19. ABSTRACT (Continue on reverse if necessary and identify by block number) This document is the Feb. 1986 update of the vendors guide which provides information about the implementations and products associated with the Defense Data Network TCP/IP internet protocols. The guide is divided into two sections. The first addresses TCP/IP (Transmission Control Protocol/ Internet Protocol) software implementations by machine type, and the second is about hardware implementations. Each section lists the products alphabetically and provides information such as their history, documentation, distributor, contact person, and other facts. This guide does not specifically endorse or recommend any product.

It is the intent of the DDN Network Information Center (NIC) to make the TCP/IP Implementations and Vendors Guide widely available to DDN users at minimal cost. It may be obtained in hardcopy or machine-readable form from several sources. [REDACTED]

[REDACTED] Non-military users such as contractors, systems personnel, and researchers may obtain hardcopy from the NIC by sending \$10.00 (\$13.00 overseas) to the DDN Network Information Center, SRI International, Room EJ291, 333 Ravenswood Avenue, Menlo Park, CA 94025. Copies are available online to DDN users who have access to File Transfer Protocol (FTP). The file NETINFO:TCP-IP-IMPLEMENTATIONS.TXT contains an ASCII sequential version. This file is updated on a continual basis. The hardcopy version is produced twice a year, in February and July.

TCP/IP Implementations and Vendors Guide. Printed and bound in the United States of America. Published by the DDN Network Information Center, SRI International, Menlo Park, CA 94025.

Date: February 1986

ACKNOWLEDGEMENTS

The TCP/IP Implementations and Vendors Guide was prepared by the DDN Network Information Center (NIC) for the Defense Communications Systems (DCS) of the Defense Communications Agency (DCA) under contract number DCA-200-84-C-0024, CDRLs E009 and E009A. This Guide was compiled with the assistance of many people, most of whom are the contacts for products listed within this document. The NIC appreciates their contributions.

INTRODUCTION

This is a guide to implementations and products associated with the Department of Defense (DoD) Defense Data Network (DDN) TCP/IP protocols. It is published *for informational purposes only* by the Network Information Center (NIC) at SRI International on behalf of the Defense Communications Agency (DCA), Defense Communications Systems (DCS) and in no way endorses or officially recommends any implementation or product on the part of the Defense Communications Agency, the Defense Advanced Research Projects Agency (DARPA), the NIC or DoD. It is not complete. Omission of any vendor or implementor has no significant implication, other than that the NIC has no information about that vendor or implementor, or that the information was not available at the time of this printing. Likewise, only completed fields of the product templates are included, and unfilled fields have been deleted to conserve space. Anyone planning to use either a product or an implementation is urged to do their own investigation of the details, costs, and support of the product.

This Guide is divided into software implementations (listed alphabetically by machine type) and hardware implementations (listed alphabetically by company), and multiple machine implementations.

For your convenience in locating particular implementations, an index is provided. The index is sorted by O/S, machine type, company name and other important keywords such as "X.25" and "Gateway".

Vendors who wish to have their TCP/IP products tested and qualified for use on the DDN should contact Code B613, the Development, Test and Evaluation Branch of the DDN DCS for details.

Request for comments (RFCs) and Internet Experimental Notes (IENs), referred to in this document, are available from the NIC. Network users may obtain online copies from the SRI-NIC.ARPA host through the File Transfer Protocol (FTP). Filenames are of the format RFC:RFCnnn.TXT (where nnn is the number of the RFC) and IENs are of the format IEN:IEN-nnn.TXT (where nnn is the number of the IEN -- note the dash in the IEN filename). People without access to the DDN may call the NIC at (800) 235-3155 for hardcopies of RFCs, IENs or this guide.

Online copies of the guide are available through FTP in the file named NETINFO:TCP-IP-IMPLEMENTATIONS.TXT. For those who are not on the network, contact the DDN Network Information Center to request copies of RFCs, IENs or this guide by calling our toll-free number (800) 235-3155. Network users without FTP capability may send requests to NIC@SRI-NIC.ARPA.

The NIC welcomes your comments, additions and corrections. The last page of this document contains a Feedback form for your convenience in sending us your comments. Network users may send in the form via network mail to OLE@SRI-NIC.ARPA.

1. TCP/IP SOFTWARE IMPLEMENTATIONS BY MACHINE TYPE

1.1. Apple

1.1.1. Stanford Ethernet Appletalk Gateway

PRODUCT-OR-PACKAGE-NAME: Stanford Ethernet Appletalk Gateway (SEAGATE)

DESCRIPTION:

SEAGATE is a gateway that connects an Ethernet using the internet protocols, to an applebus (AppleTalk) using Apple or IP protocols. With such a gateway in place, it becomes possible to create server daemons to provide file, printing, mail, etc. services for Macintoshes.

This distribution of SEAGATE provides all the information and software you should need to setup your own gateway. Please bear in mind that this distribution is not 'supported' and that we can't give extensive help about the mechanics of putting your gateway together. We would like to hear about bug reports or enhancements however.

To assemble your own gateway, you will need at least the items below:

- The hardware is a 3 card multibus system: A 'SUN' (or Forward) 68000 CPU board, an Interlan NI3210 Ethernet card, and a homemade applebus card (about 8 chips) which takes an afternoon to wirewrap.
- A UNIX (usually VAX) running 4.2 BSD, 4.1 BSD or Eunice. This is because the source distributed is written in the PCC/MIT 68000 C compiler. [This is the same compiler included with the SUMACC Mac C cross development kit.] You can probably substitute any 68K C compiler and assembler, but it will be harder.
- Inside Mac, update service, and the Mac software supplement.
- Applebus Developer's Kit, includes: protocol manual, applebus taps and interconnecting cable, Mac applebus drivers on SONY disks.

Software usable through the gateway includes:

- MAT (Mac / ATP transfer program). A simple file transfer utility and daemon. Also serves as a skeleton application for general Mac transaction services. For example you could easily build a Mac program to read and create 'internet mail' containing pictures and speech.
- EFS (external file system). Allows UNIX to act as a general file server for the Macintosh. The Mac user sees the standard 'desktop' iconic model of his remote directory on UNIX. This software was written by John Seamons of LucasFilm and adapted by us for AppleTalk.
- TELNET and TFTP. These correspond to the UNIX programs used to access virtual terminal and file transfer services. The Mac programs here were developed by MIT (Romkey) / Dartmouth (Mark Sherman) and CMU (Tim Maroney). This software has been released by Tim to net.sources.mac (usenet) and is FTPable from CMU.

PREVIOUS PAGE
IS BLANK

The released material for all of the above includes source code and documentation. These files are currently publicly accessible on-line via FTP to our SUMEX host, in the <info-mac> directory. There are also tar magtapes available of SUMACC and INFO-MAC (which contains the seagate files). Magtape info:

The tape duplication company below charges \$65 to send each tape. This includes the new reel of tape and surface (book rate) postage. They will accept prepaid checks or money orders. Call the number below for additional info about postage for airmail or international mail.

Maria Code
Data Processing Services
Info-Mac TAR tape, and/or SUMACC TAR tape
1371 Sydney Drive
Sunnyvale, CA 94087
(408) 735-8006

DOCUMENTATION:

On [SUMEX] <info-mac> the files are:

seagate.ms	documentation in -ms format
seagate.hard	the wirelist for the applebus interface
seagate.shar1	the main gateway sources (including above docs)
seagate.shar2	the ddt, dlq, testsc, and tftp subdirectories
seagate-efs.shar	the file service (client and server)
seagate-mat.shar	the MAT service

All these files are plain ASCII and can be FTP'd from SUMEX with the 'anonymous' login. The shar (shell archive) files are large so we would appreciate it if you would avoid transfers during 9 AM to 5 PM PST.

Public domain (Copyrighted by Stanford; may be used, but not sold without permission)

INFORMATION-UPDATED:

January 1986

1.1.2. Apple Macintosh IP

PRODUCT-OR-PACKAGE-NAME: MacIP

DESCRIPTION:

MacIP is a set of libraries and programs for the Apple Macintosh. The programs allow use of Telnet and TFTP over AppleTalk. In conjunction with gateways and bridges, the programs allow the use of Telnet and TFTP with other IP hosts on other networks, e.g., a Vax/Unix on Ethernet. The libraries can be used by Macintosh programs written in Lisa Pascal to provide access to implementations of IP, TCP and UDP protocols on AppleTalk.

DOCUMENTATION:

Preliminary documentation is available as a technical report from the Mathematics and Computer Science Department, Dartmouth College, Hanover, NH 03755. A later (more complete and accurate) document may be forthcoming from the University Computation Center, Carnegie-Mellon University, Pittsburgh, PA 15213. (See contacts below). Some documentation accompanies the sources.

CPU:

Apple Macintosh (TFTP: 128K; Telnet: 512K)

O/S:

Apple Macintosh

IMPLEMENTATION-LANGUAGE:

Lisa Pascal and 68000 Assembler

DISTRIBUTOR:

- 1) Usenet (net.sources.mac)
- 2) Mark Sherman (see below)
- 3) Tim Maroney (see below)

CONTACT:

1) **Tim Maroney, Tim.Maroney@CMU-CS-K.ARPA**
University Computation Center
Carnegie-Mellon University
Pittsburgh, PA 15213

2) **Mark Sherman, mss%Dartmouth@CSNET-RELAY.ARPA**
Dept. of Mathematics and Computer Science
Dartmouth College
Hanover, NH 03755

ORDERING-PROCEDURE:

Under revision. Generally, Tim Maroney handles Usenet postings, Mark Sherman handles individual requests. Currently, send a request to Mark Sherman along with five blank single-sided microdisks (3.5 Sony compatible). We will return five disks with sources and programs (payment instead of disks is acceptable. Current estimate is \$5/disk.)

PROPRIETY-STATUS:

None.

INFORMATION-UPDATED:

November 1985

1.2. Bolt Beranek and Newman

1.2.1. BBN-C/70

PRODUCT-OR-PACKAGE-NAME: BBN-C/70

DESCRIPTION:

The C/70 processor is a BBN-designed system with a native instruction set oriented toward executing the C language. It supports BBN O/S, a UNIX look-alike. A full, well-debugged, implementation of TCP/IP is provided as part of the kernel. Both user and server Telnet, SMTP, and FTP run as 20-bit user processes.

CPU:

C/70

O/S:

BBN O/S (a UNIX look-alike)

IMPLEMENTATION-LANGUAGE:

C

DISTRIBUTOR:

BBN Communications Corporation
50 Moulton Street
Cambridge, MA 02238

CONTACT:

Mitchell Tasman, (mtasman@BBN-UNIX.ARPA), (617) 497-2562

INFORMATION-UPDATED:

February 1986

1.2.2. BBN-Gateways

DESCRIPTION:

In an effort to provide improved service in the gateways maintained at BBN, a new gateway implementation written in MACRO-11 instead of BCPL has been developed. The MACRO-11 gateway provides users with internet service that is functionally equivalent to that provided by the current BCPL gateways with the following exceptions:

- Packets with options will be fragmented if necessary.
- ICMP protocol is supported.
- The gateway sends Time Exceeded, Parameter Problem, Echo, Information Request, Destination Unreachable, and Redirect ICMP messages.
- Initially, Source Quench and Timestamp packets will not be supported.
- Class A, B, and C Network Address formats as specified in the September 1981 Internet Protocol Specification (RFC791) are supported.

The gateway contains an internetwork debugger (XNET) that allows the gateway to be examined while it is running. Buffer space is greatly expanded to provide better throughput. ARPANET RFNMs are counted so the gateway will not send more than 8 outstanding messages to an ARPANET host.

IMPLEMENTATION-LANGUAGE:

MACRO-11

CONTACT:

Robert Hinden (hinden@BBNCCV.ARPA), (617) 497-3757

1.3. Burroughs

1.3.1. SDC

PRODUCT-OR-PACKAGE-NAME: Burroughs DDN Interface

DESCRIPTION:

The Burroughs DDN Interface augments the Burroughs Network Architecture to support communication with Burroughs and other vendor equipment employing DoD protocols. DoD network software is implemented partly in the mainframe and partly in an intelligent front end processor. DDN connection is via X.25 Standard Mode at speeds up to 56 Kbps. Telnet, FTP, and SMTP protocols are supported above TCP and IP. Several mainframes may be connected to DDN through the same front end via a proprietary LAN, in which case the front end supports the External Gateway Protocol. Multiple IMP connections may also be supported.

CPU:

B 5900, 6900, 7900, A-Series

1.4. Control Data Corporation

1.4.1. [CDC-Cyber]

DESCRIPTION:

This will be a package of software and technical support services for interfacing Cyber computing environments to the Defense Data Network. The expected date of completion is the end of 1985.

CPU:

Cyber 170

O/S:

NOS

DISTRIBUTOR:

Control Data Corporation

1.4.2. CYGNUS

PRODUCT-OR-PACKAGE-NAME: Cyber TCP/IP, CYGNUS, NIP

DESCRIPTION:

CYGNUS is a central processor program which implements TCP, UDP, and IP. NIP is a peripheral processor program which acts as the network device driver for CYGNUS. Communication with the rest of the Internet is accomplished using a Cyber channel adapter which connects the Cyber with a Vax 11/780 system. The Vax acts as a front-end processor for the Cyber: ARP is implemented there and standard Ethernet hardware is used to physically connect to the network. This implementation is in experimental testing and will not be available for general release until May 1986.

DOCUMENTATION:

No published documentation currently exists. Internal documentation is under preparation.

CPU:

Cyber 170/750 with Vax 11/780 as front-end

O/S:

UT2D (University of Texas Dual Dinosaur)

1.5. Data General

1.5.1. [DG/VS]

DESCRIPTION:

The TCP/IP product currently supports Ethernet under the DG/VX operations system and will run under the AOS/VS operating system in the future. Support for the DDN implementation is forthcoming. Presently the product includes implementations of FTP and Telnet protocols. TCP/IP tracks the UNIX 4.2 BSD implementation.

1.7.1. BRL Gateway

PRODUCT-OR-PACKAGE-NAME: BRL Gateway

DESCRIPTION:

The BRL Gateway is a total redesign. None of the original MIT code was used. The gateway runs as a set of tasks on a simple multiprocessing operating system called LOS. Both LOS and the gateway code as described here were entirely designed and written by Ron Natalie.

This is an IP gateway with EGP support. The gateway will run on most PDP-11 series processors, but is designed to be portable to other machines that have C compilers. Point-to-point serial links, DEC PCL-11/B, and the ACC LH-DH/11 interfaces are currently supported. Work is in process to support the Interlan Ethernet interfaces with the Address Resolution Protocol, the Network Systems Corporation's HYPERchannel, and the Proteon Ringnet hardware.

All gateway functions and features of the IP and ICMP protocols are supported with the following exceptions. The ICMP timestamp packet is not implemented and ICMP source quench messages are ignored. IP timestamp and routing options are supported. The Exterior Gateway Protocol is supported as described in RFC904. Deviations from the specification are made to optimize the performance as a stub system from the existing core networks. The gateway also uses its own UDP based debug and monitoring protocol. GGP echo packets are also answered.

In addition, the gateway provides Virtual-Host service. TCP connections to be dynamically directed to an active host on the BRLNET. This allows the host "BRL" to appear to always be up for mail purposes.

The original BRL gateway was an early version of the MIT-C gateway modified to know about class B and C addresses and to work with the previously mentioned network interfaces. With the advent of EGP, higher network traffic, and greater routing intelligence, the modified MIT gateway became ineffective.

DOCUMENTATION:

Not yet

CPU:

Any PDP-11 processor that has memory management. The machines currently in use are a PDP-11/34 and LSI-11/23. A console terminal interface and a clock are required, as well as any network interfaces. The built-in line frequency clock on the LSI-11 processors may be used in lieu of an additional clock.

O/S:

LOS (the Little Operating System) is a small message-passing, multitasking operating system written for the implementation of the gateway, but is also being planned for use in real-time and file server applications. The Gateway code runs in the hardware user mode, while LOS itself runs in kernel mode. Interrupts are serviced in real-time by the user code.

IMPLEMENTATION-LANGUAGE:

With the exception of small parts of the operating system and some bit manipulation routines, which are written in assembler, both LOS and the Gateway code are written in the C language.

PROPRIETY-STATUS:

Both LOS and the Gateway are the property of the Department of the Army. They are available for public use at no charge. They may be distributed with commercial products with slight restrictions.

1.7.2. Fuzzball

PRODUCT-OR-PACKAGE-NAME: DCN/Fuzzball System for the PDP11

DESCRIPTION:

The Fuzzball internet software system has been developed with DARPA sponsorship over the last three years and used extensively for testing, evaluation and experimentation with other implementations. It currently runs in a sizable number of PDP11s and LSI-11s with varying configurations and applications. The system is designed to be used with the DCnet local network protocols as described in RFC-891 and the Fuzzball operating system for a multi-media internet workstation (also called a "Fuzzball"), which operates using emulation techniques to support the DEC RT-11 operating system and application programs. However, the system has also been used on other networks, including ARPANET, and with other operating systems, including RSX-11. An RSX-11 based version incorporating only IP/TCP modules is presently used to support the INTELPOST electronic-mail network.

The software system consists of a package of MACRO-11 and C modules structured into levels corresponding to local-net, IP, TCP and application levels, with user interfaces at each level. The local-net level supports several communication devices, including synchronous and asynchronous serial lines, 16-bit parallel links, Ethernet and 1822 interfaces. Hosts using these devices have been connected to ARPANET IMPs, Satellite IMPs, MACRO-11 Internet Gateways, SRI Port Expanders and to standard Ethernets, DECnets and X.25 public networks, as well as several DCnet local networks. When used on DCnet the system supports subnets as described in RFC-950, supports network-level alternate routing and local-level dynamic routing, as well as time-synchronization and error-reporting functions.

The IP level conforms to the RFC-791 specification, including fragmentation, reassembly, extended addressing and options, as well as the source-route option. A full set of ICMP features compatible with RFC-792 is available, including destination-unreachable, timestamp, redirect and source-quench messages. Destination-unreachable and source-quench information is conveyed to the user level via the TCP and raw-datagram protocol modules. Internet gateway (routing and non-routing) facilities conforming to the Exterior Gateway Protocol (EGP) RFC-904 specification can be included on an optional basis. This support can be configured to support hierarchically structured gateways and subnets.

The TCP level conforms to the RFC-793 specification, including PUSH, URGENT and options. Its structure is based on circular buffers for reassembly and retransmission, with repacketizing on each retransmission. Retransmission timeouts are dynamically determined using measured roundtrip delays, as adjusted for backoff. Data flow into the network is controlled by measured network bandwidth, and adjusted by source-quench information. Features are included to avoid excessive segment fragmentation and retransmission into zero windows. The user interface level provides error and URGENT notification, as well as a means to set outgoing IP/TCP options.

A raw-datagram interface is available for non-TCP protocols such as UDP (RFC-768). It includes internal congestion and fairness controls, multiple-connection management and timestamping. Protocols above UDP supported in the present system include Network Time Protocol (RFC-958), Time Server (RFC-868) and Name Server (IEN-116), Domain Name Server (RFC-883), and Trivial File-Transfer Protocol (RFC-783). Other raw-datagram services include XNET (IEN-158), Exterior Gateway Protocol (RFC-904), and several experimental services.

A number of user-level protocol modules above TCP have been built and tested with other internet hosts, including TELNET (RFC-854), File Transfer Protocol (RFC-959), Simple Mail Transfer Protocol (RFC-821), Multi-Media Mail Protocol and various other file-transfer, debugging and control/monitoring protocols.

Code sizes and speeds depend greatly on the system configuration and features selected. A typical 30K-word LSI-11/2 single-user configuration with all features selected and including the operating system, device drivers and all buffers and control blocks, leaves about 16K words for user-level application programs and protocol modules. A typical 124K-word LSI-11/23 or LSI-11/73 configuration provides the same service for up to 24 individually relocated users. Disk-to-disk FTP transfers across a DMA interprocessor link between LSI-11/23s operate in the range 30-50 Kbps with 576-octet packets. The 124K-word PDP11/34 INTELPOST

adaptation supports two 56-Kbps lines and a number of lower-speed lines. Typical throughputs range from 100 to 400 packets per second, depending on processor type and interface type.

1.7.5. UNIX V6

DESCRIPTION:

In the UNIX kernel we have modules to drive a "Pronet" device (10 Mb/s token-passing ringnet), to transmit and receive internet packets, to demultiplex incoming TCP and UDP packets, to reassemble internet fragments, and to maintain a cache of internet hosts and their best first hop gateways. Kernel code and data use from 9k to 10.5k bytes depending on the size of the receive packets buffer.

Outside the kernel we have: TCP, user and server Telnet, SMTP, ICMP, and TFTP. All are running but are in varying stages of development.

DOCUMENTATION:

Some documentation about the user/kernel interface and about the kernel code

CPU:

ORDERING-PROCEDURE:

We are willing to give this software to anyone who wants it, has a UNIX source license, and will agree to a few constraints. We should point out that it would be difficult for someone who is not a UNIX wizard to install this code. To find out more about the software send mail to martin@MIT-CSR.ARPA or to lwa@MIT-CSR.ARPA.

PROPRIETY-STATUS:

Copyright MIT Laboratory for Computer Science

1.7.6. Venix/11

PRODUCT-OR-PACKAGE-NAME: Venix/11 TCP/IP

DESCRIPTION:

This is based on the "UNIX V6" implementation available from the MIT Laboratory for Computer Science. It has been ported to a V7 UNIX system, in particular VenturCom's Venix/11 V2.0.

As little of the processing as possible takes place in the kernel, to minimize the code space required. It fits comfortably on I&D machines, but is almost hopeless on the smaller machines. The kernel includes a proNET device driver, IP fragment reassembly, IP header processing, local-net header processing, and simple routing. The rest of the IP processing, and all of the UDP and TCP functions, are in user libraries. The psuedo-teletype driver is also in the kernel, and is used by Server TELNET.

User programs handle ICMP processing; User and Server TELNET, SMTP, TFTP, Finger, and Discard. There are User programs for Nicname and Hostname. IEN-116 nameservers are used by all programs, and an IEN-116 nameserver is also provided. The TCP used is very simple, not very fast, and lies about windows. No FTP is available, nor is one currently planned.

DOCUMENTATION:

There is a full set of manual pages, and some internals documentation. The kernel code is well commented.

CPU:

PDP-11/44, 45, 70, 73, 84

O/S:

Venix/11 V2.0, should be simple to port to other V7 UNIX systems.

1.7.7. UNIX 2.9 BSD

DESCRIPTION:

2.9 BSD TCP/IP is an adaptation of Berkeley's original VAX TCP/IP (running under BSD 4.1 UNIX) which in turn is an offshoot of BBN's VAX TCP/IP. 2.9 BSD TCP/IP runs on PDP-11/44s and PDP-11/70s. The 2.8 version from SRI was adapted by Bill Croft (formerly at SRI), then Tektronix adapted it for 2.9. Berkeley took over modification of the software and brought it back to SRI where Dan Chernikoff and Greg Satz adapted it for a later release of 2.9. In addition to TCP/IP, UDP, ARP and the raw packet interface is available. ICMP redirects are not supported. User software implementations include Telnet and FTP, plus Berkeley-developed local net protocols, RWHO, RSH, RLOGIN, and RCP.

2.9 BSD with TCP/IP support could probably be made to run on smaller PDP-11s although the address space would be very tight and might present problems.

DOCUMENTATION:

Some documentation available; will be sent with tape request

CPU:

PDP-11/44, PDP-11/70

INFORMATION-UPDATED:

October 1985

1.7.9. BBN UNIX

PRODUCT-OR-PACKAGE-NAME: BBN-VAX-UNIX

DESCRIPTION:

BBN has developed an implementation of TCP/IP for DEC's VAX(TM) family of processors, that runs under the Berkeley 4.1 BSD version of UNIX(TM). The development effort was funded by DARPA. Some important features of the BBN VAX TCP/IP are that it runs in the UNIX kernel for enhanced performance, it is a complete implementation of the TCP and IP protocols, and provides facilities for direct user access to the IP and underlying network protocols. The IP module supports checksums, option interpretation, fragmentation and reassembly, extended internet address support, gateway communication with ICMP, and support of multi-homing (multiple interfaces and addresses on the same or different networks). The TCP supports checksums, sequencing, the ability to pass options through to the IP level, and advanced windowing and adaptive retransmission algorithms. Support is also provided for the User Datagram Protocol (UDP).

In addition to the TCP/IP software for the VAX, BBN has developed implementations of the Telnet Virtual Terminal Protocol, File Transfer Protocol (FTP), and Simple Mail Transfer Protocol (SMTP), for use with TCP. These protocols are operated as user level programs. Also provided are network programming support tools, such as network name/address manipulation libraries, status, tracing, and debugging tools.

The TCP/IP and higher level protocol software are now available direct from BBN. The software is distributed on a 1600 bpi tar format tape, containing the sources and binaries for a 4.1 BSD UNIX kernel containing the network modifications and the sources and binaries for the higher level protocols and support software. Documentation is provided in the form of a set of UNIX manual pages for the network access device, user programs, and libraries. In addition, a detailed installation document is provided. Device drivers are supplied for the ACC LH-DH/11 IMP interface, the Proteon Associates PRONET Local Network Interface, the ACC IF-11 IMP interface, and the Interlan 10MB Ethernet interface.

CPU:

DEC VAX-11 series.

O/S:

UNIX 4.1 BSD

IMPLEMENTATION-LANGUAGE:

C

DISTRIBUTOR:

BBN (see above)

CONTACT:

Patricia Buckley, (617) 497-3707

1.7.15. Internet VMS

PRODUCT-OR-PACKAGE-NAME: HYPER-Link

DESCRIPTION:

Hyper-Link is a series of communications software and hardware products which meet the Defense Communications Agency MIL-STDs for the Defense Data Network, for use on any of the DDN networks, such as ARPANET, MILNET, etc. These products also conform to the conventions of the UNIX 4.2 BSD implementation of these protocols for use with the many popular UNIX based graphic workstations, such as SUN, APOLLO, CIMLINK, CADNETIX, and others.

Hyper-Link supplies TCP/IP communication protocol software products, an Application Programming Interface to TCP functions for PASCAL, C and Assembly, and the MIL-STD applications File Transfer (FTP), Virtual Terminal (TELNET), and Simple Mail Transfer (SMTP).

Hyper-Link for VAX and MicroVAX VMS systems support Ethernet and DDN X.25 communications links. Ethernet attachment is through DEUNA or DEQNA controller boards. DDN X.25 attachment is through a "standard" certified ACC board (ACC 6250 or 5250). DDN LHDH attachment is also supported through the ACC LHDH controller. The X.25 connection can also be made certifiable to certain commercial X.25 networks such as GTE TELENET, TYMNET and others.

Hyper-Link software can concurrently operate with DECNET in a single VAX or MicroVAX system sharing a single DEUNA or DEQNA board Ethernet connection. This enables a low cost bridge function to operate between the two Ethernet networks.

Similarly, Hyper-Link supports both an X.25 and Ethernet connection in the same system, enabling operation of a LAN to Wide Area Network bridge function.

1.7.16. Tektronix VMS

PRODUCT-OR-PACKAGE-NAME: VAX/VMS

DESCRIPTION:

This implementation runs under VAX 780/VMS. It has a hyperchannel interface with a home-grown VMS driver. TCP/IP from 3COM interoperates with VMS TCP/IP over HYPERchannel. They have added TCP and IP options to UNET. Currently, there is no plan to market TCP/IP software, although it is available to the network research community for internal use only. Support has been added for Ethernet using an Interlan driver.

- TCP: Has no security or precedence.
- IP: No datagram reassembly or fragmentation. Neither Internet control protocol nor gateway protocol have been implemented. There are no plans to implement fragmentation.
- FTP: Not compatible with UNIX 4.2 BSD but compatible with 3COM's implementation of FTP. There are plans, however, to make it compatible with UNIX 4.2 BSD.

1.7.17. Wollongong MicroVMS

PRODUCT-OR-PACKAGE-NAME: WIN/MicroVX

DESCRIPTION:

This TCP/IP implementation includes Telnet (remote login), FTP (file transfer), SMTP (Mail) Netstat, Finger, TFTP. Supports the following network interface: DEC DEUNA Ethernet Controller.

DOCUMENTATION:

Installation Guide, Programmers Guide, QIO Guide, TCP/IP Primer and Users Manual provided.

CPU:

DEC MicroVAX I and II

O/S:

Micro VMS 4.0 or greater

IMPLEMENTATION LANGUAGE:

C

DISTRIBUTOR:

The Wollongong Group
1129 San Antonio Road
Palo Alto, CA 94303

CONTACT:

Wollongong Sales

December 1985

1.7.23. TENEX/FOONEX/AUGUST

DESCRIPTION:

SRI has implemented TCP/IP for the TENEX (FOONEX and AUGUST) operating system running on DEC-10 KA or KI and F2, F3 or F4 Foonly processors. It was adapted from the BBN and ISI versions of TENEX TCP/IP, with contributions from Ed Taft of Xerox and Phil French of Tymshare, and resides in the operating system. It is largely upward-compatible with TOPS-20 implementations and fully compatible with AUGMENT. Telnet, FTP, SMTP, ICMP, ECHO, TIME, WHOIS, and NAME service are available although some are still under development.

This is an implementation done at BBN. DARPA has dropped funding for continued support for Tenex development, and thus the latest versions done for BBN and DEC for TOPS-20 are not available for Tenex.

DOCUMENTATION:

None available at this time other than that embedded in the programs

CPU:

DEC-10 (KA, KI), Foonly (F2,F3,F4)

MIT-MC

1.7.26. BBN TOPS-20

PRODUCT-OR-PACKAGE-NAME: BBN-TOPS-20

DESCRIPTION:

The TOPS20 Internetworking software supports multiple networks, multiple interfaces on a single network, and multiple protocol suites. Included in the standard distribution are an interface to 1822 nets via an AN20, an interface to a network front-end via a DTE20, and the DARPA protocol suite (DEC is developing an Ethernet interface).

The DARPA IP, ICMP, TCP, Server TELNET protocols are included within the TOPS20 monitor; other protocols are implemented as user application processes. The IP module supports a routing cache maintained via ICMP redirect NET and HOST messages. It performs fragmentation and reassembly, implements all options and can forward traffic between any of the host's interfaces. Applications may interface to the IP layer using User Queues.

All ICMP messages are supported; error messages may be sent by any of the protocol layers; higher layers are notified when a message is received concerning one of their packets. Messages can be sent by applications using the User Queue facility.

Applications can interface to TCP either as a read/write file or via multiple buffers. The TCP layer supports IP routing options, ICMP destination unreachable, source quench, and redirects which specify a type-of-service, and the segment size option. Support for preemption, precedence, and security options is delegated to the application. Telnet supports options and subnegotiations.

There is extensive inter-layer flow control, error reporting, and monitoring. Utilities are available to provide information, list monitoring data, and perform diagnostics.

DEC has distributed a prior version of this implementation as part of its standard TOPS20-AN monitor; the current version is currently being transferred to DEC.

DOCUMENTATION:

User's Manual including Site Configuration Guide

1.7.27. DEC TOPS-20

PRODUCT-OR-PACKAGE-NAME: TOPS-20AN

DESCRIPTION:

Based on the DARPA sponsored TCP/IP implementation for TOPS-20 with major modifications. The BBN TCP/IP software was merged into the standard supported TOPS-20, and a different JSYS interface was implemented that utilized the existing TOPS-20 I/O JSYSs by adding a logical device for TCP. Supports: the 1822 interface, DEC NI20 Ethernet interface and the DEC CI20 computer interconnect.

DOCUMENTATION:

Hardware manuals, print sets, diagnostics write-up and descriptions in the TOPS-20 software notebooks.

1.12.4. Spartacus IBM-PC

PRODUCT-OR-PACKAGE-NAME: KNET TCP/PC

DESCRIPTION:

This product enables the IBM Personal Computer to participate as host on Ethernet or any network using TCP/IP protocols. Supports TFTP and Telnet. Requires 128K bytes of memory, one disk drive, mono or color monitor with 80 column display and 3Com Etherlink Control Board. Compatible with other systems supporting TCP/IP.

DOCUMENTATION:

Available from vendor

CPU:

IBM PC, PC/XT

O/S:

DOS 2.0, 2.1, 3.0

IMPLEMENTATION-LANGUAGE:

1.12.6. Frontier IBM-PC

PRODUCT-OR-PACKAGE-NAME: PC-DDN

DESCRIPTION:

Frontier Technologies Corporation has introduced a hardware and software package that allows IBM-PC's, XT's and AT's (and compatibles) to communicate over DDN. The hardware consists of an intelligent communications controller (AdCom2-I) with 1/2 Megabyte of local RAM and MIL-188-144, Mil-188C interfaces. The X.25 resides in the 64 K PROM on board and is executed by the local CPU (80188). The TCP/IP is loaded in the local RAM from the PC. The resident real time operating system (VRTX) allows the highest performance execution of X.25 and TCP/IP. The ADCom2-I also runs 3270 SNA/SDLC, 3270 Bisync, and Async terminal emulations. Implementation of FTP/TELNET/SMTP is in progress.

1.12.9. IBM-VM

PRODUCT-OR-PACKAGE-NAME: IBM VM

DESCRIPTION:

The VM software is written almost entirely in Pascal, with a small amount of assembler-language support. Some assembler code running on the Series/1 interfaces with the X.25 code, which is a standard IBM product. Standard IBM-released software is used throughout.

TCP/IP runs in a separate disconnected virtual machine. Similarly, user SMTP, server SMTP, server FTP, and server Telnet each occupies a dedicated virtual machine. User FTP and user Telnet run within a user's virtual machine under CMS. Communication between virtual machines is done through the IBM Virtual Machine Communication Facility (VMCF). A detailed preliminary design document is available by contacting one of the individuals listed below. (Some details have changed since it was written, but it is still mostly accurate.)

A Pronet driver has been implemented to enable the IP/TCP to use the PRONET 10 megabit/sec token ring LAN. The hardware interface is via a DACU (Device Access Control Unit) provided by IBM. The DACU enables connection of UNIBUS devices to an IBM channel. A driver for Ethernet will also be provided.

Direct connection to a C/30 IMP will require implementation of a software driver in conjunction with a suitable hardware interface (e.g., DACU--LH/DH or Series/1--HDH.)

The University of Wisconsin has implemented the Internet protocols (FTP/SMTP/Telnet/TCP/IP) for IBM VM systems under contract with IBM. In addition, a software interface between IP and an X.25 implementation running on a Series/1 (RPS operating system) has been completed. The complete package will enable CSNET IBM VM hosts to connect to the DARPA Internet via TELENET. This product is available on the commercial market for VM/SP Release 3, Series/1 EDX Version 4, Series/1 RPS Version 5.2.

CPU:

Will run on any 370 architecture using VM

O/S:

VM/SP

IMPLEMENTATION-LANGUAGE:

IBM Pascal and assembler

1.12.10. IBM-VM WISCNET

PRODUCT-OR-PACKAGE-NAME: WISCNET

DESCRIPTION:

The University of Wisconsin has implemented the Internet protocols (FTP/SMTP/Telnet/TCP/IP) fro IBM VM systems under contract with IBM.

TCP/IP runs in a separate disconnected virtual machine. Similarly, user SMTP, server SMTP, server FTP, and server Telnet each occupies a dedicated virtual machine. User FTP and user Telnet run within a user's virtual machine under CMS. Communication between virtual machines is done through the IBM Virtual Machine Coummunication Facility (VMCF). A detailed description of the software is available from the contact listed below.

Drivers have been implemented to enable TCP/IP to use either the Proteon PRONET token ring LAN or an Ethernet. The hardware interface is via an IBM DACU (Device Access Control Unit). The DACU enables connection of UNIBUS devices to an IBM channel. A software driver for an AUSCOM interface is also available.

CPU:

Will run on any 370 architecture using VM

O/S:

VM/SP

IMPLEMENTATION-LANGUAGE:

IBM Pascal and assembler

DISTRIBUTOR:

University of Wisconsin, Madison

1.12.11. Spartacus VM

PRODUCT-OR-PACKAGE-NAME: KNET TCP/VM

DESCRIPTION:

KNET TCP/VM is a TCP/IP-based network software package supporting the Ethernet local-area network, Bisync and CTCA links. KNET conforms to the ISO/OSI Reference Model for layered network architecture and runs as an application on the mainframe. (See also "Spartacus, K200" described in the Hardware Section of this document)

Services supported include client and server Telnet, client and server FTP, client and server TFTP. An application interface to TCP virtual circuits and UDP datagram circuits is also available. In addition, the following small servers are available for UDP: time, discard, echo, name, and quote of the day. Support for TCP echo and discard services is also provided. Telnet access to all VM services is provided via 3270 emulation. Support is provided under FTP for both binary mode and for NETASCII. Automatic data conversion to/from ASCII to EBCDIC is supported. No modification of VM/SP is required. All services run either under CMS or as a guest operating system under CP. SMTP option is available. KNET/VM also supports XNS protocols.

1.12.12. IBM UNIX

PRODUCT-OR-PACKAGE-NAME: IBM-FED-SYS

DESCRIPTION:

IBM Fed Sys Division is working on a Series/1 FEP for interface to the DDN/ARPANET. That box will be based on a Series 1 that was done for USA DARCOM by Channel Systems, Inc. as a sub to IBM. The Channel Systems box was acquired to attach to the IBM I/O channel to provide the host an HDH/HDLC interface to a remote IMP.

McKay is expanding the DARCOM box to run IBM UNIX and will then migrate an existing UNIX-based TCP/IP to it. The resulting FEP would allow the host to implement FTP, Telnet and Mail and rely on the Series/1 for TCP/IP and connection to the net. There are some efforts to pick up the completed UCLA implementation and support it as a complete package or as host-based FTP, Mail and Telnet for use with the Series/1 FEP.

O/S:

IBM UNIX

DISTRIBUTOR:

1.12.14. Internet MVS

PRODUCT-OR-PACKAGE-NAME: HYPER-Link

DESCRIPTION:

Hyper-Link is a series of communications software and hardware products which meet the Defense Communication Agency MIL-STDs for the Defense Data Network, for use on any of the DDN networks, such as ARPANET, MILNET, etc. These products also conform to the conventions of the UNIX 4.2 BSD implementation of these protocols for use with the many popular UNIX based graphic workstations, such as SUN, APOLLO, CIMLINK, CADNETIX, VALID LOGIC and others.

Hyper-Link supplies TCP/IP communication protocol software products, an Application Programming Interface to TCP functions for PASCAL, PLI, and BAL, and the MIL-STD applications File Transfer (FTP), Virtual Terminal (TELNET), and Simple Mail Transfer (SMTP).

Hyper-Link connects the IBM MVS host to Ethernet or DDN X.25 networks through a channel attached Front End Processor. DDN LHDH attachment is also supported. The X.25 connection can also be made certifiable to certain commercial X.25 networks such as GTE TELENET, TYMNET and others.

1.12.15. Spartacus MVS

PRODUCT OR PACKAGE NAME: KNET TCP/MVS

DESCRIPTION:

KNET TCP/MVS is a TCP/IP-based network software package supporting the Ethernet local area network and channel-to-channel adapters. KNET conforms to the ISO/OSI Reference Model for layered network architecture and runs as a started task under the control of MVS. (See also, "Spartacus, K200" described in the Hardware Section of this document).

Users of KNET can perform complex operations such as file transfer and remote applications access between heterogeneous systems. Through the use of KNET, any system implementing TCP/IP protocols can communicate with the IBM host on the Ethernet. KNET implements FTP (file transfer protocol), TFTP (trivial file transfer protocol), and Telnet (remote logon services).

KNET TCP/MVS provides a set of routines that allow a user to write cooperating network applications. These routines provide the interface between a user application and TCP/IP network layers.

1.12.16. Spartacus 310

PRODUCT OR PACKAGE NAME: K310 T1/Ethernet System

DESCRIPTION:

The K310 is a communications system that connects a mainframe computer to the Ethernet local area network using a T1 wide area network data link. The K310 consists of a host control unit and Ethernet control unit interconnected by any T1 data link facility.

The host control unit and the Ethernet control unit are interconnected using any T1 wide area network data link. T1 data links allow full duplex data transfers at 1.54 megabits per second in each direction providing instantaneous capacity in excess of 3 megabits per second.

Supported data links include local lines, long-haul lines, satellite links, microwave links, fiber optic links, broadband CATV networks and others.

K310 implements the Physical and Data Link layers of the ISO/OSI Reference Model for layered network architecture, and conforms to the specifications for IBM I/O channels, Ethernet LANs, and ATT Accunet T1 service.

1.17. Sperry

1.17.1. Maryland TCP/IP

PRODUCT-OR-PACKAGE-NAME: SPERRY-UNIVAC

DESCRIPTION:

The University of Maryland Computer Science Center has implemented TCP/IP for the SPERRY 1100/60/70/80/90 machines. The implementation supports IP, ICMP, TCP, SMTP, and Telnet. The link layer connection is made via the DCNET local-network protocol. The IP level conforms to RFC791, and supports reassembly and extended addressing. ICMP functions are implemented per RFC792 and support destination-unreachable, redirects, echo and timestamps. The TCP conforms to the RFC793 except that security, precedence and URGENT have not yet been implemented. An STMP server is also supplied.

DOCUMENTATION:

User and internals documents are included with distribution

1.17.2. Sperry-1100

PRODUCT-OR-PACKAGE-NAME: SPERRY-1100

DESCRIPTION:

The following DDN protocols are supported in this implementation: IP, ICMP, TCP, Telnet, FTP and SMTP. In addition, X.25 and HDLC Distant Host are supported. FTP and SMTP are implemented within DDP in the 1100 host. All other protocols are implemented within TELCON. Two hardware configurations are required as a minimum at each Series 1100 host location: an 1100/60, 1100/70, 1100/80 or 1100/90 computer and a Distributed Communications Processor (DCP/40, DCP/20 or DCP/10A) as a front-end. The DCP's may also be configured as remote concentrators to provide remote terminal access to DDN hosts. A medium or high-speed loadable line module configured to support bit-synchronous communications protocols is required in the DCP to support the HDLC interface.

Full interoperability of the X.25 interface as a heterogeneous DDN host is targeted for January 1986. The DDN X.25 interface was unconditionally qualified with DCA in February of 1985.

PROPRIETARY-STATUS:

Product of Internet Systems Corporation

INFORMATION-UPDATED:

February 1986

1.18. Sun Microsystems

1.18.1. Sun-68000

PRODUCT-OR-PACKAGE-NAME: Sun Workstation, SunLink Internetwork Router

DESCRIPTION:

The Sun workstation was based on a design by Stanford University and is now a family of commercial computer products. The Sun-2 workstations use the Motorola 68010 virtual memory processor and run 4.2 BSD VMUNIX with compatibility enhancements of AT&T System V. The Sun-3 family uses the Motorola 68020 32-bit processor and 68881 floating-point processor for higher performance. The basic workstation and server products use 4.2 BSD TCP/IP protocols in conjunction with a 10 Mb/second Ethernet local-area network. In addition to the standard internet protocols, Sun supports the same services as the 4.2 BSD VAX UNIX network software: RLOGIN, RSH, RWHO, RUPTIME, DSH, ROUTED, REXECD, and COURIER.

The SunLink product is available to implement point-to-point internetwork links, using either one of the CPU's standard serial ports (up to 9.9 kbps) or using the Sun Communications Processor for higher speeds (up to 56 kbps). 1822 interface software is available from SRI, and multiple Ethernet controllers are supported. Software products also provide gateways to HDLC, X.25, Bisync, and IBM SNA networks.

Sun has developed the Network File System protocol to allow workstations to share file systems across the network. The NFS is implemented on a Remote Procedure Call protocol, and External Data Representation (RPC and XDR) standard, to allow portability across different computer architectures. The Yellow Pages protocols are used to provide domain-wide distributed administrative databases such as user names, and mail aliases. All of these protocols use the DARPA standard Internet Protocol (IP).

1.19. Symbolics

1.19.1. Symbolics LISP Machine

PRODUCT-OR-PACKAGE-NAME: Symbolics TCP/IP

DESCRIPTION:

An implementation of the Internet protocol family for Symbolics 36xx Machines running release 5.2 or later. This includes IP, ICMP, TCP, and UDP. Higher level protocols supported include Telnet, SUPDUP, FTP, SMTP and TFTP. TCP/IP is completely integrated in the Lisp Machine generic network system and will be used by the system automatically whenever necessary.

DOCUMENTATION:

Use of the generic network system is documented in standard manuals and is available online through a keyword lookup system.

1.21. MULTIPLE-MACHINE IMPLEMENTATIONS

1.21.1. Communication Machinery Corporation

PRODUCT-OR-PACKAGE-NAME: CMC Internet TCP/IP

DESCRIPTION:

An implementation of TCP/IP for UNIX System V and 4.2 BSD systems with CMC's DDN Node Processor (DNP), Front-End Processor for MULTIBUS. The TCP, IP, ICMP, and UDP protocols run on the DNP; the applications, which run on the host UNIX system, include TELNET, FTP, SMTP, rlogin, rsh and rcp.

DOCUMENTATION:

System calls as documented in 4.2 BSD documentation. Also from CMC:

- Internet User's Guide
- Internet Programming Guide
- Internet System Manager Guide

CPU:

1.21.4. Excelan EXOS 8010

PRODUCT-OR-PACKAGE-NAME: EXOS 8010

DESCRIPTION:

The EXOS 8010 Protocol Package consists of two parts. One, the TCP/IP protocol module, is downloaded to any of Excelan's EXOS 200 series Intelligent Ethernet Controllers (described separately-see the Hardware Section of this document). Running this code, the controller then provides TCP,UDP, and IP services to the host system. The protocol module is supplied in object form. It can be used with any host system, and is independent of operating system design. The second part of the EXOS 8010 product consists of I/O drivers, libraries, and utilities which can be integrated with any version of the UNIX operating system. These emulate the BSD network interface model, and include applications such as FTP, rlogin, rsh, rcp, and mail.

1.21.7. LANlord

PRODUCT-OR-PACKAGE-NAME: LANlord High Speed Networking System

DESCRIPTION:

This is a high performance back-end LAN (25 Mb/s) designed to physically, electronically and logically connect mainframe computers and other networking technologies.

Release ONE of LANlord supports TCP/IP-based host software from Internet Systems Corporation and is available now.

Release TWO of LANlord implements TCP/IP protocols on the network, supports FTP applications on the host, and will be available 3rd quarter 1986.

LINKlord gateways implementing T-1 links between LANlord networks are available now. A LINKlord gateway to Ethernet will be available 2nd quarter 1986.

1.21.8. Unisoft UNIX

PRODUCT-OR-PACKAGE-NAME: B-NET

DESCRIPTION:

The UNIPLUS+ networking software which offers multiple and interactive links between UNIPLUS+ based systems (68000-based) and other computers running TCP/IP compatible protocols. The interconnected systems may use a variety of physical layers including Ethernet LAN products and may be geographically distributed or physically adjacent to one another and interconnected in a variety of topologies.

B-NET features include: process-to-process communication, remote file transfer, virtual terminal facilities, datagram service, electronic mail, automatic route-through, flexibility for adding additional network drivers, and access to all levels of protocols.

This software is basically an enhanced version of Berkeley's 4.2 UNIX.

2. TCP/IP HARDWARE IMPLEMENTATIONS

2.1. Advanced Computer Communications

2.1.1. ACC-ECU

PRODUCT-OR-PACKAGE-NAME: ECU-II

DESCRIPTION:

The Error Control Unit provides an error-controlled link for long distance connection of LH-DH/11 to DDN IMPs. Data transfer between ECU-II units can take place at 1.5Mb/s when directly connected by a 4-pair low capacitance cable up to 914 meters (3000 feet) in length. Lower rates can be selected or determined by attached modem types 303, 209, V.35, or 188-114. Units are in pairs, one at each end of the communication link. The data rate is enhanced by elimination of the need for inter resource "handshaking" on every bit transferred. The units serve as store-and-forward buffers, receiving and buffering resource-generated data in semi-conductor RAMs, then forwarding it by special protocol to the ECU near the other resource device. Since the ECUs have two separate buffers they are capable of simultaneous receipt and transmission in each direction. ECUs communicate with the IMP via direct cable or modems and support BBN-1822 protocol. Compatible with native mode C/30 IMPs and TCP/IP.

2.1.5. ACC-IF-IMP/370

PRODUCT-OR-PACKAGE-NAME: IF-IMP/370 (IF-370/1822)

DESCRIPTION:

Connects an IBM host computer to the DDN. It provides a DDN X.25 or HDH (1822-J) access to the DDN Interface Message Processor (IMP). The IF-370/DDN attaches to the Block Multiplexer Channel of any IBM 370, 303x, 43xx, or 308x system, or to the Block Multiplexer Channel of plug-compatible systems produced by other manufacturers (e.g. Amdahl). Host resident TCP/IP support for MVS systems to be provided by Network Solutions. MVS operating system support provided by the UCLA ARPANET Control Program.

2.3. Bolt Beranek and Newman

2.3.1. BBN-C/30

PRODUCT-OR-PACKAGE-NAME: BBN-C/30

DESCRIPTION:

The Terminal Access Controller (TAC) is a user Telnet host that supports the TCP/IP host-to-host protocols. It runs in a 64K C/30 computer. It supports up to 63 terminal ports, and connects to a network via an 1822 or HDH host interface. The TAC TCP/IP conforms with RFC791 and RFC793 specifications with the following exceptions:

- - IP options are accepted but ignored.
- - All TCP options except maximum segment size are not accepted.
- - Precedence, security, etc. are ignored. The TAC also supports Packet core, TAC Monitoring, Internet Control Message Protocol (ICMP), and a subset of the Gateway-Gateway protocols.

For more information on the TAC's design, see IEN-166. All major features have been implemented except Class B and C addressing, IP reassembly, and TCP Urgent handling. These will be done in the near future.

2.4. Bridge Communications

2.4.1. Bridge CS/1

PRODUCT-OR-PACKAGE-NAME: The Communications Server 1 (CS/1)

DESCRIPTION:

Bridge's CS/1 server with TCP/IP software performs the function of a terminal or host server, allowing up to 32 asynchronous devices (e.g., terminals, printers, computers) to access host computers that support TCP/IP and are attached to an Ethernet LAN. The CS/1 also supports the User Datagram Protocol (UDP) and the Ethernet Address Resolution Protocol (ARP). Bridge Communications also offers gateway servers which interface the CS/1 to broadband networks and the IBM SDLC world.

IMPLEMENTATION-LANGUAGE:

2.4.3. Bridge GS/3

PRODUCT-OR-PACKAGE-NAME: The Gateway Server 3 (GS/3)

DESCRIPTION:

Bridge's GS/3 server with TCP/IP software interconnects physically isolated Ethernet segments over multiple point to-point communication links. It supports up to four synchronous communications lines with data rates up to 64K bps each. As an internetwork router, the GS/3 uses the Internet Protocol (IP) to route packets across networks. It is compatible with Bridge's comprehensive TCP/IP line of communications, gateway, and network control servers.

2.4.4. Bridge GS/6

PRODUCT-OR-PACKAGE-NAME: The Gateway Server 6 (GS/6)

DESCRIPTION:

Bridge's GS/6 server with TCP/IP software interconnects an Ethernet segment to the broadband backbone trunk. As many as 255 Ethernet TCP/IP networks can be supported over a single 6 Mhz broadband channel using GS/6s Carrier Sense Multiple Access (CSMA) mechanism. As an internetwork router, the GS/6 uses the Internet Protocol (IP) to route packets across networks. It is compatible with Bridge's comprehensive TCP/IP line of communications, gateway, and network control servers.

2.4.5. Bridge CS/1-SNA

PRODUCT-OR-PACKAGE-NAME: The Communications Server 1-SNA (CS/1-SNA)

DESCRIPTION:

Bridge's CS/1-SNA server with TCP/IP software supports one synchronous SDLC port to an IBM communications controller with a maximum of 24 LU-to-LU sessions. It provides a connection service between a wide variety of non-IBM terminals, workstations, and an IBM host running Systems Network Architecture (SNA) protocol. The CS/1-SNA is compatible with Bridge's comprehensive TCP/IP line of communications, gateway, and network control servers.

2.5.2. CMC Gateway

PRODUCT-OR-PACKAGE-NAME: CMC TCP/IP Ethernet/DDN Gateway Software

DESCRIPTION:

An implementation of TCP/IP for UNIX System V and 4.2 BSD systems with CMC's DDN - Ethernet Node Processor for MULTIBUS. The EGP, TCP, IP, ICMP and UDP protocols run on the Node Processor, allowing users access to either the DDN or an Ethernet. The Node Processor can additionally act as a gateway between the two networks. Applications, which run in the host UNIX system, include TELNET, FTP, TFTP and SMTP.

2.6. Encore

2.6.1. Annex-UX

PRODUCT-OR-PACKAGE-NAME: Annex-UX

DESCRIPTION:

The Annex-UX is a terminal server for Ethernet that uses TCP/IP. It has 16 asynchronous serial ports and one parallel printer port. Each serial port can support an auto-answer modem. Both rlogin and telnet protocols are supported, and each port can have up to three virtual terminal connections. The IP implementation interprets both ICMP redirects and 4.2 route daemon messages.

The Annex-UX has been successfully tested with 4.2 and 4.3bsd Unix. Planned enhancements during 1986 include IP subnet support, security features, and a editing front end capable of offloading standard Unix machines by handling simple editing operations within the Annex-UX.

DOCUMENTATION:

A two manual set is shipped with each Annex-UX. It consists of a Hardware Installation Guide and a Users Guide. A Network Administrators Guide is available for a nominal charge.

2.7. Excelan

2.7.1. Excelan EXOS-200

PRODUCT-OR-PACKAGE-NAME: EXOS 200 Series Intelligent Ethernet Controller

DESCRIPTION:

The EXOS 200 Series includes boards for Multibus, VME, Q-bus, UNIBUS, IBM-PC/XT/AT (and compatibles). The design is modular, and can be readily adapted to other host bus designs. Each is a single-board front-end processor which includes an 80186 CPU, at least 256 Kbytes RAM, and an Ethernet Data Link controller. In addition, a DMA-backed SBX bus connector allows additional communications links to be supported via off-the-shelf daughter boards. An EPROM-based operating system kernel manages EXOS resources, and provides a standard high-level programming environment for protocol code. All boards can run the same object code, and are 100% software compatible with other Excelan products. TCP/IP protocol code, available separately from Excelan, can be downloaded to EXOS RAM at start-up time either by the host system, or over the Ethernet.

2.10. MITRE

2.10.1. MITRE NAC

PRODUCT-OR-PACKAGE-NAME: Mitre Network Access Component

DESCRIPTION:

This is Mitre's second generation network controller (see ZILOG-Z8000). Using an expanded hardware base, industry standard backplanes and multiple microprocessor boards, Mitre has built a MCS-68000-based network access component. This network component has both MULTIBUS and VERSABUS form factors and broadband, Ethernet and 1822 network interfaces.

The standard MULTIBUS network component contains an OMNIBYTE-dual-ported 68000, with 128K bytes dynamic RAM, and 96K bytes EPROM, a memory board, and a Bridge serial i/o (SIO) interface board. The SIO board has its own 68000 cpu, 8 serial ports, 4K bytes RAM and 32K bytes ROM. The long-haul network version contains an ACC MULTIBUS-1822 interface. The VERSABUS version supports an ACC VERSABUS-1822 interface. In addition, the VERSABUS version supports an ACC VERSABUS-UNIBUS interface for host-interfacing to DEC machines.

The software is written in 'C' and runs under CMOS, a 'C' version of SRI's Micro Operating System. In addition to supporting TCP, IP, ICMP, and the appropriate network level protocol, the network front-end version (aka a host interface unit for the LAN environment) supports both the DTI-Host-to-Front-End Protocol and a Mitre Network Access Protocol.

2.10.2. Mitre Z8000

PRODUCT-OR-PACKAGE-NAME: MITRE Zilog Z8000

DESCRIPTION:

This network controller is the product of a series of Mitre projects aimed at making network access (both local and long-haul) as straightforward as computer peripheral access. Some of the new microprocessors make it possible to construct a "network controller" that handles the particulars of packet ordering and flow control in the same way that hardware controllers handle the particulars of disk cylinder centerline or an end of tap sensor. This TCP/IP network controller, supported by a Z8000 microprocessor box, is currently interfaced to a number of UNIX systems via a UMC-Z80. The outboard box is accessed by a set of I/O-like management calls (open, close, read, write, and special) which transport TCP requests via a network access protocol.

The outboard box has 64K bytes of Ram, 32 bytes of Rom, a Z8002 micro, and a serial Usart (880K BPS max.) All of the software was written in C using an in-house version of the portable C compiler. The unit interfaces as easily to a local network as it does to the DDN. All that is necessary for this conversion is the addition of an ACC-1822 hardware device and a new device driver. Other than different round trip delays, host user-level software sees no difference between the two network devices. The resulting set of Z8000-based building blocks supports host interface unit and a terminal concentrator on the local net.

Performance with TCP/IP has been measured with two user processes talking via TCP/IP over the cable at 350K BPS. Rates as high as 450K BPS occur when user I/O buffer sizes are set at 8K bytes per I/O. The Internet Protocol contains the lowest level of addressing. This allows for local units to be addressed in the same way remote units, two or three networks away, are addressed. The effect of 300 bit TCP/IP headers has negligible impact on performance.

2.11. SCOPE

2.11.1. Scope DDN MicroGateway

PRODUCT-OR-PACKAGE NAME: DDN MicroGateway

DESCRIPTION:

The DDN MICROGATEWAY is a single board product which implements the MIL Standard TCP/IP as well as ICMP and lower layer link and network protocols - either FIPS 100/X.25 or 1822/HDH.

Using a Motorola 68008 microprocessor, the DDN MICROGATEWAY provides full-service host support at 56K bits per second, and it will accommodate up to 64 TCP/IP sessions with its shared memory interface.

A companion DDN MICROGATEWAY software product support host TELNET, FTP, and SMTP applications, thus offering a total turn-key solution for certain UNIX operating system environments.

DOCUMENTATION:

A user's manual describes product design and provides information on how to integrate the DDN MICROGATEWAY into the user's host hardware and operating system environment.

CPU:

Single board implementations for MULTIBUS and IBM-PC Bus. Other buses planned.

O/S:

Board product is not O/S specific. ULPs are based on UNIX 4.2 BSD or UNIX System V. Other O/S's are available.

IMPLEMENTATION-LANGUAGE:

TCP/IP, X.25 are in C firmware, embedded in the hardware product. ULPs are in C.

2.13.1. SDC CP8001

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT LAN Network Front End (CP8001)

DESCRIPTION:

The MIL/INT product line includes network front ends, terminal concentrators, and gateways implementing DoD protocols for both DDN and broadband LANs. The LAN NFE provides access to a broadband LAN for a host computer implementing the DoD Host to Front End Protocol (HFP). The NFE implements HFP, TCP, IP, ICMP, and the LAN access protocol. Connection to the host is via HFP with X.25 LAPB at speeds up to 600 Kbps. The host must implement HFP and any application protocols desired (Telnet, FTP, SMTP). The LAN interface is a proprietary CSMA/CD network access protocol on industry standard broadband cable (CATV) systems. The data rate on each channel of the LAN is 2 Mbps.

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT LAN Terminal Concentrator (CP8040)

DESCRIPTION:

The MIL/INT product line includes network front ends, terminal concentrators, and gateways implementing DoD protocols for both DDN and broadband LANs. The LAN TC provides access to a LAN for up to eight asynchronous terminals operating at speeds up to 19.2 Kbps. The TC may also be configured as a Terminal Emulation Processor (TEP) to attach asynchronous ports on a host to the network. The LAN operates using a proprietary CSMA/CD network access protocol on industry standard broadband cable (CATV) systems. The data rate on each channel of the LAN is 2 Mbps. The TC also implements Telnet, TCP, IP, and ICMP, to support terminal communication with other DoD compatible devices.

2.13.4. SDC DDN Gateway

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT Long Haul Network Gateway (CP8060)

DESCRIPTION:

The MIL/INT product line includes network front ends, terminal concentrators, and gateways implementing DoD protocols for both DDN and broadband LANs. The Long Haul Network Gateway interconnects the long haul backbone network of DDN (or any network based on IMP type switches) with a broadband LAN. Dynamic routing is supported using both an internal Gateway-to-Gateway (GGP) protocol with other LAN gateways in the local system, and the DoD External Gateway Protocol (EGP) with the core DDN system. IP, ICMP, and network access protocols are also supported. The LAN employs a proprietary CSMA/CD network access protocol on industry standard broadband cable (CATV) systems. The data rate on each channel of the LAN is 2 Mbps. DDN access may be either local or remote (via modems) using either X.25 or HDH protocols at speeds up to 56 Kbps. The MIL/INT DDN TC has been certified by DCA for DDN access.

2.13.6. SDC CP8201

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT Long Haul Network Front End (CP8201)

DESCRIPTION:

The MIL/INT product line includes network front ends, terminal concentrators, and gateways implementing DoD protocols for both DDN and broadband LANs. The Long Haul NFE provides access to the long haul backbone of the DDN (or any network based on IMP type switches) for a host computer implementing the DoD Host to Front End Protocol (HFP). The NFE implements HFP, TCP, IP, ICMP, and the long haul DDN network access protocols (X.25 or HDH). Connection to the host is via HFP with X.25 LAPB at speeds up to 600 Kbps. The host must implement HFP and any application protocols desired (Telnet, FTP, SMTP). IMP connections may be local or remote (via modems) at speeds up to 56 Kbps. The MIL/INT DDN NFE has been certified by DCA for DDN access.

DOCUMENTATION:

Product Specification, Installation Manual, and User Manual

CPU:

Multiple Intel 8086 microprocessors

O/S:

Proprietary realtime OS86 based on secure kernel technology

IMPLEMENTATION LANGUAGE:

C

DISTRIBUTOR:

System Development Corporation
2525 Colorado Ave
Santa Monica, CA 90406

2.13.7. SDC CP8240

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT Long Haul Network Terminal Concentrator (CP8240)

DESCRIPTION:

The MIL/INT product line includes network front ends, terminal concentrators, and gateways implementing DoD protocols for both DDN and broadband LANs. The Long Haul Network TC provides access to the long haul backbone of DDN (or any network based on IMP type switches) for up to eight asynchronous terminals operating at speeds up to 19.2 Kbps. The TC may also be configured as a Terminal Emulation Processor (TEP) to attach asynchronous ports on a host to the network. The TC implements Telnet, TCP, IP, ICMP, and the DDN network access protocols (X.25 or HDH). IMP connections may be local or remote (via modems) at speeds up to 56 Kbps. The MIL/INT DDN TC has been certified by DCA for DDN access.

2.14. Tektronix

2.14.1. Tektronix 6130 Workstation

PRODUCT-OR-PACKAGE-NAME: 6130 Intelligent Graphics Workstation

DESCRIPTION:

The Tektronix Model 6130 is a UNIX 4.2 BSD & System V based workstation that has a 32-bit processor, 1 megabyte of parity memory (with 16 MB virtual addressability), 20 megabyte winchester (expandable to 40 or 80 MB), dual RS-232-C interfaces, Local Area Network (LAN) interface and ethernet TCP/IP with Distributed File System (DFS) software and a General Purpose Interface Bus (GPIB) all standard. The system can be expanded with additional disks, interfaces, streamer tape drives and software products.

The 6130 uses the ethernet standard (IEEE 803.2) with Transmission Control Protocol/Internet Protocol (TCP/IP) which handles the communications between a users program and other processes executing on the same workstation, at a different workstation on the LAN, or on a different network. The 6130 supports the File Transfer Protocol (FTP), the Simple Mail Transfer Protocol (SMTP) and the Virtual Terminal (Telnet). Tektronix has implemented a Distributed File System that allows a workstation to access files on other workstations as though they were resident locally. The 6130 can support up to 14 RS-232 terminals although 2 or 3 users per system is recommended.

DOCUMENTATION:

The documentation set that is included with the 6130 consists of ten well written manuals which cover system installation, operations, system administration, and extensive reference material. Over 40 other manuals are available which describe the language compilers, statistical software, spreadsheet programs, and other software and enhancement products.

CPU:

The 6130 uses the National Semiconductor 32000 Family of processors. The CPU is the NS 32016 with the NS 32081 Floating Point Unit.

O/S:

UTek, Tektronix UNIX-based (System V and 4.2 BSD)

IMPLEMENTATION-LANGUAGE:

C Language

2.15. Wollongong Group

2.15.1. Wollongong DDN Host Access Board

PRODUCT-OR-PACKAGE-NAME: WIN/VX (DDN)

DESCRIPTION:

This is a complete hardware/software TCP/IP implementation which allows any VAX/VMS host to connect to the DDN. Includes Telnet (remote login), FTP (file transfer), SMTP (Mail) Netstat, Finger, TFTP.

Supports the following network interfaces:

- ACC HDH (1822-J)
- ACC X.25

DOCUMENTATION:

Installation Guide and User Manual provided

CPU:

DEC VAX-11

O/S:

VMS 3.1 or greater and VMS 4.x

IMPLEMENTATION LANGUAGE:

C
