REPLY TO ATTENTION OF: NEDED

JUN 2 9 1979

Honorable Hugh J. Gallen Governor of the State of New Hampshire State House Concord, New Hampshire 03301

Dear Governor Gallen:

I am forwarding to you a copy of the Goose Pond Dam Phase I Inspection Report, which was prepared under the National Program for Inspection of Non-Federal Dams. This report is presented for your use and is based upon a visual inspection, a review of the past performance and a brief hydrological study of the dam. A brief assessment is included at the beginning of the report. I have approved the report and support the findings and recommendations described in Section 7 and ask that you keep me informed of the actions taken to implement them. This follow-up action is a vitally important part of this program.

A copy of this report has been forwarded to the Water Resources Board, the cooperating agency for the State of New Hampshire. In addition, a copy of the report has also been furnished the owner, the State of New Hampshire, New Hampshire Water Resources Board, Concord, New Hampshire 03301, ATTN: Mr. George M. McGee, Sr., Chairman.

Copies of this report will be made available to the public, upon request, by this office under the Freedom of Information Act. In the case of this report the release date will be thirty days from the date of this letter.

I wish to take this opportunity to thank you and the Water Resources Board for your cooperation in carrying out this program.

Sincerely yours,

Incl As stated JOHN P. CHANDLER Colonel, Corps of Engineers

Division Engineer

DAMS, INSPECTION, DAM SAFETY,

Connecticut River Basin Canaan, New Hampshire Goose pond Dam

20. ABSTRACT (Continue on reverse side if necessary and identify by block masher)

The dam is a 1240 ft. long earthfill dam. The maximum height of the dam is 31 ft. The dam is judged to be in fair condition. It is intermediate in size with a high hazard potential classification. The slope on the upstream slope east of the spillway should be re-established. The exposed concrete surface of the core wall should be repaired.

PHASE I INSPECTION REPORT NATIONAL DAM INSPECTION PROGRAM

#### NATIONAL DAM INSPECTION PROGRAM PHASE I INSPECTION REPORT

Identification No.: NH 00118

Name of Dam: Goose Pond Dam

Town: Canaan

County & State: Grafton, New Hampshire

Stream: Goose Pond Dam
Date of Inspection: June 8, 1978

#### BRIEF ASSESSMENT

Goose Pond Dam is located in the central western part of the State of New Hampshire, approximately nine miles northeast of the City of Lebanon. It is a 1,240-foot long earth fill dam that was reconstructed in 1952, with an upstream concrete core wall and riprap on the upstream face. The maximum height of the dam is 31 feet. The concrete spillway is an Ambursen box type modified for flood discharge. It has an effective length of 50 feet and is topped with sectional flashboards.

Based on visual inspection, available records and past operational performance, the dam is judged to be in fair condition. Standing water was noted at the toe of the eastern and western embankments. Riprap on the upstream slope eastern of the spillway and for a length of 40 feet has been partially washed away. Erosion of the concrete core wall was also noted. Continuance of this classification depends on proper operations and maintenance of the dam.

This dam falls under the category of high hazard potential, and it is intermediate in size. The test flood peak inflow is equal to the probable maximum flood, 28,730 cfs, and the test flood peak outflow is 3,650 cfs obtained as a result of routing the test flood through the pond. Hydraulic analysis indicates that the maximum surcharge pool elevation will be 105.3 (local datum) approximately 7 feet below the top of the dam. The project will pass the test flood peak outflow without overtopping the dam, and therefore, the spillway capacity is adequate.

The following recommended operation and maintenance measures, as stated in Section 7.3, be implemented within 1 year of the receipt of this Phase I report by the owner:

- The slope protection on the upstream slope east of the spillway should be re-established.
- The exposed concrete surface of the core wall should be repaired.

- 3. The areas where standing water was observed should be monitored regularly to determine the cause and then corrective measures should be taken.
- 4. Vegetation should be removed except for grass cover that prevents slope erosion.
- 5. Upstream slope of the dam and the intake structure should be inspected at low water.
- 6. A program of regular maintenance should be established.
- 7. A program of technical annual periodic inspection of the project features should be prepared and initiated.
- 8. A plan for surveillance and a warning system should be developed for periods of unusually heavy rains and runoff.

#### **PREFACE**

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation, and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I investigation; however, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structure and may obscure certain conditions which might otherwise be detectable if inspected under the normal operating environment of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspection can there be any chance that unsafe conditions be detected.

Phase I inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the Spillway Test Flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonable possible storm runoff), or fractions thereof. Because of the magnitude and rarity of such a storm event, a finding that a spillway will not pass the test flood should not be interpreted as necessarily posing a highly inadequate condition. The test flood provides a measure of relative spillway capacity and serves as an aide in determining the need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition, and the downstream damage potential.

#### GOOSE POND DAM

#### SECTION 1 - PROJECT INFORMATION

#### 1.1 General

#### a. Authority

Public Law 92-367, August 8, 1972, authorized the Secretary of the Army, through the Corps of Engineers, to initiate a National Program of Dam Inspection throughout the United States. The New England Division of the Corps of Engineers has been assigned the responsibility of supervising the inspection of dams within the New England Region. Fay, Spofford & Thorndike, Inc., Engineers, have been retained by the New England Divison to inspect and report on selected dams in the State of New Hampshire. Authorization and notice to proceed was issued to Fay, Spofford & Thorndike, Inc., under a letter of May 3, 1978, from Mr. Ralph T. Garver, Colonel, Corps of Engineers. Contract No. DACW 33-78-C-0308 has been assigned by the Corps of Engineers for this work.

#### b. Purpose

- (1) Perform technical inspection and evaluation of non-Federal dams to identify conditions which threaten the public safety and thus permit correction in a timely manner by non-Federal interests.
- (2) Encourage and prepare the states to initiate quickly effective dam safety programs for non-Federal dams.
- (3) To update, verify, and complete the National Inventory of Dams.

#### 1.2 Description of Project

#### a. Location

Goose Pond is located in the central western part of the state of New Hampshire. The dam is located on the southern tip of the pond, within the Town of Canaan, and nine miles northeast of Lebanon. The outlet, Goose Pond Brook, is a tributary to the Mascoma and Connecticut Rivers. There is a road and about twenty houses located along the eastern shores of Goose Pond and several houses are located near the dam on the downstream side. The nearest town is Enfield,

which is about 7 miles downstream and along the courses of Goose Pond Brook and Mascoma River.

#### b. Description of Dam

This is a rolled earth dam with a concrete core wall. The overall dimensions are 1,240 feet in length, 31 feet in height, and 12 feet wide at the top. The earth embankment has an upstream slope of 1 vertical to 2 1/2 horizontal, covered with riprap (Photographs No. 1 and 11, Appendix C) and a downstream slope of 1 vertical to 2 horizontal. There are four clean-out basins along the downstream toe near the east end of the dam (Photograph No. 13, Appendix C).

The concrete spillway is of rectangular Ambursen type, 15 feet wide, with flashboards on three sides, for a total effective length of 50 feet (Photographs No. 2 and 3, Appendix C). At the bottom of the intake structure, there is a rectangular concrete culvert, 10 feet wide by 10 feet high with stop logs at the upstream end (Photograph No. 4, Appendix C). There are two 4-foot by 4-foot gates with the sill 29.5 feet below the top of the dam. The gates discharge into the same culvert. The manually-operated gate shafts are supported on a platform over the spillway. This platform has concrete piers, steel beams, and a creosoted planking floor (Photograph No. 14, Appendix C).

The discharge sluiceway on top of the culvert is 11 feet wide and is located near the center of the dam. It is wider on the downstream side and has concrete wingwalls. The culvert, projecting approximately 50 feet downstream, serves as an apron for the spillway overflow (Photographs No. 6, 7, and 8, Appendix C). There is a footbridge across the sluiceway, connecting both halves of the embankment.

#### c. Size Classification

The storage capacity at the spillway crest is 11,688 acre-feet, which falls in the range  $\geqslant 1,000$  and < 50,000 acre-feet. On the basis of Table 1, Size Classification, in the "Recommended Guidelines for Safety Inspection of Dams," furnished by the Corps of Engineers, the dam is classified as intermediate in size.

#### d. Hazard Classification

In the event of failure of this dam, the town of Enfield, which is at a distance of approximately 7 miles downstream of the dam, will be in danger of being flooded. The depth of the water at the damage impact area, as shown on page 14 in Appendix D, is estimated. It is also estimated that in the event of failure of this dam, loss of more than a few lives and excessive property damage would probably

occur. Therefore, on the basis of Table 2, Hazard Potential Classification, in the "Recommended Guidelines for Safety Inspection of Dams," furnished by the Corps of Engineers, this dam falls in the category of high hazard potential.

#### e. Ownership

During construction of this dam between 1917 and 1918, the owner was the Mascoma River Improvement Company of Lebanon, New Hampshire. In 1936, the same owner was referred to as a subsidiary of the New England Power Service Company.

In 1938, the owner was the Granite State Electric Co. of Lebanon, New Hampshire, which was also affiliated with the New England Power Service Company. Since 1969, Goose Pond Dam, the water rights and land connected therewith were acquired by the New Hampshire Water Resources Board. Therefore, the present owner is the State of New Hampshire.

#### f. Operator

The dam is being operated by the New Hampshire Water Resources Board, 37 Pleasant Street, Concord, New Hampshire, telephone (603) 271-3406. Mr. Vernon Knowlton is the chief engineer.

#### g. Purpose of Dam

Goose Pond Dam was built to store spring run-off waters in order to maintain normal flow needed for power plants on Mascoma River. While doing this, the dam helps to maintain the required water level for recreation. There are numerous cottages and houses on the lake shore.

#### h. Design and Construction History

The original dam was a rock filled timber crib dam built in the 19th century and approximately 10 feet high. It had a 59-foot long spillway and a trap gate at the base of the dam to drain the pond. It was impractical to repair this dam, and a new earth embankment with a concrete core wall was constructed between August, 1917, and July, 1918. The new dam was designed by Mascoma River Improvement Company, Engineering Department, Turners Falls, Massachusetts. The contractor was H. P. Cummings Construction Co., Canaan, New Hamphire. The new dam was constructed about 50 feet downstream from the old dam. The earth embankment required 19,000 cubic yards of material and the core wall 1,450 cubic yards of concrete. The new dam is approximately 12 feet higher than the existing one. A rectangular Ambursen

type reinforced concrete spillway with concrete cut-off walls, bulk-head walls, an apron, and a sluiceway constituted the intake/discharge structure. It is located near the center of the 1240-foot long dam.

During construction of the dam in the winter of 1917-1918, Mr. Arthur T. Safford, a consulting engineer of Lowell, Massachusetts, was consulted regarding the safety of the unfinished dam to pass the oncoming spring freshet.

The owner undertook major repairs and improvements of the dam in 1952. It was engineered by the New England Power Service Company, Boston, Massachusetts. The New Hampshire Water Resources Board approved the owner's petition for reconstruction on June 16, 1952. The work was done between October, and December, 1952. The spillway discharge was increased by reducing the elevation of the concrete crest by 5 feet and installing 5-foot flashboards. A stop log section was constructed, and the discharge conduit was covered to make a rectangular culvert. The top width of the earth dike was increased from 5 feet to 12 feet and was regraded. The concrete core wall was strengthened by widening the footings and adding concrete buttresses.

#### i. Normal Operational Procedure

This dam is checked weekly by personnel of the New Hampshire Water Resources Board using their established procedures. The only control available to lower the pond level is a 10-foot by 10-foot concrete conduit that is regulated by two gates and stop logs, both of which are manually operated.

#### 1.3 Pertinent Data

All the elevations and information presented below are with respect to local datum. According to the U.S.G.S. Quadrangle Sheet, the top of the spillway flashboard, Elevation 106.5 (local datum), is equal to 825 msl (estimated).

#### a. Drainage Area

Goose Pond as shown on the U.S.G.S. Quadrangle Sheet is located on the headwaters of Goose Pond Brook. It has a total drainage area of 15.7 square miles and the watershed is highly wooded and mountainous.

#### b. Discharge at Dam Site

Outlet works (sluice culvert) - size 10 feet by 10 feet at Invert Elevation 83.0 (Photograph No. 4, Appendix C). The estimated discharge capacities of this culvert

are given below with both gates, each 4 feet by 4 feet, fully open and stop logs closed:

608 cfs at Reservoir Elevation 101.5 (top of concrete spillway)

704 cfs at Reservoir Elevation 106.5 (top of flash-boards)

- (2) Maximum known flood at dam site information not available.
- (3) Ungated spillway capacity at top of dam 6700 cfs at Elevation 112.50.
- (4) Ungated spillway capacity at test flood maximum pool elevation - 3650 cfs at Elevation 105.3 (see page 13 in Appendix D).
- c. Elevation (Feet above local datum)
  - (1) Top of dam 112.5.
  - (2) Test flood maximum pool 105.3.
  - (3) Top of flashboards 106.5.
  - (4) Spillway crest (top of concrete) 101.5.
  - (5) Stream bed at centerline of dam 81.5.
  - (6) Maximum tailwater 86.0 (estimated).
- d. Reservoir
  - (1) Length of maximum pool 3.2 miles (estimated).
  - (2) Length of recreation pool 2.5 miles.
  - (3) Length of flood control pool not applicable.
- e. Storage (Acre-Feet)
  - (1) Top of dam 15,800 acre-feet.
  - (2) Test flood maximum pool elevation 10,800 cfs.

- (3) Recreation pool unknown.
- (4) Spillway crest 8,487 acre-feet.

#### f. Reservoir Surface (Acres)

- (1) Top of dam 740 acres (estimated).
- (2) Maximum pool 650 acres (estimated).
- (3) Flood control pool not applicable.
- (4) Recreation pool unknown.
- (5) Spillway crest 610 acres.

#### g. Dam

- (1) Type Earth fill embankment.
- (2) Length 1,240 feet.
- (3) Height 31 feet.
- (4) Top width 12 feet.
- (5) Side slopes
  - (a) Upstream Approximately 1 vertical to 2.5 horizontal.
  - (b) Downstream l vertical to 2 horizontal.
- (6) Zoning Not applicable.
- (7) Impervious core Not applicable.
- (8) Cutoff Upstream concrete core wall.

#### h. Spillway

- (1) Type Rectangular (Ambursen).
- (2) Length of weir Effective length 50 feet.

	(3)	Crest elevation (top of concrete)		
		(a) Front	104.5.	
		(b) Sides	101.5.	
	(4)	Flashboard	Pin-type flashboards - 5 feet and 2 feet high.	
		(a) Crest elevation (top of board)	106.5.	
	(5)	U/S Channel	Pond.	
i.	Regulating Outlets			
	(1)	Invert	88.5 upstream and 81.3 downstream.	
	(2)	Size	10-foot by 10-foot sub- merged culvert with a 10-foot by 15-foot en- trance opening.	
	(3)	Description	Rectangular concrete cul- vert.	
	(4)	Control mechanism	Stop logs and two 4-foot by 4-foot gates, manually operated.	

#### SECTION 2 - ENGINEERING DATA

#### 2.1 Design

Drawings indicating plans, elevations and sections of the dam and appurtenant structures, including the details of the discharge facilities, are available from project records. Selected drawings are included in Appendix B, following the listing of records, and past inspection reports. Soil Profiles, limited in nature, are also available from project records.

#### 2.2 Construction

No engineering data are available on the construction of this dam.

#### 2.3 Operation

No engineering operational data was disclosed. The original use of the storage in this pond was for generation of hydropower. Presently, the pond is used for recreation. Goose Pond is a part of the Mascoma River storage system. The operation of Goose Pond is interlinked with the operation of the remaining three lakes of the Mascoma River system, namely, Grafton Pond, Crystal Lake, and Mascoma Lake. Goose Pond is the largest of four ponds in the terms of storage volume. The pond is filled by spring runoff, and the resulting stored water is gradually released during the summer to supplement dry weather flow in the Mascoma River and to maintain the level of Mascoma Lake. The fall rains result in additional water being stored for use during the winter months and to keep the channel open at the Lebanon water Works Pumping Station. The pond level is dropped to a point consistent with the amount of snow cover to make room for spring runoff.

#### 2.4 Evaluation

#### a. Availability

Pertinent structural, geotechnical, and hydrologic data, which formed the basis of the design of the dam, are available on a limited basis.

#### b. Adequacy

Sufficient engineering data are available for a Phase I inspection.

#### c. Validity

The available data is considered valid on the basis of the results of the visual inspection.

#### SECTION 3 - VISUAL INSPECTION

#### 3.1 Findings

The Phase I inspection of the Goose Pond Dam was performed on June 8, 1978. A copy of the inspection check list is included in Appendix A.

#### a. General

In general, the soil features are in fair condition. The concrete was observed to be in poor to good condition, see subparagraph c.

#### b. Dam

No evidence of vertical or horizontal misalignments was observed. There is no indication of sloughing, bulging, or movement of the slopes nor is there any evidence of piping.

The riprap slope protection on the upstream slope is in poor to fair condition. A section of the slope protection, approximately between 66 feet and 105 feet east of the spillway, has been washed away.

Standing water, approximately 300 feet west of the spillway, was observed at the toe of the western embankment. The area appears inadequately graded for drainage, and it is probable that the water observed is a combination of runoff and seepage.

At the toe of the eastern embankment between the two extreme eastern clean-out basins, standing water was observed. The area downstream of the dam in this area is not adequately graded for drainage, and it is probable that this water is trapped runoff rather than seepage.

The four clean-out basins located east of the spillway are in good operating condition. Visual observations indicate approximately 2 to 4 inches of sand in the bottom of the basin.

Vegetation, consisting of grass and weeds, was noted on the upstream slopes and on the top of the dam. Small bushes were observed on the downstream slope.

#### c. Appurtenant Structures

At the time of our inspection, the water level of the pond was at elevation 106.6 (local datum), approximately 0.1 foot above the top of the spillway flashboard. Therefore, we could not visually inspect the intake structure, the outlet culvert (10 feet by 10 feet), the two 4-foot by 4-foot gates regulating flow into the outlet culvert due to the fact that they were underwater.

The concrete of the spillway and its wingwalls above the water level was observed to be in good condition. Joint alignment is generally good and no erosion was noted.

The manually operated gate shafts are supported on a platform over the spillway. The cresoted wooden planking floor of the platform and the footbridge is in very good condition. The flashboards and the manually operated gate shafts were observed to be in operable condition. The railings of the platform and the footbridge are in good condition.

The exposed concrete of the core wall is in poor condition. Both horizontal and vertical cracks were observed with numerous areas of erosion. The concrete of the outlet structure and its wingwalls above the water level was observed to be sound. Joint alignment is generally good and no erosion was noted.

#### d. Reservoir Area

Goose Pond covers 668 acres in the towns of Canaan and Hanover in Grafton County, New Hampshire. It was formed by a dam on the Goose Pond Brook, which is a tributary to the Mascoma River, and is located 8.6 miles above Mascoma Dam. The pond collects the runoff from a drainage area of 15.7 square miles. The pond is approximately 2.5 miles long. There are several private cottages and year-round residences located on the shores of the pond. The reservoir shores are heavily wooded.

#### e. Downstream Channel

The downstream channel and side slopes are in good condition.

#### 3.2 Evaluation

The observed condition of the dam is fair. The potential problems observed during the visual inspection are listed as follows:

a. Standing water at the toe of the eastern and western  $\mbox{\sc embank-ments.}$ 

- b. Erosion of the exposed concrete of the core wall.
- c. Lack of slope protection on the upstream slope between 66 feet and 105 feet east of the spillway.

#### SECTION 4 - OPERATIONAL PROCEDURES

#### 4.1 Procedure

The New Hampshire Water Resources Board has operated Goose Pond Dam since 1969. The Pond level is maintained by a box type spillway located at the center of the dam. The flow is controlled by sectional flashboards 5 feet high and 2 feet high. The only control available to lower the pond level is a 10-foot by 10-foot conduit that is regulated by two gates and stop logs, both of which are manually operated.

#### 4.2 Maintenance of Dam

The maintenance of Goose Pond Dam is the responsibility of the New Hampshire Water Resouces Board.

#### 4.3 Maintenance of Operating Facilities

Throughout the year, the Dam is visited on a weekly basis by an inspector from the New Hampshire Water Resources Board. The maintenance of the gate operating facilities controlling the flow through the undersluice at the bottom of the intake structure is satisfactory:

#### 4.4 Description of any Warning System in Effect

A flood warning system is non-existent.

#### 4.5 Evaluation

The operation and maintenance procedures for Goose Pond Dam, consisting of a weekly program of inspection, should ensure that all problems encountered can be remedied within a reasonable period of time.

#### SECTION 5 - HYDRAULIC/HYDROLOGIC

#### 5.1 Evaluation of Features

#### a. Design Data

- (1) This dam falls under the category of high hazard potential, and it is intermediate in size. Using the "Recommended Guidelines for Safety Inspection of Dams," the recommended spillway test flood peak inflow is equal to the probable maximum flood. The spillway test flood inflow hydrograph, estimated, is furnished in Appendix D. The test flood peak inflow is 28,730 cfs.
- (2) The estimated peak outflow is 3,650 cfs, corresponding to the routed spillway test flood through the pond. Refer to Appendix D for details.
- (3) The Goose Pond storage capacity versus the elevation, an estimated capacity curve, is included in Appendix D.
- (4) The estimated composite discharge rating curve for all the discharge facilities is furnished in Appendix D.
- (5) The hydrologic map of the watershed above the dam site, including the reservoir area, watercourse, and elevation contours, is furnished in Appendix D.

#### b. Experience Data

Except for limited information, past flood details are not available for this dam.

#### c. Visual Observations

The crest of the non-overflow section is l1 feet above the crest of the spillway. At the time of inspection, water was observed flowing over the flashboards on the spillway crest. The hydraulic design of the spillway is good.

#### d. Overtopping Potential

The spillway test flood peak inflow is 28,730 cfs. Using the spillway test flood inflow hydrograph, the composite rating curve for all the discharge facilities, the capacity curve, detailed flood routing computations were made, and it was found that the surcharge

elevation to be approximately 105.3 (see Appendix D for details). There is enough clearance since the top of the earth embankment is at Elevation 112.5. Therefore, the dam will not be overtopped by the test flood if all the discharge facilities are functioning at their optimum capacity.

#### SECTION 6 - STRUCTURAL STABILITY

#### 6.1 Evaluation of Structural Stability

#### a. Visual Observations

The upstream slope could not be seen due to the fact that it was under water. The visual inspection revealed the following evidence of possible stability problems:

- (1) Standing water at the toe of the eastern and western embankments.
- (2) Lack of slope protection on the upstream slope between 66 feet and 105 feet east of the spillway.

Visual inspection of the concrete core wall and spillway section did not reveal any evidence of instability.

b. Design and Construction Data

There are no design computations available, but design drawings, dated 1917 and 1952, were obtained from project records.

c. Operating Records

Except for memorandums and correspondence listed in Appendix B, other records are not available at the office of the New Hampshire Water Resources Board.

d. Post-Construction Changes

No changes were made since 1952.

e. Seismic Stability

The dam is located in Seismic Zone 2 and in accordance with recommended Phase I guidelines does not warrant seismic analyses.

#### SECTION 7 - ASSESSMENT, RECOMMENDATIONS & REMEDIAL MEASURES

#### 7.1 Dam Assessment

#### a. Condition

Visual inspection and operational history indicates that Goose Pond Dam is in fair condition and functioning satisfactorily.

#### b. Adequacy of Information

An adequate assessment of the dam consistent with the scope of Phase I investigation has been made based upon the visual inspection and available information.

#### c. Urgency

The recommended operation and maintenance measures enumerated below should be implemented within 1 year of receipt of this Phase I report by the owner.

#### d. Need for Additional Investigation

The information available from the visual inspection is adequate to identify the potential problems which are: standing water at the toe of the western and eastern embankments, and the lack of slope protection on the upstream slope east of the spillway. These problems require the attention of the engineering staff of the New Hampshire Water Resources Board to determine the cause, and then specify remedial measures to rectify the problem. If left unattended, the problems could lead to instability of the structure.

#### 7.2 Recommendations

No major modification or engineering investigation is recommended at this time.

#### 7.3 Remedial Measures

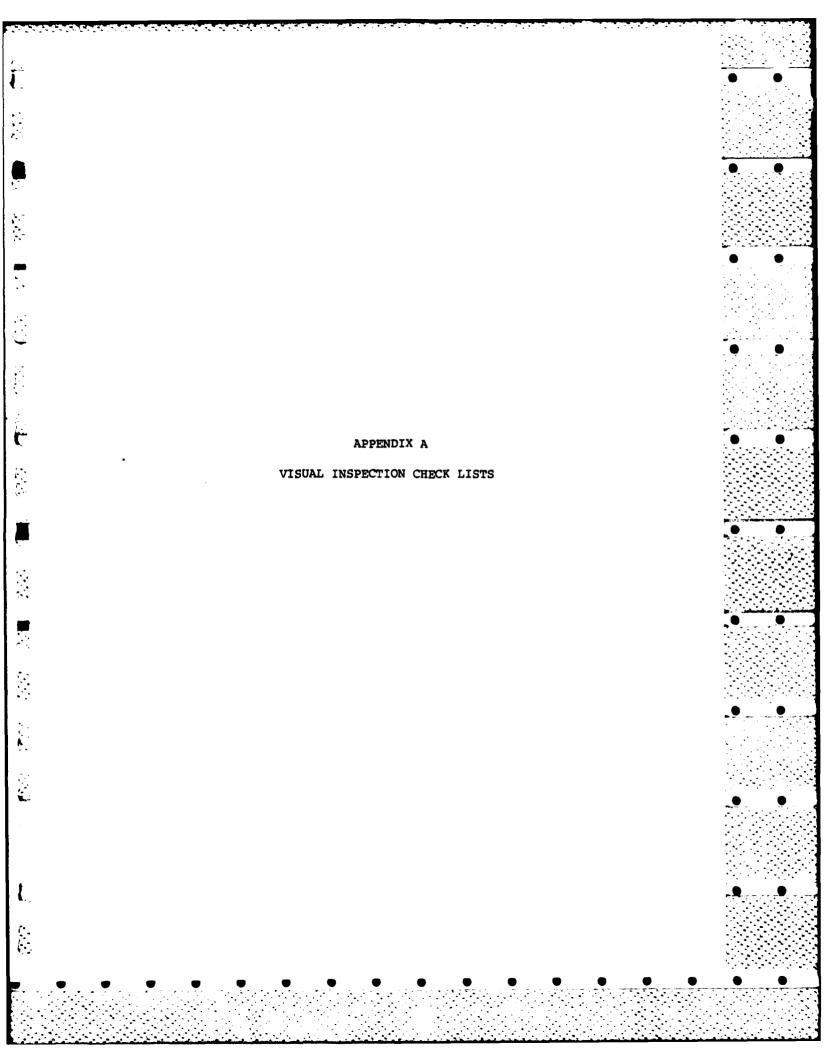

It is considered important that the following operating and maintenance procedures be attended to as early as practical:

a. The slope protection on the upstream slope between 66 feet and 105 feet east of the spillway should be reestablished. If not corrected, this could develop into a serious problem.

- b. The concrete surface of the core wall should be repaired as continued deterioration could develop into a serious problem.
- c. Standing water was observed at the toe of the eastern and western embankments. These areas should be monitored regularly to determine the cause. If it is seepage from the pond, appropriate remedial measures should be taken.
- d. Vegetation should be removed from the dam embankment, except for grass cover that prevents slope erosion.
- e. Upstream slope of dam and the intake structure should be inspected at low water.
  - f. A program of regular maintenance should be established.
- g. A program of technical annual periodic inspection of the project features should be prepared and initiated.
- h. Because the dam is located upstream of a populated area, round-the-clock surveillance should be provided during periods of high precipitation.
- i. The owner should develop a formal warning system. An operational procedure to follow in the event of an emergency should also be adopted.

#### 7.4 Alternatives

None recommended.

APPENDIX B EXISTING AVAILABLE INFORMATION

#### APPENDIX B

#### 1. Listing of Records and Their Location

The New Hampshire Water Resources Board, 37 Pleasant Street, Concord, New Hampshire, has four folders of records and correspondence from 1915 to 1977. These folders are filed under Town/Dam No. 36.01, Canaan/Goose Pond.

The documents of importance to the design and maintenance of the dam are as follows:

- (1) June, 1917 to July, 1918. Letters regarding the design and construction of an earth dam and concrete spillway in lieu of an old worn out timber crib. The correspondence regarding the sand and gravel test results was written by representatives of the Connecticut River Conservation Co., Turners Falls, Massachusetts; the Public Service Commission, Concord, New Hampshire; and Pittsburgh Testing Laboratory, Pittsburg, Pennsylvania. This file includes five photographs that were taken during the construction.
- (2) February 4, 1918. A technical report by Mr. Arthur T. Safford, Consulting Engineer, Lowell, Massachusetts, regarding the safety and capacity of the unfinished dam to pass the oncoming spring flood.
- (3) May 6, 1952. A petition by the Granite State Electric Co. to the New Hampshire Water Resources Board for reconstruction and repairs of the dam. This petition was granted by order of the New Hampshire Water Resources Board on June 16, 1952. The letter was signed by Mr. L. R. Frost, Water Resources Engineer.
- (4) October, November, 1952. Five large photographs taken during the reconstruction of the dam.
- (5) May 20, 1968. A description of properties in the towns of Canaan and Hanover proposed to be deeded to the State of New Hampshire, including Goose Pond.
- (6) 1969. An act by the general court authorizing the New Hampshire Water Resources Board to acquire the dam and water rights of Goose Pond.

(7) March 15, 1974. Five photographs for the Corps of Engineers' inventory program. No copy of the inventory program was available.

The following files at the New Hampshire Water Resources Board contain important hydrological data and hydraulic computations:

- (1) 1915. The maximum flood discharges from 1895 to 1915, on the Connecticut River drainage area.
- (2) July 8, and 9, 1915. The flood discharge curves.
- ( 3) November 10, 1933. The watershed and storage capacities and a plan of operation of the Mascoma River storage system, including Goose Pond.
- (4) 1952-1953. Several sheets of hydraulic analyses by Mr. F. C. Moore, Civil Engineer.
- (5) 1953-1961. Discharge ratings tabulated by Mr. L. D. Pierce, New England Power Service Co.
- (6) 1962. Profiles at Goose Pond Dam.
- (7) September 18, 1967. Ten-day elevations of the Goose Pond reservoir.
- (8) 1924-1969. Snow depth graphs from November to May 1 of each year.

#### 2. Copies of Past Inspection Reports

Copies of the following reports are included with this report:

- (1) October 17, 1919, by Mr. Robert E. Barrett, General Manager, Connecticut River.
- (2) July 21, 1936, by the New Hampshire Water Resources Board, two pages.
- ( 3) October 31, 1938, by the New Hampshire Water Control Commission, initialed by AAN & RLT, two pages.
- (4) December 31, 1960, data sheet by the Granite State Electric Co.

#### 3. Drawings

The New Hampshire Water Resources Board has the following prints showing the layout of the dam, sections, and details. Numbers (2) through (7) were made from June 12, 1917, to June 12, 1918, by the Mascoma River Improvement Company, Engineering Department, Turners Falls' office. Numbers (8) through (13) were made in 1952 by the New England Power Service Company, Boston, Massachusetts.

- (1) July, 1915, C-678, Goose Pond Plan (with some contours).
- ( 2) F-2114 Details of Earth Embankment at Goose Pond Dam.
- (3) F-2178, F-2179, and F-2180 Embankment Sections.
- (4) F-2115, F-2116, F-2117, F-2118, and F-2119 General Layout, Bulkhead, Spillway, and Sluiceway Details.
- (5) B-57, B-58, B-61, and B-62 Plan of Road, Floodgate, Alternate Spillway, Plans, Profiles, and Sections.
- (6) L-25, L-26, L-27 (L-2121, L-2122, L-2254) Details of Rack Bars, Reinforcing of Temporary Gate Opening.
- (7) September, 1928, E-2969; and without a date, L-2110 and E-4685 Profiles at Goose Pond Dam, Clean-out Basins.
- (8) \*H-13823, H-13824, H-13825, H-13831, and H-13836 Spillway Changes.
- (9) H-1037 Topography of Goose Pond Dam and Vicinity.
- (10) \*H-13805 Repairs to be Made to Dike.
- (11) D-4681, LS-3087 Rack Details, Steel Nosing Pieces.
- (12) January 17, 1944 D-3740 Goose Pond Property and Dam, by the Mascoma River Improvement Co.
- (13) January 31, 1978 F-2177 Goose Pond Dam Plan, Profile, and Sections, by the Mascoma River Improvement Co., Engineering Department.

<sup>\*</sup>Reduced copies of drawings are included with this report.

EXCERPT from letter of Robert E. Barrett, General Manager, Connecticut River Conservation Company, Greenfield, Mass., October 17th, 1919. Original letter filed in connection with Grafton Pond file.

#### GOOSE POND -

On September 24th Goose Pond was visited. This dam is built of earth with a concrete core wall. The exposed portion of the core wall was in first-class condition, there being no evidence of settlement or bulging. No cracks were visible. A good growth of grass was on the downstream embankment and there was no evidence of washing. The heavy riprap on the upstream face of the dam was in good condition except a portion fifty feet long westerly from the spillway where the stone had caved in a foot or more due to the fine gravel upon which it was laid being washed out.

The caretaker was placing additional riprap upon this section and was going to fill up to the original surface of the riprap. An open tile drain was being laid at the toe of the downstream embankment on the westerly side. The downstream slope showed no evidence of sloughing and was in first-class condition.

The water stood at gage 8.7; full pond is gage 23.5. This reservoir was filled to overflowing on April 6th and the gate tender recorded a maximum depth of 16 inches over the spillway in the Spring. There was no floating debris in front of the dam. A large number of floating logs and stumps were removed from in front of the dam during the high water in the Spring by the use of the derrick over the spillway.

\*With the repairs to the riprap and the laying of the open tile drain, both of which should be completed by the middle of October, the dam will be in first-class condition,

\* October 16th. This work is now practically completed.

BHEET NUMBER 114

DATE 1-50-1978

SUBJECT GOORE POND DIAM.

ESTINATION OF DEPTH OF FLUID WATE CHECKED BY

IN THE VICINITY OF DAMAGE IMPACT AREA DUE TO BREACH IN THE DAM AT RECENCIE.

Ad emploined in dection 12 d, it is not possed to

to generate downstrus on dam failure hypograph in the widnist of the samege ampact areas using USGS quadrang a sheet on which the contours are at 20-fort untersuls.

was a vailable for the area.

impact area and the course of the stream, a bull park whimate has been made a stollows:

Dipth of Water above the Kinerled at F.R.L

= 106.5-81.5

= 25.0

Hught of Herd wave at damage impact

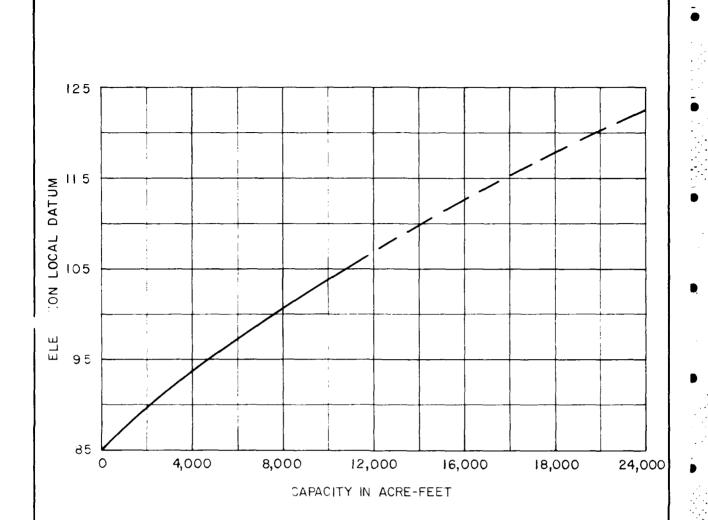

anca is estimated to be 15 feet.
Midth of water spread at dominge impact
anca is approximately indicated on the
USGS MAP included in the APPENDIX-D.
