1.0. INTRODUCTION

This final technical report was prepared by OLIS Engineering, a division of OLIS Enterprises, Inc., for the U.S. Army Tank-Automotive Command (TACOM) under Contract DAAE07-86-C-R089. It describes the Phase II development effort which was performed to produce the prototype hardware to dispose of human waste generated within combat vehicles while operating in a nuclear, biologically, or chemically (NBC) contaminated environment. The work performed resulted in the development of a waste processing unit for use in combat vehicles as well as a prototype of a waste processing system for marine applications.

2.0. OBJECTIVE

The primary objective of Phase II of this research was to produce a waste disposal system for combat vehicles operating in an NBC contaminated environment. A system was needed which will safely and efficiently process and dispose of the human waste generated within the confines of a combat vehicle operating under conditions which prohibit opening the vehicle to dispose of the generated waste. As space, power, and water are extremely limited in the types of vehicles under consideration, concepts were defined which require a minimum of those commodities under Phase I of this research. While developing a viable waste disposal system for this specific application, it was also a goal of this research to define and develop a waste processing system for various marine applications as a possible commercial application of the concept.

3.0. CONCLUSIONS

The work performed under Phase II of this contract has resulted in the design and fabrication of a system capable of the efficient disposal of human waste from within a combat vehicle operating in an NBC environment with minimum impact to the vehicle or to the personnel operating within that vehicle. The Waste Processing Unit (WPU) has been demonstrated both by analysis and testing. The WPU for combat vehicle is currently undergoing further testing at Aberdeen Proving Grounds. Additionally, a modified version of the WPU was fabricated and tested to verify the feasibility of adapting the concept to marine applications. This effort has proven the feasibility of the application, and appears to have significant commercial possibilities.

4.0. RECOMMENDATIONS

4.1. Installation

Installation of the WPU into a combat vehicle should be accomplished by the addition of a bypass exhaust system to the existing engine exhaust system. The bypass exhaust system should include a cutout valve for activating or deactivating the system, and a check valve at the final exhaust line from the WPU.

4.2 Waste Disposal Port Seal

Depending on the application, the seals at the Waste Disposal Port drum should be modified by the addition of another seal positioned in such a manner as to provide a more effective seal around the drum.

5.0. DISCUSSION

5.1. Description of Work

To develop a viable vehicle waste disposal system for combat vehicles operating in an NBC contaminated environment, the following work was performed.

5.1.1. WPU Test Stand. A facility for the testing of the WPU bench model and development units was designed and fabricated. The WPU test stand consisted of an automotive-type six-cylinder gasoline engine with all necessary ancillary equipment required to maintain controlled operation of the engine. The engine exhaust manifold was modified with a fitting for the attachment of the WPU's testing. The entire assembly was mounted on a stand permitting relocation of the unit when it was not in use. A collection tray was also provided to collect effluents from the WPU for analysis. A photograph of the WPU test stand is shown in Figure 5-1.

5.1.2. Bench Model Testing. Following the completion of the WPU test ttand, the WPU bench model #WPU-BM001 was modified as shown in Figure 5-2 and tested in accordance with the WPU Bench Model Test Procedure #OEI-BM001. The bench model testing obtained specific parameters pertinent to the optimization of the WPU design, and included the operating temperatures in various regions within the WPU, effects of insulation on internal temperatures, minimum operational inlet temperature, average cycle time as a function of inlet temperature, effluent properties and quantities, etc.

5.1.3. WPU Development Unit. Based on the results of the bench model testing, the WPU development unit was designed specifically to fit within the confines of the Concept Command Post Vehicle (CCPV), and was powered by a portion of the exhaust from the main engine of that vehicle. Specific limitations on the design included the available volume within the compartment in the CCPV allocated for the WPU. A photograph of the basic WPU development unit is shown in Figure 5-3.

5.1.4. Waste Disposal Port. A waste disposal port for the transferring of waste from the interior of the CCPV to the WPU was designed. The Waste Disposal Port (WDP) was designed so as to permit waste to be placed into the WPU directly from the Pacto toilet currently in the CCPV without danger of compromising the interior of the vehicle. An interlock should be provided to prevent opening of the WDP unless the main engine is operating. Several concepts were developed and evaluated; the best concept for this application was fabricated for use on the CCPV. The WDP uses a rotary valve integral to the top of the WPU. Other approaches that were investigated included variations of incineration dump chutes used in the past in multistory apartment buildings.

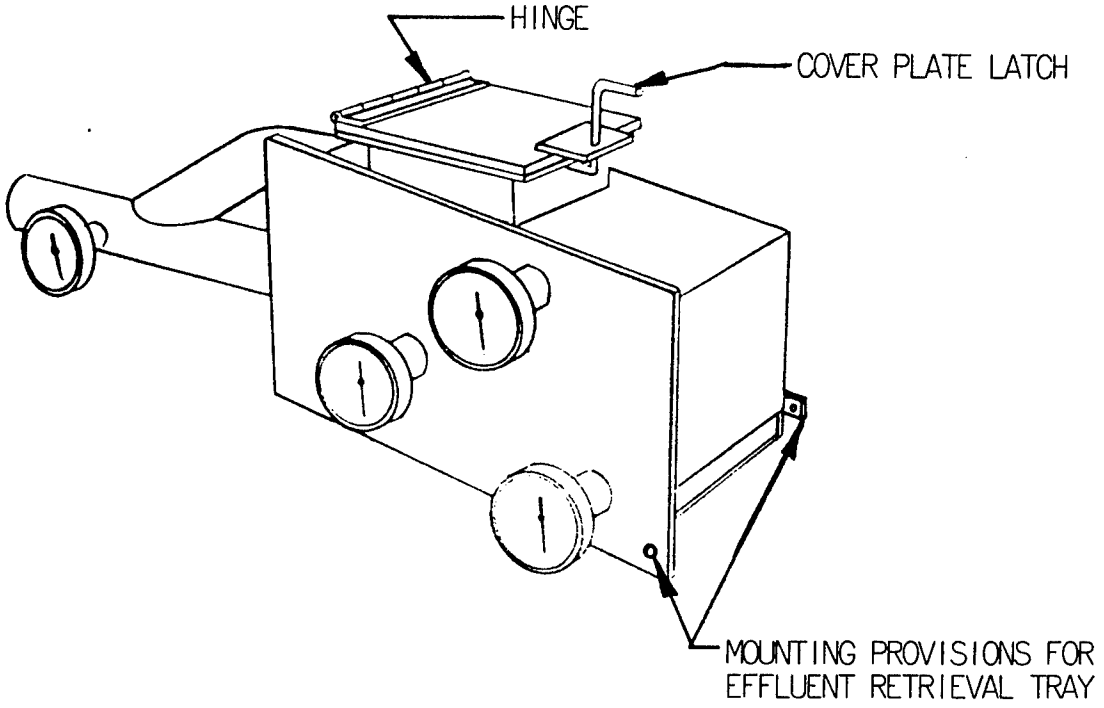

Figure 5-2. WPU Bench Model Modifications

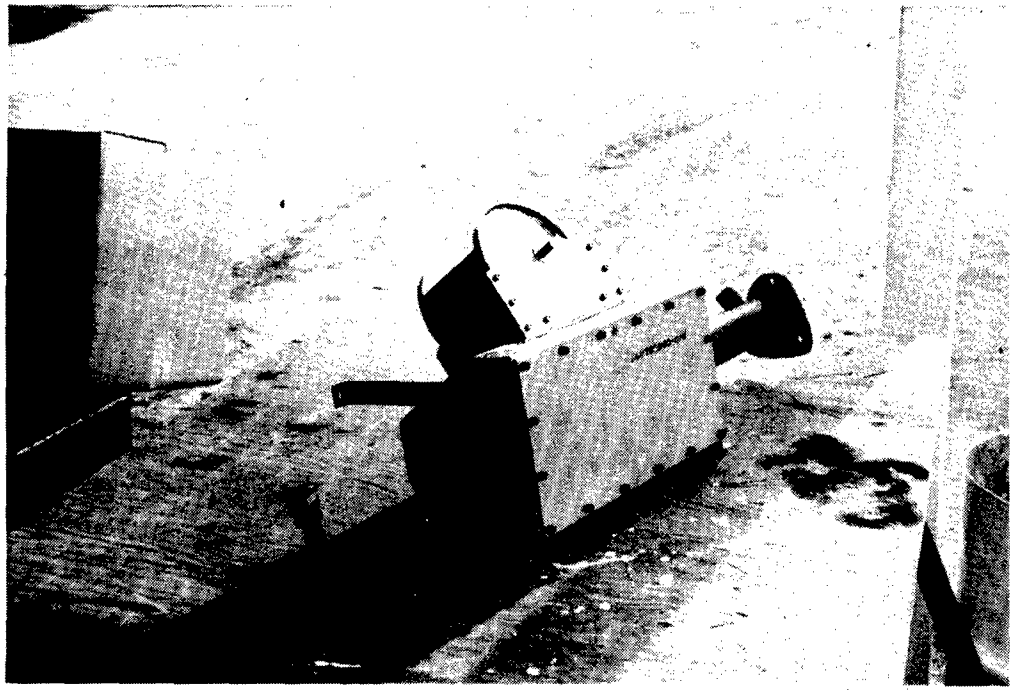
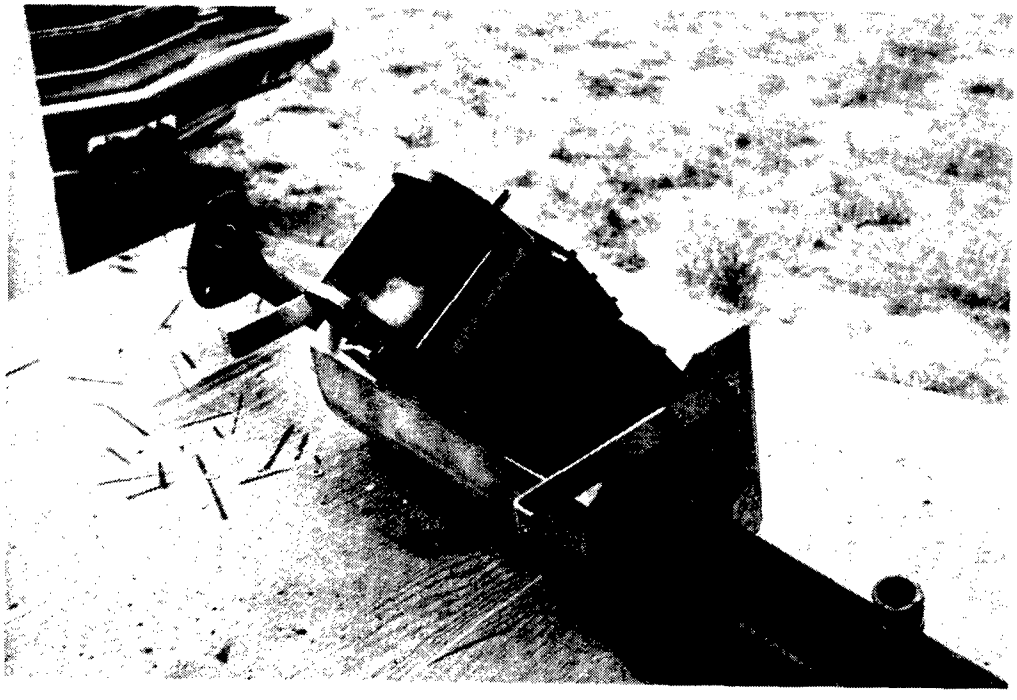


(a) Front view, looking from WPU Outlet



(b) Top View, showing WDP

Figure 5-3. WPU Development Unit

THIS PAGE LEFT BLANK INTENTIONALLY

5.1.5. Marine WPU. A WPU development unit was designed for the specific application of processing waste from a marine head. This unit was quite similar to the standard WPU, but was mounted so as to permit flushing water to flow through the unit and out the exhaust pipe, while trapping the solid waste for incineration by the engine exhaust. A diagram of the Marine WPU development unit is shown in Figure 5-4.

5.1.6. Development Model Fabrication. The WPU development unit for the CCPV, the WDP, and the Marine WPU development unit were fabricated. Primary material was corrosion resistant (stainless) steel. The development units differed from operational units only in that they had removable adaptors for attachment onto the WPU test stand.

5.1.7. Development Model Testing. The WPU development units and the WDP were tested under simulated actual operating conditions using the WPU test stand, and a modified form of the WPU Bench Model Test Procedure #OEI-BM001.

5.1.8. Operation Manual. A manual was to be prepared to clearly describe all aspects of the operation and maintenance of the WPU, but this will be deferred pending completion of the testing of the WPU at Aberdeen Proving Grounds.

5.1.9. WPU Development Unit Refurbish. The WPU development unit and the WDP for the CCPV were refurbished as required and prepared for installation into the CCPV for further testing.

5.1.10. WPU/WDP Installation. The principal investigator accompanied the refurbished WPU and WDP to Aberdeen Proving Grounds to assist TACOM personnel in the installation of the units into the concept Command Post Vehicle, and participated in the checkout of the units after installation.

THIS PAGE LEFT BLANK INTENTIONALLY

5.2 Project Results

Although final results of the field testing of the WPU Development Unit at Aberdeen Proving Grounds is not yet available, preliminary test results indicate that the WPU may prove suitable for combat vehicle applications. A summary of the overall project results and conclusions follows.

5.2.1. WPU. A development model of the WPU was designed and fabricated for advanced testing. The unit was constructed entirely of stainless steel, and was designed to fit within the confines of the waste storage compartment under the Pacto toilet in the CCPV. A WDP was incorporated in the top of the WPU, and employs a sealed and insulated rotating drum to deliver the waste to the WPU. Inlet and outlet flanges were provided to permit attaching the WPU to a bypass exhaust system from the vehicle's main engine. A front cover assembly, including the necessary hardware for mounting the operating handle, was also fabricated. The WPU was tested at Olis Engineering, where it was determined that the unit was effective at processing human waste to a light, dry ash using only internal combustion engine exhaust as a power source. For differing applications, modifications to the WDP sealing system may be desired. Following the development testing at Olis Engineering, the WPU and WDP were refurbished to like-new condition and delivered to Aberdeen Proving Grounds for further testing and evaluation.

5.2.2. Marine WPU. The original WPU bench model was modified extensively for the specific purpose of evaluating the feasibility of developing a WPU for marine applications. It was determined that if the objectionable odor associated with the incineration of the waste material could be minimized, a potential commercial application for the WPU would be various types of smaller marine craft, especially those operating in inland and coastal waters. In order to verify the premise that exhausting the outflow from the WPU under water would reduce the odor to an acceptable level, and to verify satisfactory operation of the WPU when flush water was used to deliver the waste material to the unit, a marine WPU development unit was constructed around the original WPU bench model. Testing of this unit at Olis Engineering indicated that not only did the concept work, but that odors were reduced to a level as to be essentially undetectable. The concept of using a standard collection and delivery system (i.e., standard flushing toilet connected to standard plumbing delivers the waste to the WPU) proved to be most effective. It was determined, however, that a flapper valve should be included in the design at the WPU to prevent backflow of exhaust into the plumbing and toilet when there is insufficient water in the trap to prevent backflow.

5.2.3. Conclusions. This research has resulted in the definition of two systems for effectively processing human waste using waste heat and gas flow resulting from vehicle engine exhaust. While specific applications will require modifications to the system, the basic WPU has been proven effective at reducing human waste material to a harmless black ash, which is expelled from the system as the vehicle engine supplies exhaust to the unit. Promising commercial applications have been identified, and are being pursued. The necessary steps for protecting the concept have been taken, and patent application is pending.

WPU BENCH MODEL TESTS

THIS PAGE LEFT BLANK INTENTIONALLY

ENGINEERING DEVELOPMENT TEST:

WASTE PROCESSING UNIT BENCH MODEL TEST PROCEDURE

#OEI - BM001

TEST DATE: start 86-11-14
complete 86-12-5

TEST CONDUCTOR: James A. Shirley

APPROVAL: Carter K. Ford DATE: 86-12-05
Principal Investigator

OEI - WPUBM001

Purpose

The purpose of this Engineering Development Test is to obtain specific parameters pertinent to the optimization of the Waste Processing Unit (WPU) currently under development. Certain performance characteristics can best be determined by the experimental process. These include operating temperatures in various regions within the WPU, effects of insulation on internal temperatures, minimum operational inlet temperature, average cycle time as a function of inlet temperature, etc. This data will be utilized in the design optimization process for the WPU.

Verified LORD Date DEC 03 1986

Description of Effluents : Approximately 1 TBSP ~~Spoon~~ (sooty) liquid appeared immediately after insertion of sample.

6.6 Description of WPUBM001 interior and contents: Interior unchanged - small spot (2" x 3") of sooty plastic residue on bottom.

Weight of contents: approx. 0

OEI - WPUBM001

Data Sheet DS002 (cont.)

Date: DEC 03 1986

6.7 Effluent Description:

weight: - 0 -

Comments: After the first 5 minutes there was a small amount of liquid in ruptured bag. (approx. 1 TB. Spoon)

10 minutes after insertion of bag: still small amount of liquid and plastic

15 minutes after insertion of bag: No liquid - small amount of plastic

20 minutes after insertion of bag: No liquid - small amount of plastic

25 minutes after insertion of bag: No liquid - small amount of plastic

30 minutes - same conditions as previous.

35 minutes - Plastic burning nicely - small amount left.

40 minutes after insertion of bag: very small amount plastic residue left.

41 minutes smoky black residue left at bottom of chamber.

OEI - WPUBM001

Description of Effluents: Approximately 4 TB. Spoon Black Ash in Effluent Retrieval Tray.

6.6 Description of WPUBM001 interior and contents:
Small amount of Black Ash in Bottom

Weight of contents: .3097 oz

OEI - WPUBM001

Data Sheet DS002 (cont.)

Date: DEC 03 1986

6.7 Effluent Description:

weight: .3097 oz

Comments: 5 Minutes after insertion of bag: Outside edge charred

10 minutes after insertion of bag: Outside is completely charred.

20 minutes after insertion of bag: Package is visibly smaller and charred.

30 minutes after insertion of of bag: Bag and contents about ½ the size when put in. Smoke visible from exhaust, no particule being discharged in catch pan.

40 minutes after insertion of bag: Small amount of burned particules in pan. 3 TB. Spoons.

50 minutes after insertion of bag: very small amount left, about 3 or 4 TB. Spoons. Debris in catch pan, no smoke visible.

60 minutes after insertion of bag: all gone--3 to 4 TB spoons in catch pan.

6.7 Effluent Description:

weight: .546302

Comments: 5 minutes after insertion of bag: no visible smoke, bag ruptured and edges charred, no contents in catch pan. Smell it charring.

10 minutes after insertion of bag: No visible smoke a little more charred-- no contents in catch pan. Smell it charring.

15 minutes after insertion of bag: No visible smoke can smell it burning. charred nicely.

25 minutes after insertion of bag: Light smoke visible - still smell it burning nicely - about the original size.

35 minutes after insertion of bag: Well charred, more smoke, very small amount of ash in catch pan.

45 minutes after insertion of bag: About ½ gone, smoke visible, smell, very small amount of ash in catch pan.

55 minutes after insertion of bag: Fair amount of smoke - still smell it.

65 minutes after insertion of bag: Fair amount of smoke - still smell it, ½ gone

75 minutes after insertion of bag: smoke fair amount, smells real nice - about ½ gone, picking up more ash. 1 TB Spoon.

85 minutes after insertion of bag: Very little smoke still smells - ½ to two thirds gone. 2 charred pieces left.

95 minutes after insertion of bag: No noticeable smoke - smell not so strong. About 1 TB. Spoon of ash.

125 minutes after insertion of bag: No smell except engine exhaust. No smoke No noticeable change in size of charred remaines.

Date: DEC 04 1986

6.7 Effluent Description:

weight: .365702

Comments: 30 seconds after insertion of bag: Noticeable smell.

5 minutes after insertion of bag: No visible smoke - strong smell - bag ruptured liquid boiling some charring.

15 mintes after insertion of bag: Fair amount of smoke burning smell - no ash yet. Outsides and surfaces charred well. No liquid boiling.

25 minutes after insertion of bag: Strong charred or burning smell - fair amount of smoke. No liquid visible - charred - no particules in catch pan.

35 minutes after insertion of bag: Goodly amount of smoke, very, very small amount of ash in catcher bag and contents heavily charred.

45 minutes after insertion of bag: Conditions same as last entry.

55 minutes after insertion of bag: Same amount of smoke, strong smell (charring) very little amount of particules yet. $\frac{1}{4}$ teaspoon, heavily charred. About $\frac{1}{2}$ to 2/3 gone.

65 minutes after insertion of bag: Fair amount of smoke, strong charring smell. about 3/4 gone. Still very, very little ash in catch pans.

75 minutes after insertion of bag: Very little smoke, charring smell not strong, still very little ash in catch pans. Remains in chamber still burning, not much size difference.

85 minutes after insertion of bag: Same as above:

95 minutes after insertion of bag: No smell except engine exhaust, no smoke.

100 minutes after insertion of bag: No smell, No smoke, end of test. 2 small incinerated pieces about 3/8" thick 2" long left in chamber. $\frac{1}{2}$ teaspoon in catch pans.

Weight of contents: 3337 oz

OEI - WPUBM001

Data Sheet DS002 (cont.)

Date: DEC 05 1986

6.7 Effluent Description:

weight: .3337 oz

Comments: 10 seconds after insertion of bag: Strong Smell

10 minutes after insertion of bag: Very strong smell, no smoke yet, lightly charred around edges, bag ruptured.

20 minutes after insertion of bag: Smell not as stong, no visible smoke yet, heavy charring, no liquid visible, small amount of ash.

30 minutes after insertion of bag: smell not as strong, no visible smoke, small amount of ash, heavy charring.

40 minutes after insertion of bag: smell is about the same, still no visible smoke, same amount of ash,size of contents smaller, heavily charred.

50 minutes after insertion of bag: Smell decreasing, visible smoke, heavy charring still.

55 minutes after insertion of bag: Smell decreasing, still fair amount of smoke, no noticeable change in contents of burner from last check, still very small, amount of ash in catch pans.

60 minutes after insertion of bag: Fair amount of smoke, smell decreasing, no noticeable change in contents size, heavily charred.

65 minutes after insertion of Bag: Same amount of smoke, no change in ash in catch pans, smell not bad, contents looks a little smaller, charred heavily.

70 minutes after insertion of bag: smokes decreasing, smell the same.

75 minutes after insertion of bag: No visible smoke, smell decreasing, smells of burnt or charred whatever, same amount of ash in catch pans. No visible changes in contents size.

80 minutes after insertion of bag: No visible changes from last time checked. Small amount of ash, no bad smell that I can tell. No smoke visible. Contents looks thinner and smaller.

85 minutes after insertion of bag:

Comments: (cont)

90 minutes after insertion of bag: Charring smell only, no smoke visible, same amount of ash, contents breaking up a little.

95 minutes after insertion of bag: Same as last check.

100 minutes after insertion of bag: Done, test completed.
No smell except engine exhaust.
small amount of ash in catch pans.
1 clinker in burn chamber.

WPU DEVELOPMENT UNIT TEST

THIS PAGE LEFT BLANK INTENTIONALLY

ENGINEERING DEVELOPMENT TEST:

WASTE PROCESSING UNIT DEVELOPMENT TEST PROCEDURE

#OEI - WPUD001

TEST DATE: Aug 17-19, 1987

TEST CONDUCTOR: _____

APPROVAL: Carter K. Ford DATE: AUG 19 1987
Principal Investigator

OEI - WPUD001

Purpose

The purpose of this Engineering Development Test is to determine specific parameters pertinent to the performance of the Waste Processing Unit (WPU) currently under development. Certain performance characteristics can best be determined by the experimental process. These include operating temperatures within the WPU, effects of insulation on internal temperatures, seal performance, minimum operational inlet temperature, average cycle time as a function of inlet temperature, etc.

EQUIPMENT/MATERIALS REQUIRED

QTY	ITEM	I.D. NUMBER
1	WPU TEST STAND	
1	EFFLUENT RETRIEVAL UNIT	(not assigned)
1	WPU DEVELOPMENT UNIT (with adaptor inlet and outlet pipes)	#WPU-BM001 8611TAC0100-009
1	TEMPERATURE PROBE: 200°-1000°F (2.5" Lg.)	#1
1	TEMPERATURE PROBE: 200°-1000°F (4.5" Lg.)	#2

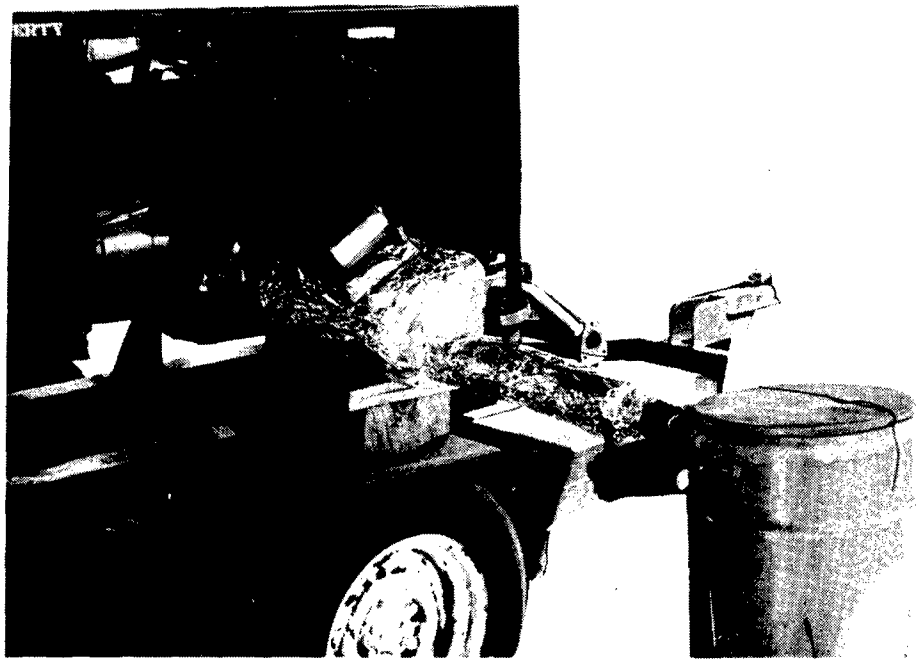
LORD
CAL Verified: AUG 17 1987

LORD
#2 CAL Verified: AUG 17 1987

A/R	Waste samples, sealed in plastic bags
1	Thermometer, -20°F to +100°F, for recording ambient temperature

Documents Required

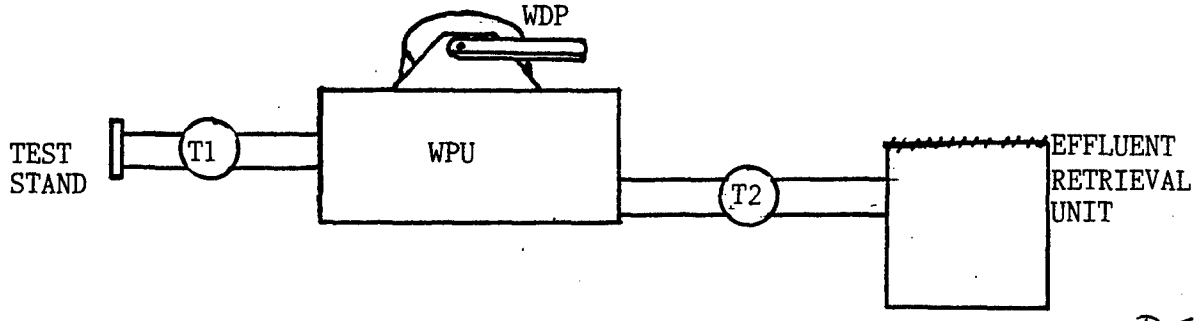
1	Engineering Test Procedure #OEI-WPUD001 (with data sheets)
1	Operational Procedures, WPU Test Stand (OP8611000)



OEI - WPUD001

TEST PROCEDURE

1.0 Following calibration of temperature probes, install temperature probes into WPU Development Unit 8611TAC0100-009 as shown in sketch below.



Verified LORD Date AUG 17 1987

2.0 Install Development Unit onto WPU Test Stand using sections of pipe provided.

Verified LORD Date AUG 17 1987

3.0 With WDP in the "up" position, activate WPU Test Stand and adjust for an inlet response of Temperature probe #1 and #2 until a steady state condition is reached. (Note - inlet temperature is taken from T_1)

TIME	RPM	T_1, °F	T_2, °F			$T_{ambient}$, °F

COMMENT: NO NOTICE OF ANY LEAKS AROUND SEALS AT DRUM (WDP)

5.0 Waste Processing Tests

5.1 Attach effluent retrieval unit to the outlet of WPU.

Verified LORD Date AUG 1 8 1987

5.2 Weigh a waste sample and record on data sheet DS002.

5.3 Place a waste sample into WPU, and return WDP to the "UP" position. Record response of system on data sheet DS002. Continue operating unit for 15 minutes. Use Video system to record characteristics of effluents.

5.4 With the WDP in the "UP" position, activate the WPU Test Stand, and adjust to attain an inlet temperature of 850 ± 25°F. Allow system to reach steady state condition and record temperatures on data sheet DS002.

5.5 Turn WPU Test Stand Off and allow unit to return to ambient temperature. Remove side plate of WPU and inspect condition of unit and contents, if any.

5.6 Weigh contents of effluent retrieval unit and record on data sheet DS002.

5.7 Repeat steps 5.1 through 5.6 for various inlet temperatures (minimum of 4).

5.8 Record results, observations, conclutions, etc. on data sheet DS003.

5.9 Repeat steps 5.1, 5.2, and 5.4 thru 5.7 with WPU at steady state operating temperature of T_1 = 850° ± 25° F.

weight: <1 OZ

TIME:
0914 Slight smell- no smoke visible- no liquid or steam visible
0918 Considerable odor- smoke visible
0922 considerable light blue smoke- charred smell
0925 Considerable light blue smoke- charred smell
0928 Still smoking- charred smell
0931 Less smoke- charred smell- no visible effluents in retrieval unit yet
0935 More smoke- strong charred smell
0940 Same as above
0945 Lots of light blue smoke-strong charred smell
0950 Same as above
1000 Less smoke- still strong charred smell
smoke dissipates within 15 - 20 feet from unit
1010 Much less light blue smoke- minimal charred smell
1015 No smoke visible- very little charred smell

SAMPLE #2

OEI - WPUD001

Data Sheet DS002

Date: AUG 18 1987

5.4 Preliminary Status

TIME	INLET T_1 °F		T_2 °F		$T_{ambient}$, °F

weight: 1 oz (SAMPLES 3&4)

0918 SAMPLE #4 INTO WDP & ROTATE LOTS OF SMOKE IMMEDIATELY
DRUM OK- SAMPLE DID NOT STICK, AND BAG APPARENTLY DID NOT MELT IN DRUM
0923 SMALL AMOUNT OF SMOKE & CHARRED SMELL
0927 NORMAL AMOUNT OF SMOKE & CHARRED SMELL
0928 NO VISIBLE LEAKS AROUND WDP DRUM
0935 NORMAL AMOUNTS OF SMOKE & charred smell
0942 NO CHANGE
0945 SMOKE DIMINISHING, AS WELL AS SMELL
0948 VERY LITTLE SMOKE, SOME SMELL
0950 NO SMOKE, VERY SLIGHT SMELL
0953 NO SMOKE, NO SMELL (NORMAL EXHAUST SMELL)
0954 SHUT DOWN TEST STAND TEST #4 COMPLETED

OEI - WPUD001

Data Sheet DS003

Date: AUG 19 1987

5.8 Observation, Results, Conclusions:

Insertion of samples #1, 2, & 3 was with the WPU at ambient temperature. Sample #4 was inserted with the WPU at operating temperature. No problems were found with either operational scenario.

The WDP does not seal completely when in the "down" position - suggest operational and control features be added to require WDP to be in the "UP" position when exhaust flow is ON thru the WPU.

APPENDIX C

MARINE WPU DEVELOPMENT UNIT TEST

THIS PAGE LEFT BLANK INTENTIONALLY

ENGINEERING DEVELOPMENT TEST:

WASTE PROCESSING UNIT DEVELOPMENT TEST PROCEDURE

#OEI - WPUD001

TEST DATE: 11-5-87

TEST CONDUCTOR: Jim Shirley

APPROVAL: [signature] DATE: 12-1-87
Principal Investigator

OEI - WPUD001

Purpose

The purpose of this Engineering Development Test is to determine specific parameters pertinent to the performance of the Marine Waste Processing Unit (Marine WPU) currently under development. Certain performance characteristics can best be determined by the experimental process. These include operating temperatures within the Marine WPU, effects of insulation on internal temperatures, seal performance, minimum operational inlet temperature, average cycle time as a function of inlet temperature, etc. Of particular interest for this test is the presence or absence of objectional odor during the processing cycle. It has been determined analytically that most objectionable odors should be eliminated by placing the WPU exhaust under water. The primary purpose of this test is to verify that analysis.

OEI - WPUD001

EQUIPMENT/MATERIALS REQUIRED

QTY	ITEM	I.D. NUMBER	
1	WPU TEST STAND		
1	EFFLUENT RETRIEVAL UNIT	(not assigned)	
1	WPU DEVELOPMENT UNIT (with adaptor inlet and outlet pipes)	#WPU-BM001 8611TAC0100-009	
1	TEMPERATURE PROBE: 200°-1000°F (2.5" Lg.)	#1	CAL Verified: NOV 0 5 1987
1	TEMPERATURE PROBE: 200°-1000°F (4.5" Lg.)	#2	#2 CAL Verified: NOV 0 5 1987
A/R	Waste samples, sealed in plastic bags		
1	Thermometer, -20°F to +100°F, for recording ambient temperature		

Documents Required

1	Engineering Test Procedure #OEI-WPUD001 (with data sheets)
1	Operational Procedures, WPU Test Stand (OP8611000)

MARINE

OEI - WPUD001

TEST PROCEDURE

1.0 Following calibration of temperature probes, install temperature probes into WPU Development Unit 8611MAR0100-009 .

Verified LORD Date NOV 0 5 1987

2.0 Install Development Unit onto WPU Test Stand using sections of pipe provided.

Verified LORD Date NOV 0 5 1987

3.0 Activate WPU Test Stand and adjust for an inlet temperature of 850±25°F. Once steady state conditions have been reached, flush toilet on Marine WPU (no sample- water only) and record response of system.

TIME	RPM	T_1, °F	T_2, °F	TIME		$T_{ambient}$, °F

Description of Effluents : OTHER THAN STEAM IMMEDIATELY AFTER FLUSH, NO EFFLUENT FOUND. EFFLUENT FROM EXHAUST APPEARED TO BE ONLY STEAM AND CLEAR WATER (SLIGHTLY DISCOLORED)

5.5 Description of WPUBM001 interior and contents: MINUTE AMOUNT OF DRY BLACK ASH

Weight of contents: ~0 oz

OEI - WPUD001

Data Sheet DS003

Date: NOV 0 5 1987

5.8 Observation, Results, Conclusions:

1030 STEAM RISING FROM EFFLUENT RETRIEVAL UNIT (EXHAUST IS UNDER WATER)
1033 REFLUSHED TOILET
1034 NO ODOR, NO SMOKE
1035
1036
1037
1038
1050
1100
1105
1112 NO ODOR, NO SMOKE

Results of this test indicate that exhausting the WPU below the water line effectively eliminates smoke and odor from the unit.

Due to the possibility of exhaust pressure entering the waste pipe when an insufficient amount of water is in the "P" trap of the system, it is recommended that a counterweighted check valve be installed in the WPU at the Waste inlet.
