20. ABSTRACT (Continue on reverse side if necessary and identify by block number) jmk

A pre- and post-processor of finite element data for use on a color graphics microcomputer has recently been developed, within the Mechanics & Structures Branch at the U.S. Army's Ballistic Research Laboratory. The entire data file, which includes information for gridding, material properties and loading schemes, can be generated and debugged locally on a microcomputer before being sent to the mainframe computer. Before the emergence of advanced, large

(continued on other side)

(continued)

20. memory microcomputers, the preprocessing was performed interactively with the mainframe computer which consumed a considerable amount of wall-clock time. Another advantage of pre-processing on microcomputers is that the mainframe is less burdened by interactive usage and is returned to the batch mode allowing it to perform more jobs in less time.

The post-processor transforms the output data into a representative color, denoting a component, and intensity of that color, denoting a normalized stress level in the element. This allows the analyst to examine the state of stress in a multi-component structure in a single picture. For effective stress the stresses are normalized with respect to the material yield strength in each component. For the three unidirectional and shear stresses the elements comprising each component are searched for the maximum value and stresses are normalized to that value. The maximum stress levels are listed in a key at the top of the display. This process reduces the need for printed output to a backup-only basis.

LIST OF ILLUSTRATIONS

I. INTRODUCTION

The use of the finite element method of stress analysis to study artillery projectiles has been prevalent for at least the past decade. The complexity of these projectiles is growing steadily and likewise is the need for highly accurate and realistic finite element methods. What is presented here is not a new finite element code but a new, highly understandable method of grid generation (the pre-processor) and stress output display (the post-processor). The pre- and post-processor PREPPY was written within the U.S. Army's Ballistic Research Laboratory for a 2-D axisymmetric finite element code.[1] The code takes full advantage of the color graphics capabilities of a microcomputer system.

II. BACKGROUND

Until the onset of high technology warfare most artillery projectiles consisted of a high explosive housed in a steel shell and capped with a fuze. Today's modern arsenal still includes high explosive types but also includes many cargo-carrying varieties in which the payload is disseminated through an expellable base at the rear of the projectile.[2] An ejection charge housed in the nose cone is initiated by one of many types of fuzes. The expanding gases push on the payload which in turn pushes on the base and shears the screw threads coupling it to the body. The cargo, which could be grenades, land mines or smoke pellets, for example, then fall to the ground, so it is obvious the many components of these projectiles must be accurately modeled in the finite element grid.

III. PRE-PROCESSOR

One can imagine that a structure made of three different materials, say, steel, plastic and aluminum can have up to ten materials in the finite element domain. These include the three real materials and as many as seven artificial materials which could be tailored to behave as screw threads, interfaces or voids between any two of the materials. A natural course of action would be color coding as in the pre-processor of PREPPY.

PREPPY is a computer program which can be used on a microcomputer to pre-process the input data file and send it on its way to the mainframe computer undisturbed. The program enables the user to generate and de-bug the grid locally which is less costly and less time consuming than the old method of interacting with the mainframe computer. The mainframe computer also benefits in that it is not burdened with interactive usage and thereby is free to work in the batch mode for which it was designed.

2 Bender, J.M., Burns, B.P., "Use of the Finite Element Method of Stress Analysis as an Aid in the Design of Large and Small Caliber Projectiles," Proceedings of the 2nd Annual ASME Computer Engineering Conference, 1982.

PREPPY reads the input data file in the format identical to that used in the main program. It creates a 1000 x 11 array containing 11 bits of information about each element, including the element number, material identification number (1 through 10), the x- and y- coordinates of the four corners, and the yield strength of the element material. This array is then permanently stored on disk and is available to create color coded grids as in Figure 1 or numbered element grids as in Figure 2. The color coded grid is also accessed by the post-processor for displaying output data.

Figure 3 illustrates how the manufacturer's drawings are transformed into a finite element grid. Typically only the rear portion of projectiles are analyzed since that is where body forces accumulate in the severe in-bore phase of the launch. Generally, the loads on projectiles consist of propelling charge pressure, axial acceleration and rotating band pressure as shown in Figure 4. In the case shown, the rotating bands exert an inward-acting radial pressure of about 30 kpsi. Propellant gasses exert a pressure of about 50 kpsi to the base up to the rotating band. The resulting axial in-bore acceleration is approximately 15,000 g's .

When the user is satisifed that the grid and loading scheme are in order the microcomputer can be placed in the terminal mode and transfer the file to the mainframe computer for execution.

IV. POST-PROCESSOR

The main program to which the data file is sent includes a routine to write selected output data to a file which is easily accessed by the microcomputer acting in the terminal mode. After the file is transferred to disk the microcomputer is switched back to command mode where the post-processor of PREPPY will go to work.

Up to this point post-processing was performed by hand numbering the finite element grid and searching through reams of paper, matching printed data to the grid. If one was so inclined, colored highlighters could be used to color in elements according to material and/or stress level. This procedure can be very time consuming and tedious, especially when performing parametric studies which could result in as many as twenty output files. The post-processor of PREPPY has made this method obsolete. PREPPY will automatically generate colored stress output by the following method. First, PREPPY accesses the element information array developed during pre-processing. The eleventh column of this array contains the color code number (0 through 1) for each element. As examples, 0.1 will decode to the color red, 0.2 decodes to orange, 0.5 decodes to blue and so forth. However, this number (hue) is only one of three numbers needed for full color description. The two remaining numbers (also 0 through 1) are the intensity and luminosity. The luminosity, or brightness, is left at the value 1.0 for maximum brightness. However, the intensity value will be varied according to the stress level. The element will retain its color code but range in appearance from white through pink to red to denote low through medium to high stress levels respectively in elements color coded by red. Red for example, denotes aluminum. In a like manner, the other nine distinct colors (materials) are coded. The level of intensity is determined by accessing the 1000 x 5 stress output array which is transferred to the microcomputer's disk by the mainframe computer. This array contains the axial, radial, hoop, shear

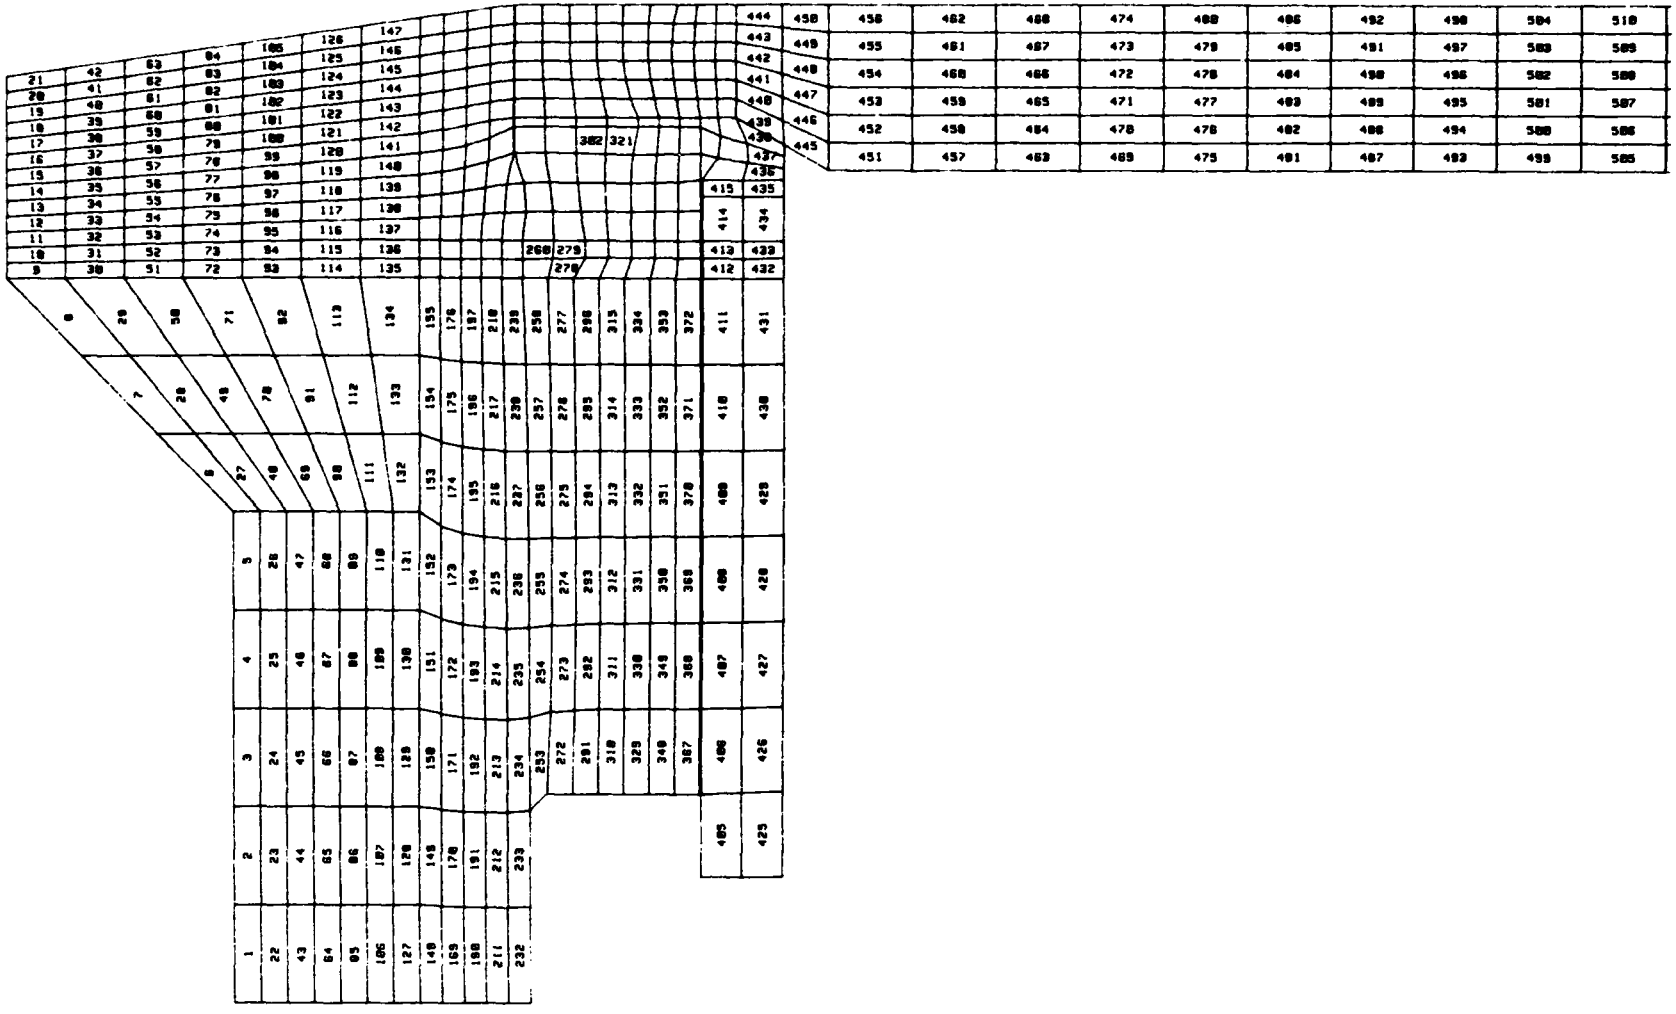

Figure 2. Numbered Element Grid

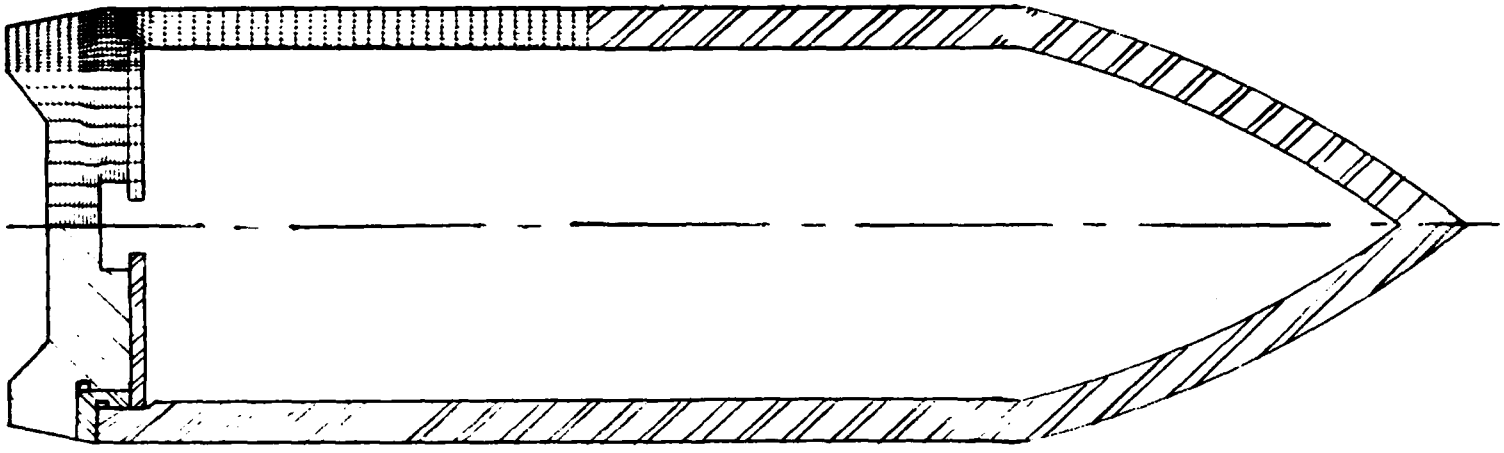

Figure 3. Drawing of Projectile and Finite Element Grid Reflection

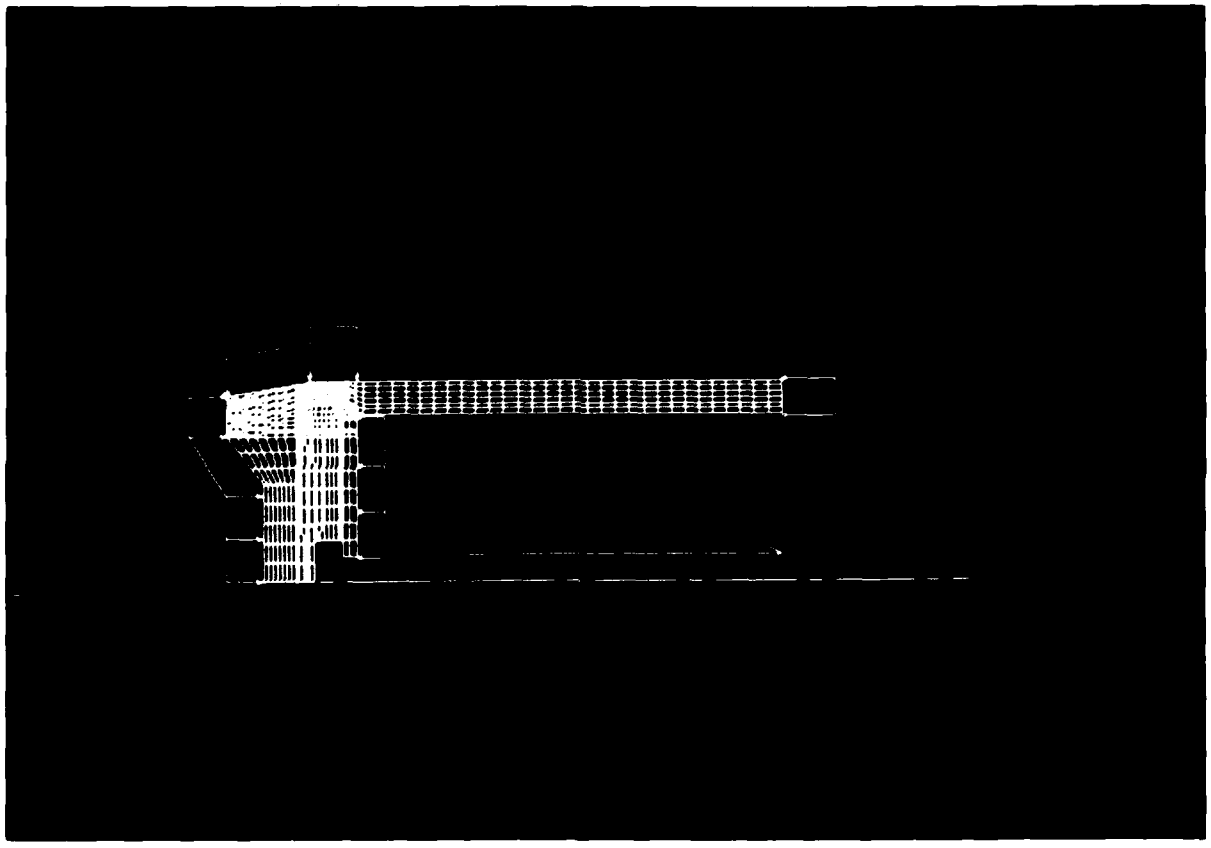

Figure 4. Loads on the Projectile During Launch

and effective stress[3,4] levels for each element. For the effective stress the value is picked off the output array and divided by the yield point of the material of the same element on the element information array. This quotient, say 0.7 for example, will create an element with 70% intensity of the designated color. Tables 1 and 2 are partial lists of the element information array and the stress output array respectively, and illustrate the procedure.

TABLE 1

Element #	Radial Stress (psi)	Hoop Stress (psi)	Axial Stress (psi)	Shear Stress (psi)	Effective Stress (psi)
345	36,264	16,035	107,892	16,514	121,031
346	38,392	14,901	106,041	16,617	107,389
347	40,392	138,771	101,581	17,722	64,993

TABLE 2

Element #	I.D. #	Coordinates LL	UL	UR	LR	Yield Stress (psi)
345	2	x,y	x,y	x,y	x,y	140,000
346	2	x,y	x,y	x,y	x,y	140,000
347	4	x,y	x,y	x,y	x,y	65,000

Referring to Tables 1 and 2, for element 346 the intensity would be 107,389/140,000 or 0.767 which decodes to orange at about 77% color intensity. Element 347 decodes to blue at 64,993/65,000 or nearly 100% color intensity. This element's stress is near the yield point. Should the value exceed 102%, an "x" is placed on the element, indicating that perhaps an elastic-plastic computation is warranted.

For stress in a uniaxial direction (axial, radial, hoop, or shear) the elements must be grouped according to identification number. Each group is searched for the maximum value in each stress direction. These maximum values are listed in a key at the top of the stress plot. The same procedure is used as in effective stress to compute intensity except that the group maximum

---

4 Thomas, T.Y., Plastic Flow and Fracture in Solids, Academic Press, New York, NY, 1961.

value replaces the yield stress in the computation. Tables 3 and 4 illustrate the procedure where Table 3 contains the group of elements with identification number 6 and Table 4 contains pertinent portions of the element information array.

TABLE 3.

Element #	Radial Stress (psi)	Hoop Stress (psi)	Axial Stress (psi)	Shear Stress (psi)	Effective Stress (psi)
23	21,962	16,123	60,007	1692	63,222
24	23,091	16,242	59,066	2023	63,359
25	27,211	16,397	57,243	2394	63,494
196	29,997	17,291	54,129	2711	64,093
197	31,035	18,121	52,449	2638	64,125
198	33,323	19,892	50,030	2469	64,210

TABLE 4

Element #	I.D. #	Coordinates LL	UL	UR	LR	Yield Stress (psi)
23	6	x,y	x,y	x,y	x,y	65,000
24	6	x,y	x,y	x,y	x,y	65,000
25	6	x,y	x,y	x,y	x,y	65,000
196	6	x,y	x,y	x,y	x,y	65,000
197	6	x,y	x,y	x,y	x,y	65,000

In Table 3, the maximum values are boxed in. Element 23 would be green at 21,962/33,323 or 66% intensity for the radial stress plot. If the axial stress plot were generated element 23 would be green at 60,007/60,007 or 100% intensity since this is the highest stressed element in the axial direction. Table 4 is used to obtain the coordinates of the particular element.

Thus far only positive or tensile stresses have been examined. However, the MATRIX SEARCH routine includes provisions to search for minimum values (maximum compression) as well and groups these in a like manner as the tensile stresses. Just as negative (compression) values are ignored during the search for maximum tension in each group, positive values are ignored during the search for maximum compressive stresses. On the actual plots, the ignored elements are colored in at full intensity but at 20% luminosity for

completeness of the figure. Stressed elements appear much brighter. Figures 5 through 9 are examples of PREPPY's stress plots.

V. CONCLUSIONS

It can be seen that there are nine possible stress plots for each computer run: radial, hoop, axial, and shear all in either compression or tension (shear merely shows direction) and the effective stress. In most cases tensile stresses are given more attention since they tend to impact crack propagation and critical defect size.[5] In practice over the past year PREPPY has been found to help the seasoned engineer by making efficient use of time and as a visual aid in communications with the higher echelons. PREPPY has also proven itself as a valuable training tool for new engineers to help them visualize and recognize stress patterns in structures.

APPENDIX A

PREPPY USER'S GUIDE

1. CREATE A DATA FILE JUST AS IF YOU WERE RUNNING ON THE CDC. THIS CAN BE DONE USING RUFUS. THE TWO TYPES OF RUN STREAMS ARE LISTED IN THE APPENDIX. EACH TYPE HAS A SPECIFIC FUNCTION WHICH WILL BE DISCUSSED LATER. DO NOT INCLUDE THE END-OF-RECORD MARKS.

2. AFTER THE DATA FILE IS CREATED DO A LOAD"PREPPY:D". THE FIRST TIME THROUGH YOUR MENU SELECTION WILL BE "D" FOR DATA FILE. THIS ROUTINE WILL COMPUTE AND GENERATE YOUR GRID. IF YOU ARE HAPPY WITH THE GRID YOU CAN STORE IT AS A "GRID" FILE. ACTUALLY, YOU ARE PLOTTING INTO AN ARRAY WHICH WHEN RECALLED TAKES A FRACTION OF THE TIME TO REPLOT COMPARED TO GENERATING THE GRID. YOUR GRID WILL APPEAR ON THE CRT, HOWEVER YOU ARE GIVEN THE OPTION OF A HARD COPY. THE HARD COPY WILL BE A LARGE PLOT WHICH FITS ON USED COMPUTER PAPER OR LARGE HP PAPER RATHER WELL. PLEASE BEGIN THE NAME OF THE GRID FILE WITH A "G" SUCH AS "RING" BECOMES "GRING" AS A GRID FILE.

3. AFTER EXERCISING YOUR GRID STORAGE OPTION, PREPPY WILL CONTINUE AND BEGIN TO FILL IN THE ELEMENTS WITH A COLOR ACCORDING TO YOUR MATERIAL BLOCK ASSIGNMENT CARDS. KEEP IN MIND THAT GREEN (2), BLUE (4), AND RED (6) PHOTOGRAPH THE BEST. AS AN ATTEMPT TO STANDARDIZE THE COLOR CODING SCHEME, TRY TO RESERVE BLUE, FOR STEEL AND RED, FOR ALUMINUM. YELLOW (1) DOES NOT SHOW UP WELL SO USE IT FOR AIR. SAAS DOES NOT CARE WHAT ORDER THE MATERIAL BLOCK ASSIGNMENT CARDS OR THE MATERIAL INFORMATION CARDS ARE IN. HOWEVER, UNLIKE RUNNING SAAS ON THE CDC PREPPY IS PARTICULAR ON ASSIGNING MATERIAL TO NON-EXSISTENT ELEMENTS, SO COLOR IN ONLY THE ELEMENTS YOU HAVE. GRANTED, THIS CREATES A FEW MORE LINES, BUT THE OVERALL TIME SAVINGS IS SIGNIFICANT AND MAKES NO DIFFERENCE TO SAAS ON THE CDC.

4. IF YOU ARE HAPPY WITH THE COLOR CODED GRID, PREPPY WILL ASK YOU IF YOU WANT TO STORE A SUPERGRID. THE SUPER GRID FILE CONTAINS ALL THE INFORMATION NECESSARY FOR RECREATING THE COLOR-CODED GRID QUICKLY, THE NUMBERED ELEMENT GRID, AND THE STRESS PLOTS. IT IS SUGGESTED THAT THE NAME OF THE SUPERGRID FILE START WITH "S" SO THAT IT IS EASILY RECOGNIZED AS SUCH (EXAMPLE: THE SUPERGRID FILE OF "GAGE" BECOMES "SGAGE"). KEEP IN MIND THAT THE 9845 WILL SPEND ABOUT FOUR MINUTES COMPUTING COORDINATES FOR 300 ELEMENT GRID.

5. TO OBTAIN THE GRID FILE SELECT "G" FROM THE PREPPY MENU. ENTER THE NAME OF THE GRID FILE. SELECT THE SCALE: "FULL" MEANS THE ENTIRE FIGURE, "1/2" MEANS THE FIRST HALF, "2/4" MEANS THE SECOND QUARTER ETC, ETC. IF YOU WANT A HARD COPY SELECT THE SIZE OF THE PAPER AND THE SCALE. IF NOT, THE GRID WILL APPEAR ON THE SCREEN.

6. IF YOU WANT A NUMBERED-ELEMENT GRID, YOU MUST HAVE FIRST CREATED A SUPERGRID FILE. SIMPLY ENTER THE NAME OF THE SUPERGRID FILE, THEN SELECT THE SCALE. PLACE AN OVERSIZE SHEET OF PAPER (COMPUTER) ON THE PLATEN. THIS PROGRAM WILL NOT RUN UNLESS THE PLOTTER IS TURNED ON. BECAUSE OF JAGGIES THE NUMERALS DO NOT SHOW UP WELL ON THE CRT.

7. IF YOU ARE NOW READY FOR STRESS PLOTS, YOU MUST HAVE FIRST USED THE LONG RUNSTREAM (APPENDIX). THE THIRD ENTRY ON LINE 14 PROVIDES FOR THE OUTPUT FILE USED BY PREPPY TO GENERATE THE STRESS PLOTS. NOW IS THE TIME TO TRANSFER THE DATA FILE TO THE CDC. DON'T FORGET TO ADD IN THE END-OF-RECORD MARKS BEFORE THE HEADER LINE AND THE END. WHEN THE PROGRAM IS EXECUTED THE OUTPUT FILE (USUALLY STARTED WITH A P) WILL AUTOMATICALLY BE CREATED. THIS FILE MUST BE TRANSFERRED OVER TO THE 9845'S DISK. SELECT "S" FROM THE PREPPY MENU AND FOLLOW THE INSTRUCTIONS. MAKE ABSOLUETLY CERTAIN THAT THE OUTPUT OR P-FILE IS

COMPATIBLE WITH THE SUPERGRID FILE. TO HELP YOU KEEP FILES STRAIGHT USE THE PREPPY LOG BOOK IN RM 107, OR CREATE YOUR OWN SYSTEM. YOU CAN CREATE UP TO NINE STRESS PLOTS FOR EACH RUN: RADIAL, TANGENTIAL OR HOOP, AXIAL SHEAR (ALL IN TENSION(+) OR COMPRESSION(-), AND THE VON MISES OR EFFECTIVE STRESS. FOR THE UNIAXIAL DIRECTIONS THE HIGH EST STRESSED ELEMENT IS THE DARKEST COLORED ONE IN THE COLOR GROUP. ALL OTHER STRESSES ARE NORMALIZED TO THAT VALUE. THE MAGNITUDE OF THAT STRESS IS LISTED IN A KEY AT THE TOP OF THE PLOT. FOR THE EFF-ECTIVE STRESS ALL STRESSES ARE NORMALIZED WITH RESPECT TO THE YIELD POINT OF THE PARTICULAR MATERIAL INVOLVED. THE DARKEST COLORED ELE-MENTS ARE THOSE WHOSE VON MISES STRESS IS VERY NEAR THE YIELD POINT OF THE MATERIAL. SHOULD AN "X" APPEAR ON THE ELEMENT ITS EFFECTIVE STRESS HAS EXCEEDED THE YIELD STRESS BY TWO PER CENT.

8. SHOULD YOU NEED A BLACK-AND-WHITE VERSION OF (7), SELECT "BW" FROM FROM THE MENU. ONCE THE PLOT IS COMPLETED YOU CAN DUMP THE SCREEN ON TO THE DOT MATRIX PRINTER BY EXECUTING A "DUMP GRAPHICS". DON'T FORGET TO LABEL THE COMPONENTS OF THE GRID SINCE YOU NO LONGER HAVE THE COLOR-CODING ADVANTAGE.

PROCEDURE FOR CDC(--->9845 TRANSFERS

1. LOAD "CYBER:D",1 (OR HIT: k3 FROM ANPACK, THEN SELECT: 2, THEN ENTER: PAX THEN MFA OR JUST MFA)
2. TURN ON BLUE BOX.
3. HIT: CONT.
4. LOG IN.
5. HIT: k13.
6. HIT: STORE
7. CHANGE "TEST:T14" TO filename:C12
8. CHANGE "SIZE=010" TO "SIZE=300"
9. HIT:STORE
10. ENTER: TRMDEF,PW=81

--- 9845 TO CDC ---

11 ENTER: NEW/LFN1
12. ENTER: TEXT
13. HIT: SHIFT k14
14. HIT: N
15. AFTER UPLOAD HIT: CONTROL T
16. HIT: CONT
17. ENTER: SAVE,LFN1=filename

--- CDC TO 9845 ---

11. HIT: SHIFT k12
12. ENTER: GET filename
13. ENTER: ASSIGN,TT,B
14. TYPE: COPY,filename,B
15. HIT: SHIFT k15
16. HIT: CONT
17. AFTER FILE IS READ IN HIT: SHIFT k15

NOTE: THE ARROW KEYS ONLY APPEAR TO TO WORK WHEN TALKING WITH THE CDC. YOU MUST USE THE SPACEBAR OR BACKSPACE.

POPULAR XEDIT COMMANDS

Pn:	PRINTS n LINES
Nn:	MOVES POINTER n LINES
Dn:	DELETES n LINES STARTING AT CURRENT POINTER POSITION

USER EVALUATION SHEET/CHANGE OF ADDRESS

This Laboratory undertakes a continuing effort to improve the quality of the reports it publishes. Your comments/answers to the items/questions below will aid us in our efforts.

1. BRL Report Number_____ Date of Report_____

2. Date Report Received_____

3. Does this report satisfy a need? (Comment on purpose, related project, or other area of interest for which the report will be used.)_____

4. How specifically, is the report being used? (Information source, design data, procedure, source of ideas, etc.)_____

5. Has the information in this report led to any quantitative savings as far as man-hours or dollars saved, operating costs avoided or efficiencies achieved, etc? If so, please elaborate._____

6. General Comments. What do you think should be changed to improve future reports? (Indicate changes to organization, technical content, format, etc.)

CURRENT ADDRESS

Name

Organization

Address

City, State, Zip

7. If indicating a Change of Address or Address Correction, please provide the New or Correct Address in Block 6 above and the Old or Incorrect address below.
