19. ABSTRACT (Continue on reverse if necessary and identify by block number) The gain, phase shift, wavefront curvature and radius of the radiation envelope in a free-electron laser amplifier are obtained in the small signal regime. The electron beam is assumed to have a Gaussian density distribution in the transverse direction. Numerical calculations indicate that the radius and curvature of the radiation beam entering a wiggler asymptote to unique, spatially constant values after a finite transition region. However, in the asymptotic region the wavefronts are divergent. Analytical expressions for the gain, phase shift, curvature and spot size are derived. It is shown analytically that small perturbations of the optical waist and curvature about the matched value are spatially damped out, indicating the stability of the matched envelope. When the electron beam envelope is modulated in space, the optical spot size oscillates with an almost electric wavelength but is damped in phase. In the case of small amplitude long wavelength betatron modulation of the electron beam envelope, generation of optical sidebands in wave number space is examined and the effect on the dispersion characteristics of the primary wave is found to be negligible for typical experimental parameters.

OPTICAL GAIN, PHASE SHIFT AND PROFILE IN FREE-ELECTRON LASERS

I. Introduction

A well-known feature of the free-electron laser (FEL) is that the refractive index of the medium is a complex function and hence the radiation is amplified and to some extent focused in the vicinity of the electron beam.^{1,2} It may then be possible for the electron and radiation beams to interact over an extended length along the wiggler, with the diffractive tendency being compensated by the FEL interaction, thereby enhancing the efficiency of the process.

Considerable progress has been made in studying this process by several authors.³⁻⁸ The purpose of this paper is to apply the formalism of the Gaussian-Laguerre modal source dependent expansion (SDE) of Ref. 8 to examine the propagation and guiding of the optical wave in an amplifier operating in the exponential gain regime, for a variety of operating conditions.

The plan of this paper is as follows. In Section II the formalism of the SDE is employed to obtain the evolution equations for the radius and the curvature for the lowest order mode of the optical beam, along with the relevant dispersion relation for a Gaussian electron beam driving an FEL amplifier in the small signal regime. In Section III numerical solutions of the single-mode equation for the radius of the optical beam are presented and compared to the result from a multi-mode truncation of the radiation field. In this case, and for cases not presented herein, the single-mode and multi-mode results indicate that the radiation beam profile entering the wiggler asymptotes to a unique form after an initial

transient. Additionally, the numerical values of the radius of the radiation envelope and of the wavefront curvature are in fair agreement, irrespective of the degree of mode truncation, indicating the usefulness of the single-mode equations. Limiting ourselves to these equations, the electron beam is then allowed to oscillate at the betatron wavelength and the resulting radiation profile examined. It is found that the optical beam envelope follows that of the electrons with almost identical wavelength, but retarded in phase. Section IV discusses the results, deriving formulae for the matched radiation beam profile (i.e., radius and curvature) in terms of the electron beam and wiggler parameters. It is shown analytically that perturbations of the profile are spatially damped out, consistent with the numerical observations indicating a unique, asymptotic matched radius and curvature. Appendix A presents the necessary details required to derive the source term, for the wave equation, for a planar wiggler and an electron beam with uniform density along the direction of propagation. Appendix B considers the effect of the modulation of the electron beam on the optical wave. Specifically, a simple analysis, taking into account sideband generation, indicates that the dispersion characteristics of the primary wave are only slightly modified for typical experimental parameters. Appendix C presents the details of the stability calculation.

II. Mathematical Formulation

The purpose of the present section is to present the salient features of the source dependent expansion method⁸ so as to fix the notation and for reference in the subsequent sections.

For a planar wiggler, it is appropriate to assume a linearly polarized radiation vector potential

$$\underline{A} = (1/2) A(r, \theta, z) \exp \left[i \left(\frac{\omega z}{c} - \omega t \right) \right] \underline{e}_x + \text{c.c.},$$

with angular frequency ω and complex amplitude A . In the slowly varying envelope approximation, the wave equation reduces to

$$\left(\frac{1}{r} \frac{\partial}{\partial r} r \frac{\partial}{\partial r} + \frac{1}{r^2} \frac{\partial^2}{\partial \theta^2} + \frac{2i\omega}{c} \frac{\partial}{\partial z} \right) a = S(r, \theta, z), \quad (1)$$

where $a = |e|A/m_0 c^2$, and the source function is given by

$$S(r, \theta, z) = - \frac{8\pi |e|}{m_0 c^3} \left\{ J_x(r, \theta, z) \exp \left[-i \left(\frac{\omega z}{c} - \omega t \right) \right] \right\}_{\text{slow}}. \quad (2)$$

Here e is the charge on an electron of (rest) mass m_0 , $J_x(r, \theta, z)$ is the current density and $\{ \}_{\text{slow}}$ indicates that only the spatially and temporally slow part of the quantity in braces is to be retained.

The basic premise of the work presented herein is that the radiation field is azimuthally symmetric and the vector potential is expressible as:

$$a(r, \theta, z) = \sum_{m=0}^{\infty} a_m(z) D_m(\xi, z), \quad (3)$$

with $D_m = L_m(\xi) \exp \{-[1-i\alpha(z)]\xi/2\}$, where $\xi = 2r^2/r_s^2(z)$, $r_s(z)$ is related to the radiation spot size, $\alpha(z)$ is proportional to the curvature of the wavefront, and $L_m(\xi)$ is the Laguerre polynomial of order m .

Now, if the transverse profile of the radiation beam is close to a Gaussian, the lowest order mode is expected to dominate^{3,5,7,8}, and, following Ref. 8, it is simple to show that the associated vector potential evolves according to

$$\left(\frac{\partial}{\partial z} + A_0 \right) a_0 = -i F_0, \quad (4)$$

and the spot size and wavefront curvature evolve via

$$\frac{d}{dz} r_s - \frac{2c\alpha}{\omega r_s} = -r_s \left(\frac{F_1}{a_0} \right)_I, \quad (5a)$$

$$\frac{d}{dz} \alpha - 2(1+\alpha^2) \frac{c}{\omega r_s} = 2 \left[\left(\frac{F_1}{a_0} \right)_R - \alpha \left(\frac{F_1}{a_0} \right)_I \right], \quad (5b)$$

where

$$A_0 = \frac{1}{r_s} \frac{d}{dz} r_s + i \left[(1+\alpha^2) \frac{c}{\omega r_s} - \frac{\alpha}{r_s} \frac{d}{dz} r_s + \frac{1}{2} \frac{d}{dz} \alpha \right],$$

the F's are given by the following overlap integral:

$$F_m(z) = \frac{c}{2\omega} \int_0^{\infty} d\xi S(\xi, z) D_m^*(\xi, z), \quad (6)$$

and the label R (I) indicates the real (imaginary) part.

Noting that $L_0(\xi) = 1$, the normalized vector potential is seen to be given by [Eq. (3)]

$$a(r, \theta, z) \approx a_0(z) \exp \left\{ -[1-i\alpha(z)] \frac{r^2}{r_s^2(z)} \right\}, \quad (7)$$

where, in the exponential gain, small-signal regime,

$$a_0(z) \approx a(0) \exp \left\{ i \int_0^z dz_1 \left[\Delta k(z_1) - i\Gamma(z_1) \right] \right\}. \quad (8)$$

Here $a(0)$ is the input signal at $z = 0$, and the two components of the refractive index are given by

$$n_z = \left[1 + \frac{c\Delta k}{\omega} \right] - i \frac{c}{\omega} \left(\Gamma - r^2 \frac{\partial}{\partial z} \frac{1-i\alpha}{r_s^2} \right) \quad (9a)$$

$$n_r = \frac{2cr}{\omega r_s^2} (\alpha + i). \quad (9b)$$

Assuming the electron beam profile to be given by

$$n_b(z) = n_{bo} \left[\frac{r_{bo}}{r_b(z)} \right]^2 \exp \left[- \frac{r^2}{r_b^2(z)} \right], \quad (10)$$

where $r_b(z)$ is the electron beam radius at z and n_{bo} is the beam density at $r_b(z) = r_{bo}$, the source term in Eq. (1) may be readily evaluated (Appendix A), to obtain

$$S(r, z) = f_B^2 \frac{\omega_{bo}^2}{2\gamma^3 c^2} \left[\frac{r_{bo}}{r_b(z)} \right]^2 \exp \left(- \frac{r^2}{r_b^2} \right) \frac{\omega k_w a_w^2 a}{c(\Delta k - i\Gamma)^2}, \quad (11)$$

where the vector potential of the planar wiggler of periodicity $2\pi/k_w$ is given by

$$\underline{A}_w = A_w \cos(k_w z) \underline{e}_x, \quad (12)$$

$$a_w = |e| A_w / m_0 c^2, \quad (13)$$

γ is the relativistic mass factor, f_B is the usual difference of Bessel functions, $f_B = J_0(\zeta) - J_1(\zeta)$, $\zeta = (1/4)a_w^2/[1 + (1/2)a_w^2]$, and

$$\omega_{bo} = \left(4\pi |e|^2 n_{bo} / m_0 \right)^{1/2}$$

is the plasma frequency of the electron beam with density n_{bo} .

Substituting Eqs. (8) and (11) into Eq. (6) and making use of Eqs. (4) and (5), it is simple to show that the equations reduce to

$$\frac{d\alpha}{d(k_w z)} = 2(1+\alpha^2) \left(\frac{ck_w}{\omega} \right) \frac{1}{(k_w r_s)^2} + 2 \left[\left(\frac{F_1}{k_w a_o} \right)_R - \alpha \left(\frac{F_1}{k_w a_o} \right)_I \right], \quad (14a)$$

$$\frac{d(k_w r_s)^2}{d(k_w z)} = 4\alpha \left(\frac{ck_w}{\omega} \right) - 2 \left(\frac{F_1}{k_w a_o} \right)_I (k_w r_s)^2, \quad (14b)$$

$$\frac{\Delta k}{k_w} - i \frac{\Gamma}{k_w} + 2 \left(\frac{ck_w}{\omega} \right) \frac{1-i\alpha}{(k_w r_s)^2} + 2 \left(\frac{F_1}{k_w a_o} \right) \left[1 + \left(\frac{r_b}{r_s} \right)^2 \right] = 0, \quad (14c)$$

where

$$\frac{F_1}{k_w a_o} = f_B^2 \left(\frac{\omega_{bo}}{ck_w} \right)^2 \left[\frac{r_{bo}}{r_b(z)} \right]^2 \frac{a_w^2}{2\gamma^3} \frac{(r_b/r_s)^2}{[1+2(r_b/r_s)^2]^2} \left(\frac{\Delta k}{k_w} - i \frac{\Gamma}{k_w} \right)^{-2}. \quad (14d)$$

The spatial evolution of the system is governed by the differential system (14a) and (14b) along with the dispersion relation (14c), the solution of which yields $\alpha(z)$, $r_s(z)$, $\Delta k(z)$ and $\Gamma(z)$.

III. Numerical Results

Having obtained the single mode system of Eqs. (14), it is of interest to determine the extent to which it approximates the general solution in (3). Once it is established that Eqs. (14) provide an adequate representation of the general solution, it is then possible to study a variety of problems of interest by solving a simple set of equations.

Briefly, the numerical procedure for solving an initial-value problem is the following. Substituting Eq. (14d) into Eq. (14c) yields a cubic (algebraic) equation for $\Delta k - i\Gamma$ which may be solved, at each z , in terms of $r_s(z)$, $\alpha(z)$ and $r_b(z)$, thus enabling Eqs. (14a) and (14b) to be stepped forward in z . Since in the absence of source terms an input radiation signal diffracts away on the scale length defined by the Rayleigh range z_R ,

$$z_R = \frac{\omega r_s^2(z)}{2c} \Big|_{z=0}, \quad (15)$$

it is informative to present the numerical results with the distance along the wiggler measured in units of the Rayleigh range. In all the numerical results to be presented, the radiation field is assumed to be in the form of plane waves at the entrance to the wiggler, i.e., $\alpha(z=0) = 0$.

Case I

To begin with, Fig. 1 shows the results for the following parameters: beam current, $I_b = 270$ A, $r_{b0} = 0.01$ cm, $\gamma = 2000$, $2\pi/k_w = 10$ cm, $a_w = 6.15$ and $r_s(z=0) = 0.02$ cm. Noting the factor of $2^{1/2}$ difference between the definition of a_w in Eq. (13) and that in Ref. 4, it is clear from Fig. 1(a) that after a transient oscillation over a distance of about 20 Rayleigh ranges, the radiation spot size approaches a value quite close to that obtained with the two-dimensional FEL code FRED at the Lawrence Livermore National Laboratory (LLNL).⁴ We also find that for all the numerical cases examined, a unique, asymptotic spot size is obtained irrespective of the initial optical waist. Figure 1(b) shows the spatial evolution of α , indicating that it, too, approaches a constant value after an initial transient behavior.

The solid curve in Fig. 2 shows the evolution of $1/e$ width of the radiation amplitude with a five mode ($m=0,1,2,3,4$) source dependent expansion calculation using the same set of FEL parameters. The radiation field is represented by Eq. (3) and the source term is given by Eq. (11). With the assumption that the fundamental mode dominates, only the Δk and Γ of $a_0(r,z)$ are involved in the source function and they are obtained from Eqs. (14c) and (14d). It is found that the fundamental mode remains dominant over many Rayleigh lengths. For comparison the dashed curve in Fig. 2 shows the fundamental mode spot size of Fig. 1(a), and the asymptotic results are seen to differ by about 10%. This suggests that the

single-mode system of Eqs. (14) may be regarded as a reasonably accurate simplification of Eq. (3). Henceforth the results presented pertain to Eqs. (14).

Case II

Figure 3 presents the results for a case where the electron beam is not matched; i.e., the envelope of the electron beam is modulated:

$$r_b(z) = r_{b0} + \delta r_b \sin(k_\beta z), \quad (16)$$

where δr_b is the amplitude of the modulation and for simplicity k_β is chosen to be equal to the betatron wave number⁹ $k_w a_w / (\sqrt{2} \gamma \beta_z)$, neglecting self-fields.¹⁰ β_z is the beam speed along the wiggler axis normalized to c. The parameters, typical of the Advanced Test Accelerator experiment at LLNL, are $I_b = 2$ kA, $r_{b0} = 0.3$ cm, $\gamma = 100$, $2\pi/k_w = 8$ cm, $a_w = 1.72$, $r_s(z=0) = 0.35$ cm. (The reader is referred to Refs. 9 and 11 for details.) In Fig. 3, where $\delta r_b / r_{b0} = 0.1$, it is observed that the optical spot size follows the modulations in the electron envelope apparently identically. Specifically, a number of cases were examined with $\delta r_b / r_{b0}$ up to 0.4. In all cases the electron and optical beams oscillate with almost identical wavelength, although the radiation beam appears to lag behind in phase. Defining the modulation depth $\Delta = [(r)_{\max} - (r)_{\min}] / [(r)_{\max} + (r)_{\min}]$, it is found from Fig. 3(a) that $\Delta_s = 0.087$ whereas, from Eq. (16), $\Delta_b = \delta r_b / r_{b0} = 0.1$. Although the modulation depth of the electron beam differs from that of the radiation beam, it is found that Δ_s increases with δr_b .

More generally, allowing for the defocusing effect of self-fields, there is always the possibility of a small amplitude ripple on the electron beam envelope and hence on the radiation beam envelope. In Appendix B,

generation of sidebands is considered in a simplified model and found to have, for typical cases, an insignificant effect on the linear dispersion characteristics of the primary optical wave, as implicitly assumed by employing the source term in Eq. (11) in the present case.

IV. Analysis of Results

One interesting feature of the numerical results is that in all cases the radiation spot size has a unique, asymptotic limit irrespective of the initial value. The asymptotic value of r_s and of α is determined by the fixed points of Eqs. (14a) and (14b); i.e., at the fixed point

$$2(1+\alpha^2) \frac{ck_w}{\omega} \frac{1}{(k_w r_s)^2} + 2 \left[\left(\frac{F_1}{k_w a_o} \right)_R - \alpha \left(\frac{F_1}{k_w a_o} \right)_I \right] = 0, \quad (17a)$$

$$4\alpha \frac{ck_w}{\omega} - 2 \left(\frac{F_1}{k_w a_o} \right)_I (k_w r_s)^2 = 0. \quad (17b)$$

Combining Eqs. (17a) and (17b) one obtains

$$(1 - i\alpha)^2 \frac{ck_w}{\omega} + (k_w r_s)^2 \left(\frac{F_1}{k_w a_o} \right) = 0,$$

which, upon making use of Eq. (14d), yields

$$\Delta k = \frac{k_w^2 r_b \eta^{1/2}}{1+2f} \frac{\alpha}{1+\alpha^2}, \quad \Gamma = \Delta k / \alpha,$$

where

$$\eta = f_B^2 \left(\frac{\omega}{ck_w} \right) \left(\frac{\omega_{bo}}{ck_w} \right)^2 \left(\frac{r_{bo}}{r_b} \right)^2 \frac{a_w^2}{2\gamma^3},$$

and $f = (r_b/r_s)^2$ is the filling factor. Substituting the expressions for Δk and Γ into the dispersion relation (14c), one obtains

$$\alpha = [f/(3f + 2)]^{1/2},$$

$$r_s = \frac{(\gamma/v)^{1/4}}{2^{3/4} k_w \gamma f_B^{1/2}} \frac{(1+a_w^2/2)^{3/4}}{a_w^{1/2}} \frac{f^{1/4} (1+2f)^{3/2}}{(1+3f/2)^{3/4}},$$

where $v = (\omega_{bo} r_{bo} / 2c)^2$ is Budker's parameter. These expressions may be used to obtain the asymptotic spot size for a given filling factor, and then one obtains the corresponding electron beam radius via $r_b = r_s f^{1/2}$. To avoid complications arising at the outer edges of the optical beam, where the field amplitude is small, typically a filling factor $f \lesssim 1/2$ is appropriate. It is also possible to rearrange the expression for r_s to obtain

$$f^3 + f^2 + \left(\frac{1}{4} - \frac{3}{2} q\right) f - q = 0,$$

where

$$q = \left[a_w^2 \left(\frac{2f_B}{\gamma/v} \right) \left(\frac{\gamma r_b k_w}{2} \right)^4 \right]^{1/3} \frac{1}{1+a_w^2/2}.$$

The cubic equation for f may be solved to obtain an explicit expression for r_s . Noting that the sum and the product of the three roots of the cubic equal -1 and q , respectively, it follows that there is a unique, real value for the asymptotic spot size r_s .

To examine stability, it is convenient to define

$$\gamma \equiv \frac{\Delta k}{k_w} - i \frac{\Gamma}{k_w},$$

and substitute Eq. (14d) into Eq. (14c) to obtain the local dispersion relation:

$$Y^3 + 2 \left(\frac{ck_w}{\omega} \right) \frac{1-i\alpha}{(k_w r_s)^2} Y^2 = - 2 \frac{ck_w}{\omega} \eta \left(\frac{r_b}{r_s} \right)^2 \frac{1+(r_b/r_s)^2}{[1+2(r_b/r_s)^2]^2}, \quad (18)$$

which may be solved iteratively. It turns out that for the parameters of Case I, at the lowest order, the right-hand side balances the quadratic term on the left. The relevant root, with $\Delta k, \Gamma > 0$, may be substituted into Eq. (14d) to obtain, for $\alpha > 0$,

$$\begin{aligned} \frac{F_1}{k_w a_0} &= \frac{-ck_w}{\omega} \frac{1-i\alpha}{(k_w r_s)^2 + (k_w r_b)^2} - \frac{1}{2} \left[\frac{\eta}{2(1+\alpha^2)} \right]^{1/2} \frac{\alpha-i [1+(1+\alpha^2)^{1/2}]}{[1+(1+\alpha^2)^{1/2}]^{1/2}} \\ &\cdot \frac{(k_w r_s)^2}{(k_w r_s)^2 + 2(k_w r_b)^2} \frac{(k_w r_s)(k_w r_b)}{[(k_w r_s)^2 + (k_w r_b)^2]^{1/2}}. \end{aligned} \quad (19)$$

Perturbing Eqs. (14a) and (14b) about the fixed point and making use of Eq. (19), it is simple to show that the perturbation is spatially damped, thus indicating the stability of the fixed point. The algebraic details are relegated to Appendix C.

Another aspect of the results which is of interest pertains to the nature of the phase fronts and the flux of optical power in the asymptotic region. From Eqs. (7) and (8) it is simple to check that, in differential form, the surfaces of constant phase are given by $(\omega/c + \Delta k)\delta z + (2r\alpha/r_s^2)\delta r = 0$, and hence, noting that $\Delta k, \alpha > 0$, the wavefronts are divergent in the direction of propagation. Consistent with this, there is a nonvanishing transverse component of the Poynting flux. Specifically, for $r/r_s \lesssim 1$ the ratio of flux of optical energy in the transverse direction to that along the z axis is $\sim \alpha r/k r_s^2 \ll 1$.

V. Conclusion

Based on the results presented herein, the simplicity and accuracy of the single-mode Gaussian-Laguerre approximation to the solution of Maxwell's equations has been demonstrated. It is shown that, in the exponential gain regime of operation of an FEL amplifier, there is a unique, asymptotic spot size for the radiation beam irrespective of that at the entrance of the wiggler. There is, however, a transverse flux of optical power. It is shown analytically that the asymptotic profile (i.e., the radius and the curvature at large z) is stable to small amplitude perturbations. With a spatially modulated electron beam envelope, that of the optical beam is found to oscillate on the same spatial scale.

Appendix A: Source Term

In this appendix, the details of the evaluation of the source term S in Eq. (11) are presented.

The FEL source current, $J_x(r, \theta, z)$, in a linear wiggler is given by

$$\begin{aligned} J_x(r, \theta, z) &= -|e| \delta n_b(r, \theta, z) v_x \\ &= \frac{-|e|^2 \delta n_b e^{-ik_w z}}{2\gamma m_0 c} A_w + \text{c.c.} \end{aligned}$$

where δn_b is the perturbed beam density and the relation $v_x \approx v_w = |e| A_w \cdot \cos(k_w z) / \gamma m_0 c$ has been used. Equation (2) can then be written as

$$S(r, \theta, z) = \left\{ \frac{4\pi |e|^2 \delta n_b a_w}{\gamma m_0 c^2} e^{-i[(k + k_w)z - \omega t]} \right\}_{\text{slow}} \quad (\text{A1})$$

where $k = \omega/c$.

The perturbed beam density can be evaluated from the continuity equation,

$$\frac{d\delta n_b}{dt} = -n_b \frac{\partial \delta v_z}{\partial z}, \quad (\text{A2})$$

and the equation of motion in the z -direction,

$$\frac{dv_z}{dt} = -\frac{|e|}{\gamma m_0} \left[\frac{v_x B_y}{c} - \frac{v_z (v_x E_x)}{c^2} \right] \quad (\text{A3})$$

where electron self-field effects are neglected. Taking the convective time derivative of Eq. (A2), and incorporating the linearized version of Eq. (A3), one can arrive at the following equation for the perturbed beam density,

$$\frac{d^2 \delta n_b}{dt^2} = - \frac{|e| n_b}{\gamma m_0} \frac{\partial}{\partial z} \left(\frac{\partial}{\partial z} + \frac{v_z}{c^2} \frac{\partial}{\partial t} \right) \Phi_{\text{pond}} \quad (\text{A4})$$

where

$$\Phi_{\text{pond}} = - \frac{|e| A_w A}{4 \gamma m_0 c^2} e^{i \left[(k + k_w) z - \omega t \right]} + \text{c.c.}$$

With the assumption that $A(r, \theta, z)$ is a slowly varying function of z , i.e., $|\partial \ln A / \partial z| \ll k_w \ll k$, Eq. (A4) becomes

$$\frac{d^2 \delta n_b}{dt^2} = \frac{|e|^2 n_b A_w A}{2 \gamma m_0^2 c^2} k_w k e^{i \left[(k + k_w) z - \omega t \right]} + \text{c.c.} \quad (\text{A5})$$

where the resonance condition, $\omega = v_z (k + k_w)$ is used.

For a near Gaussian radiation field in the exponential gain regime,

$$A(r, \theta, z) \approx A_0(r, \theta, z) = A_0(0) \exp \left\{ i \int_0^z [\Delta k(z_1) - i \Gamma(z_1)] dz_1 - [1 - i \alpha(z)] \frac{r^2}{r_s^2(z)} \right\}$$

and assuming Δk , Γ , α and r_s are slowly varying functions of z , Eq. (A5) can be integrated immediately to give

$$\delta n_b = \frac{|e|^2 n_b A_w A k k_w}{2 \gamma m_0^2 c^4 (\Delta k - i \Gamma)^2} e^{i \left[(k + k_w) z - \omega t \right]} + \text{c.c.} \quad (\text{A6})$$

When Eq. (A6) is substituted into Eq. (A1), taking into account the usual difference of Bessel functions for a planar wiggler, and Eq. (10) for the beam profile, the source function in Eq. (1) is then given by Eq. (11).

Appendix B: Sideband Generation

In this appendix generation of sidebands to the primary optical wave, due to the spatial modulation of the electron beam, is analyzed. It is to be emphasized that the following analysis is intended merely to show that the dispersion characteristics of the primary optical wave are only slightly modified [$\sim (\delta N_0/N_0)^2$] for typical experimental parameters, as implicitly assumed in applying the results of Appendix A to the case of a modulated electron beam in Section III.

The development of the linear theory herein generalizes that of Sprangle et al.,¹² to which reference should be made for further details.

The form of the vector potential of a planar wiggler employed in this appendix is slightly different to that given by Eq. (12):

$$\underline{A}_w \approx A_w \left[\exp(ik_w z) - \text{c.c.} \right] \underline{e}_x,$$

where A_w is purely imaginary, and that of the linearly polarized radiation field is taken to be of the form

$$\underline{A} = \left\{ \underline{A}_+ \exp \left[ik_+ z - i\omega t \right] + \underline{A} \exp \left[ik_- z - i\omega t \right] + A_0 \exp \left(ik z - i\omega t \right) + \text{c.c.} \right\} \underline{e}_x,$$

where it is assumed that the electron density, modulated at the betatron wavelength $2\pi/k_\beta$, has the simple form

$$n_0 = N_0 + \frac{\delta N_0}{2} \left[\exp(ik_\beta z) + \text{c.c.} \right],$$

with $k_\beta \ll k_w \ll k$, and $k_+ = k + k_\beta$, $k_- = k - k_\beta$.

Following Ref. 12, the wave equation is found to be

$$\left(\frac{\partial^2}{\partial z^2} - \frac{1}{c^2} \frac{\partial^2}{\partial t^2} - \frac{\omega_b^2}{\gamma_0 c^2} \right) \underline{A} = \frac{4\pi |e|^2}{\gamma_0 m_0 c^2} \delta n \underline{A}_w,$$

where γ_0 is the relativistic factor in the absence of the radiation field, $\omega_b = (4\pi n_0 |e|^2 / m_0)^{1/2}$, and δn is the density perturbation caused by the radiation. Note that the velocity v_{z0} along the wiggler axis is not affected by the betatron oscillation and hence γ_0 , to lowest order in $|eA_w / \gamma_0 m_0 c^2|^2$, is not a function of z . Defining the ponderomotive potential

$$\phi_{\text{pond}} = \frac{-|e|}{\gamma_0 m_0 c^2} \underline{A}_w \cdot \underline{A},$$

the momentum, continuity and Poisson's equations may be combined to obtain

$$\begin{aligned} \frac{d^2}{dt^2} \delta n - \frac{v_{z0}}{n_0} \left(\frac{\partial n_0}{\partial z} \right) \frac{d}{dt} \delta n + \frac{4\pi n_0 |e|^2}{m_0 \gamma_0 \gamma_z^2} \delta n + \frac{|e|}{m_0 \gamma_0 \gamma_z^2} \left(\frac{\partial n_0}{\partial z} \right) \frac{\partial \phi}{\partial z} \\ = \frac{-|e|}{m_0 \gamma_0} \frac{\partial}{\partial z} n_0 \left(\frac{\partial}{\partial z} + \frac{v_{z0}}{c^2} \frac{\partial}{\partial t} \right) \phi_{\text{pond}}, \end{aligned} \quad (\text{B1})$$

where $\gamma_z = (1 - v_{z0}^2 / c^2)^{-1/2}$, ϕ is the scalar potential, and terms such as $\partial^2 n_0 / \partial z^2$, which are on the order of k_β^2 , have been neglected.

Writing $k_+ = k + k_\beta$, $k_- = k - k_\beta$,

$$\begin{aligned} \delta n = \left\{ \delta n_+ \exp[i(k_+ + k_w)z - i\omega t] + \delta n_- \exp[i(k_- + k_w)z - i\omega t] \right. \\ \left. + \delta n_0 \exp[i(k + k_w)z - i\omega t] + \text{c.c.} \right\}, \end{aligned}$$

noting that, on the left-hand side of Eq. (B1), the ratio of the fourth to the third term is on the order of $k_\beta / k \ll 1$, one finds that

$$\begin{bmatrix} m_{11} + \varepsilon^2 a_- & \varepsilon m_{12} & m_{13} \\ \varepsilon m_{21} & m_{22} + \varepsilon^2 a_{22} & \varepsilon m_{23} \\ m_{31} & \varepsilon m_{32} & m_{33} + \varepsilon^2 a_+ \end{bmatrix} \begin{bmatrix} A_+ \\ A_0 \\ A_- \end{bmatrix} = 0,$$

where $\varepsilon = (\delta N_0 / 2N_0)$, and $m_{13}, m_{31} = 0(\varepsilon^2)$. It is then simple to show that, correct to $0(\varepsilon^2)$, the dispersion relation is given by

$$m_{22} - \left(\frac{\delta N_0}{2N_0}\right)^2 \left(\frac{m_{32}m_{23}}{m_{33}} + \frac{m_{12}m_{21}}{m_{11}}\right) + \left(\frac{\delta N_0}{2N_0}\right)^2 \left[a_{22} + m_{22} \left(\frac{a_+}{m_{33}} + \frac{a_-}{m_{11}}\right) \right] = 0,$$

where

$$m_{22} = m_{22}(k) \equiv \left\{ \left[\omega - (k + k_w)v_{z0} \right]^2 - \frac{\omega_{bo}^2}{\gamma_o \gamma_z^2} \right\} \left\{ k^2 - \frac{\omega^2}{c^2} + \frac{\omega_{bo}^2}{\gamma_o c^2} \right\} - \frac{2\omega_{bo}^2}{\gamma_o^3} k k_w a_w^2,$$

is the usual matrix element for the primary wave, $m_{11} = m_{22}(k_+)$,

$$m_{33} = m_{22}(k_-),$$

$$m_{12} = m_{12}(k_+, k, k_\beta)$$

$$\equiv \frac{\omega_{bo}^2}{\gamma_o c^2} \left\{ \left[\omega - (k_+ + k_w)v_{z0} \right]^2 - \frac{\omega_{bo}^2}{\gamma_o \gamma_z^2} \right\}$$

$$+ \left\{ k_\beta v_{z0} \left[\omega - (k + k_w)v_{z0} \right] - \frac{\omega_{bo}^2}{\gamma_o \gamma_z^2} \right\}$$

$$\cdot \left(k^2 - \frac{\omega^2}{c^2} + \frac{\omega_{bo}^2}{\gamma_o c^2} \right) - \frac{2\omega_{bo}^2}{\gamma_o^3} k_+ k_w a_w^2,$$

$$m_{21} = m_{12}(k, k_+, -k_\beta), \quad m_{23} = m_{12}(k, k_-, k_\beta), \quad m_{32} = m_{12}(k_-, k, -k_\beta),$$

$$a_{22} = -\frac{2\omega_{bo}^4}{\gamma_o \gamma_z^2 c^2} + \frac{2\omega_{bo}^2 k_\beta^2 v_{zo}^2}{\gamma_o c^2},$$

$$a_{\pm} = \frac{\omega_{bo}^2}{\gamma_o c^2} \left\{ k_\beta v_{zo} \left[\omega - (k + k_w) v_{zo} \right] \mp \frac{\omega_{bo}^2}{\gamma_o \gamma_z^2} \right\},$$

and $\omega_{bo} = (4\pi e^2 N_o / m_o)^{1/2}$. Note that with the definition chosen for A_w in this appendix, $a_w^2 = (eA_w / m_o c^2)^2 < 0$.

To proceed along the lines of Ref. 12, it is convenient to write

$$m_{22} = M_{22} + C_{22},$$

where

$$M_{22} = \left\{ \left[\omega - (k + k_w) v_{zo} \right]^2 - \frac{\omega_{bo}^2}{\gamma_o \gamma_z^2} \right\} \left(k^2 - \frac{\omega^2}{c^2} + \frac{\omega_{bo}^2}{\gamma_o c^2} \right),$$

and

$$C_{22} = \frac{-2\omega_{bo}^2}{\gamma_o^3} k k_w a_w^2$$

is the "coupling" term. The dispersion relation then becomes

$$\begin{aligned} \left[1 + \left(\frac{\delta N_o}{2N_o} \right)^2 \left(\frac{a_+}{m_{33}} + \frac{a_-}{m_{11}} \right) \right] M_{22} = & - \left[1 + \left(\frac{\delta N_o}{2N_o} \right)^2 \left(\frac{a_+}{m_{33}} + \frac{a_-}{m_{11}} \right) \right] C_{22} \\ & + \left(\frac{\delta N_o}{2N_o} \right)^2 \left(\frac{m_{12} m_{21}}{m_{11}} + \frac{m_{32} m_{23}}{m_{33}} - a_{22} \right). \end{aligned} \quad (B2)$$

M_{22} yields the dispersion relation for uncoupled electromagnetic and space charge waves. The right-hand side of Eq. (B2) introduces the FEL interaction and coupling to sidebands, and its effect is included iteratively. At the lowest order, $M_{22} = 0$ for some (ω, k) . Substituting in the right-hand side, the second set of terms vanishes; the term proportional to C_{22} survives.

Substantial modification of this dispersion relation is expected if

$$1 + \left(\frac{\delta N_o}{2N_o} \right)^2 \left(\frac{a_+}{m_{33}} + \frac{a_-}{m_{11}} \right) \ll 1$$

i.e., if

$$\frac{\delta N_o}{N_o} \sim 2 k_{\beta} c \omega_{bo}^{-3/2} (2k v_{zo})^{1/2} \gamma_z^{1/2} \gamma_o^{3/4}.$$

For typical experimental parameters, the right-hand side of this equation exceeds unity, whereas $\delta N_o/N_o \ll 1$, implying the insignificance of the effect of modulation on the dispersion relation.

Appendix C: Stability Analysis

The purpose of this appendix is to establish the stability of the fixed point (r_s, α) of Eqs. (14).

Perturbing Eqs. (14a) and (14b) about the fixed point and making use of Eq. (19), it is seen that the perturbation evolves according to:

$$\frac{d}{d(k_w z)} \begin{pmatrix} \delta\alpha \\ \delta x \end{pmatrix} = 2 \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \begin{pmatrix} \delta\alpha \\ \delta x \end{pmatrix},$$

where $x = (k_w r_s)^2$, $y = (k_w r_b)^2$,

$$a_{11} = \frac{-\alpha(ck_w/\omega)}{x+y} + X_{I^+} \frac{\partial}{\partial\alpha} (X_R - \alpha X_I),$$

$$a_{12} = \frac{-(1+\alpha^2)(ck_w/\omega)y(2x+y)}{x^2(x+y)^2} + \frac{\partial}{\partial x} (X_R - \alpha X_I),$$

$$a_{21} = \frac{xX_I}{\alpha} - x \frac{\partial}{\partial\alpha} X_I,$$

$$a_{22} = -\frac{\alpha(ck_w/\omega)}{(x+y)^2} - \frac{\partial}{\partial x} (xX_I),$$

and

$$X = -\frac{1}{2} \left[\frac{\eta}{2(1+\alpha^2)} \right]^{1/2} \frac{\alpha^{-i} [1 + (1+\alpha^2)^{1/2}]}{[1 + (1+\alpha^2)^{1/2}]^{1/2}} \frac{x}{x+2y} \left(\frac{xy}{x+y} \right)^{1/2}. \quad (C1)$$

Assuming that $\delta\alpha, \delta x \sim \exp(\lambda k_w z)$, one finds that

$$\lambda = - \left[\frac{\alpha(ck_w/\omega)(x+2y)}{(x+y)^2} + S_2 + S_1 \right] \pm \left\{ \left[\frac{-\alpha(ck_w/\omega)x}{(x+y)^2} + S_2 - S_1 \right]^2 - S_3 \right\}^{1/2},$$

where

$$S_1 = - \frac{\partial X_R}{\partial \alpha} + \alpha \frac{\partial X_I}{\partial \alpha},$$

$$S_2 = \frac{\partial}{\partial x} (xX_I),$$

$$S_3 = - 4x \left(\frac{X_I}{\alpha} - \frac{\partial X_I}{\partial \alpha} \right) \left[\frac{-(1+\alpha^2) (ck_w/\omega) y(y+2x)}{x^2(x+y)^2} + \frac{\partial}{\partial x} (X_R - \alpha X_I) \right].$$

(Note that all the variables in this appendix are evaluated at the fixed point.) Making use of Eq. (C1) it is simple to show that $X_I/\alpha - \partial X_I/\partial \alpha > 0$, $\partial(X_R - \alpha X_I)/\partial x < 0$, whence $S_3 > 0$ and hence, noting that $S_2 + S_1 > 0$, and that the perturbation solution for Eq. (18) implies $S_1 < \alpha(ck_w/\omega)/(x+y)$, one finds that $\text{Re } \lambda < 0$, thus indicating the stability of the fixed point to small amplitude perturbations.

Fig. 1. Spot size (r_s), α , phase shift (Δk), and gain (Γ) vs. distance along the wiggler. z is normalized to the Rayleigh range z_R .

Fig. 2. $(1/e)$ -width of the optical field vs. distance along the wiggler.
 Solid curve: 5 mode system; dashed curve: 1 mode system.

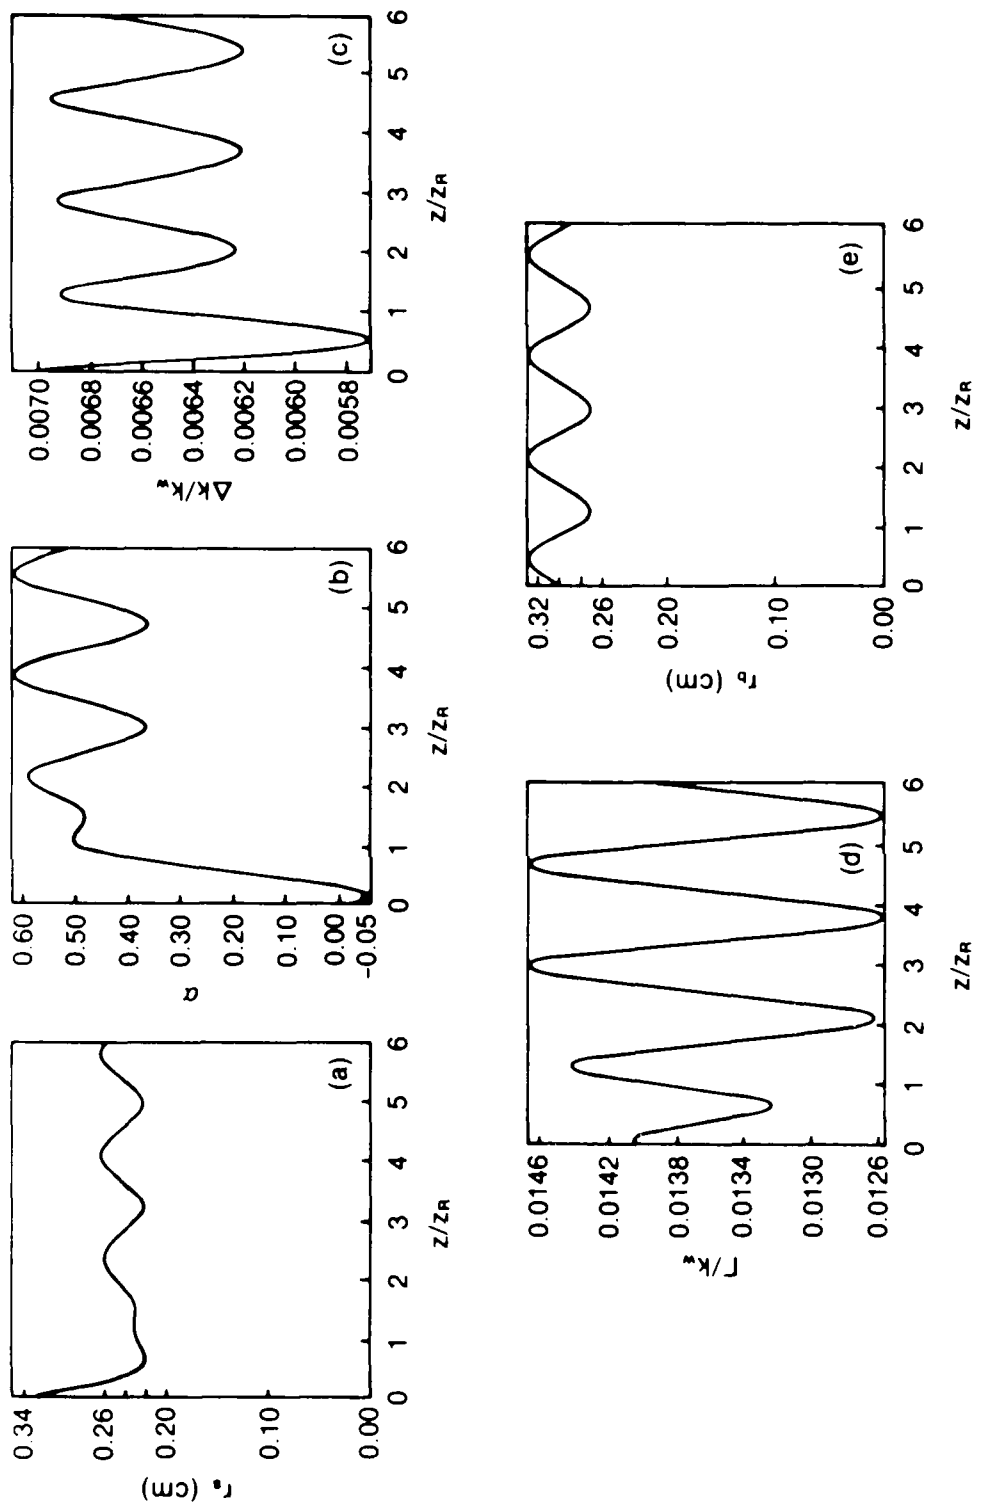

Fig. 3. Spot size (r_s), α , phase shift (Δk), gain (Γ), and radius of electron beam (r_b) vs. distance along wiggler.

2755 Northup Way
Bellevue, WA 98004

Dr. D. Rogers
Lawrence Livermore National Laboratory
P. O. Box 808
Livermore, CA 94550

Dr. H. Romero
ECE Department
University of Wisconsin
Madison, WI 53706

Dr. Jake Romero
Boeing Aerospace Company
P. O. Box 3999
Seattle, WA 98124-2499

Dr. T. Romesser
TRW, Inc.
One Space Park
Redondo Beach, Ca 90278

Dr. Marshall N. Rosenbluth
Institute for Fusion Studies
The Univ. of Texas at Austin
Austin, TX 78712

Dr. J. B. Rosenzweig
The Inst. for Accelerator Physics
Department of Physics
University of Wisconsin-Madison
Madison, WI 53706

Dr. J. Ross
Spectra Technology
2755 Northup Way
Bellevue, WA 98004

Dr. N. Rostoker
University of California
Department of Physics
Irvine, CA 92717

Dr. G. A. Saenz
Hughes Research Laboratory
3011 Malibu Canyon Road
Malibu, CA 90265

Dr. Antonio Sanchez
Lincoln Laboratory
Mass. Institute of Tech.
Room B213
P. O. Box 73
Lexington, MA 02173

Dr. Aldric Saucier
BMD-PO
Ballistic Missile Defense
Program Office
P. O. Box 15280
Arlington, VA 22215

Dr. A. Saxman
Los Alamos National Scientific Lab.
P. O. Box 1663, MSE523
Los Alamos, NM 87545

Dr. J. Scharer
ECE Dept.
Univ. of Wisconsin
Madison, WI 53706

Dr. E. T. Scharlesmann
L626
Lawrence Livermore National Laboratory
P. O. Box 808
Livermore, CA 94550

Prof. S. P. Schlesinger
Dept. of Electrical Engineering
Columbia University
New York, NY 10027

Dr. Howard Schlossberg
AFOSR
Bolling AFB
Washington, D.C. 20332

Dr. George Schmidt
Stevens Institute of Technology
Physics Department
Hoboken, NJ 07030

Dr. M. J. Schmitt
Los Alamos National Laboratory
P. O. Box 1663
Los Alamos, NM 87545

Dr. Stanley Schneider
Rotodyne Corporation
26628 Fond Du Lac Road
Palos Verdes Peninsula, CA 90274

Dr. N. Schoen
TRW DSSG
One Space Park
Redondo Beach, CA 90278

Dr. M. L. Scott
Los Alamos National Laboratory
P. O. Box 1663
Los Alamos, NM 87545

Dr. Richard L. Schriever (DP-23)
Director, Office of Inertial Fusion
U. S. Department of Energy
Washington, D.C. 20545

Dr. R. W. Schumacher
Hughes Research Laboratories
3011 Malibu Canyon Road
Malibu, CA 09265

Dr. H. Schwettmann
Phys. Dept. & High Energy
Physics Laboratory
Stanford University
Stanford, CA 94305

Dr. Marlan O. Scully
Dept. of Physics & Astronomy
Univ. of New Mexico
800 Yale Blvd. NE
Albuquerque, NM 87131

Dr. S. B. Segall
KMS Fusion
3941 Research Park Dr.
P.O. Box 1567
Ann Arbor, MI 48106

Dr. Robert Sepucha
DARPA
1400 Wilson Boulevard
Arlington, VA 22209

Prof. P. Serafim
Northeastern University
Boston, MA 02115

Dr. A. M. Sessler
Lawrence Berkeley Laboratory
University of California
1 Cyclotron Road
Berkeley, CA 94720

Dr. W. Sharp
L 626
Lawrence Livermore National Laboratory
P. O. Box 808
Livermore, CA 94550

Dr. Earl D. Shaw
Bell Laboratories
600 Mountain Avenue
Murray Hill, NJ 07974

Dr. J. P. Sheerim
KMS Fusion
P.O. Box 1567
Ann Arbor, MI 48106

Dr. R. Shefer
Science Research Laboratory
15 Ward Street
Somerville, MA 02143

Dr. R. L. Sheffield
Los Alamos National Laboratory
P.O. Box 1663
Los Alamos, NM 87545

Dr. Shemwall
Spectra Technology
2755 Northrup Way
Bellevue, WA 98004

Dr. Shen Shey
DARPA/DEO
1400 Wilson Boulevard
Arlington, VA 22209

Dr. Chun-Ching Shih
TRW, Building R-1
One Space Park
Redondo Beach, CA 90278

Dr. D. Shoffstall
Boeing Aerospace Company
P.O. Box 3999
Seattle, WA 98124

Dr. I. Shokair
SNLA, Org. 1271
Albuquerque, NM 87185

Dr. J. S. Silverstein
Harry Diamond Laboratories
2800 Powder Mill Road.
Adelphi, MD 20783

Dr. Jack Slater
Spectra Technology
2755 Northrup Way
Bellevue, WA 98004

Dr. Kenneth Smith
Physical Dynamics, Inc.
P.O. Box 556
La Jolla, CA 92038

Dr. Lloyd Smith
Lawrence Berkeley Laboratory
University of California
1 Cyclotron Road
Berkeley, CA 94720

Dr. Stephen J. Smith
JILA
Boulder, CO 80302

Dr. T. Smith
TRW, Inc.
One Apace Park
Redondo Beach, CA 90278 R1/2044

Dr. Todd Smith
Hansen Labs
Stanford University
Stanford, CA 94305

Dr. Joel A. Snow, M.S. E084
Senior Technical Advisor
Office of Energy Research
U. S. Department of Energy
Washington, D.C. 20585

Dr. J. Z. Soln (22300)
Harry Diamond Laboratories
2800 Powder Mill Road
Adelphi, MD 20783

Dr. G. Spalek
Los Alamos National Laboratory
P. O. Box 1663
Los Alamos, NM 87545

Dr. Richard Spitzer
Stanford Linear Accelerator Center
P.O. Box 4347
Stanford, CA 94305

Mrs. Alma Spring
DARPA/Administration
1400 Wilson Boulevard
Arlington, VA 22209

SRI/MP Reports Area G037 (2 copies)
ATTN: D. Leitner
333 Ravenswood Avenue
Menlo Park, CA 94025

Dr. W. Stein
Los Alamos National Laboratory
P. O. Box 1663
Los Alamos, NM 87545

Dr. L. Steinhauer
STI
2755 Northrup Way
Bellevue, WA 98004

Dr. A. Stern
Quantum Inst. and Dept. of Physics
University of California
Santa Barbara, CA 93106

Dr. Efrem J. Sternbach
Lawrence Berkeley Laboratory
University of California, Berkeley
Berkeley, CA 94720

Captain D. Stone
Defense Nuclear Agency
Washington, DC 20305

Dr. H. Strauss
Courant Institute
New York University
New York, NY 10016

Dr. M. Strauss
Department of Physics
University of California at Irvine
Irvine, CA 92717

Dr. W. C. Stwalley
Iowa Laser Facility
University of Iowa
Iowa City, Iowa

Dr. R. Sudan
Cornell University
Ithaca, NY 14850

Dr. P. W. Sumner
Hughes Research Laboratory
3011 Malibu Canyon Road
Malibu, CA 90265

Dr. David F. Sutter
ER 224, GTN
Department of Energy
Washington, D.C. 20545

Dr. Abraham Szoke
ML/L-470
Lawrence Livermore Natl. Lab.
P.O. Box 808
Livermore, CA 94550

Dr. R. Taber
Dept. of Phys. & High Energy Lab.
Stanford University
Stanford, CA 94305

Dr. T. Tajima
IPS
Univ. of Texas
Austin, TX 78712

Dr. H. Takeda
Los Alamos National Laboratory
P. O. Box 1663
Los Alamos, NM 87545

Dr. J. J. Tancredi
Hughes Aircraft Co.
Electron Dynamics Division
3100 West Lomita Blvd.
Torrance, CA 90509

Dr. S. C. Tasker
Dept. of Phys. & Res. Lab. of Electronics
Mass. Institute of Technology
Cambridge, MA 02139

Dr. Milan Tekula
AVCO Everett Research Lab.
2385 Revere Beach Parkway
Everett, MA 02149

Dr. R. Temkin (2 copies)
Mass. Institute of Technology
Plasma Fusion Center
Cambridge, MA 02139

Dr. L. Thode
Los Alamos National Laboratory
P. O. Box 1663
Los Alamos, NM 87545

Dr. Keith Thomassen, L-637
Lawrence Livermore National Laboratory
P. O. Box 808
Livermore, CA 94550

Dr. Harold Thompson
TRW, Inc.
R1/2120
One Space Park
Redondo Beach, Ca 90278

Dr. Norman H. Tolk
Physics Department
Vanderbilt University
Nashville, TN 37240

Dr. K. Tsang
Science Applications Intl. Corp.
P.O. Box 2351
La Jolla, CA 92038

Dr. E. Tyson
Boeing Aerospace Company
P.O. Box 3999
Seattle, WA 98124

Dr. H. S. Uhm
Naval Surface Weapons Center
White Oak Lab.
Silver Spring, MD 20903-5000

Dr. L. Ulstrup
TRW, Inc.
One Space Park
Redondo Beach, Ca 90278

Under Secretary of Defense (R&E)
Office of the Secretary of Defense
Room 3E1006, The Pentagon
Washington, D.C. 20301

Dr. L. Vahala
Physics Dept.
College of William & Mary
Williamsburg, VA 23185

Dr. A. Valla
Spectra Technology
2755 Northup Way
Bellevue, WA 98004

Dr. A. Vetter
