OPERATIONAL USE OF THE REEDM
by

Billie F. Boyd
Office of the Staff Meteorologist
Eastern Space and Missile Center
Patrick AFB, Florida

In 1976, H.E. Cramer Company, Inc began development of the NASA (Marshall Space Flight Center) Rocket Exhaust Effluent Diffusion code which resulted in the REEDM (Rocket Exhaust Effluent Diffusion Model). REEDM has been used for Shuttle support at Kennedy Space Center (KSC) since the start of the Shuttle program; however, the model has undergone considerable changes during that time. Cramer has been under contract to the United States Air Force since 1983 for purposes of refining the model as used at KSC and to develop a specialized model for use at Vandenberg AFB for west coast Shuttle launches.

The model has been adequately described by Clint Bowman of H.E. Cramer Company (preceding paper). The intent of this paper is to present the operational considerations in the use of the model and as such concentrates on that area outside the REEDM code: the meteorological data that goes into the code and its significance.

There are three sources for the meteorological data input to the model: rawinsonde data, instrumented ground tower data, and forecast data. The rawinsonde data files are built from rawinsonde releases at the Cape Canaveral Air Force Station (CCAFS) site approximately 10 miles southeast of the Shuttle launch area (pad 39A). Releases to support the Shuttle are normally made at 24, 11, 8 $\frac{1}{2}$, 5, 2 $\frac{1}{2}$, and 1 hour prior to launch. Data files are available 30 to 40 minutes after release. The KSC/CCAFS meteorological tower network currently consists of 16 permanent and 9 temporary towers which provide updated data every five minutes. The primary tower used for REEDM is tower 313, instrumented to 500 feet and located approximately 4 miles northwest of pad 39A.

The meteorological file from the rawinsonde is input to the REEDM which builds a file for display. The forecaster verifies the rawinsonde data, corrects if required, adds tower data if desired, determines homogenous layers in the lower 10,000 feet, and runs the model. If significant changes are expected prior to launch, actual data are changed to forecast values which are used to run the model. The following items are all significant as illustrated in the view graphs: wind direction, wind speed, directional variation (σ as a measure of turbulence), temperature and dew point. The importance of these parameters is illustrated in the series of view graphs for the two Shuttle launches in April 1985.

Measurements made for STS-51-D, launched 12 April 1985 indicate the model is currently performing quite well when the correct meteorological data are input.

Summary of View Graphs

1. Schematic diagram illustrating major components of the REEDM.
2. Diagram of KSC/CCAFS area indicating location of meteorological instrumented towers - the WINDS (Weather Information Network Display System).
3. Rawinsonde file input to the REEDM at L-5 on 12 April 1985 (Mission 51-D).
4. Rawinsonde file as modified (interpolated) by an earlier version of REEDM (51-D).
5. Rawinsonde file as interpolated by the latest REEDM. Note: 12 vs 4 additional levels, (51-D).
6. Display of met profiles and cloud segments without layering (51-D).
7. Met profiles and cloud segments after layering.
8. Isopleth values of HCl ground deposition ($25, 250, 1000 \text{ mg/m}^2$) based on the

DISTRIBUTION STATEMENT A

Approved for public release

L-5 data (51-D).

9. Gravitational deposition along the centerline by range/bearing/amount (51-D).

10. REEDM interpolated meteorological file at L-5 for mission 51-B, 29 April 1985.

11. Meteorological data profiles and cloud segment depiction based on L-5 data for mission 51B.

12. Isopleth values of HCL ground deposition based on the L-5 data (51-B).

13. Range/bearing/amount for the 51-B based on L-5 data.

14. REEDM interpolated meteorological file using launch time data. Note the wind shift (51-B).

15. Launch time met data and cloud depiction for the mission 51-B.

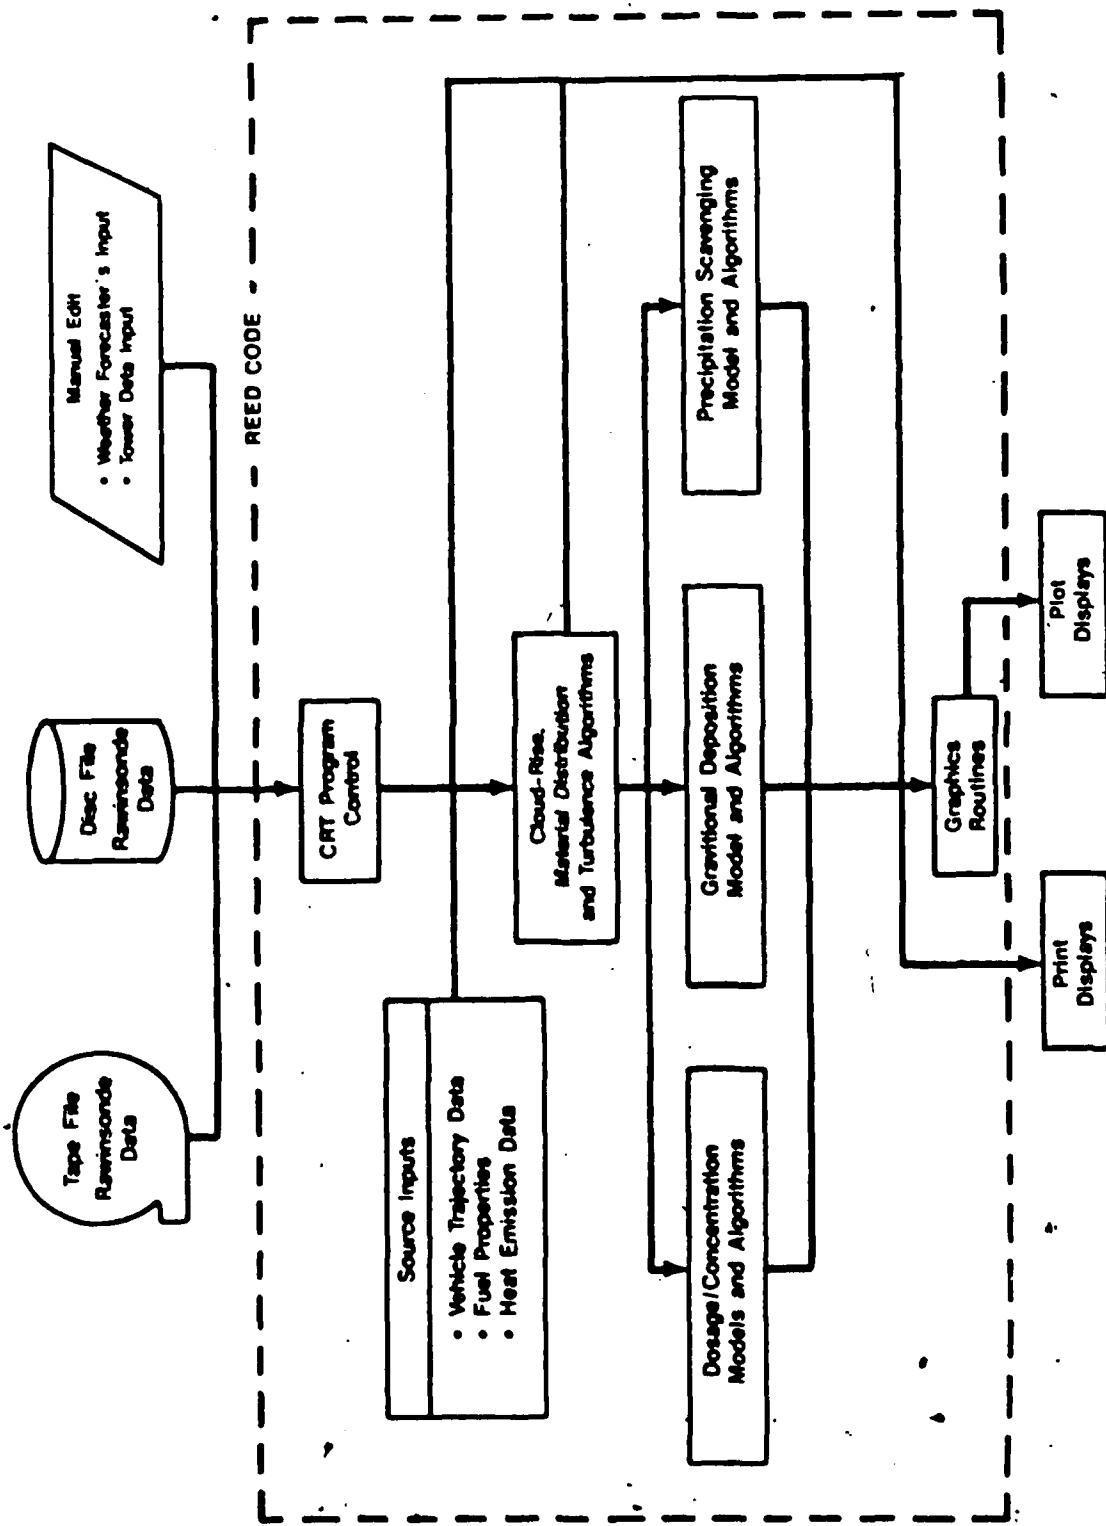

16. Isopleth values based on the launch time rawinsonde release. Note shift from L-5 (51-B).

17. Range/bearing/amount for 51-B based on the launch time rawinsonde data.
