ABSTRACT

Group decision making utilizing the Delphi method can be a time-consuming and difficult procedure, especially when the required group membership is separated by great distances. This study designs and implements an automated group decision support system^(GDSS), which may be employed by a single computer or a networking system.

This particular model is text-based as opposed to mathematical-based, a radical departure from the GDSS models currently in vogue. This program, TouchStone, successfully translates the Delphi method of criteria development to the computer. It is implemented in Turbo Pascal for the IBM-PC.

I. INTRODUCTION

A. DEFINITION OF THE PROBLEM

In today's fast-paced world community, the logistics of assembling a group of experts for the purpose of resolving a particular problem has become a problem unto itself. Conflicting schedules, prohibitive distances, and the increasing frequency of group decision-making efforts are constant barriers to effective attacks on common problems. Even if such problems were easily surmountable, the importance and complexity of today's problems would require a decision based on the consensus of an expert group rather than the opinion of a single, strong-minded individual.

B. THE NEED FOR THE COMPUTERIZED GDSS

Managerial decision making has become increasingly more dependent upon computer-generated information. As a result, management is more cognizant of the capabilities and potentials of computer-based systems. The computer-based system has evolved from assisting individuals in making a decision to supporting and enhancing a wide range of group and organizational decisions. The question is how to effectively and efficiently design a distributed Decision Support System (DSS) to aid a group in defining, evaluating, modifying, and seeking consensus in deriving the criteria for a common problem. Recent literature in computer conferencing systems suggests that a computer-based Group

Decision Support System (GDSS) could:

1. Reduce tension due to face-to-face communications,
2. Promote equal participation, and
3. Favor free and creative generation of ideas.

C. SCOPE OF TOUCHSTONE

CO-OP, a program recently developed at the Naval Post-graduate School, Monterey, California, was designed to assist in the prioritization of previously-developed criteria. TouchStone, the program written as an adjunct to this thesis, is a prototype of a text-oriented, criteria-development system which may be utilized independently or as a "front-end" to the CO-OP program. Inasmuch as it is a prototype, there are necessary physical limitations to the number of problems, criteria, and people the system is designed to handle.

While both TouchStone and CO-OP are stand-alone systems, TouchStone offers a solid baseline of developed criteria upon which CO-OP builds, and from which it processes a decision, using mathematical modeling. TouchStone is a self-contained system, with an on-line, on-screen "users manual" that provides specific information based upon the user's position and status in the program. Use of TouchStone neither requires nor precludes the use of CO-OP, but these two systems complement each other in their methods of problem resolution.

D. ORGANIZATION OF THE THESIS

Inasmuch as this thesis is project-oriented, the actual text herein is minimal, limited primarily to a description of the background for, and the process of, putting the Delphi system on an electronic medium. The bulk of the information is contained in the source code found in Appendix E. It is the technique of implementing the text-orientation, the help screens, the communicative "Chatterbox", and the hierarchical text-manipulation, which is the essence of our efforts and our thesis. TouchStone is the thesis; this written effort is merely a support and a description of the true product of our research.

E. FOCUS OF THE THESIS

This thesis, and its accompanying computer program, focus on a particular aspect of group decision making. They develop a framework for guiding committee members to individually generate criteria for a collective problem, merge them together, and allow interactive negotiation and collective refinement of the set of criteria representing the problem. This concept is centered around the premise of the Delphi method of group decision-making and reflects the attempt of that method to provide anonymous and equal partnership in problem resolution. The peculiarity of the TouchStone system is its unique utilization of organized text processing without depending upon complex mathematical modeling to reach a conclusion.

F. OBJECTIVE

Our objective is to provide the proper mix of computer assistance and creative freedom for the TouchStone users as they attempt problem resolution with the Delphi method. The program is developed to support individuals and groups having expertise in the management field but not necessarily in the computer field. It is our intent to create an automated group decision-making tool that will take pressure, both real and imagined, away from the individual member serving on a committee, while not compromising the effectiveness of the committee as a whole. The system should allow the user to interact with other members of the committee, free from the effects of those members' actions, prejudices, and mannerisms.

II. THE DELPHI METHOD OF GROUP DECISION MAKING

A. BACKGROUND

Research literature on the subject of the Delphi methodology gives a wide variety of definitions and descriptions. The concept, developed primarily by the Rand corporation beginning in the late 1960's, has some fundamental building blocks common to most versions:

1. An individual who defines a particular problem.
2. A group of experts gathered together to resolve a particular problem.
3. A facilitator who collects the input from the experts, collates it, and gives the composite results back to the experts for further consideration.
4. Anonymity in the sense that the experts do not know the individual sources of the collective information, (although they may, in fact, know who else is in the group).

The purpose of the Delphi methodology is the elimination of external influences on group consensus and decisions.

The idea is to improve the panel or committee approach in arriving at a forecast or estimate by subjecting the views of the individual participants to each other's criticism in way that avoids face-to-face confrontation. [Ref. 1]

It is by this technique that a free and open discussion of a problem may be implemented regardless of the personalities, ranks, or prestige of the participants. The solution to the problem, and little else, becomes the focus of the discussion.

B. COMPUTERIZATION OF THE DELPHI METHOD

Translating the Delphi method to the computer can be a relatively logical process. Building blocks 1 and 2 (see II, A.) are essentially unchanged; for building blocks 3 and 4, the computer replaces the human involvement. TouchStone refers to the individual defining the problem, as the 'problem invocator', and to the experts as the 'committee members'. Through the TouchStone program, the computer becomes the facilitator, collecting and collating the expert input. The anonymity of the experts is adequately maintained by the system to all but the problem invocator.

The major advantage to automating the Delphi method is time. The Delphi method is lengthy and cumbersome when executed on a committee of any significant size. The computer allows committee members to be located around the world and still to have instant access to the 'facilitator' at any time of day or night. In this manner, problems may be resolved in days instead of months, and the need to physically assemble a group of experts to resolve a problem is all but eliminated.

III. THE MODEL COMPONENT

A. MODEL BASE FOR GROUP DECISION MAKING: ALTERNATIVES VS. CRITERIA

Our framework for DSS includes modeling and model usage as one of three basic components, completely integrated with data base and dialog capabilities. This full integration is necessary to support decision-making activities such as projection, deduction, creation, and comparison of alternatives. These activities require close interaction and rapid feedback between the decision maker and the computer, with strong and flexible control mechanisms. [Ref. 2, p. 276]

Alternatives are defined as the choices available for the resolution of a given problem; criteria are the guidelines to be used in making the final decision between those alternatives. TouchStone allows for the development of both of these important aspects of any decision, by allowing members to define, explain, discuss, re-define and agree upon a collective set of alternatives and criteria. Once this initial decision has been made, the remaining user responses and actions are the same for both. The initial decision of the committee member is to make the choice between developing alternatives or developing criteria.

The TouchStone system uses the Model-Dialog link as described by Sprague and Carlson in that six basic steps are utilized:

1. Invocation: user calls and starts the model
2. Parameter request: program requests data or parameters

3. Parameter collection: user supplies data or parameters
4. Interrupt: not usually available other than unrecoverable terminate (break) or pause.
5. Model completes run, notifies and presents results in a predefined format or report.
6. Return to step 1 for another cycle if desired.
[Ref. 2, pp. 274-275]

B. PROBLEM INVOCATOR

The major design factor for TouchStone revolves around the creation of the problem and the responsibilities/limitations designated to resolve that problem. It was determined early in the research for this project that at least one person needed to be responsible for identifying the problems and for necessary housekeeping chores. We established this 'position' by looking at a normal face-to-face committee, and emulating the positions within the TouchStone System, making the "problem invocator" the committee chairman. The potential duties of the problem invocator have extensive ramifications and far reaching consequences. Initially, the invocator is responsible for naming the problem, providing a short but descriptive definition, and (optionally) expanding upon that definition to any length he feels necessary. He is also responsible for designating the committee members, adding and deleting members to any committee as indicated, and for removing completed problems from the system. Figures 16-19 exhibit screen menus with options available to the invocator. Final printouts of committee results and

archival printouts of the Chatterbox file are under his purview (see Figure 29).

One of the most important decisions made by the invocator is that of committee member anonymity. The date/time/signature line in the Chatterbox (Chapter 6, paragraph D) may be modified to delete the automatic inclusion of the committee members' initials. In this manner, the interaction between members may be truly anonymous and in keeping with the spirit of the Delphi method of group decision-making. The use of the date/time signature stamp is two-fold, not only does it provide a reference point for committee members, it also allows the problem invocator to monitor the progress of the committee.

C. COMMITTEE MEMBER

The duties of the committee members are relatively simple to define. They are required to input their ideas and await further TouchStone system instruction at each level. Although the final product of their labors can be quite complex, the step-by-step methodology simplifies their efforts.

One of the major concerns of the Delphi method was that committee members be allowed to reach a concensus without being intimidated by the leader/invocator, or other committee members [Ref. 3]. Psychological research has shown that intimidation may occur by the tone of a person's voice, or even a casual glance from a superior [Ref. 4]. In the case of the TouchStone system, the invocator defines the

problem, assigns members, and has total access over the system, but is unable to influence the committee members by any of his system actions. Also, the committee members are only able to influence other members by the strength of their ideas, not of their personality or position.

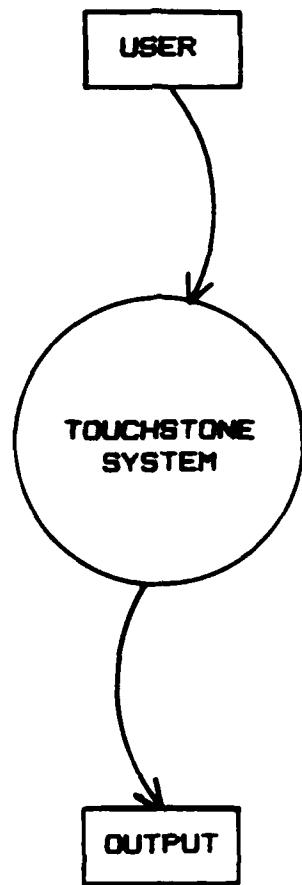

Figure 3.1 Data Flow Diagram

LEVEL 1:

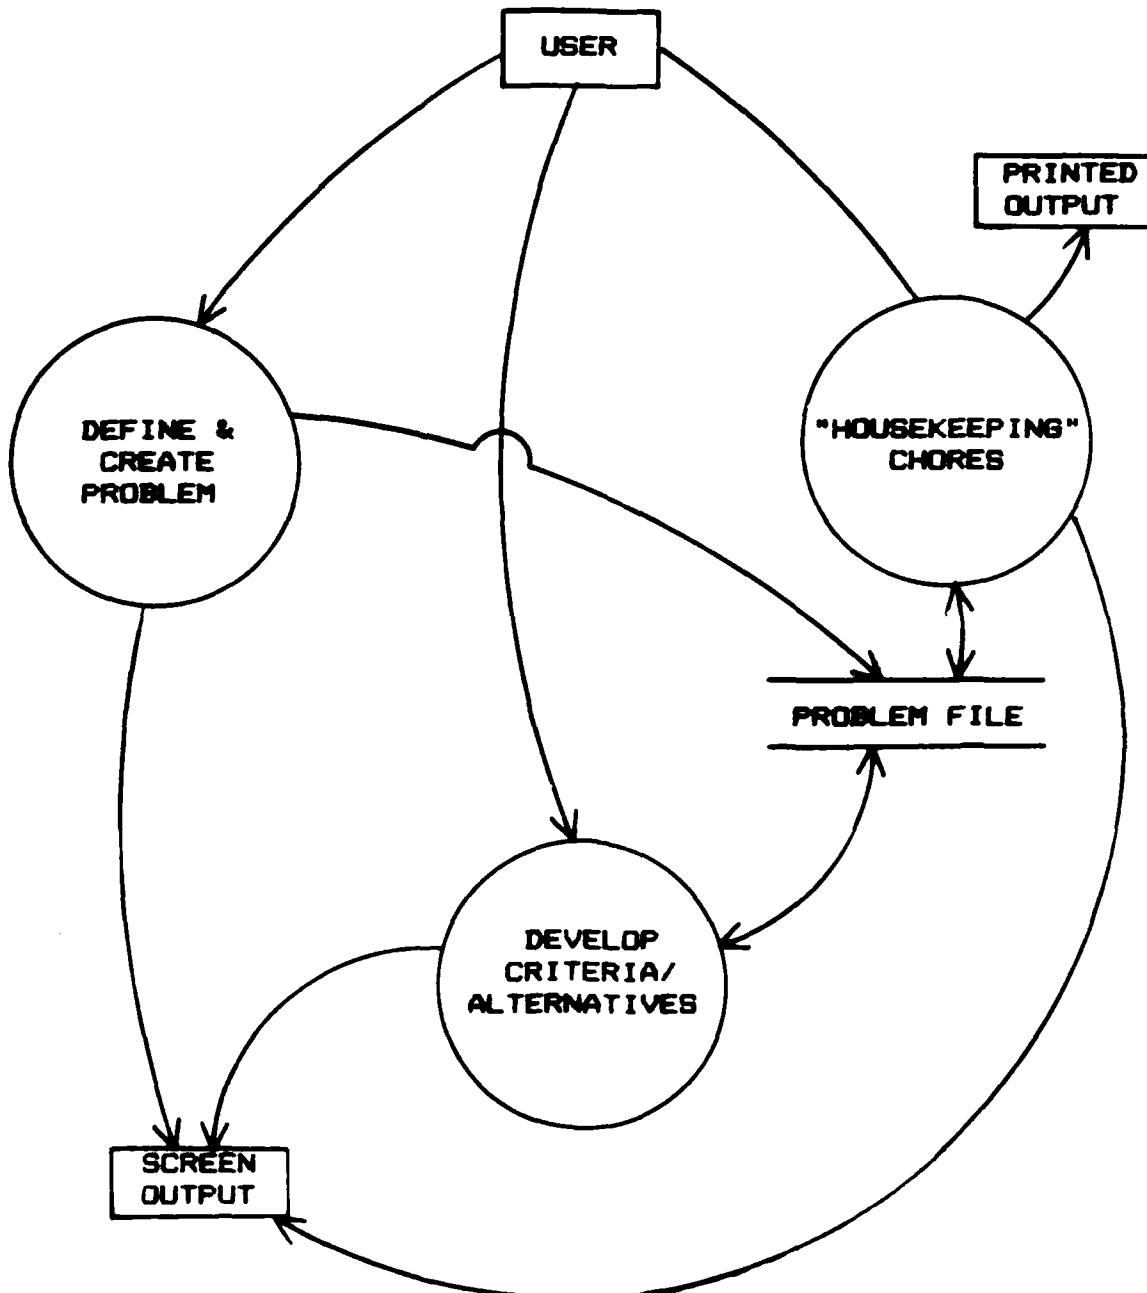

Figure 3.2 Data Flow Diagram

IV. THE INTERFACE COMPONENT

A. SCREEN DESIGN

The original concept for the screen design for TouchStone was to use a 3-window screen which would incorporate the problem definition, the Chatterbox, and the criteria manipulation. It soon became evident that this technique would not provide adequate space for any of the above-mentioned functions. The use of pop-up windows became the most reasonable alternative. Commercial software was researched, but it was felt that RAM resident windows did not provide adequate flexibility for context-sensitive help screens.

The use of multiple and/or "pop-up" windows was determined to be the most user-friendly method of providing communications and on-screen assistance. It was felt that simply refreshing the screen with the new screen, and then restoring it after the help or Chatterbox screen was through, was too distracting to the user. Employing windows allowed the user's main focus to remain on the problem screen, even when using the Chatterbox or the help screens.

The present screen design utilizes a number of separate, interactive screens. The main program uses a single box with the TouchStone logo at the top of the box. Each of the other screens is individually labeled, depending upon its function. Smaller boxes for the help screen, problem

explanation and Chatterbox are layered onto the main screen. Any information overlaid by these boxes is restored when the box is removed. The boxes are carefully positioned for the express purpose of minimizing the amount of current information hidden by the overlay. (See Figures 36-38).

Screens are designed for maximum user effectiveness, keeping in mind, that a "busy" screen is often confusing. Menus are used as frequently as possible, limiting the number of choices to a minimum. The basic background colors are a light blue for all screens, with contrasting colors being utilized for special flags and pop-up windows. An example of this is the use of a red background for certain error messages.

One of the special features of TouchStone's screen design is the Odometer, which tracks and displays the user's relative position in the TouchStone decision making process. It also indicates a Chatterbox entry that the current user has not viewed. Located at the bottom of main the screens the Odometer also contains instructions for the use of the Function Keys. (See Figure 35).

B. DIALOGUE STYLE

As previously mentioned, the program is developed to support individuals and groups who are novices in computers. The use of "special function" keys is kept to a minimum, with clear definitions as to their usage displayed in the Odometer. Thus the simplicity of TouchStone eliminates the

necessity for a manager or CEO to use a "computer chauffeur" for data input.

C. ON-LINE ASSISTANCE

Program assistance from TouchStone is provided in two forms, the "Introduction" screen and the "Help" screens. The "Introduction" screen is an option presented at the beginning of each TouchStone session, and contains a general, 4-page overview of the program.

The initial idea for the Help Screens was to implement an "automatic" screen, one which would appear when appropriate, without user action. Three categories of user expertise were defined, with corresponding levels of pop-up help windows. The user would indicate his ability level at the beginning of each session, following which the context-sensitive on-line help screens would appear as the programmers felt necessary. Subsequent research revealed that this idea was neither feasible nor desirable, from either the programmers' or the users' standpoint.

The present design of the "Help" screens for TouchStone follows the basic premise used by some of today's more popular software. A single function key (F-1) accesses one of the many pre-written help screens. Each screen is coded for access depending upon the user's location within the program. In this manner, the help screens remain current with the user and do not require a complex set of keystrokes on the user's part for access. The "help" text is frequently larger than the size of the screens, and a

scrolling capability is implemented to compensate for this discrepancy.

V. THE DATA COMPONENT

A. DATA STRUCTURE/MANAGEMENT

The primary purpose of TouchStone, that of criteria/alternative development, forces it to rely almost completely on the manipulation of text rather than data. The data component of TouchStone functions as a vehicle for flags and arrays. Each individual user of TouchStone is given a separate file for each problem to which he is assigned. That file contains the user name, the problem name, the current status of the user within that problem, and the criteria/alternatives that have been developed. When this file is created, an entry is made in the "master" file. Conversely, when a problem is concluded and the user files deleted, the master file is updated accordingly. These are the files dealing with text/data manipulation. Files utilized by the help screens, Chatterbox, and problem explanation screens are all text files. The help screen files have been created by the programmers; the problem explanation files is (optionally) created by the problem invocator at the time a new problem is defined; the Chatterbox files are created and updated each time the Chatterbox is used. The problem invocator has the option to print out the Chatterbox files at any time he so desires.

Data Management concerns itself with the recording, editing, and manipulation of text input for criteria and

alternatives. Data management for TouchStone is based upon the complex alliance of two fundamental cornerstones: Flags and Arrays. The flags provide a "location map" for all members on a committee, allowing the program (and the problem invocator) to accurately monitor the progress and status of each problem resolution. Arrays provide the structure necessary to contain and control the free-flow text input vital to creative thought. The algorithm used for the marriage of these two building-blocks gives a large degree of freedom to the user while maintaining the structured environment required by the computer.

The manipulation of data is handled mainly by the extensive use of arrays. Data is initially input directly into a file. On the next user-access this data is brought up in the form of an array. This technique allows the sorting of individual files and, when required, the collating of multiple-user files. It also permits the user to 'edit' the text while reviewing his individual files. When multiple-user files are collated, duplicate records are eliminated, and the array replaces the original file with a new, composite file of criteria.

Manipulating text data from a variety of individuals calls for the use of an intricate series of flags. Each committee member's file has a flag-set based on the position of that file within the program. At certain points, continuation in the program is dependent upon the flag set of all other members in the committee. In addition,

overseeing the progress of each problem resolution is an important task of the problem invocator. For these reasons, a separate master file was conceived, containing each problem name, each member of the committee dealing with each problem, and the current status of each member within a given problem.

The unique procedure "GetTheKeys" provides a variety of options for the system. Each keystroke is processed individually allowing the length of the input to be varied by the calling procedure. In that manner the user is prevented from entering data whose length is in excess of the size of the data field. The possibility of inputting a string of 60 characters, when the data field was only 10 characters long, is thereby eliminated. The reading of each keystroke also allows the function keys to be accessed at any time during the program, and during the review and editing of the text portion of the program, the special functions of the numeric keypad (i.e. arrows and paging keys) are activated.

An important feature of the data management of Touch-Stone is that it works in background mode, manipulating data, opening and loading files, and functioning as a system controller. It is an typical example of the "Black Box" in action. The user inputs data and receives results while the intricate process of weaving the input into a proper output goes largely unnoticed.

VI. THE COMMUNICATION COMPONENT

A. OVERVIEW

A main focus of TouchStone is communication--communication among users, communication between the user and the problem invocator, and user communication with the program itself. Without this intricate network of communication, the entire fabric of Touchstone would be lost.

B. TEXT EDITING

Inasmuch as TouchStone is highly involved in text manipulation, a variety of techniques in performing this manipulation was necessary to achieve our overall purpose. Once again, it was our goal to provide as much freedom as possible for the user while maintaining the necessary degree of system integrity. The concept of using a form of wordprocessing to input data is expected to be the most "user-friendly" method of inputting and manipulating data. Each keystroke is read and manipulated by our program. This practice allows the function keys and special keys to be programmer-defined and available throughout the system. Also, the on-line help-screens are automatically provided, progressing throughout the program.

Word-processing indicates the capability to block copy, move text, read to and from files, as well as text manipulation. TouchStone's version of "word-processing" is

really a text editor, allowing for text input, erasure, scrolling, paging, and home/end-of-file movement. Three specific versions of text-editing are utilized in Touch-Stone, each necessitated by the very different conditions under which it is used.

The expanded problem explanation used by the problem invocator is a straight text editor employed when a problem is first described. Once invoked, a detailed explanation is written to file for later recall by the committee members. Full text manipulation is possible only by the invocator; committee members are limited to a read-only status. In this manner, only the problem invocator has the ability to define the problem, ensuring that each committee member is using the same baseline information.

Although previous Chatterbox entries are available for review, text editing in the Chatterbox is available only at the specified point at the end of the file. Action in the review mode is limited to scrolling and paging. Once an entry has been saved, it is not available for editing. By limiting editing access to the entry being made, a "permanent" record of Chatterbox entries may be made.

Text-editing in the main section of the program is limited to single-line input. The length of each line is location sensitive and specifically defined. This method allows for a wide range of functions, including the constant access to help and Chatterbox screens, as well as the ability to input string and numerical variables employing

the same procedural call. Elimination of all "READ" and "READLN" calls was the unique contribution of this procedure and the basis for an increased elegance in programming.

C. HELP SCREENS

Help screens are important for the system to be informative. Help screens are discussed in Chapter IV, paragraph C.

D. PROBLEM EXPLANATION SCREEN

The problem invocator communicates with the committee members via the "problem explanation" box, accessed with the F-2 key. During the initial creation of the problem, the invocator is prompted to give a detailed explanation of the new problem. If he elects to do so, a file of up to 100 text lines is made available to him. The committee member then has a custom-made information file for each problem on which he is working. Text manipulation is "read" and "write" for the problem invocator (at the time of problem creation only) and "read-only" for the committee member. Since the problem explanation may be considerably larger than the problem explanation screen, scrolling and page up/down features are available to the user.

E. THE CHATTERBOX

The primary purpose of the Chatterbox is to promote the informal exchange of information among committee members. It has remained unchanged in its basic concept throughout the design and coding. However, of the many technical

enhancements considered, those implemented were based primarily upon user acceptance.

Chatterbox differs from a conventional notepad in a number of ways. As mentioned before, in order to prevent "malicious" erasure of text, previous entries of text cannot be changed. Also, each individual problem has its own unique, automatically accessed, Chatterbox. Anytime the user leaves the Chatterbox, the file is saved unless no entry has been made. Any entry made in the Chatterbox is date/time/signature stamped providing an automatic record of the user. The problem invocator has the option of eliminating the signature from the viewed stamp for any given problem.

Location of the Chatterbox was the source of much discussion. The Chatterbox is located at the right-hand side of the screen, in order to leave important information residing in the main screen visible to the user. Ideally, it would be nice to provide a movable window; however, in this version, the location of the Chatterbox is fixed.

Designed to be used on a single computer or in a network, Chatterbox has a few unique features.

- 1) Only one person may write to Chatterbox at a given time, but more than one person may use it on a read-only basis.
- 2) The last 80 text lines of a given Chatterbox file are read into the Chatterbox array, with capability to add up to 40 lines of new text. However, a flag attached to the line counter prevents writing to any area except the last forty lines. In that manner, only new information may be edited.
- 3) One of the special features of the Chatterbox is to locate the user, upon re-entry, in the place

(time/date), where he last logged out of the Chatterbox. This feature allows him to check the messages that were entered after the last logout. Consequently, all new entries are immediately available for his review.

- 4) The line counter, in the upper right hand corner of the Chatterbox, allows for quick location reference when browsing.
- 5) Standardizing the line number between the read-write and read-only sections of Chatterbox made this delineation easier to implement. The appropriate placement of the text retrieval from the files was the primary key to controlling this procedure.

There were two specific issues which were considered, but rejected as part of the final design: 1) The imposition of time limits for a person using the Chatterbox was discussed but not implemented. It was felt that the use of a forty line limit on each entry was to be a sufficient constraint. 2) We also ruled out the possibility of importing data files into the Chatterbox. Such a situation would reduce the reading capability of the user, and fill the Chatterbox with excess information.

The Chatterbox is an integral part of the TouchStone system, being as important as the internal algorithms that aid the users in making a decision. Communication, as always, is vital to any decision-making process, and the Chatterbox enhances this aspect of the system.

VII. IMPLEMENTATION OF TOUCHSTONE

A. HARDWARE/SOFTWARE

TouchStone was developed on a Microsoft-based DOS computer with 640K RAM and a color card. TouchStone can be processed on a dual disk floppy drive system or a single floppy disk, with a hard disk system. Each floppy disk drive should be 360K RAM.

The Microsoft Disk Operating System utilized was version 3.1. The TouchStone System was written in Turbo Pascal version 3.01. No other software packages were employed in the final version of TouchStone. The system is comprised of four separate programs in the form of command files:

- 1) ATOUCH.COM
- 2) BTOUCH.COM
- 3) CTOUCH.COM
- 4) FLAGSET.COM.

These files are incorporated in a batch file called TS.bat. Each command file is basically a driver program, with numerous include files. These include files are listed in Appendix E. Documentation is done internally at the beginning of each procedure. Internal documentation lists the following:

Procedure name.
Program supported.
Local variables used.
Global variables used.
Arrays used.
Files accessed.

External Calls.

External filters (include files) used.

Where the procedure is called from.

Purpose of the procedure.

The effort expended (manhours) was as follows: system analysis and design, 100; research and thesis preparation, 150; coding, testing, and debugging: 700.

VIII. CONCLUSIONS

TouchStone, originally conceived as a criteria development tool for another DSS program ("CO-OP"), subsequently evolved into a stand alone program. As a non-mathematical, text-oriented SDSS, this program has entered a new area of computer support for making decisions. Although not thoroughly tested in a networking environment, the potential for such a use was an integral part of the design consideration and was incorporated in the final product.

TouchStone works. It provides a vehicle for criteria development in a group environment using the Delphi method, creating a novel technique of computer assistance. The objective of providing a proper mix of computer assistance and creative freedom in the explanation and analysis phase of the problem solving process, has been achieved.

APPENDIX A

DATA DICTIONARY

A, B, I, J, W, X, Y, Z: Various integer counters used throughout the system.

L, M and N: Integers that are summed and value passed to variable checkpoint.

ACTIVEPROBLEMFILE: file of PROBREC.

ALT: Single character used in identifying the file as an Alternative or Criteria, to be printed.

ALTERNATIVE: A single character, 'A' or 'C' for Alternatives or Criteria, used for assignment or comparisons.

ANONYMOUS: Boolean expression used in the chatterbox. When created, the problem invocator has the option to make communications anonymous from other committee members.

AUTHORIZED: Boolean expression, if true, allows the system to execute, if false, terminates the system.

CH, CHA: Single characters used for YES/NO type questions.

CHANGEFLAG: Boolean variable responsible for setting flags appropriately depending on whether the user is in "Alternatives" or "Criteria".

CHANGEREC: A single character used to confirm whether the problem is an Alternative or Criteria.

CHATFILE: 12 character string denoting the chatterbox file to be used.

CHATOK: Boolean expression that controls the use of the chatterbox utility.

CHECKCHANGE: A single character used to confirm whether the problem is an Alternative or Criteria.

CHECKPOINT: Integer denoting the sum of the first three flags in this record. These records are sorted on this field to keep them in order according to the level of the data, i.e., 111 would equate a piece of data under the first major criteria, under the first sub-criteria.

CHECKSTATE: Is a single character used to track the user's position in the system.

CHKFLAG1, CHKFLAG2, and CHKFLAG3: Integers used to number the different levels of alternatives/criteria.

CHOICE: A single character, 'A' or 'C' for Alternatives or Criteria, used for assignment or comparisons.

CHT: Single character utilized for error trapping procedures.

CLEARIT: Integers used for tracking the arrays, advanced once for each record.

CODEARRAY: String of 12 characters used to encode and decode passwords.

CODENAME: String variable used for encoding and decoding user passwords.

COUNT, COUNTED, COUNTER: Integers used for tracking the arrays, advanced once for each record.

CRITARRAY: An array of the records in the format of CRIREC.

CRITDEF: String of 58 characters defining the above variable CRITNAME.

CRITERIA: Used in conjunction with the record CRIREC.

CRITLIMIT: Integer denoting the maximum number of alternatives/criteria allowed.

CRITNAME: String of 10 characters denoting criteria/alternatives name.

DATE: A string of 12 characters passed to a file as the day, month and year for tracking the last time a file was accessed.

DATELINE: String of 12 characters which gives the last date that the file was accessed.

DEFINITION: String of 58 characters which gives the short version of the problem definition.

DOUBLECOUNTED: An integer counter used during the merging of files process.

FILECHECK: Boolean expression used when checking the validity of a filename.

FILEDRIVE: Single character denoting the drive the data files reside on.

FLAGCHOICE: A string of 1 character used to set users problemflag.

FLAGCOUNT: Integers used for tracking the arrays, advanced once for each record.

FLAGEND: Integer that counts all files with the same problem name and the same flag setting.

FLAGGED: Single character used to check committee member status prior to merging files.

FLAG1: Integer denoting level 1, major criteria.

FLAG2: Integer denoting level 2, sub-criteria.

FLAG3: Integer denoting level 3, tertiary criteria.

HELPDRIVE: Single character denoting the drive the help files reside on.

HELPER: Single character that indicates the active help screen.

HELPSIZE: Integer parameter passed to determine the size of the helpscreen.

INPUTSTRING: Used with the variable STRINGARRAY, as a passed parameter to the procedure GetTheKeys.

INVOCATOR: A single character either a 'W' or 'M' used to determine whether the user is a problem invocator (M), or a committee member (C).

KEEPTOGETHER: An integer counter used during the sorting routine to keep the records in the various levels in the order in which they were entered.

KRITERIAFILE: file of CRIREC.

LIMID: An integer parameter passed to a procedure denoting the number of records in an array.

LIMMIT: Integer set to the maximum number of records in an array.

LINEMARK: Boolean expression used to advance line counter when displaying data on the screen.

MARKER: Integer used in conjunction with the gotoXY call when positioning data on the screen.

MEMBER: String of three characters which indicates that there is a file in the DOS directory with the extension using this members name.

MEMBERS: Used in conjunction with the record PROBREC.

MOVEOVER: Integer used in conjunction with the gotoXY call for positioning data on the screen.

MOVEX: Integer used with the gotoXY statement positioning data on the screen.

NAMES: Variable used with the record CRIREC and array CRITARRAY.

NAMESTRING: A string of three characters that is used as the extension when recalling the user's file.

NEWCRITLIMIT: Integer denoting the maximum number of alternatives/criteria allowed.

NEWLIMIT: An integer limiting the number of entries that can be made for alternatives/criteria.

NEWNAME: 3 character string used when verifying filenames.

NEWPROB: Single characters used for YES/NO type questions.

NEWSTRING: 12 character string denoting the file to be used.

NUM: Integers used for numbering the criteria/alternatives when displayed on the screen.

NUMMEMS: Integer that tracks the number of members on a particular committee. Minimum value of 2 and maximum value of 15.

ONCECOUNTED: A boolean expression used in the merging process.

PRINTONE: Boolean expression used when printing alternatives/criteria.

PROBARRAY: An array of the records in the format of PROBREC.

PROBLEM: String of seven characters which indicates that there is a file in the DOS directory beginning with this string.

PROBLEMFLAG: Single character used to track the status of the user who is logged on to TouchStone.

PROBNAME: A string of seven characters that is used as the first seven letters when recalling a user file.

PROBS: Variable used with the record PROBREC and array PROBARRAY.

PT1, PT2, PT3 and PT4: Integers used as points when defining the various windows used in the system.

QUITFLAG: Integer used in moving from level to level in the alternatives/criteria data entry.

QUITFLG1, QUITFLG2, QUITFLG3: Integers tracking the number of alternatives/criteria at the various levels.

RECOUNT: Integer used in positioning the pointer when writing to a users problem file.

SCROLLIT: Boolean expression that controls the use of the arrow keys, so that they may only be used during certain portions of the program.

SECNUM: Integers used for numbering the criteria/alternatives when displayed on the screen.

SELECTED: Integers used for tracking the arrays, advanced once for each record.

SHOWME: Integer used in moving from level to level in the alternatives/criteria data entry.

STARTMERGE: A boolean expression, that, when true allows all files with the same problem name to be merged into one.

STARTUP: Boolean expression used in several procedures to check the validity of the file requested or to check for duplication.

STATFLAG: Character that tracks where the user is in the system.

STRINGARRAY: An array of 1 to 59 characters, used in conjunction with the procedure GetTheKeys.

STOPGAP: Boolean expression used to stop alternatives/criteria input beyond a predetermined limit.

STOPPROG: Boolean expression, if true terminates a procedure or the entire program, depending on when it is toggled.

TEMPFILE: A temporary file using text vice records.

TEMPNAME: String variable used for encoding and decoding user passwords.

THRNUM: Integers used for numbering the criteria/alternatives when displayed on the screen.

TRACK1: Integer denoting number of records in an array.

USERCODE: 8 character code used to verify password.

WEEDDEF: Boolean expression used to activate the F3 key when the program goes past the problem selection stage.

APPENDIX B

FILE STRUCTURE

PROBREC: Is the master record that holds the following information on all of the problems in the system. The following variables comprise this record:

CHECKCHANGE: A single character used to confirm whether the problem is an Alternative or Criteria.

CHECKSTATE: Is a single character used to track the user's position in the system.

CHOICE: A single character, 'A' or 'C' for Alternatives or Criteria, used for assignment or comparisons.

DATELINE: String of 12 characters which gives the last date that the file was accessed.

DEFINITION: String of 58 characters which gives the short version of the problem definition.

MEMBER: String of three characters which indicates that there is a file in the DOS directory with the extension using this members name.

NUMMEMS: Integer that tracks the number of members on a particuiar committee. Minimum value of 2 and maximum value of 15.

PROBLEM: String of seven characters which indicates that there is a file in the DOS directory beginning with this string.

CRIREC: Is a record that is contained in a file in DOS. There is one file for each committee member for each specific problem. The record contains the following information:

CHECKPOINT: Integer denoting the sum of the first three flags in this record. These records are sorted on this field to keep them in order according to the level of the data, i.e., 111 would equate a piece of data under the first major criteria, under the first sub-criteria.

CRITDEF: String of 58 characters defining the above variable CRITNAME.

CRITNAME: String of 10 characters denoting criteria/alternatives name.

FLAG1: Integer denoting level 1, major criteria.

FLAG2: Integer denoting level 2, sub-criteria.

FLAG3: Integer denoting level 3, tertiary criteria.

STATFLAG: Character that tracks where the user is in the system.

TITLE SCREEN

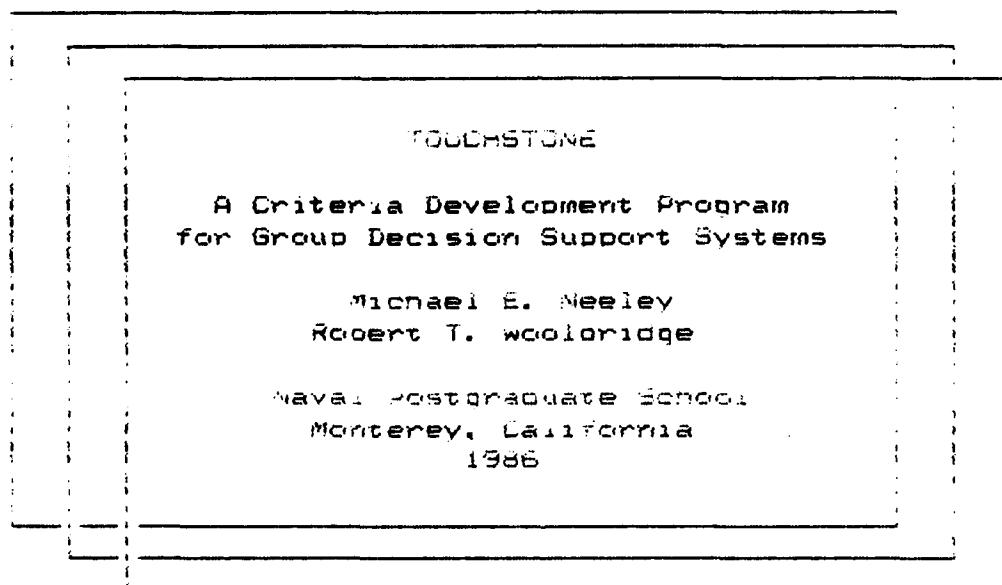

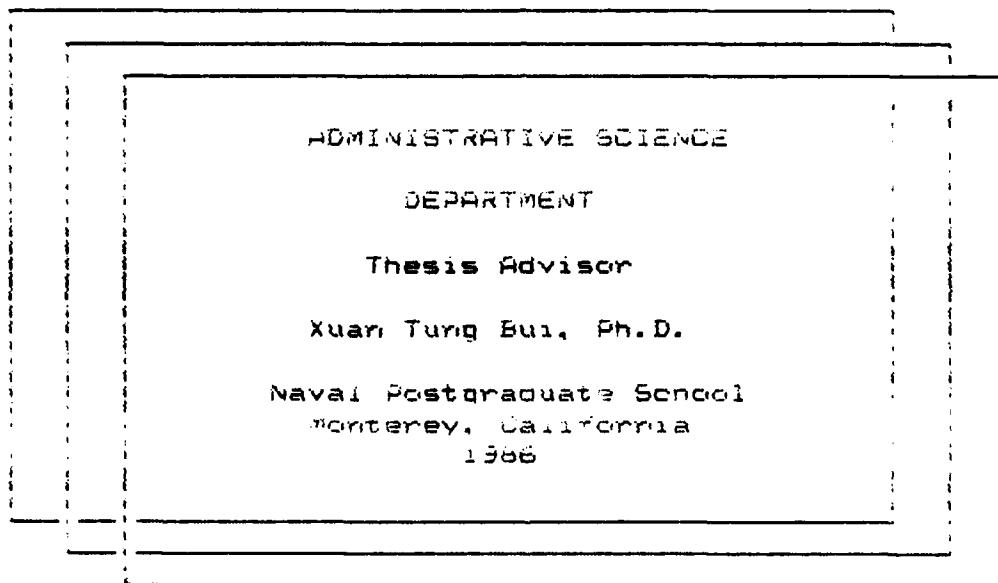

FIGURE 2
THESIS ADVISOR SCREEN

**FIGURE 3
DATE SCREEN**

TOUCHSTONE

THE CORRECT DATE IS VERY IMPORTANT TO THE
PROPER FUNCTIONING OF TOUCHSTONE!

Jan 26, 1987

Is this date correct? Y

**FIGURE 4
INTRODUCTION OPTION SCREEN**

TOUCHSTONE

WOULD YOU LIKE AN INTRODUCTION TO TOUCHSTONE? (Y/N) *

FIGURE 5
INSTRUCTION SCREEN #1

TOUCHSTONE

* INTRODUCTION & INFORMATION *

The TOUCHSTONE program is designed to assist you in developing functional and meaningful group criteria for a Group Decision Support System. Utilizing the TOUCHSTONE program, you will be able to condense a large list of spontaneously-considered criteria into a compact, well-defined, GROUP-SELECTED set of criteria.

(PRESS ANY KEY TO CONTINUE)

FIGURE 6
INSTRUCTION SCREEN #2

TOUCHSTONE

* INTRODUCTION & INFORMATION (continued) *

These criteria will be uniquely designed to assist you in resolving your current problem, whatever it might be. Instructions, specific to each portion of the program, may be called at any time by pressing the (F-1) ("HELP") key. Communication between "committee members" is accomplished via the "Chatterbox", an electronic notepad which is

(PRESS ANY KEY TO CONTINUE)

FIGURE 7
INSTRUCTION SCREEN #3

TOUCHSTONE

* INTRODUCTION & INFORMATION (continued) *

called by the **(F-2)** key. An extended explanation of the problem on which you are working may be seen by pressing the **(F-3)** key. Specific information for the use of these may be found on-screen at the bottom of each flash-up box.

TOUCHSTONE proceeds through three levels of criteria development. At the end of each level, the individual

(PRESS ANY KEY TO CONTINUE)

FIGURE 8
INSTRUCTION SCREEN #4

TOUCHSTONE

* INTRODUCTION & INFORMATION (continued) *

criteria are combined for group decision and editing. Once there is agreement on this level of criteria, TOUCHSTONE moves on to the next level and the next until the THIRD level has been completed. Finally, there is an opportunity to edit the completed list. This list is then ready for use with a DSS to evaluate the specifics for each criterion.

(PRESS ANY KEY TO CONTINUE)

**FIGURE 9
FILE INITIALIZATION SCREEN**

TOUCHSTONE

* FILE INITIALIZATION *

First, before you start, I need some vital information:

On which drive are the HELP files located:

DRIVE: A (Default: Drive A)

On which drive are the committee files located:

DRIVE: B (Default: Drive B)

Is the above information accurate? Y

**FIGURE 10
INITIALIZATION SCREEN FOR FIRST PROBLEM INVOCATOR**

TOUCHSTONE

The files on drive B have not yet been initialized.
For these files, you will need a master password.
Please input one now: (Maximum of 8 letters)

FIGURE 11
INTRODUCTION SCREEN (1) FOR FIRST PROBLEM INVOCATOR

TOUCHSTONE

GREETINGS. NEW PROBLEM INVOCATOR!

As the person initiating this copy of TOUCHSTONE, you are designated as the:
"Problem Invocator".
As such, you are the one to define the problems, select the committee membership, and perform the various other maintenance functions. You may, of course, designate other problem invocators if you so desire, or maintain control by yourself. The choice is yours.

For log-on purposes, I will need to know your initials (a maximum of 3): ***

FIGURE 12
INTRODUCTION SCREEN (2) FOR FIRST PROBLEM INVOCATOR

TOUCHSTONE

Thank you for your initials. You will need to use these to identify yourself to the computer each time you log on. When you do log on to TOUCHSTONE, you will need to use the Problem Invocator Password if you wish to identify yourself as the problem invocator. For this version of TOUCHSTONE, that password is:
*** WINDMILL ***

(You should memorize this password for future use. If you wish, you have the option to change it in the Problem Invocator Menu.) If you prefer to log on as a committee member instead, you will need a personal password of your own. This word (letters only) can be up to 8 letters in length: *****

FIGURE 13
INPUT COMMITTEE MEMBER/PROBLEM INVOCATOR INFORMATION

TOUCHSTONE

** COMMITTEE MEMBER INFORMATION **

Now is a good time to input the initials of those people you know will need to have access to TOUCHSTONE. Please input their initials and, for each, designate whether that individual is to be a [P]roblem invocator or merely a [C]ommittee member. (The default choice is Committee member.)

Initials: *** Access level (P/C): [C]

(Write 'ZZZ' to exit)

FILE      : FILTER4.LIB (26092)
WRITTEN BY : Mike Nealey & Bob Wooldridge, May,86
PURPOSE   : Procedure library for TOUCHSTONE (COOP
              Criteria Filter Program) written as a part
              of a thesis for a Master of Science in
              Computer Systems Management, Naval
              Postgraduate School, Monterey, California
CONTENTS  : CHATRBOX
(*****)
PROCEDURE  : CHATRBOX
WRITTEN BY : Mike Nealey & Bob Wooldridge, May,86
              Word processing section based on a program
              by Mark Hayes
PURPOSE   : Reads from a text file, puts text into a
              specified window, and allows scrolling
              within that window for previous input;
              allows word processing for the new input.
PARAMETERS: FILEDRIVE : drive on which the file is
              located
              PROBFILE  : name of the textfile called
              PRESNAME  : name/initials of the user
              ALTERNATIVE : Character designating
                            criteria/alternative selection
EXTERNAL
NEEDS     : type
              STRING8 = string[8]
              STRING3 = string[3]
              var
              ALTERNATIVE : string[1];
              INCLUDE file :
FILTER1.LIB,FILTER2.LIB,FILTER3.LIB
(*****)
