372 (Vol.II), January 1982 (referred to below as *). This update consists primarily of listings of revised assembly language code for both NIC and CTL; the biggest change being that it is no longer necessary to down load the "operational code" from NIC to CTL, since this code has been stored in the CTL EPROM.

In addition more descriptive material is included on using the NIC software with emphasis on its use to control the Hamamatsu C1000 camera.

As before:

CTL = NIC-488/CTL, a GPIB interface for the Nicolet 1080 series of computers
NIC = the Nicolet 1080 computer
C1000 = the Hamamatsu C1000 camera (or more exactly that camera's controller)

SECTION I Controlling the C1000 using NIC/CTL.

CTL presently contains software in EPROM which allows it to run in "automatic" or "manual" mode. The automatic mode is used mainly to test the camera, bus and CTL - it can not be used at present to usefully gather video data from the C1000. In manual mode, the user has full control of the camera through NIC software which is referred to below as MAIN. As explained in ", MAIN is also used for other functions such as down loading CTL from NIC and for examaning (and changing) code in CTL.

Automatic Mode

To use the automatic mode, the CTL address switch 6 (see appendix A) must be placed in the "bit set" position while either address switch 5 or 4 or both must also be "set" (the other 2 address switch positions are immaterial) the sixth switch 1, numbered, is the SYC switch which should always be "set".

If switch 5 is set, the camera cursor first moves from its default x-coordenate of 512 to 0 and is then stepped to x=1023 and thence to 0.

If switch 4 is set, a complete "frame" of video is gathered using the default interface value of 2 (512 pixels/scan). The frame starts at x=0 if switch 5 is set and at 512 otherwise.

The automatic mode may start when CTL is first turned on (assuming that the C1000 controller is on). Usually, however, CTL will power on in a "frozen" state where nothing can happen before a soft reset is done. (This happens because the various "latches" in CTL go to random states on power on). Thus to reliably use the auromatic mode a reset command should be sent from NIC to CTL. This can be done, for example, by running MAIN in "mode 1" (see next section) or by executing the CTLRS instruction (octal 4072).

Manual Mode

This is the normal mode of operation for camera control. This mode is possible whenever CTL address switch 6 is "off".

Program MAIN should be loaded into NIC by typing the console command RUN NIC CTL. MAIN will issue the query "MODE?-". There are three "modes" having to do with camera control, modes 1,4 and 5.

mode 1

This mode is used to set the system including camera, camera controller, CTL and MAIN in a known "initial" state. In particular the camera parameters are givin their default values. (see table 1)

Previsiosly (see *), mode 1 was also used to down-load the CTL operational software from NIC. Now, however, this software is resident in CTL EPROM. It is still possible to down load software in mode 2, however.

Mode 1 should always be invoked whenever the system is first powered on and whenever a system "hang" condition is encountered.

mode 4

Mode 4 is used to control the camera format (output/input), various camera parameters (x-coordinate, interface, marker on/off) and buffer display. (Horizontal resolution and external anolog select are not available on the present camera). The mode query for mode 4 is "MNEMONIC?-" to which the user may answer with one of the 3 letter mnemonic codes given in table 1. The current numerical value associated with the mnemonic (if any) is displayed to which the user may "reply" with CR if no change in value is to be made, or with the appropriate new numerical value. Note that BUF (buffer display) requires no data and immediately activates the buffer display if BUF is entered.

MNEMONIC	MEANING	DEFAULT VALUE	PERMISSIBLE VALUES	MEANING	NOTE
OUT	Output Format	1	1,2	1=ASCII data 2=binary data	1
INF	Input Format	1	1,2,3	1=ASCII 2=binary 3="print"	2
XCO	X-Coordinate	512	0-1023		3
INT	Interlace	2	1,2,4	1=256 pixel 2=512 pixel 4=1024 pixel	4
MAR	Marker on/off	1	0,1	0=on 1=off	5
BUF	Buffer Display				6

1. The output format is the format (ASCII or binary) of data passed from CTL to the camera. The default value of 1 should not be changed, since MAIN sends all data to the camera in ASCII.

2. The input format is the format of (video) data passed from the camera to CTL. ASCII data means that each 8 bit video value (datum) is sent as 3 ASCII numbers, most significant number first, with ASCII space following each number. Binary data means that each datum is sent as a single 8 bit binary integer. "Print" is the same as ASCII except that a carriage return, line feed is sent in place of every 16th space. INF (3) should never be used since there is not enough buffer space in CTL to receive data in this mode. INF (1) should be used only if INT (1) is also used. (This means that the CTL buffer will be completely filled with 1024 bytes (256 pixels at 4 bytes per pixel.) INF (2) must be used if data is to be stored on MAC disk. On the other hand, if a scan line is to be received on the MAC oscilloscope (or plotted) INF (1) must be used.

3. This is the x-coordinate of the (vertical) video scan line which is digitized by the camera. (If the marker is on, it will be positioned at the current x-coordinate.) Normally, XCO should be set to zero before a frame of video is gathered. It has been found by experiment that the x-coordinate does not change properly if an n-digit (n=2,3,4) number was previously entered and then an m-digit number (m<n) is entered. For example, if a value of XCO (1000) is entered followed by XCO (200) then the final position will be wrong. This quirk of the camera can be overcome by always entering 4 digits of x-coordinate values (e.g. 0010 is permissible for XCO (10)).

Table 1 - A summary of mode and camera "commands".

4. The interlace value refers to the multiplier of 256; thus the default value of 2 means that each video scan line consists of 512 pixels.

5. The marker is a vertical cursor which appears on a camera video monitor to indicate the relative location of the vertical scan line which is digitized.

6. The buffer display is a vertical plot (observable on a camera video monitor) of video intensity vs. y-position for the video scan line currently being digitized. The buffer display appears whenever the camera is reset (using mode 1, for instance) and disappears whenever a command (other than BUF) is issued to the camera.

Table 1- (continued)

mode 5

Mode 5 is used to gather a single line of video or a "frame" of video after the camera has been properly "formatted" using mode 4. The video may be displayed or stored (in packed form) for later manipulation.

The first mode query is "FILE NAME?-" to which the user should reply with an up-to-six character file name (not starting with "PRI") if the video data is to be stored or with "PRINT" (can be abbreviated to "PRI") if the data is to be displayed.

The second mode query is "FRAME?-" to which the user should reply with VI1, VII or VID for 1 line of video, 1 "frame" of video - positive increment, 1 "frame" of video - negative increment. For VI1, a single video scan line is obtained, at the x-coordinate value chosen under mode 3 (or default 512). For VII, a frame of data is gathered, starting at the current x-coordinate and ending at x = 1023. Similaraly for VID except the ending x-coordinate is 0. In both VII and VID the size of the step between increments is controlled by the value of INT; thus if INT=4 the step size is 1, for INT=2 it is 2 and for INT=1 it is 4.

Two forms of "print" (if FILE NAME=PRINT) are used depending on the value of INF. If INF=1 then 16 numerical values per line are printed - each value is separated by a space. If INF=2, 32 hexadecimal values (00 to FF) per line are printed with no spaces. It should be noted that if INF=1, a print file is always chosen, regardless of the value given to FILE NAME. e.i. ASCII data is never filed. Also, if the value of INT and INF is such that CTL buffer overflow will occur (see mode 4) a message saying "CHANGE INT OR INF" is printed.

For details on the form of the packed video file, see Appendix B.

The status byte received from CTL during serial poll is printed each time a video scan line is to be received. In "PRINT" mode this byte is printed on a line above the video data; in "file" mode, a maximum of 36 status bytes per line are printed.

SECTION II - Peripheral Commands for NIC/CTL

In the previous section, modes 1,4 and 5 were described for use in controlling the C1000. In this section, the peripheral "commands" for use with CTL are described. These commands are invoked as modes 2,3,6,7 and 8.

mode 2

This mode may be used to automatically down load Z-80 code (command 8) from NIC to CTL and to cause this code to be executed. However, MAIN itself does not at present include code to execute the "command 8" corresponding to CTL command 8. The two mode queries are "COMMAND#?-" and "FILE NAME?-". The first query is a formality since only 8 can be entered. (Previously two commands were possible.) The file name is the name of the NIC file containing the code to be down loaded to CTL, (see note below) This code may be most conveniently developed on a Tektronix 8002 Development system and then stored on the Comm-Stor as a WHEX file. (see Mode 3) This WHEX file is then transferred to a NIC file using Mode 3.

The code is loaded starting at location 0900H in CTL and should have entry point 0900H. A total of 512 bytes are loaded.

The only other restriction on the code is that is should return via a jump to subroutine RETURN. (use JP 14EH)

The NIC subrountine corresponding to CTL "COM 8" must include a command table transfer followed by a call to MONITOR near the begining and at least one call to MONITOR at the end of the command. (Other calls to MONITOR may be required if data is to be transferred from CTL to NIC.) See NIC "COM 1" or "COM 2" for examples of programs which merely pass the command table to CTL.

Mode 2 is normally used as a temporary expedient to try out new code in the CTL.

NOTE Mode 8 may be used to easily modify Z-80 code before it is transferred to CTL. The code to be modified must be loaded into NIC "data" memory starting at octal 100000. The modified code can then be transferred to CTL by using Mode 2 and replying to "FILE NAME?-" with a non-existent file name.

mode 3

This mode is used to transfer and store Z-80 code from another device to NIC. This code can later be down loaded into CTL using mode 2, for example. The transfer is via the NIC serial input (RS-232) and specifically requires that the code be transferred in the form of a Tektronix WHEX (hexadecimal) file (see *, Appendix D). Mode 3 was

specifically designed to be used with a SYKES Comm-Stor (communication storage unit with floppy disk storage). It can be used however with any computer (or possibly intelligent terminal) which can output the required WHEX file and respond (start sending) to the command "IB file" where file is the user supplied answer to the query "FILE NAME?-". It should be noted that NIC requires 8 bit ASCII with the eighth bit always 1 at various baud rates from 110 to 1200. No other protocal is required.

mode 6

This mode is used to transfer part of CTL memory (in blocks of 256 bytes) to NIC where it can be examined using mode 7 or examined and changed using mode 8.

The mode query is "HEXN-" to which the user should reply with the 4 digit hexadecimal starting address of CTL memory to be examined followed by a single digit representing the number of 256 byte blocks to be transferred.

mode 7

Displays NIC data mamory (starting at 100000) in hexadecimal from (5 nibbles/NIC word) at 32 characters/line. The number of bytes (2 nibbles/byte) displayed is given by the contents of location NBY5 (see symbol table for SEG1A). If mode 3 or 6 is run prior to mode 7, NBY5 contains the number of bytes transferred during mode 3 or 6 operation. (Note that during mode 3 the CTL code is stored in NIC data memory prior to being filed.)

mode 8

Examine and change "hexadecimal" data in NIC memory. This mode may be used to modify the CTL program to be stored in CTL in mode 2 operation. Note that CTL memory locations 0000-07FF (2048 bytes) are in EPROM and can not be changed. (See Appendix C for the map of memory in both NIC and CTL.)

The mode query is OCT-, to which the user should reply with the (up to 7 digit) octal starting address of NIC memory to be examined and possibly changed. (The address given is right justified zero-fill. Thus, 100=0000100. Usually the address will be 100000 plus.)

The contents of memory at this location is then displayed as 5 hexadecimal digits (5 nibbles in each word). The user may respond with

(a) space (actually any sequence of 1 to 4 characters) followed by CR.

(b) 5 characters followed by CR.

(c) CR with no preceding character.

If (a), then the next word is displayed with no change to the current word.

If (b), the current word is changed to the value given and the next word is displayed. (If the value is not hexadecimal, then the changed word is nonsense.)

If (c), then the mode is exited with no change to the current word.

SECTION III Miscellaneous Operating Notes.

There are various "escapes" in MAIN which may be used to change the flow of program execution. These are listed and discussed below.

CONTROL-Q: If control-Q is typed at any time that MAIN is waiting for input from the user e.g. while waiting for a reply to a mode query, a jump is made to NICBUG. The user can then examine memory or jump to the NIC operating system (monitor) by typing 7600G. A return to MAIN can be made from NICBUG by typing 71G.

CONTROL-G: Similar to control-Q except a jump is made to the start of MAIN which will cause MODE?- to be typed. This is a convenient excape from a mis-typed input (Note that rubout does not work in MAIN.)

CONTROL-Z: Must be typed to excape from the "no find" condition in mode 3. The end-of-file character which mode 3 expects is control-Z. If this character is never sent (e.g. if the file does not exist in the sending device), it must be provided by the user.

Any character: If a "hung" condition is encountered, it is usually possible to escape by typing any character. This condition usually occurs either when NIC is trying to communicate with CTL or CTL is trying to communicate with the bus (e.g., the C1000). In the former case, a jump to NICBUG is made; in the latter case, the state of CTL is printed out (see Table 2) and a jump is made to NICBUG. In either case the user should try to determine the cause of the hung condition before continuing. Frequently, all that is necessary is to return to MAIN (use 71G) and use mode 1 to reset.

ROW 1 (CTL Command Table)

Identifier Code	=	Value Name

8	=	8292 BUS STATUS

Table 2 - CTL State Data Returned on Interrupt

SECTION IV CTL Software

The original CTL software as outlined in * and listed there has been modified. The major modification is the inclusion of the ability to interrupt program execution and relocation of the program to origin 0. This allows the program to be put in EPROM so it does not have to be down loaded from NIC. Other changes were made. For example, no check is made of the SYC switch to determine if CTL is the controller in charge of the bus.

The CTL software (now actually "firmware") is refered to below as CTLF1 (CTL firmware 1). It consists of the following components:

(1) An initialization routine which sets various registers in the 8291-set and causes the IFC (interface clear) message to be sent on the bus. (Assuming SYC is set.) The routine is always run whenever a software reset is done (CTLRS) and on power on (provided hardware latches permit it).

(2) An "automatic" test module which is invoked if address switch 0 is "on". This module is invoked under the same conditions as the initialization routine.

(3) An interrupt driven routine which transfers CTL state data to locations starting at the end of the command table. (The command table presently starts at the bottom of RAM at 800H.) This routine starts at 38H. Interrupt mode 1 is enabled so that whenever an interrupt occurs, this routine is activated. Note that a NIC CTLWR instruction will cause a Z-80 interrupt if interrupts are enabled. Interrupts are disabled whenever data is being transferred from NIC to CTL.

(4) 6 "command" routines. These command routines are labeled COM 1, COM 2, COM 4, COM 5, COM 6, and COM 7. A seventh "command" (COM 3) may be loaded and run at 900H.

These commands are table driven, i.e. a 20 byte table containing the number of the command to be executed and command parameters is transferred from NIC to CTL prior to command execution. Three of the commands (COM 1, COM 2, COM 4) transfer data to or from the bus while two of the commands (COM 5, COM 6) transfer data to or from NIC. COM 7 is used to transfer data directly from the bus to NIC. A brief description of these "commands" and the required parameters follow:

Bus Commands

These commands always exit with the ATN message inactive so that as long as a bus command is not being executed, the bus is in an "idle" state.

COM 1 (NL1ST, LIS1P, LIS1S, LIS2P, LIS2S, LIS3P, LIS3S, NDAT, NDATB, DATADD)

This command causes data stored in the CTL "buffer" starting at location DATADD (2 bytes) to be transmitted on the bus to NLIST listeners (up to 3) identified by their primary/secondary address (LIS1P/LIS1S, etc.). The number of bytes transferred is determined by NDAT and/or NDATB as follows:

(a) if NDAT and NDATB are both zero no data is sent. Listener addresses are sent however provided NLIST ≠0.

(b) if NDAT ≠ 0, NDAT bytes are sent (0 < NDAT < 255)

(c) if NDAT = 0 and NDATB ≠ 0 then NDATB 256-byte blocks are sent where 0 < NDATB ≤ 4 since up to 1024 bytes may be stored in the CTL buffer. The last byte transferred is accompanied by the END message. (EOI active.)

The NLIST device addresses (pairs) are sent prior to sending the data. If a secondary address is 0, it is not sent.

The universal unlisten message (UNL) is sent after all the data has been transmitted.

COM 2 (TALKP, TALKS, EOSC, NDAT, NDATB, DATADD)

This command transfers data from the bus to the CTL "buffer" starting a DATADD. The amount of data transferred depends on the values of EOSC, NDAT and NDATb. The rules are as follows:

(a) If an END is received with the n^{th} byte and n is less than or equal to the amount of data "expected" (see below), then n bytes are transferred.

(b) Similarly, if EOSC is not zero and a character is received which matches EOSC, n bytes are transferred.

(c) The "expected" amount of data is given by NDAT and NDATB as for COM 1 i.e. if NDAT ≠ 0, then the expected number is NDAT while if NDAT = 0 and NDATB ≠ 0, NDATB 256 byte blocks of data are expected.

(d) If END is not received (or EOSC ≠0 and no match character is received), the "expected" amount of data is transferred.

(e) If NDAT = NDATB = 0 the "expected" amount of data is considered to be unknown. In this case the number of bytes transferred is given by the above rules except that NDATB is assigned an implicit value of 4 (the maximum number of blocks

which can be contained in the CTL buffer). In addition, if END (or matching EOSC) is recevied, the amount of data received is "returned" in NDATB and the first byte of DATADD: (NDATB contains the least significant byte of the 2 byte value returned).

Before the data is gathered from the bus, the talker address given by TALKP/TALKS is transmitted to the bus. If TALKS = 0, no secondary talk address is transmitted.

After data has been gathered, the universal untalk message (UNT) is transmitted to the bus.

COM 4 (LIS1P, LIS1S)

This command responds to a request for service, polls (serial poll) the device with address LIS1P/LIS1S (LIS1S = 0 means no secondary address) and returns the serial poll "status byte" to NIC. (The "status byte" consists of the uniline message, RQS, on data line 7 and STB on data lines 1-6 and 8. If the RQS message is true, the addressed device is requesting service; otherwise it is not. Status information may or may not be passed in the multi-line STB message. The C1000 passes no status information.)

It is noteworthy that the C1000 never requests service if ATN is inactive. Thus the first action in COM 4 is to activate ATN using the TCNTR command to the 8292. (This may cause problems with other devices.)

After the SRQ message is received by COM 4, the serial poll enable, SPE, message is sent followed by the address of the device to be polled. Next CTL goes to stand by to receive the "status byte" and return it to NIC provided CTL is not in the "automatic" (test) mode.

Next the universal untalk message (UNT) is sent followed by the serial poll disable message (SPD).

COM 7 (TALKP, TALKS)

This command passes each datum from the bus directly to NIC without using the CTL buffer. Thus, in a sense it is a combination of COM 2 and COM 6. Like COMM 2 it addresses the talker using TALKP and TALKS. Using COM 7 it is possible to receive "files" of data longer than 1024 bytes.

COM 7 ends reception when the END message is received (EOI is asserted) with the last datum. When this happens the SRVC bit in the CTRLO port is set such that the NIC instruction CTLRD of CTLRDC will "see" the 8th bit of ACC set to 1. It is reset before COM 7 returns.

Non-bus Commands

COM 5 (NDAT, NDATB, DATADD)

This command transfers data stored in CTL starting at DATADD to NIC. The use of NDAT and NDATB are as for COM 1.

COM 6 (NDAT, NDATB, DATADD)

This is the inverse of COM 5 i.e., data is transferred from NIC to CTL "buffer".

SECTION V Software Maintenance

In this section some miscellaneous information concerning software maintenance for both CTL and NIC is presented.

NIC Software

All NIC software was written in Nicolet Assembly Language using the Disk Editor (DISKED), and assembled using the Nicolet Disk Assembler (ASM), (see Appendix E). The source program MAIN is written in 6 segments which should be individually assembled. Any given segment is completely within a page (pages are 1024 words long starting at address 0), but there may be more than one segment per page (see Appendix C). Entry points external to a given segment are always given at the end of the segment (in a list of externals) where they are relatively easily accessible for change. It is important to make note of values assigned to these entry points so that software changes in one segment causing a change of entry point address will be changed in the list of externals of other segments.

The first segment (now called SEG1A) but latter versions may have a different suffix letter) is partitioned into 3 sub-segments called SEG1A1, SEG1A2, SEG1A3 for ease of transfer to backup disks. (A maximum of 4 complete tracks can be stored in data memory.) Before assembly these sub-segments should be combined into one segment using the DISKED K command.

The source software is also stored on floppy disk (in the Sykes Comm-Stor) using the DISKED L command on the complete source program. (All segments are combined using DISKED and the command K, NICP, SEG1A, SEG2A, SEG3, SEG4, SEG5, SEG6.)

Assuming that NICP has been created and DISKED has been invoked, the file can be transferred using the Comm-Stor command !RØNICP#LØNICP.

! = Comm-Stor prompt.

R = Read and store from modem port.

NICP = Name to be assigned to the file (the name does not have to be the same as that being transferred.)

= Separator for a command to be sent out of the modem port prior to data reception.

L NICP is the DISKED command "list file NICP".

In order to transfer this program back to NIC, a NIC program

called COMNIC is available (see Appendix D). If COMNIC is not available in "run" form it should be assembled using ASM and overlayed on program MAIN since COMNIC uses several subroutines in MAIN. Assume MAIN has been loaded, simply use RUN LOADER followed by COMNIC:G.

COMNIC transmits a send command to Comm-Stor in the form !SØfile-name where file-name is given by the user in response to the query "FILE NAME?-. If the file exists in Comm-Stor, it will be transferred to NIC and stored under file-name:A. This new file will then be essentially identical to the one originally transferred from NIC and may be edited using DISKED.

CTL Software

The CTL software was written on a Tektronix 8002A Micro-Processor Lab using the resident editor with Zilog mnemonics and assembled using the resident assembler (see Appendix F). The source program is stored in 6 segments, partly for logical reasons and partly so that any given segment will fit into the 300 line buffer of the editor. The segments are as follows:

CTLSYM1 - The list of equates.

TTLMAC1 - Macro definitions.

CTLMAIN1 - Main control routine and ancillary routines.

TTLSUBS1 - All command subroutines except COM1.

TTLSUB01 - Command subroutine COM1 and the automatic TEST routine along with its BCD to ASCII routine.

CTLSTOR - Parameter table and other RAM storage definitions.

These source subroutines are stored on floppy disk with back up disks.

The machine code can be transferred to CTL in two ways. One method is via Tektronix WHEX files as described under mode 3 in Section II. This method is used for code that is to be down loaded into CTL RAM. The other method is to transfer the code into EPROM as described below.

The PROM burner used at PML is on a CP/M based system. Thus it is necessary to transfer machine code from the 8002A to a file in the CP/M based system. This is accomplished using the 8002A COMM command (see Tektronix 8001/8002 System User's Newsletter - Issue #11, Spring 1980) to send the file and program TEKREC (listed in Appendix G) to receive the file. Modem port (J101) is used with

COMM - see figure 1 for the appropriate cabling diagram.

PIN#	8002 FUNCTION	CODE		CP/M FUNCTION	CODE
2	Transmitted Data	TXD	——▷——	Received Data	RXD
3	Received Data	RXD	——◁——	Transmitted Data	TXD
5	Clear to send *	CTS	——◁——	Request to Send	RTS
7	Signal ground	GND	——▷◁——	Signal Ground	GND
8	Signal Detect	DCD	——◁——	Data Terminal Ready	DTR

* A jumper on the Communication board may be changed to use PIN 6.

Notes

(1) CTS must be on before the start of data transmission (before COMM is called). It may be set off during transmission to halt transmission.

(2) DCD must be on before and during data transmission.

(3) PIN 4 is the 8002 RTS line which is always ON. It may be used by the CP/M system if necessary.

Figure 1 - RS-232 Cabling Diagram for communications with the Tektronix 8002A J101 Modem Port.

The file transfer is initiated by first loading the assembled code to be transferred using the command LOAD "file", where "file" is the name of the file to be loaded. (Optionally, the memory area to be loaded can first be filled with hex FF so that areas of memory which will not contain code will contain FF. Use FILL start-address end-address FF.)

Next use the COMM command:

COMM P=0A.

This is followed with a request for a Formatted Upload by typing:

NULL start-address end-address CR

(NULL is SHIFT/CONTROL @)

APPENDIX A - Address Switch Description

The address switch chip contains six single pole, double throw switches. These switches are numbered (left to right) from 1 to 6. (Note switch 1 corresponds to "logical" switch 0.)

Switch 1 is the SYC switch which may be used to initialize CTL as the system controller in charge of the bus. Normally (with the present software) this switch should be in the "set" position or "off" as marked on the switch. (Set means that SYC is active.)

Switches 2-6 can be used to set the primary address of the CTL, switch 6 corresponds to the least significant bit of the 5 bit address etc. A switch in the off position means that the corresponding bit is set (to 1).

With the current software, the CTL can not be addressed as a talker/listener since it controls what devices are to talk and/or listen - CTL knows it is a listener if another device is asked to talk. Thus the address switches are not used as such, but are instead used to determine "automatic" or "manual" mode of operation of CTL as described in Section I. Again, a bit is "set" by putting the corresponding switch in the "off" position.

APPENDIX B Video Data Files

Each pixel in a video frame (one or more scan lines of video) is an 8 bit byte representing a relative intensily value from 0 to 255. These bytes are packed 2.5 bytes per NIC 20 bit word. NIC data memory (starting at 100000) is used as a buffer to hold 4 tracks worth of data before it is written to the disk. These 4 tracks hold 6144 words or 15360 bytes of video data. This corresponds to 15, 30 and 60 scan lines at INT values 4, 2, 1 respectively. When unpacking the data for display (or other) purposes it is necessary to know the number of scan lines, n, and the value of INT which was used. This infromation (and more) is containing in the file directory as follows:

Directory Word	Interpretation
Core buffer address	Starting x-coordinate (binary form)
File size (words)	File size (words), (note 1,2)
Program starting address (PSA)	n and INT, (note 3)

The file starting track number is, of course, also included in the directory.

Note 1 - The last track will seldom be completely filled with video data.

Note 2 - The file size is actually the number of tracks times 1536 (3000 octal).

Note 3 - The interlace number (1, 2 or 4) is stored in bits 11-14 of the PSA and the number of lines, n, in bits 0-10.

APPENDIX C Memory Maps

	NIC Octal Addresses	Memory Map
	0

APPENDIX D - COMNIC Source Listing

(OMNIC
(NIC -80)

```
/       PROGRAM COMNIC
/ REVISION -- JUNE 8,1981
/ AUTHOR   -   BARRETT,TB
/ PURPOSE  -   READ A DISKED A-FILE FROM COMM STOR
/       TO NIC AND PACK IT FOR USE BY DISKED.
/       NOTE   THE COMM-STOR FILE IS PRODUCED BY USING THE "L"
/       COMMAND IN DISKED.
/ QUERIES  - FILE NAME?
/       REPLY WITH THE NAME OF THE COMM STOR FILE TO BE TRANSFERRED.
/       THE PACKED FILE WILL BE GIVEN THE SAME NAME.
/ CAUTION    THE FILE IS STORED AFTER ALL OTHER FILES ON THE DISK.
/       NO CHECK IS MADE FOR ADEQUATE SPACE.

/       COMM STOR MUST BE CONFIGURED TO RESPOND TO  S FOR STOP
/       TRANSMISSION (#19) AND TO  Q FOR START (#20).
/       THE FILE MUST USE  Z FOR EOF (#8) AND COMM-STOR MUST
/       SEND IT (#9).

/ NOTE THE SECTION OF CODE STARTING WITH CHRCK. THIS CODE
/ IS USED TO REPLACE ALL CONTROL CHARACTERS EXCEPT CR,TAB,LF WITH ?
/ IF THIS IS NOT DONE, DISKED WILL MISS ENTIRE BLOCKS OF
/ INPUT TEXT.

APPENDIX E - MAIN Source Listing

```
#
--------
/ CAMERA MAIN (NOVEMBER 6,1981)
//  CAMERA MAIN (NOVEMBER 6,1981)
//  MAIN DRIVER PROGRAM FOR CAMERA CONTROL. THIS PROGRAM PERFORMS
/ VARIOUS BASIC OPERATIONS HAVING TO DO WITH CONTROLLING THE
/ HAMAMATSU C1000 CAMERA VIA THE NIC-488/CTL INTERFACE.
/ IN ADDITION VARIOUS CONTROLLER FUNCTIONS ARE PERFORMED. EACH FUNCTION
/ IS CALLED A MODE (OF OPERATION). AT PRESENT 7 MODES HAVE BEEN
/ IMPLEMENTED AS FOLLOWS:
/
/ MODE1 - RESET THE CAMERA,CONTROLLER (NO LONGER HAVE TO BOOT LOAD)
/ THIS OPERATION SHOULD USUALLY BE THE FIRST OPERATION ON SYSTEM
/ START AND MAY BE REPEATED ANY TIME THE USER WISHES TO
/ IN RAM WHICH MUST BE RELOADED EACH TIME THE CTL IS TURNED OFF.)
/
/ MODE2 - LOAD AND EXECUTE SPECIAL "COMMANDS". AT PRESENT THE
/ CTL RECOGNIZES ONE OPTIONAL COMMAND (NO. 8). THIS
/ COMMAND IS NOT PART OF THE MAIN SEQUENCE OF CTL PROGRAMS AND
/ MUST BE LOADED BEFORE CALLING. AT PRESENT, IT IS ASSUMED THAT THE
/ CORRESPONDING NIC COMMAND PROGRAM IS IN NIC CORE. THE MODE QUERY IS-
/       COMMAND #?- (REPLY  8)
/       FILE NAME?- (REPLY WITH THE NIC FILE TO BE LOADED)
/       [OPTIONAL SPECIAL DATA, DEPENDING ON THE COMMAND]
/
/ MODE3 - TRANSFER AND TRANSFORM A TEKTRONIX 8002 TEK-HEX
/ FILE FROM COMM-STOR TO A NIC LOAD FILE. THIS MODE PROVIDES FOR
/ EASY TRANSFER OF ASSEMBLED Z-80 CODE TO NIC AND THENCE TO CTL.
/ THE MODE QUERY IS -
/       FILE NAME?- (RESPOND WITH THE COMM-STOR FILE NAME WHICH
/                ALSO BECOMES THE NIC FILE NAME)
/ NOTE- IF THE FILE DOES NOT EXIST IN COMMSTOR, THE USER WILL
/ BE INFORMED OF THIS. HE MUST THEN TYPE ^Z TO GET PROGRAM CONTROL.
/
/ MODE4 - CAMERA SET-UP. USING THIS MODE, ANY OF 5 LEGITIMATE
/ CAMERA SET-UP COMMANDS GIVEN IN CAMERA TABLE ARE SENT TO THE CAMERA.
/ THE MODE QUERY IS -
/       MNEMONIC?- (REPLY WITH ONE OF THE 3 LETTER MNEMONIC
/       CODES: OUT INF XCO INT MAR
/ THE CURRENT VALUE IS THEN PRINTED AFTER WHICH THE USER MAY TYPE
/ IN A NEW VALUE OR CR TO RETAIN THE GIVEN ONE.
/ NOTE THAT AT PRESENT THE USER SHOULD NOT CHANGE OUT WHICH GIVES
/ THE FORMAT OF DATA SENT TO THE CAMERA. IT SHOULD STAY AT
/ ITS DEFAULT VALUE OF 1 MEANING ASCII DATA.
/
/ MODE5 - OBTAIN A "FRAME" OF VIDEO DATA (THE SIZE OF A FRAME DEPENDS
/ ON THE CAMERA TABLE VALUES FOR XCO AND INT AND ON THE COMMAND).
/ THE MODE QUERY IS -
```

```
/       FILE NAME?- (REPLY WITH THE NAME OF THE NIC FILE TO RECEIVE
/       THE DATA OR WITH "PRINT" WHICH WILL CAUSE THE DATA TO BE
/       PRINTED BUT NOT STORED. IF "PRINT" IS GIVEN, THE ACTUAL FORM
/       OF THE PRINTED VIDEO DEPENDS ON THE INPUT FORMAT (INF). IF 1 OR 3,
/       THE DISPLAY IS 3 CHARACTER (000-256) FOLLOWED BY "BLANK", 16
/       PIXELS/LINE. IF 2, THE DISPLAY IS 2 CHARACTER HEX (00-FF) WITH
/       NO BLANKS AND 32 PIXELS/LINE.)
/       FRAME?- (REPLY WITH VI1,VII,VID FOR 1-LINE VIDEO,A FRAME
/       STARTING AT X-COORD GOING TO HIGHER X-VALUES, A FRAME
--------
/ CAMERA MAIN (NOVEMBER 6,1981)
/       STARTING AT X-COORD GOING TO LOWER X-VALUES RESPECTIVELY.
/
/ MODE6 - TRANSFER CTL MEMORY TO NIC AT 100000 IN PACKED FORM.
/ THE MODE QUERY IS -
/       HEXN- (REPLY WITH 4 HEX DIGIT ADDRESS AND A SINGLE DIGIT
/              SPECIFYING THE NO. OF 256 BYTE BLOCKS WANTED.
/            E.G. 0C004 MEANS ADDRESS C00 AND 4 BLOCKS)
/ THE DATA OBTAINED MAY BE DISPLAYED BY CALLING MODE7
/
/MODE7 - DISPLAY MEMORY IN HEX FORMAT. THE REGION DDISPLAYED STARTS
/ AT 100000 AND IS NW3 WORDS LONG WHERE NW3 IS OBTAINED BY RUNNING MODE3
/ OR MODE6. THE USER CAN ALSO CHANGE NW3 HOWEVER.
/ THE WORDS ARE ASSUMED TO BE IN PACKED FORM.
/
/MODE8 - DISPLAY NIC WORDS IN HEX AND PERMIT THE USER TO CHANGE THE
/ DISPLAYED WORD (ALSO IN HEX). THIS MODE CAN BE USED TO PUT PROGRAM
 / PATCHES INTO CTL.
/ THE MODE QUERY IS -
/       OCT - ( REPLY WITH THE STARTING ADDRESS (OCTAL) OF NIC
/            MEMORY TO BE OBSERVED AND/OR CHANGED )
/       THE PROGRAM THEN DISPLAYS THE FIRST WORD AS 5 HEX DIGITS AND
/       WAITS FOR USER RESPONSE. A SPACE (OR ANY SEQUENCE OF 1 TO 4
/       CHARACTERS) THEN CR WILL CAUSE NO CHANGE.
/       IF 5 HEX CHARACTERS ARE ENTERED THEY WILL REPLACE THE DISPLAYED
/       WORD. THE NEXT WORD WILL THEN BE DISPLAYED, ETC. TO EXIT THIS
/       MODE REPLY WITH CR ONLY. THE CHANGED CODE CAN BE
/       LOADED INTO CTL MEMORY VIA MODE 1 WITH A NON-EXISTANT FILE
/       NAME.
/
/
/ THE USER MAY EXIT CTLSYS VIA NICBUG TO NICSYS AND STORE THIS PROGRAM
/ DATA FOR LATER USE. USE STORE NAME 100000-100632;100000:P
/
/ NOTE -- WHEN RESPONDING TO A QUERY, THE USER MAY TYPE ^G TO ABORT
/ THE MODE. TYPING ^Q WILL BRING THE USER TO NICBUG (IF LOADED).
/ VALUE ASSIGNED TO ABORT.

 / FUNCTION ERROR
// FUNCTION ERROR
/ REVISION -- NOVEMBER 6,1981
/ PURPOSE -- ERROR IS THE "ABORT" ROUTINE WHICH IS ENTERED WHEN THE SYSTE
/ "HUNG". THE USER CAN TYPE ANY CHARACTER ON THE CONSOLE WHICH CAUSES
/ ERROR TO START. ERROR FIRST CAUSES NICCTL TO INTERRUPT AND TO EXECUTE
/AN INTERRUPT SUBROUTINE WHICH STORES THE "STATE" OF NICFIL IN RAM STARTI
/ AT 80C AND TO THEN REINITIALIZE THE BUS AND WAIT FOR COMMANDS FROM NIC.
/ERROR GATHERS THE STATE DATA PLUS THE CONTENTS OF THE CTL COMMAND TABLE
/AND PRINTS THIS DATA ALONG WITH IDENTIFIERS AS FOLLOWS:
/
/       ROW 1                                   ROW 2
/       -----                                   -----
/

/// SUBROUTINE DEC
 // SUBROUTINE DEC
/ REVISION -- DECEMBER  30,1980
/ AUTHOR   --BARRETT,TB
/ PURPOSE  -- TRANSFORM A PACKED ASCII HEX STRING TO BINARY AND PACK
/       5 NIBBLES PER NIC WORD
/ ARGUMENTS -- ALL ARGUMENTS ARE PASSED THROUGH A COMMON AREA
/       WITH THE FOLLOWING VARIABLES IN THE ORDER SHOWN-
/       WPNT - POINTS TO STORAGE LOCATION OF THE LAST WORD
/                STORED. THIS IS INCREMENTED WHENEVER A WORD IS
/                COMPLETE SO IT SHOULD BE SET ACCORDINGLY
/                ON INITIAL ENTRY.
/       WORD - CONTAINS THE NIBBLES OR PORTIONS THEREOF TO
/                BE STORED AT WPNT+1. IT SHOULD BE SET TO 0 ON
/                INITIAL CALL.
/       WCNT - A COUNTER FOR WORD. WHEN WORD IS EMPTY,WCNT
/                =5, WHEN FULL WCNT=0. WHEN WCNT GOES TO 0, WORD IS
/                STORED AT WPNT+1 AND WPNT IS INCREMENTED. SET TO 6
/                AT INITIAL CALL TO DEC.
/       COUNT - THE NUMBER OF NIBBLES+1 TO BE PACKED. NOTE THAT COUNT
/                IS DECREMENTED TO 0 BY DEC.
/       BCNT - BYTE COUNTER. SET TO 1 FOR INITIAL CALL.
/       APNT - POINT TO CURRENT STRING WORD. SET TO 1 LESS THAN THE
/                START OF THE STRING INITIALLY.
/       CHKSUM - NIBBLE VALUES ARE ADDED & STORED IN CHKSUM. SET TO
/                0 ON EACH CALL TO DEC (USUALLY).
/       NWORD - NO. OF WORDS STORED. (USUALLY SET TO 0 AT EACH CALL.
/       NOTE----
/       IN ORDER TO FORCE A WORD OUT OF DEC, SET WCNT TO COUNT.

 // SUBROUTINE TEKHEX(CNT,NBYTE)
/ REVISION -- JANUARY 24,1981
/ AUTHOR   -- BARRETT,TB
/ PURPOSE  -- DECODES (TO BINARY) A TEKTRONIX HEX  ILE AND PUTS
```

```
/                THE RESULT IN PACKED FORM STARTING AT LOCATION
/                100000. THE INPUT FILE IS ASSUMED TO BE IN
/                PACKED FORM STARTING AT 100000.
/ ARGUMENTS -- CNT - TOTAL NO. OF PACKED WORDS IN THE OUTPUT.
/                NOTE THAT THE LAST PACKED WORD MAY HAVE 0 FILL.
/                ALSO NOTE THAT DEC PACKS WORDS SUCH THAT NIBBLE1
/                OCCUPIES 19-16....,NIBBLE5, 3-0.
/                NBYTE - TOTAL NO. OF BYTES (2 NIBS) STORED.
/       - NOTE THAT THIS SUBROUTINE ASSUMES THAT THE TEK. 8002 AND
/       COMM-STOR ARE CONFIGURED SUCH THAT EACH "LEADING" SLASH IS
/       PREFACED WITH XOF (ASCII 223). ALSO NOTE THAT THERE ARE
/       17 (21 OCT) SURPLUS CHARS. AFTER THE LAST CR.
/       BE SURE TO USE MX MODE WHEN STORING THE HEX FILE.

 // SUBROUTINE SEARCH(MNEM,CODE,VALUE,NBYTE,TABLA,FLAG)
/ REVISION -- JANUARY 22,1981
/ AUTHOR   -- BARRETT,TB
/ PURPOSE  -- SEARCH A TABLE FOR CODE&VALUE&NO. OF BYTES IN THE
/               VALUE (WHERE VALUE IS A SINGLE WORD WITH UP TO
/               5 NIBBLES) OR INSERT VALUE & NO. OF NIBBLES IN VALUE
/ PARAMETERS --
/       MNEM - 3 LETTER MNEMONIC (PACKED) WHICH IDENTIFIES AN ENTRY
/       CODE - THE CORRESPONDING CODE (CAMERA "SECONDARY ADDRESS")
/       VALUE - DATA WORD ASSOCIATED WITH THE CODE (MAY BE 0)
/               TYPICALLY THIS IS A BCD CODE. FOR EXAMPLE 1203
/               WOULD HAVE NIBBLES 1,2,0,3,0 IN THAT ORDER FOR
/               AN OCTAL WORD = 0220060.
/       NBYTE - NO. OF NIBBLES IN VALUE (MAY BE 0)
/       TABLA - ADDRESS OF THE START OF THE TABLE
/       FLAG - ON ENTRY, FLAG IS USED TO INDICATE WHETHER THIS
/               IS A RETURN (0) OR REPLACE (1) OPERATION. ON
/               SEARCH OPERATIONS, FLAG IS ALSO RETURNED AS 0 FOR
/               A SUCCESSFUL SEARCH AND AS 1 FOR NO-FIND.
/       NOTE ---
/       TABLE HAS THE FORM -
/       MNEMONIC (3 PACKED LETTERS,R-JUSTIFIED)
/       CODE  RIGHT JUSTIFIED 8-BIT CODE
/       N-NIBBLES NO. OF NIBBLES IN VALUE
/       VALUE PACKED NIBBLES
/       ETC.
/       THE TABLE SHOULD BE TERMINATED WITH @.

MISSION
of
Rome Air Development Center

RADC plans and executes research, development, test and selected acquisition programs in support of Command, Control Communications and Intelligence (C^3I) activities. Technical and engineering support within areas of technical competence is provided to ESD Program Offices (POs) and other ESD elements. The principal technical mission areas are communications, electromagnetic guidance and control, surveillance of ground and aerospace objects, intelligence data collection and handling, information system technology, solid state sciences, electromagnetics and electronic reliability, maintainability and compatibility.
