PREFACE

This product specification covers the work performed under Air Force Contract F33615-80-C-5155 (ICAM Project 6201). This contract is sponsored by the Materials Laboratory, Air Force Systems Command, Wright-Patterson Air Force Base, Ohio. It was administered under the technical direction of Mr. Gerald C. Shumaker, ICAM Program Manager, Manufacturing Technology Division, through Project Manager, Mr. David Judson. The Prime Contractor was Production Resources Consulting of the General Electric Company, Schenectady, New York, under the direction of Mr. Alan Rubenstein. The General Electric Project Manager was Mr. Myron Hurlbut of Industrial Automation Systems Department, Albany, New York.

Certain work aimed at improving Test Bed Technology has been performed by other contracts with Project 6201 performing integrating functions. This work consisted of enhancements to Test Bed software and establishment and operation of Test Bed hardware and communications for developers and other users. Documentation relating to the Test Bed from all of these contractors and projects have been integrated under Project 6201 for publication and treatment as an integrated set of documents. The particular contributors to each document are noted on the Report Documentation Page (DD1473). A listing and description of the entire project documentation system and how they are related is contained in document FTR620100001, Project Overview.

The subcontractors and their contributing activities were as follows:

TASK 4.2

<u>Subcontractors</u>	<u>Role</u>
Boeing Military Aircraft Company (BMAC)	Reviewer
D. Appleton Company (DACOM)	Responsible for IDEF support, state-of-the-art literature search
General Dynamics/ Ft. Worth	Responsible for factory view function and information models

Subcontractors

Role

**Illinois Institute of
Technology**

**Responsible for factory view
function research (IITRI)
and information models of
small and medium-size business**

North American Rockwell

Reviewer

Northrop Corporation

**Responsible for factory view
function and information
models**

Pritsker and Associates

Responsible for IDEF2 support

SofTech

Responsible for IDEF0 support

TASKS 4.3 - 4.9 (TEST BED)

Subcontractors

Role

**Boeing Military Aircraft
Company (EMAC)**

**Responsible for consultation on
applications of the technology
and on IBM computer technology.**

**Computer Technology
Associates (CTA)**

**Assisted in the areas of
communications systems, system
design and integration
methodology, and design of the
Network Transaction Manager.**

**Control Data Corporation
(CDC)**

**Responsible for the Common Data
Model (CDM) implementation and
part of the CDM design (shared
with DACOM).**

**D. Appleton Company
(DACOM)**

**Responsible for the overall CDM
Subsystem design integration
and test plan, as well as part
of the design of the CDM
(shared with CDC). DACOM also
developed the Integration
Methodology and did the schema
mappings for the Application
Subsystems.**

PS 620141200

Subcontractors

Role

Digital Equipment
Corporation (DEC)

Consulting and support of the
performance testing and on DEC
software and computer systems
operation.

McDonnell Douglas
Automation Company
(McAuto)

Responsible for the support and
enhancements to the Network
Transaction Manager Subsystem
during 1984/1985 period.

On-Line Software
International (OSI)

Responsible for programming the
Communications Subsystem on the
IBM and for consulting on the
IBM.

Rath and Strong Systems
Products (RSSP) (In 1985
became McCormack & Dodge)

Responsible for assistance in
the implementation and use of
the MRP II package (PIOS) that
they supplied.

SofTech, Inc.

Responsible for the design and
implementation of the Network
Transaction Manager (NTM) in
1981/1984 period.

Software Performance
Engineering (SPE)

Responsible for directing the
work on performance evaluation
and analysis.

Structural Dynamics
Research Corporation
(SDRC)

Responsible for the User
Interface and Virtual Terminal
Interface Subsystems.

Prime contractors under other projects who have contributed
to Test Bed Technology, their contributing activities and
responsible projects are as follows:

3-1	Interface of PREO with Other CPCI's	3-2

SECTION 1

SCOPE

1.1 Identification

This specification establishes the design of a number of software modules necessary for the precompiler that were not addressed in any of the NDML Precompiler Development Specification. They can be referred to as PREO, "NDML Control Modules", to be built and formally accepted by the ICAM Program Office. This CI constitutes one of the subsystems of the Common Data Model Processor (CDMP).

1.2 Functional Summary

This configuration item consists of the following software modules:

1. CDM01, APNAME
2. MAIN, CDPRE
3. CDECHK
4. RPTERR
5. CDP13

The purpose of Computer Program Configuration Item (CPCI) and a brief description of the major functions follows:

1. CDM01 is designated to be a queue server process that accesses an ORACLE database. It is accessed by a call to the module APNAME. It determines the next available name to use for a software module that is to be generated. It is also accessed by a call to module RUMOD to signal reuse of a software module during error recovery.
2. MAIN and CDPRE are designed to be the user interface entry point and top level NDML precompiler control module respectively. At this time, the user interface is the NDML precompiler and is designed to be a simple batch-oriented COBOL program. The inputs to the precompiler are "ACCEPTED" from a single file and the

outputs (the identification of generated code) are "DISPLAY" output. This user interface main, after having assembled the input, then calls CDPRE. CDPRE is the callable entry point to the precompiler itself. The precompiler has been made a callable routine to support many other user interfaces as yet unbuilt. CDPRE is essentially a control routine of other designed CPCI's of the NDML precompiler. It executes a loop while over the user input file. This allows for many user modules of a single logical unit of work to be precompiled at the same time (a requirement of the current design). After each user module is precompiled, CDECHK is called to perform any error handling chores. At the end of the user's batch, CDP14 (PRE14) is accessed to generate the necessary request processor main routines.

3. CDECHK is a module that localizes all error checking and handling for the precompilation of a single user module. If the precompile was successful, a record of all generated code is stored on the CDM ORACLE database. If unsuccessful, all module names assigned and generated during the precompilation process must be marked as re-useable.
4. A generalized routine, RPTERR, is used to report user errors during precompilation. This writes the specific message into an error file that contains all user input code along with the interspersed error messages in much the same way as a standard COBOL compiler.
5. CDP13 is a module designed to control all code generation activities of the precompiler. It is called by PRE5. Input to CDP13 consists of the logical specifications for each subtransaction to be generated. For each subtransaction, APNAME is called to get a new name for the module to be generated for a query. PRE8 is called to generate the CS to ES transformer. PRE10 is called to generate code into the user's AP. Also, one of the DBMS specific code generator's is called based upon the type of DBMS the subtransaction must access.

2.2 Terms and Abbreviations

Attribute Use Class: (AUC)

Conceptual Schema: (CS)

Common Data Model Processor: (CDMP)

Common Data Model: (CDM) Describes common data application process formats, form definitions, etc, of the IISS and includes conceptual schema, external, internal schemas, and schema transformation operators.

Data Field: (DF) An element of data in the external schema. It

is by this name that an NDML programmer references data.

Database Management System: (DBMS)

Distributed Request Supervisor: (DRS) This IISS CDM subsystem configuration item controls the execution of distributed NDML queries and non distributed updates.

Domain: A logical definition of legal attribute class values.

Domain Constraint: Predicate that applies to a single domain.

External Schema: (ES)

Forms: Structured views which may be imposed on windows or other forms. A form is composed of fields where each field is a form, item, or window.

Forms Processor: (FP) A set of callable execution time routines available to an application program for form processing.

Internal Schema: (IS)

Integrated Information Support System: (IISS) A test computing environment used to investigate, demonstrate and test the concepts of information management and information integration in the context of Aerospace Manufacturing. The IISS addresses the problems of integration of data resident on heterogeneous databases supported by heterogeneous computers interconnected via a local Area Network.

Mapping: The correspondence of independent objects in two schemas: ES to CS or CS to IS.

Network Transaction Manager: (NTM) Performs the coordination, communication and housekeeping functions required to integrate the application processes and system services resident on the various hosts into a cohesive system.

Neutral Data Manipulation Language: (NDML) A language developed by the IISS project to provide uniform access to common data, regardless of database manager or distribution criteria. It provides distributed retrieved and single node updates.

ORACLE: Relational DBMS based on the SQL (Structured Query Language, a product of ORACLE Corp. Menlo Park, CA). The CDM is an ORACLE database.

Parcel: A sequential file containing sections source code of the input application program.

Request Processor: (RP) A COBOL program that will satisfy a retrieval or update NDML subtransaction against a particular Database Management System.

User Interface: (UI) Controls the user's terminal and interfaces with the rest of the system.

Virtual Terminal Interface: (VTI) Performs the interfacing between different terminals and the UI. This is done by defining a specific set of terminal features and protocols which must be supported by UI software which constitutes the Virtual Terminal Definition. Specific terminals are then mapped against the Virtual Terminal software by specific software modules written for each type of real terminal supported.

SECTION 3

REQUIREMENTS

3.1 Structural Description

A graphic portrayal of this CPCI is included in Section 3.10. This chart shows the hierarchical relationship of each module making up this CPCI. Since only those modules of this CPCI are shown in Section 3.10, the user is referred to the diagrams of Section 3.3 to show how these modules control the CPCI's of the NDML precompiler.

3.2 Functional Flow

A single execution of the NDML precompiler may have many logical units of work, each consisting of a batch of user modules. MAIN controls this loop. Each batch consists of many user modules which may be precompiled successfully or unsuccessfully. This loop is controlled by CDPRE. Error handling logic, for each user module, is controlled by CDECHK. Many NDML statements may be found in each user module. This logic is controlled by PRE2. Each NDML statement may require many conceptual transactions (the original request plus any integrity tests) which is controlled by PRE4. Each conceptual transaction may require many internal schema subtransactions. This is determined by PRE5. The generation of code for each subtransaction is controlled by CDP13.

3.3 Interfaces

Figure 3-1 depicts the interface of PRE0 with other CPCI's in the system.

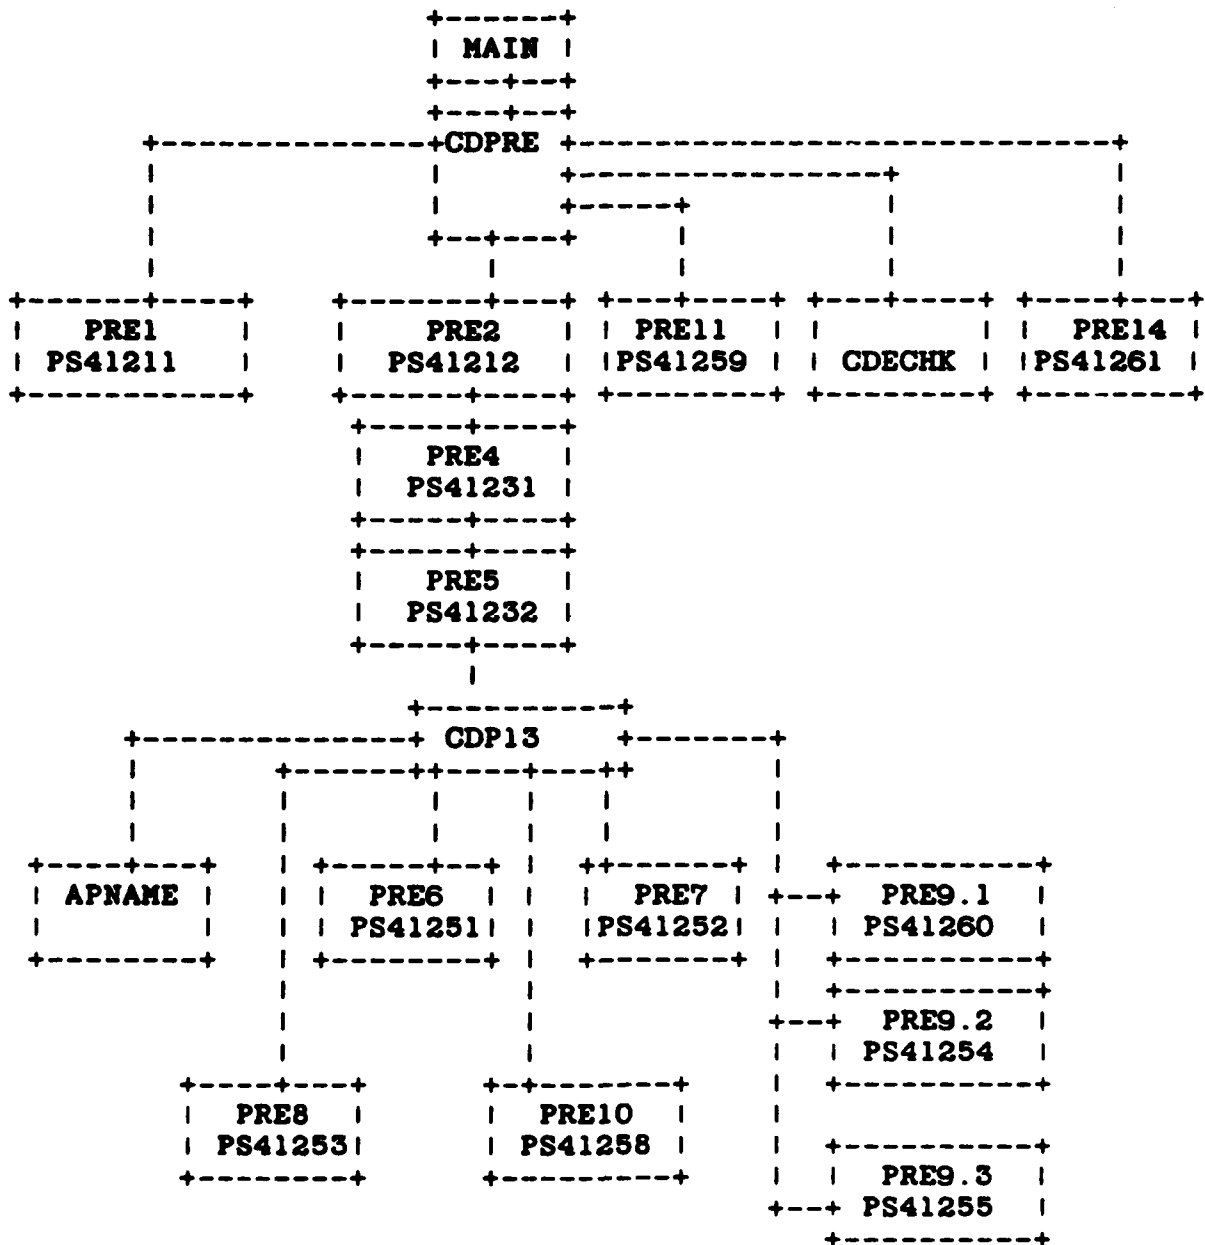

Figure 3-1. Interface of PREO with Other CPCI's

3.3.1 Inputs/Outputs

The following tables depict the inputs and outputs of each module in this CPCI. A detailed description for each item can be found in the DS for this CPCI.

3.4 Program Interrupts

Not applicable to this CPCI.

3.5 Timing and Sequencing Description

Not applicable to this CPCI.

3.6 Special Control Features

Not applicable to this CPCI.

3.7 Storage Allocation

3.7.1 Database Definition

The database used by this CPCI is the Common Data Model (CDM) database. This model is defined by the CDM1, the IDEF1 model of the CDM, Reference Number 3.

3.7.1.1 File Description

No permanent files have been defined for this CPCI. It may use temporary scratch files for such things as generated program source code or temporary query results.

3.7.1.2 Table Description

Not applicable to this CPCI.

3.7.1.3 Item Description

Not applicable to this CPCI.

3.8 Object Code Creation

The object code for this CPCI will be created by the system integration test team by using defined IISS Software Configuration Management Procedures. This CPCI will use the COBOL language compiler.

3.9 Adaptation Data

This CPCI has been coded using ANSI COBOL. The intent was to provide a transportable system. Any system environment supporting this language, a virtual memory management scheme, the COMM and NTM subsystem of IISS and the ORACLE Database Management System should be able to support this CPCI. Every possible attempt has been made to localize and identify any machine or environment dependent modules through the original design of the IISS and application of Configuration Management Procedures.

3.10 Detail Design Description

The following sections have been computer generated for this CPCI.

3.10.1 Main Program List

The following is a list of all "Main Programs" which are modules that are not called by any other module being documented here. These modules are either program entry points or, if they are hooked into another set of programs via subroutine calls, they are the points the external programs can call and therefore enter through. To differentiate between the two types of entry points, look at the individual Module Documentation (section 3.10.8) and look at Module Type for each of the Main Program modules listed. Note whether the routine is a Program, Subroutine, or Function. If it is a Program, it is truly a main program entry point. If not, then it is merely called by other programs not being documented here.

RPTERR	OUTPUT PRECOMPILER ERROR MESSAGES TO AP LISTING
RUMOD	SIGNAL REUSE OF A MODULE
STRMOV	MOVE THE STRING TO THE POOL
SUBMOV	FACILITATE A SUB-STRING MOVE

3.10.3 External Routines List

The following is a list of all routines or functions not documented here that are called by modules that are documented here. The first caller, in alphabetical order, is listed as well. The specification in which any module is documented may be found in the Module Documentation Index (Document Number CM 620100001). See section 3.10.6 for a list of the modules that call each of these external routines.

3.10.4 Include File List

The following is a list of all include files called in by modules being documented here. Each include file has a unique name regardless of the language being used. The purpose of each include file is listed as well. A more complete description of each include file is given in section 3.10.9. The purpose listed is the one that is in the source code of the include file.

A purpose of "***** PURPOSE NOT FOUND BY STRIPPER *****" indicates that a purpose statement was not written into the include file itself. The most common reason for this is that the include file comes from system libraries that were not developed by the project, such as 'C' libraries that are provided with the 'C' compiler.

See section 3.10.6 for a set of lists which show all the modules which call in each of these include files.

PRECOMPILER CONTROL Include File List

3.10.7 Main Program Parts List

The following lists each Main Program listed in 3.10.1 and all the modules which are called either by that module itself or by any of the documented modules which it calls. It is possible for a non-main module to be listed more than once if it is called by multiple modules. The called modules, in this case known as program parts, are marked as to whether they are documented here. If so, the phrase "well-defined module" appears by the module name, if not it is an "external routine". The Purpose of the Main Program module is listed as well.

3.10.8 Module Documentation

The following documentation describes information which is specific to each individual module being documented in this specification as listed in section 3.10.2. It provides a compact way of getting information that would be otherwise buried within each module's source code.

The specific items in this module documentation have the following meanings:

NAME:	Name of program Module.
PURPOSE:	Purpose of Module as detailed in the source code.
LANGUAGE:	Programming language source code is written in. The choices are: VAX-11 FORTRAN C (I/S-1 Workbench 'C') VAX-11 COBOL
MODULE TYPE:	Whether a Program, Subroutine, or Function.
SOURCE FILE:	Name of Source File from file specification.
SOURCE FILE TYPE:	Source File Extension from file specification.
HOST:	Whether this is a host-dependent routine (VAX or IBM) or blank if host-independent.
SUBSYSTEM:	IISS sub-system this file resides in.
SUBDIRECTORY:	Sub-directory of that subsystem in which this file resides.
DOCUMENTATION GROUP:	Name of documentation group of which this source file is a member.
DESCRIPTION:	A description of the module as obtained from the source code.

ARGUMENTS: The arguments with which this routine is called if it is a Subroutine or a Function.

INCLUDE FILES: A list of all the files that are included into this module as well as their purposes.

ROUTINES CALLED: Subroutines or Functions, either documented or external, called by this module, if any.

CALLED DIRECTLY BY: The documented routines which call this module, if any.

USED IN MAIN PROGRAM(S): The documented Main Programs which contain this module in their parts list according to the list in section 3.10.7.

The Module Documentation is arranged alphabetically according to Module Name.

PURPOSE: MARK PREVIOUSLY ASSIGNED MODULES AS
REUSABLE
LANGUAGE: VAX-11 COBOL
MODULE TYPE: SUBROUTINE
SOURCE FILE: RCMOD
SOURCE FILE TYPE: .COB
HOST:
SUBSYSTEM: CDM
SUBDIRECTORY:
DOCUMENTATION GROUP: PS41200

DESCRIPTION:

THIS ROUTINE MUST BE USED TO MARK ALL PREVIOUSLY
ASSIGNED MODULES GENERATED FOR THE USER MODULE NAME
AS REUSEABLE. IT EXPECTS THE NAME OF A USER MODULE.

ARGUMENTS:

USER-MOD-NAME = DSPLY [X(10)]
RET-STATUS = DSPLY [X(5)]

INCLUDE FILES:

SRVRET - AS THE RETURN GIVEN A TABLE-FULL ERROR
ERRCDM - IISS ERROR STATUS CODES FOR CDMP MODULES
CHKCDM - IISS CDMP CHECK STATUS CODES
ERRPRO - PROCESS ERROR INCLUDE FILE

ROUTINES CALLED:

CDFUNC
NSEND
RCV
ERRPRO

CALLED DIRECTLY BY:

PS 620141200
1 November 1985

CDECHK - PROVIDE PRECOMPILER ERROR CHECKING

USED IN MAIN PROGRAM(S):

MAIN - PROGRAM NAME NDML MAIN AND UI

PS 620141200
1 November 1985

PRECOMPILER CONTROL Module Documentation

NAME: RPTERR
PURPOSE: OUTPUT PRECOMPILER ERROR MESSAGES TO AP
LISTING
LANGUAGE: VAX-11 COBOL
MODULE TYPE: SUBROUTINE
SOURCE FILE: RPTERR
SOURCE FILE TYPE: .COB
HOST:
SUBSYSTEM: CDM
SUBDIRECTORY:
DOCUMENTATION GROUP: PS41200

DESCRIPTION:

-

THIS PROGRAM OUTPUTS ERROR MESSAGES TO AP
LISTING FROM PRECOMPILER-ENCOUNTERED ERRORS.
THIS ROUTINE SIMPLY OPENS THE LISTING AT END,
WRITES THE MESSAGE AND CLOSSES THE LISTING.

ARGUMENTS:

FNAME = DSPLY [X(30)]
ERRMESS = DSPLY [X(60)]

INCLUDE FILES:

FILSTAT - VARIABLE DEFINITION FOR FILE STATUS
ERRPRO - PROCESS ERROR INCLUDE FILE

ROUTINES CALLED:

ERRPRO

CALLED DIRECTLY BY:

CDP13 - CONTROLS REQUEST PROCESSOR CODE GENERATION

PS 620141200
1 November 1985

CDPRE - CDPRE MAIN ENTRY POINT FOR THE NDML
PRECOMPILER

USED IN MAIN PROGRAM(S):

CDPIS - CONTROLS REQUEST PROCESSOR CODE GENERATION
MAIN - PROGRAM NAME NDML MAIN AND UI

PRECOMPILER CONTROL Module Documentation

NAME: RUMOD
PURPOSE: SIGNAL REUSE OF A MODULE
LANGUAGE: VAX-11 COBOL
MODULE TYPE: SUBROUTINE
SOURCE FILE: RUMOD
SOURCE FILE TYPE: .COB
HOST:
SUBSYSTEM: CDM
SUBDIRECTORY:
DOCUMENTATION GROUP: PS41200

DESCRIPTION:

THIS ROUTINE MUST BE USED TO MARK A SINGLE
MODULE NAME AS AVAILABLE FOR REUSE. IT WILL
SEND A MESSAGE TO THE MODULE NAME Q-SERVER.

ARGUMENTS:

DEMS-NAME = DSPLY [X(10)]
AP-NAME = DSPLY [X(10)]
RET-STATUS = DSPLY [X(8)]

INCLUDE FILES:

SRVRET - AS THE RETURN GIVEN A TABLE-FULL ERROR
ERRCDM - IISS ERROR STATUS CODES FOR CDMF MODULES
CHKCDM - IISS CDMF CHECK STATUS CODES
ERRPRO - PROCESS ERROR INCLUDE FILE

ROUTINES CALLED:

CDFUNC

FILE NAME: UVABBR
PURPOSE: USER VIEW ABBREVIATION LIST
LANGUAGE: VAX-11 COBOL

DESCRIPTION:

CONTAINS THE ABBREVIATIONS FOR ALL USER
VIEW REFERENCED IN THE NDML REQUEST

3.10.10 Hierarchy Chart

The following hierarchy charts show the relationships between all of the modules mentioned in the above documentation. A module may call a subroutine several times within its code, but the call will only be shown once as a single relationship on this hierarchy chart. All modules shown at the top of the first page are considered Main Programs as described in section 3.10.1 above.

There is an internal paging scheme as marked by the numbers in the upper right corner of each page. An index after the last page of the chart shows where a routine and its calls are first defined. If a routine has no page reference, it either makes no calls or is an external routine. A continuation box on the end of a tree limb shows where that the tree continues on the page numbered mentioned. A number in a box with a routine name points to the page where the routine is further defined within the hierarchy tree. If there is no number in a box, the routine either makes no calls or is an external routine.

3.11 Program Listings Comments

This information is contained in the Module Descriptions in section 3.10.

SECTION 4

QUALITY ASSURANCE PROVISIONS

4.1 Introduction and Definitions

"Testing" is a systematic process that may be preplanned and explicitly stated. Test techniques and procedures may be defined in advance, and a sequence of test steps may be specified. "Debugging" is the process of isolation and correction of the cause of an error.

"Antibugging" is defined as the philosophy of writing programs in such a way as to make bugs less likely to occur and when they do occur, to make them more noticeable to the programmer and the user. In other words, as much error checking as is practical and possible in each routine should be performed.

4.2 Computer Programming Test and Evaluation

The quality assurance provisions for test consists of the normal testing techniques that are accomplished during the construction process. They consist of design and code walk-throughs, unit testing, and integration testing. These tests are performed by the design team. Structured design, design walk-through and the incorporation of "antibugging" facilitate this testing by exposing and addressing problem areas before they become coded "bugs."
