20. ABSTRACT (Continue on reverse side if necessary and identify by block number) (U)Surface winds at NWC can affect tests and flight activities. The winds and the dust they can carry affect not only visibility and personnel safety, they also aerodynamically influence missiles and parachutes. (U)Surface winds at NWC tend to be seasonally similar as well as similar in their daily surface pattern. A compendium of seasonal and daily surface wind information is useful to Center personnel in scheduling tests as well as in performing test assessments. (U)The compiled data are presented in tables and wind roses.

INTRODUCTION

The Naval Weapons Center (NWC), China Lake, California, is the principal Navy RDT&E Center for air warfare systems and missile weapon systems, and the national range/facility for parachute test and evaluation.

NWC is geographically well located for its mission because good flying weather and abundant air and ground space are essential for weapon testing and evaluation. Clear skies prevail at NWC throughout most of the year; the climate is semi-arid with precipitation averaging about 3.5 inches a year.

Surface winds affect tests and flight activities at NWC. This report contains surface wind data recorded at the Center over a 19-year period. Because winds blow in a seasonal pattern as well as in a diurnal pattern, the wind data contained in this report will help Center personnel in planning and scheduling tests and will aid in test evaluation.

Surface wind data in this report were recorded at the Instrument Observation Building (IOB) on NWC's China Lake Complex. Attention must be paid, however, to topographic and orographic details at NWC, because winds can be highly variable from place to place. The IOB is located in a position which makes it less subject to high winds, especially northerly winds, than either the the Naval Air Facility or the west side of the valley. On the other hand, westerly winds are more likely to be stronger at IOB than on the west side of the valley. Therefore, test site location should be taken into consideration when surface wind data is used for scheduling and test evaluation.

TOPOGRAPHY OF NWC RANGES

NWC lies on the northwestern edge of the Mojave Desert at latitude 35°N and longitude 117°W, and is 2,215 feet above mean sea level (msl) (see Figure 1). NWC has two major areas: the China Lake Complex and the Mojave B/Randsburg Wash Complex. The NWC headquarters area, the China Lake community, and the city of Ridgecrest are located in the Indian Wells Valley near the southern edge of the China Lake Complex.

The Mojave B/Randsburg Wash Test Range Complex administrative facilities are located in Randsburg Wash, 25 miles southeast of the China Lake community. Winds over this Complex have not been consistently monitored and are not considered in this report.

Mountains surround the China Lake Complex test ranges: the peaks of the Sierra Nevada, a few miles to the west reach 8,000 feet; about 75 miles north, Mt. Whitney, the highest point in the contiguous 48 states, exceeds 14,000 feet. The China Lake Complex is bounded on the north by the Coso Range and on the east by the Argus Range with peaks up to 8,000 feet; and to the south by the El Paso Moutnains which reach heights of 6,000 feet. Further east, the Panamint Mountains rise over 10,000 feet.

EFFECT OF WIND PATTERNS ON FLYING WEATHER

Air routinely flows into the Indian Wells Valley through low mountain passes. Air circulates in from the San Joaquin Valley via Tehachapi Pass and Red Rock Canyon as well as Walker Pass. To the northwest, air from Owens Valley flows through the gap at Little Lake. From the east, air often comes into the Valley through Burro Canyon and, from the southeast, through the gap between the Argus and El Paso Mountains (see Figure 1).

Flying weather is generally good throughout the year except for turbulence caused by gusty surface winds. Flying is affected at all altitudes by the gusty winds and by turbulence produced near, or downwind of mountain slopes. Wave clouds over the Sierra Nevada Mountains occur during strong westerly flows. These flows, called horizontal rotors, eddy thousands of feet in a circular motion. The surrounding mountains, however, have a moderating effect on the jet stream. When a moderate-to-strong northwesterly jet stream lies high above the Center and causes strong winds over the southern Mojave Desert, only a light southwesterly flow occurs over the Center because of the mountains.

Each month averages more than 20 clear days. Ceilings less than 5,000 feet occur only 3 to 6 days a year. Marginal flying conditions exist about 6 days a year, and are caused either by poor visibility from blowing dust and sand, or by lowered ceilings occurring in conjunction with frontal precipitation. For a few summer days, mainly during August, torrential rains, low ceilings, and cumulus activity may accompany southeasterly to southwesterly flows.

SEASONAL WINDS

The strongest winds occur in the late winter and spring as fronts move rapidly through the area. These fronts occasionally cause severe heavy sand and dust storms.

Winters are cool—nighttime temperatures often drop below 32° with daytime temperatures hovering in the 50s for about 70 days. A trace of snow falls at China Lake about once a year, but every 2 or 3 years as many as 4 inches may accumulate. Light surface winds are typical of winter months. Frontal systems with an average wind speed of 30 mph pass quickly through the Center. Occasionally during the winter, westerly winds of 25 to 40 mph blow for 24 hours.

Excellent visibility (50 to 150 miles) generally prevails during the winter. Even though winds over 15 mph frequently pick up loose sand, visibility seldom decreases to less than 10 miles. When strong north winds develop after the passage of fast-moving cold fronts or low pressure troughs, blowing dust or alkali that are carried into the valley can further decrease visibility to 2 to 7 miles. This happens only 2 or 3 days a winter.

Summers at NWC are characteristically hot and dry; visibility is about 60 miles. Daytime temperatures rise to 100°F or higher about 60 days a year and at nighttime drop to between 60° and 70°. Winds are usually calm during morning hours, but as afternoon temperatures rise, southwesterly winds of 10 to 20 mph develop. At times rapid and uneven surface ground heating creates "dust devils," whirlwinds filled with sand, with localized winds up to 35 mph.

NWC TP 6572

FIGURE 1. Map Showing NWC, the Surrounding Mountains, and the Major Air Flows.

WINDS AND TEST AND EVALUATION

Surface winds are a critical factor affecting tests and flight activities at NWC. Winds, and the dust they can carry, affect not only visibility and personnel safety, but also influence the trajectory of missiles and parachutes, thereby distorting test results. In addition, blowing dust can cause electrical effects that make handling of explosives hazardous.

DATA COLLECTION AND REDUCTION

The surface wind data herein were recorded over a 19-year period from early 1964 through late 1982, and are presented in the form of tables and graphs (wind roses). The data are compiled in 13 sets of five figures each. One figure of each set covers a 24-hour period. Each of the four figures covers four daily 6-hour time segments. The first set is a multi-year compilation of wind directions and speeds; the other 12 sets are compilations for like months.

Surface winds were recorded hourly at the IOB on NWC's China Lake Complex with a Bendix Friez Model 120 wind sensor. Using this data, Charter Data Processing (CDP), on contract to the Environmental Office at NWC, digitized and compiled the surface wind speeds and directions.

Recorded wind information is combined into four daily segments: 0000-0600, 0600-1200, 1200-1800, and 1800-2400. Wind direction is labeled for each of the 16 compass directions, and the corresponding wind speed value is placed into one of the following groups: 1-3, 4-6, 7-9, 10-14, 15-19, 20-24, and above 25 mph.

DATA PRESENTATION

NWC surface-wind data are presented in tables and in wind roses in the Appendix. Both presentations are used because each emphasizes a different aspect of the compiled data.

The tables (see sample below) emphasize wind speed during a certain percentage of the total number of recorded hours. Column 1 identifies the 16 compass directions from which the wind blows. Columns 2 through 8 give the number of hourly recordings of the wind speeds (in mph) blowing from each of the 16 compass directions. Column 9 gives the total number of hourly wind recordings for each compass direction and Column 10 gives the average wind speed for each compass direction. Column 11 gives the percentage of time the wind blew from each direction. Note that the total percentage of time the wind blew from each of the 16 directions does not always total up to 100.0% because of rounding-off. For example, in the period covered in the sample table, the wind blew from the north in 1738 hourly recording periods. These recordings represent 1% of the total number of recordings made, and the wind speed averaged 9 mph when it blew from the north.

NWC TP 6572

The wind roses in this publication show the direction of the wind at a given location during a certain time. Radii extending from the center of the circle show the percentage of time the wind blew from a particular direction. For example, a radius extending from the center of the circle to the north indicates that the wind blew from the north; the percentage of time it blew is indicated by the length of that radius. Each wind rose accommodates a maximum radius (center to edge) representing 30 percent. Radii representing less than 3% (considered insignificant in identifying trends) have been excluded. At the end of each radius is a number that indicates the average wind speed for that radius.

WIND DIRECTION

The wind directions used in this document define the direction, relative to true north, from which the wind is blowing. Listed below are the limiting angles for the sixteen compass points used in the tables and wind roses. Wind speeds are stated in miles per hour.

Appendix
COMPILED SURFACE WIND DATA

This Appendix contains tables and wind roses showing the compilation of 19 years of surface wind data at NWC. The tables and wind roses are presented as a multi-year compilation of data followed by compilations of data for like-months.
