FIELD	GROUP	SUB-GROUP	Transmission Control Protocol/ Internet Protocol; TCP/IP; Vendor Guide; TCP/IP Implementations; Defense Data Network DDN; DDN protocol suite.
19. ABSTRACT (Continue on reverse if necessary and identify by block number) This guide provides information about implementations and products compatible with the DOD Defense Data Network (DDN) suite of data communication protocols. The first section supplies background information about DDN protocol policy, and about the protocols themselves. Such information includes qualification testing and evaluation procedures, and how to obtain pertinent documentation. The next two sections of the document list software implementations alphabetically by machine type, and hardware implementations alphabetically by company. Information given about products includes their history, documentation, contact person, and distributor. The fourth section describes analysis tools. It includes information about network analysis products, such as protocol and network analyzers. This guide does not specifically endorse or recommend any product.

It is the intent of the DDN Network Information Center (NIC) to make the DDN Protocol Implementations and Vendors Guide widely available to subscribers of the DDN. The Guide may be obtained in hardcopy or machine-readable form. Hardcopy is available from the NIC for \$40.00 (\$50.00 overseas) to cover the costs of reproduction and handling. Send check or purchase order to the DDN Network Information Center, SRI International, Room EJ291, 333 Ravenswood Avenue, Menlo Park, CA 94025. Copies are available online to DDN users who have access to the file transfer services, FTP or KERMIT, using path name: NETINFO:VENDORS-GUIDE.DOC. The hardcopy version is published twice a year in February and August.

DDN Protocol Implementations and Vendors Guide. Printed and bound in the United States of America.
Published by the DDN Network Information Center, SRI International, Menlo Park, CA 94025.

Date: August, 1988

ISBN 0-944604-10-2

NOTICE

The DDN Protocol Implementation and Vendors Guide is for informational purposes only. Inclusion of an implementation or product in this Guide does not constitute an endorsement or an official recommendation on the part of the Defense Communications Agency (DCA), the Defense Advanced Research Projects Agency (DARPA), the DDN Network Information Center (NIC), or the Department of Defense (DoD). Omission of any vendor or implementor has no significant implication, other than that the NIC had no information about that product or implementation, or that the information was not forthcoming by the time of publication. Anyone planning to use the hardware or software described in this Guide is advised to thoroughly investigate the suitability, quality, costs, available support, and other related details pertaining to any given selection, and to make sure that products or implementations being considered for use on the Defense Data Network (DDN) comply with the official DoD Military Standard (MIL-STD) protocols.

ACKNOWLEDGMENTS

The DDN Protocol Implementations and Vendors Guide was prepared by the DDN Network Information Center (NIC) for the Defense Communications System Data Systems (DCS DS) Office under contract number DCA-200-87-C-0020, CDRLs E009 and E009A. The Guide was compiled with the assistance of many people, most of whom are cited as contacts for the products and implementations listed within this document. The NIC gratefully acknowledges their contributions.

Table of Contents

INTRODUCTION	1
1. BACKGROUND	3
1.1. The DoD Protocol Suite	3
1.1.1. DoD Protocol Selection and Announcement Procedures	3
1.1.2. OSD Directives	3
1.1.3. DoD Plans for the Transition to International Protocols	3
1.1.4. Government OSI Profile (GOSIP)	5
1.2. The Defense Data Network (DDN)	5
1.2.1. DDN Protocol Qualification Testing	5
1.3. Obtaining Protocol Documentation	6
1.3.1. Military Standards	6
1.3.2. RFCs	6
1.3.3. DDN Protocol Handbook	6
1.3.4. Government OSI Profile (GOSIP)	6
1.3.5. Blacker Front End Interface Control Document	7
1.3.6. DDN X.25 Host Interface Specification	7
1.3.7. DDN Subscriber Interface Guide	7
1.3.8. DDN Subscriber Security Guide	7
1.3.9. NIC Document Ordering Information	8
1.3.10. NIC Shipping Information	8

INTRODUCTION

This is a guide to implementations and products associated with the DoD Defense Data Network (DDN) suite of data communication protocols, notably TCP/IP and OSI implementations. It is published for informational purposes only by the DDN Network Information Center at SRI International on behalf of the Defense Communications System Data Systems (DCS DS) Office to assist those wishing to identify existing implementations or products incorporating the DoD protocols.

The guide has four major sections.

Section One contains background information about DoD protocols, DDN protocol policy, and qualification testing and evaluation procedures. It also explains how to obtain specific DoD protocol specifications and related documentation.

Sections Two through Four contain the implementation descriptions. Section Two lists software implementations, sorted alphabetically by company machine type. The Digital Equipment Corporation and IBM Corporation sections cover a wide range of machinery software from PC/compatibles to minis and mainframes; each is listed alphabetically within each machine category. A "Multiple Machine Implementations" list completes the Software section.

Section Three contains hardware implementations sorted alphabetically by company machine type and concludes with a list of multiple machine implementations.

Section Four is a new section, called Analysis Tools, and has been created to cover the emerging field of network analysis products, notably protocol and network analyzers.

The index at the back of the book can assist in locating particular implementations. It is sorted by operating system, machine type, company name and important keywords such as "X.25," "OSI," and "Gateway."

This document is available to Internet users as a public file on the SRI-NIC.ARPA host (26.0.0.73, 10.0.0.51). The file can be copied via FTP or KERMIT using the pathname: NETINFO:VENDORS-GUIDE.DOC.

SYMBOL KEY:

v Taken from vendor literature

Last edit: August, 1988

NOTE FOR VENDORS:

This document is produced twice a year in hardcopy form. The release dates are FEBRUARY and AUGUST. If you have new product information or corrections to this text be sure to send them at least 30 days prior to each release date. The last page of the guide contains a convenient form for mailing in vendor information. Network users may also send the form via electronic mail to NIC@SRI-NIC.ARPA.

1. BACKGROUND

1.1. The DoD Protocol Suite

In 1982 the Defense Advanced Research Projects Agency (DARPA) Transmission Control Protocol (TCP) and Internet Protocol (IP) were designated official DoD network communication protocols by the Office of the Secretary of Defense (OSD). These protocols are currently in use by the DDN, as is a DoD version of X.25. In late 1987 DoD began its transition to international protocols. (See Section 1.1.3 below.) Subscribers to the DDN need implementations and vendor products that incorporate both the TCP/IP and the OSI-based protocols, and protocols that assist with conversion between the two. This guide provides a list of such implementations and products.

1.1.1. DoD Protocol Selection and Announcement Procedures

Official Military Standard (MIL-STD) protocols are selected through a rigorous review process by the military services and the Defense Communications Agency (DCA). Once selected, they are deposited at the Naval Publications and Forms Center and are announced in the catalogs published by that organization as official military standards. See Section 1.3.1 for guidelines on ordering MIL-STDs.

The Department of Defense and each branch of the military have their own protocol announcement procedures as do non-military government agencies, such as the National Bureau of Standards. Commercial, national, and international standards organizations also have their own review and announcement procedures. See *IEEE Communications Magazine*, Vol. 23, No. 1, 43-55 (January 1985) for an excellent overview of the standardization practices of the various protocol standardization bodies within and outside of DoD.

1.1.2. OSD Directives

A number of memoranda from the Office of the Secretary of Defense have been issued which are specific policy statements regarding the DoD protocols. These memoranda are available via FTP, KERMIT or SERVICE, the NIC's automatic electronic mail service, from the SRI-NIC.ARPA host computer using the following pathnames:

Host-to-Host Protocols for Data Communication Networks	PROTOCOLS:OSDIR-1.TXT
DoD Policy on Standardization of Host-to-Host Protocols for Data Communications Networks	PROTOCOLS:OSDIR-2.TXT
DDN Implementation	PROTOCOLS:OSDIR-3.TXT
DoD Policy on DDN Protocols	PROTOCOLS:OSDIR-4.TXT
DoD Statement on NRC Report on TP4	PROTOCOLS:OSDIR-5.TXT
Open Systems Interconnection Protocols	PROTOCOLS:OSDIR-7-87.TXT

1.1.3. DoD Plans for the Transition to International Protocols

Vendors and implementors should be aware that the DoD has recently announced that it intends to transition to international protocols, when and if these protocols meet the requirements of the DoD. It is anticipated that any such transition will take place gradually and will not significantly impact the functionality, or the current level of interoperability on the DDN. To assist with this transition, this guide will include transition products as they are developed.

The following is an extract from a memorandum from the office of the Assistant Secretary of Defense for Command, Control, Communications and Intelligence that specifically addresses the Department of Defense plans to transition from the current suite of military standard data communications protocols based on the TCP/IP protocols to the suite of networking protocols based on the international standards. (Available online in its entirety as PROTOCOLS:OSDIR-7-87.TXT from the SRI-NIC.ARPA host computer.)

MEMORANDUM

MEMORANDUM FOR:

SECRETARIES OF THE MILITARY DEPARTMENTS
CHAIRMAN, JOINT CHIEFS OF STAFF
DIRECTORS, DEFENSE AGENCIES

SUBJECT: Open Systems Interconnection Protocols

There has been recent rapid progress in the specification and implementation of computer protocols based on the International Organization for Standardization model for Open Systems Interconnection (OSI). The Government OSI Profile (GOSIP), dated 22 April 1987, contains sufficient information to specify adequately and acquire interoperable vendor implementations of OSI message handling and file transfer capabilities. Therefore, the policy on standardization of host-to-host protocols for data communications, promulgated by USDR&E memo of 23 March 1982, is modified as follows. The OSI message handling and file transfer protocols, together with their underlying protocols as defined in GOSIP, are adopted as experimental co-standards to the DoD protocols which provide similar services (MIL-STDs 1777, 1778, 1780, and 1781). These OSI protocols may be specified in addition to, in lieu of, or as an optional alternative to DoD protocols, in cases where the current DoD protocol applicability statements apply. They are designated as experimental because of the limited operational experience currently available with the OSI protocols and the limited operational, testing, and security environment currently defined in GOSIP. Services and agencies choosing to implement OSI protocols at this time should carefully evaluate these factors and be prepared to deal with the complications which may accompany the introduction of new technology.

It is intended to adopt the OSI protocols as a full co-standard with the DoD protocols when GOSIP is formally approved as a Federal Information Processing Standard. Two years thereafter, the OSI protocols would become the sole mandatory interoperable protocol suite; however, a capability for interoperation with DoD protocols would be provided for the expected life of systems supporting the DoD protocols.

1.1.4. Government OSI Profile (GOSIP)

A Federal Information Processing Standard (FIPS) has been issued by the National Bureau of Standards (NBS) for GOSIP in the Federal Register, V52, Vo. 208, Oct. 28, 1987.

This FIPS proposes a Federal Information Processing Standard for a Government Open Systems Interconnection Profile (GOSIP) and outlines the policy of the Federal government, including the DoD transition from TCP/IP to ISO international protocols.

The GOSIP cites the Implementation Agreements for Open Systems Interconnection Protocols, the Manufacturing Automation Protocol (MAP) and Technical and Office Protocols (TOP) specifications, as well as the numerous federal standards, military standards, and international standards from ISO and CCITT upon which the "Workshop Agreements" are based.

GOSIP supports the Message Handling Systems (MHS) and File Transfer, Access, and Management applications (FTAM). GOSIP also supports interconnection of the following network technologies: CCITT Recommendation X.25; Carrier Sense Multiple Access with Collision Detection (IEEE 802.3); Token Bus (IEEE 802.4); and Token Ring (IEEE 802.5). Additional applications and network technologies will be added to later versions of the GOSIP document or vendor products in which such protocols are embedded.

Once the GOSIP specification is accepted, it is expected to become mandatory after two years for new acquisitions across the entire Federal Government, including DoD. DoD is expected to announce Co-Standard status for the ISO/OSI protocols in the same timeframe. A detailed interoperability and transition plan is under development by DoD for DoD networks.

1.2. The Defense Data Network (DDN)

All equipment attached to the DDN by military subscribers must incorporate, or be compatible with, the DoD internet and transport protocols. In addition, the OSI message handling and file transfer protocols, together with their underlying protocols as defined in GOSIP, have been adopted as experimental co-standards to the DoD protocols.

Potential implementors should be aware that protocol implementations for use in the DoD environment MUST comply with the MIL-STD versions of the protocol specifications. It is also important that the LATEST version of these specifications be used. Most of the protocol documents needed for implementation purposes are included in the DDN Protocol Handbook issued by the DDN Network Information Center. This handbook can serve as a useful reference to DoD protocols; however, implementors using this or any other similar document should always check to see if there are any later protocol or policy changes that apply.

1.2.1. DDN Protocol Qualification Testing

Subscriber interfaces which are to be used on the DDN must be qualified by meeting a series of performance tests. The results of these tests must satisfy a Technical Acceptance Team made up of personnel from the DCS DS, the Defense Communications Engineering Center (DCEC), or other appropriate assignees. The DCS DS has the final approving authority for subscriber interface qualification. Currently, X.25 (up to level 3) is the only protocol being tested. There are plans to test TCP/IP and related application software at DCEC. TCP/IP may be tested by DCA B613 in the future.

1.3. Obtaining Protocol Documentation

1.3.1. Military Standards

Official Military Standards (MIL-STDS) may be ordered from the

Naval Publications and Forms Center, Code 3015
5801 Tabor Avenue
Philadelphia, PA 19120
Phone: (215) 697-3321 (order tape)
(215) 697-4834 (conversation)

1.3.2. RFCs

Requests for Comments (RFCs) are a set of protocol-related technical notes available from the NIC. Network users may obtain online copies from the SRI-NIC.ARPA host using the file transfer services, FTP or KERMIT or SERVICE. Pathnames are of the format RFC:RFCnnn.TXT (where "nnn" is the number of the RFC).

RFCs can also be purchased in hardcopy from the NIC. The prices are as follows:

RFC Index	\$5.00 domestic/\$8.00 foreign
RFCs	\$5.00 domestic/\$8.00 foreign (under 100 pp.)
RFCs	\$10.00 domestic/\$13.00 foreign (100 pp. & over) (RFC Nos. 806,809,841,905,909,1000,1013,1045)

An RFC Subscription service is available for \$200.00 per year domestic/\$230.00 foreign.

1.3.3. DDN Protocol Handbook

The DDN Protocol Handbook is a three-volume reference set containing official DoD network protocols and experimental ARPANET protocols, together with military standards, implementation guidelines, and related background information. Published by the NIC.

NIC Price: \$110.00 per set domestic/\$175.00 per set foreign

1.3.4. Government OSI Profile (GOSIP)

Network users may obtain online copies from the SRI-NIC.ARPA host via FTP (using the anonymous login convention), KERMIT, or SERVICE by using the following pathnames:

PROTOCOLS:GOSIP-FEDREG.TXT	Federal Register announcement of the FIPS
PROTOCOLS:GOSIP-V1.DOC	The GOSIP Profile
PROTOCOLS:OSDIR-7-87.TXT	The OSD Directive to proceed with policy within the DoD
PROTOCOLS:GOSIP-FIPS-DRAFT.TXT	The GOSIP FIPS draft
PROTOCOLS:NBSOSI-AGREEMENTS.DOC	NBS OSI Implementation Agreements

Hardcopy of the GOSIP document and the NBS OSI Implementation Agreements can be ordered from the NIC for \$50.00 domestic/\$90.00 foreign or from:

National Technical Information Service (NTIS)
U.S. Department of Commerce
5285 Port Royal Road
Springfield, VA 22161
(703) 485-4560 (order desk)

1.3.5. Blacker Front End Interface Control Document

The Blacker Front End Interface Control Document contains the specification for end-to-end data encryption on the DDN. It may be obtained via FTP or KERMIT from the SRI-NIC.ARPA host using pathname NETINFO:BLACKER.DOC and is also reproduced in the DDN Protocol Handbook.

1.3.6. DDN X.25 Host Interface Specification

This document contains the specific options and features of CCITT Recommendation X.25 (1980) and the Federal Information Processing Standard (FIPS) 100/Federal Standard 1041, (July 1983). Published by DCA, December 1983.

NIC Price: \$10.00 domestic/\$13.00 foreign

1.3.7. DDN Subscriber Interface Guide

The DDN Subscriber Interface Guide describes representative hardware connections to the DDN, and includes guidelines for connecting equipment to the DDN. Published by DCA, July 1983. An update to this document is pending.

NIC Price: \$10.00 domestic/\$13.00 foreign

1.3.8. DDN Subscriber Security Guide

This guide describes the security architecture of the DDN. Published by DCA, November 1983. An update to this document is pending.

NIC Price: \$10.00 domestic/\$13.00 foreign

1.3.9. NIC Document Ordering Information

Documents can be ordered from the NIC by sending a check, money order, or purchase order for the total amount in US dollars, made payable to SRI International. Non-military California residents must add 6.5% sales tax. Cash payments or charge cards are not accepted. For all orders, please include your full name, US mailing address with zip code, telephone number, and network mailbox (if available) and send to:

DDN Network Information Center
SRI International, Room EJ291
333 Ravenswood Avenue
Menlo Park, CA 94025
(800) 235-3155 or (415) 859-3695

Send online requests for an order form to NIC@SRI-NIC.ARPA, or call the NIC at one of the above telephone numbers.

1.3.10. NIC Shipping Information

DOMESTIC (USA and Canada): Orders are shipped via UPS ground service. Please allow 5-10 working days for delivery. Prices include postage.

OVERSEAS: Overseas orders are shipped via "air printed matter". Prices include postage.

SPECIAL: Orders will be shipped via courier services by special arrangement only. If you want an order shipped via one of these methods, please request a document order form from the NIC.

2. SOFTWARE IMPLEMENTATIONS

2.1. AT&T INFORMATION SYSTEMS

2.1.1. AT&T 3B Series

PRODUCT-OR-PACKAGE-NAME: AT&T Enhanced TCP/IP WIN/3B

DESCRIPTION:

Package includes FTP, SMTP, TFTP, Telnet, rlogin, rwho, rcp (remsh), finger, TCP, UDP, ICMP and IP. Lower level protocols supported are Ethernet and X.25. Berkeley sockets interface and the AT&T Transport Level Interface (TLI) are supported.

DOCUMENTATION:

User Guide, Administrator Guide, Programmer Reference Manual, and Quick Reference Card

CPU:

AT&T 3B/300, 3B/310, 3B/400, 3B5, 3B15, 3B20S and 3B20A computers

O/S:

UNIX System V, Release 2

IMPLEMENTATION-LANGUAGE:

Mostly C (binary distribution)

DISTRIBUTOR:

AT&T Information Systems
1776 On The Green
Morristown, NJ 07960

CONTACT:

2.2. APPLE COMPUTER, INC.

2.2.1. Apple Computer, Inc.

2.2.1.1. A/UXtm

PRODUCT-OR-PACKAGE-NAME: A/UXtm

DESCRIPTION:

A/UX is software that allows a Macintosh II to function as a network workstation in the Internet. When configured with the Ethernalk Interface Card (M0225), a Macintosh II running A/UX provides DoD Internet protocols, including TCP/IP, FTP, Telnet, SMTP, TFTP, ICMP, and UDP. In addition, A/UX supports BSD network extensions, including rlogin, rcp, remsh, rwho, talk, ruptime, rexec, and bind, and Sun Microsystems extensions, including XDR, RPC and NFS.

DOCUMENTATION:

Complete documentation is available from distributor under Apple Part Number M8044.

CPU:

Apple Macintosh II

O/S:

A/UX is Apple's implementation of AT&T System V UNIXtm

IMPLEMENTATION-LANGUAGE:

C and 68020 Assembly

DISTRIBUTOR:

2.2.2. Stanford University

2.2.2.1. SU-Mac/IP

PRODUCT-OR-PACKAGE-NAME: SU-Mac/IP

DESCRIPTION:

Version 3.0 of SU-Mac/IP, Stanford University's TCP/IP protocol package for Apple Computer's MacIntoshes, is based on driver-level implementation of TCP/IP/UDP. This package includes the following clients: FTP; TELNET; FINGER; WHOIS; POP and SMTP. A total of five concurrent sessions (up to three TELNET sessions, one FTP session, and one FINGER/WHOIS session) are allowed. MacIntosh facilities, like scroll-back (up to 512 lines) and cut-&-paste, are also supported. TELNET sessions provide VT100 terminal emulation and may be recorded in a file with the "photo" option. FTP has a friendly user interface with pop-up windows and buttons. MacMH, the mail program, provides the functionality of the RAND Mail Handler. MacMH uses pop-up windows and a button interface. SU-Mac/IP requires the Kinetics FastPath Appletalk-Ethernet gateway running KIP code.

DOCUMENTATION:

A manual is provided for users and administrators.

2.3. BOLT BERANEK AND NEWMAN INC.

2.3.1. BBN-Gateway Software

PRODUCT-OR-PACKAGE-NAME: BBN-Gateway Software **DESCRIPTION:**

In an effort to provide improved service in the gateways maintained at BBN, a new gateway implementation written in MACRO-11 instead of BCPL has been developed. The MACRO-11 gateway provides users with internet service that is functionally equivalent to that provided by the current BCPL gateways with the following exceptions:

- Packets with options will be fragmented if necessary.
- ICMP protocol is supported.
- The gateway sends Time Exceeded, Parameter Problem, Echo, Information Request, Destination Unreachable, and Redirect ICMP messages.
- Initially, Source Quench and Timestamp packets will not be supported.
- Class A, B, and C Network Address formats as specified in the September 1981 Internet Protocol Specification (RFC791) are supported.

The gateway contains an internetwork debugger (XNET) that allows the gateway to be examined while it is running. Buffer space is greatly expanded to provide better throughput. ARPANET RFNMs are counted so the gateway will not send more than 8 outstanding messages to an ARPANET host.

IMPLEMENTATION-LANGUAGE:

MACRO-11

2.4. CRAY RESEARCH, INC.

2.4.1. Cray TCP/IP

PRODUCT-OR-PACKAGE NAME: Cray TCP/IP Network Package

DESCRIPTION:

The TCP/IP Network Package is an implementation of the TCP/IP protocol suite, based on the University of California at Berkeley's 4.2 BSD. It supports DoD standard IP, ICMP, TCP, UDP, Telnet, and FTP protocols. SMTP support is planned.

Also supported are extensions developed at UC-Berkeley: socket interface, remote shell (remsh), remote copy (rcp), remote execution (rexecd). Remote login (rlogin) support is planned.

The TCP/IP network package is available with drivers for Network Systems Corporation HYPERchannel adapters and media. A number of other vendors have worked with Cray to make their IP implementations available over the HYPERchannel media. These implementations, in addition to providing direct connections to Cray systems, can provide IP-level gateways to other media (most typically, to Ethernet).

DOCUMENTATION:

Complete documentation is available to Cray customers.

CPU:

Cray-1/S, Cray-1/M, Cray X-MP, Cray-2

2.5.2.2. Data General AOS/VS XODIAC Transport Service (XTS)

PRODUCT-OR-PACKAGE-NAME: AOS/VS XODIAC Transport Service (XTS)

DESCRIPTION:

XTS is a generalized transport server based on the CCITT X.25 protocol. It supports wide-area point-to-point, multipoint and packet data networks as well as IEEE 802.3 local area networks. XTS provides transport services to Data General's XODIAC product line, which include file transfer, virtual terminal and system call deflection capabilities. XTS also supports Data General's office automation product, CEO as well as provides a programming interface to its X.25 service for the development and support of user and third-party networked applications.

DOCUMENTATION:

Documentation includes how to control and manage the system, how to use the network as a user, and how to program the network.

CPU:

2.6. DATAPPOINT CORPORATION

2.6.1. Datapoint WAN-X.25

PRODUCT-OR-PACKAGE-NAME: Wide Area Networking - X.25

DESCRIPTION:

Wide Area Networking - X.25 (WAN-X.25) is a communications product designed according to the Open Systems Interconnection (OSI) model. WAN-X.25 uses CCITT X.25 as the transport mechanism for Datapoint-to-Datapoint communications. Datapoint provides a set of software products to utilize the WAN-X.25 services, and a program interface for COBOL, DATABUS, DASL, and Assembler routines.

WAN-X.25 can operate on Packet Switched Data Networks (PSDN), Circuit Switched Telephone Networks (CSTN), Point-to-Point Private/Leased lines, and Circuit Switched Data Networks (CSDN). WAN-X.25 is certified to work on most public data networks world-wide.

WAN-X.25 has been certified by the DDN Program Management Office (PMO) as a DCAC-370-P195-(XX) compliant X.25 product, and is fully qualified to run on the DDN Network.

2.7. DIGITAL EQUIPMENT CORPORATION

2.7.1. DEC-10/DECSYSTEM-20

2.7.1.1. BBN TOPS-20

PRODUCT-OR-PACKAGE-NAME: BBN-TOPS-20

DESCRIPTION:

The TOPS20 Internetworking software supports multiple networks, multiple interfaces on a single network, and multiple protocol suites. Included in the standard distribution are an interface to 1822 nets via an AN20, an interface to a network front-end via a DTE20, and the DARPA protocol suite (DEC is developing an Ethernet interface).

The DARPA IP, ICMP, TCP, Server TELNET protocols are included within the TOPS20 monitor; other protocols are implemented as user application processes. The IP module supports a routing cache maintained via ICMP redirect NET and HOST messages. It performs fragmentation and reassembly, implements all options and can forward traffic between any of the host's interfaces. Applications may interface to the IP layer using User Queues.

All ICMP messages are supported; error messages may be sent by any of the protocol layers; higher layers are notified when a message is received concerning one of their packets. Messages can be sent by applications using the User Queue facility.

Applications can interface to TCP either as a read/write file or via multiple buffers. The TCP layer supports IP routing options, ICMP destination unreachable, source quench, and redirects which specify a type-of-service, and the segment size option. Support for preemption, precedence, and security options is delegated to the application. Telnet supports options and subnegotiations.

There is extensive inter-layer flow control, error reporting, and monitoring. Utilities are available to provide information, list monitoring data, and perform diagnostics.

DEC has distributed a prior version of this implementation as part of its standard TOPS20-AN monitor; the current version is currently being transferred to DEC.

DOCUMENTATION:

CONTACT:

Charles Lynn, (CLynn@BBN.COM), (617) 873-3367

ORDERING-PROCEDURE:

The latest software release should soon be available as part of the standard DEC TOPS20-AN monitor. Until the transfer process has been completed, the software is available via FIP over the internet, or by sending a magtape to:

Bolt Beranek and Newman Inc.
10 Moulton Street
Cambridge, MA 02238
Attn: Charles Lynn

A return mailing label should be included. Also required is a TOPS-20 Source License and the TOPS-20 monitor sources, as the implementation includes source-level changes to the standard DEC monitor.

PROPRIETY-STATUS:

Public domain

INFORMATION-UPDATED:

February 1988

2.7.1.2. Digital Equipment Corporation TOPS-20

PRODUCT-OR-PACKAGE-NAME: TOPS-20AN

DESCRIPTION:

Based on the DARPA sponsored TCP/IP implementation for TOPS-20 with major modifications. The BBN TCP/IP software was merged into the standard supported TOPS-20, and a different JSYS interface was implemented that utilized the existing TOPS-20 I/O JSYSs by adding a logical device for TCP. Supports: the 1822 interface, DEC NI20 Ethernet interface and the DEC CI20 computer interconnect.

DOCUMENTATION:

2.7.2. PDP-11/LSI-11

2.7.2.1. BRL Gateway Software

PRODUCT-OR-PACKAGE-NAME: BRL Gateway Software

DESCRIPTION:

The BRL Gateway is a total redesign. None of the original MIT code was used. The gateway runs as a set of tasks on a simple multiprocessing operating system called LOS. Both LOS and the gateway code as described here were entirely designed and written by Ron Natalie.

This is an IP gateway with EGP support. The gateway will run on most PDP-11 series processors, but is designed to be portable to other machines that have C compilers. Currently supported are DEC PCL-11/B, ACC LH/DH-11, Network Systems HYPERchannel, Proteon Ring, Interlan NI1010, and serial lines.

All gateway functions and features of the IP and ICMP protocols are supported with the following exceptions. The ICMP timestamp packet is not implemented and ICMP source quench messages are ignored. IP timestamp and routing options are supported. The Exterior Gateway Protocol is supported as described in RFC904. Deviations from the specification are made to optimize the performance as a stub system from the existing core networks. The gateway also uses its own UDP based debug and monitoring protocol. GGP echo packets are also answered. Network Time Protocol (NTP) is also supported.

In addition, the gateway provides Virtual-Host service. TCP connections to be dynamically directed to an active host on the BRLNET. This allows the host "BRL" to appear to always be up for mail purposes.

The original BRL gateway was an early version of the MIT-C gateway modified to know about class B and C addresses and to work with the previously mentioned network interfaces. With the advent of EGP, higher network traffic, and greater routing intelligence, the modified MIT gateway became ineffective.

DOCUMENTATION:

Included in the distribution

CPU:

Any PDP-11 processor that has memory management. The machines currently in use are a PDP-11/23, 24, 34, 44, 70 and LSI-11/23. A console terminal interface and a clock are required, as well as any network interfaces. The built-in line frequency clock on the LSI-11 processors may be used in lieu of an additional clock.

O/S:

LOS (the Little Operating System) is a small message-passing, multitasking operating system written for the implementation of the gateway, but is also being planned for use in real-time and file server applications. The Gateway code runs in the hardware user mode, while LOS itself runs in kernel mode. Interrupts are serviced in real-time by the user code.

IMPLEMENTATION-LANGUAGE:

With the exception of small parts of the operating system and some bit manipulation routines, which are written in assembler, both LOS and the Gateway code are written in the C language.

DISTRIBUTOR:

U.S. Army Ballistic Research Laboratory
ATTN: SLCBR-SE-C/ R. Natalie

2.7.2.4. Process Software FTP-IAS

PRODUCT-OR-PACKAGE-NAME: FTP-IAS

DESCRIPTION:

FTP-IAS is a complete, low-cost TCP/IP networking software product designed exclusively for DEC's IAS operating system environment. FTP-IAS implements the FTP, TCP, IP, and ARP protocols. FTP-IAS supports multiple simultaneous users, as well as both client (user) and server FTP protocols.

FTP-IAS is organized into a common File Transfer Server and a separate File Transfer Utility for each user. The File Transfer Server is operated as a stand-alone task, and each File Transfer Utility connects to the Server via queued message communications. User-written subroutines can be linked with the Server and called upon file transfer notification to effect local control on the IAS system.

Because FTP-IAS is designed to take advantage of the PDP-11 architecture and the IAS operating system, it operates efficiently with low CPU overhead and minimum memory resources. FTP-IAS works with standard DEC Ethernet controllers, and it includes all needed software components for installation and user-operation.

DOCUMENTATION:

Fully documented; FTP-IAS is supplied with a User's Guide. An on-line HELP facility is also provided.

CPU:

2.7.2.5. Process Software FTP-RSX

PRODUCT-OR-PACKAGE-NAME: FTP-RSX

DESCRIPTION:

FTP-RSX is a highly efficient, low cost TCP/IP networking software product designed exclusively for DEC'S RSX-11 operating system environment. FTP-RSX implements the FTP, TCP, IP, and ARP protocols. FTP-RSX supports multiple simultaneous users, with each user operating multiple simultaneous FTP or TCP connections. Both client (user) and server FTP protocols are provided.

Because FTP-RSX is designed to take advantage of the PDP-11 architecture and the RSX-11 operating system, it operates efficiently with low CPU overhead and minimum memory resources. The TCP and IP protocol layers (together with ARP) are implemented within an RSX I/O driver and ACP (Ancillary Control Processor) running in kernel mode.

FTP-RSX is easy to install and operate, and it supports account and password protection and full UIC-based file protection, preventing unauthorized file access from remote users. FTP-RSX also supports application programmers with a set of library routines that can establish FTP connections and transfer files with remote hosts.

FTP-RSX works with all standard DEC Ethernet controllers, and it includes all needed software components for installation, user-operation, TCP programmed I/O, network monitoring and management, and system administration. A companion product, called TELNET-RSX, is also available.

DOCUMENTATION:

Fully documented; FTP-RSX is supplied with a User's Guide. A complete on-line HELP facility is also provided.

CPU:

2.7.2.7. Process Software FTP-RT

PRODUCT-OR-PACKAGE-NAME: FTP-RT

DESCRIPTION:

FTP-RT is a highly efficient, low cost TCP/IP networking software product designed exclusively for DEC'S RT-11 operating system environment. FTP-RT implements the FTP, TCP, IP, and ARP protocols. FTP-RT supports both client (user) and server FTP protocols using separate utility programs.

FTP-RT supports application programmers with a set of library subroutines that can establish FTP connections and transfer files with remote hosts. For memory restrictive environments, these subroutines can be arranged into overlay regions and a small root section.

Because FTP-RT is designed to take advantage of the PDP-11 architecture and the RT-11 operating system, it provides high thruput with low CPU overhead and minimum memory resources. The FTP-RT utility programs and library subroutines can run on either the SJ, FB, or XM monitor, and they can also run as virtual jobs in extended memory.

FTP-RT is a field-proven product that is easy to install and operate. FTP-RT works with all standard DEC Ethernet controllers, and it includes all needed software components for installation and user-operation, including Ethernet I/O drivers for the SJ and FB monitors. Several companion products, called TCPIP-RT and TELNET-RT, are also available.

DOCUMENTATION:

Fully documented: FTP-RT is supplied with a User's Guide. An on-line HELP facility is also provided.

CPU:

Any DEC PDP-11 or MicroPDP-11

O/S:

RT-11 (either SJ, FB, or XM)

IMPLEMENTATION-LANGUAGE:

All modules are in MACRO-11.

2.7.2.8. Process Software TELNET-RT

PRODUCT-OR-PACKAGE-NAME: TELNET-RT

DESCRIPTION:

TELNET-RT is a highly efficient, low cost TCP/IP networking software product designed exclusively for DEC'S RT-11 operating system environment. TELNET-RT implements the TELNET, TCP, IP, and ARP protocols. TELNET-RT supports both client (user) and server TELNET protocols with a user-run utility program.

TELNET-RT supports application programmers with a set of library subroutines that can establish TELNET connections with remote hosts. For memory restrictive environments, these subroutines can be arranged into overlay regions and a small root section.

Because TELNET-RT is designed to take advantage of the PDP-11 architecture and the RT-11 operating system, it provides high thruput with low CPU overhead and minimum memory resources. The TELNET-RT utility programs and library subroutines can run on either the SJ, FB, or XM monitor, and they can also run as virtual jobs in extended memory.

TELNET-RT is a field-proven product that is easy to install and operate. TELNET-RT works with all standard DEC Ethernet controllers, and it includes all needed software components for installation and user-operation, including Ethernet I/O drivers for the SJ and FB monitors. Several companion products, called FTP-RT and TCPIP-RT, are also available.

DOCUMENTATION:

2.7.2.9. Process Software TCPIP-RT

PRODUCT-OR-PACKAGE-NAME: TCPIP-RT

DESCRIPTION:

TCPIP-RT is a *highly efficient, low cost TCP/IP networking software product designed exclusively for DEC'S RT-11 operating system environment.* TCPIP-RT implements the TCP, IP, and ARP protocols. TCPIP-RT supports high-speed process-to-process communications with a library of subroutines that can establish and maintain TCP connections with retnote hosts.

Application programmers can use the subroutines in TCPIP-RT to open active or passive TCP connections, send data, receive data, close or abort connections, and read status information. The subroutines are callable from any DEC high-level language. For memory restrictive environments, the subroutines can be arranged into overlay regions and a small root section.

Because TCPIP-RT is designed to take advantage of the PDP-11 architecture and the RT-11 operating system, it provides high thrupt with low CPU overhead and minimum memory resources. The TCPIP-RT utility programs and library subroutines can run on either the SJ, FB, or XM monitor, and they can also run within a virtual job in extended memory.

TCPIP-RT is a *field-proven product that is easy to install and operate.* TCPIP-RT works with all standard DEC Ethernet controllers, and it includes all needed software components for installation and user-operation, including Ethernet I/O drivers for the SJ and FB monitors. Several companion products, called FTP-RT and TELNET-RT, are also available.

2.7.2.10. Process Software FTP-TSX

PRODUCT-OR-PACKAGE-NAME: FTP-TSX

DESCRIPTION:

FTP-TSX is a complete, low-cost TCP/IP networking software product designed exclusively for the TSX-Plus operating system environment. FTP-TSX implements the FTP, TCP, IP, and ARP protocols. FTP-TSX supports multiple simultaneous users, as well as both client (user) and server FTP protocols.

FTP-TSX is organized into a common File Transfer Server and a Separate File Transfer Utility for each user. The File Transfer Server is operated as a detached job, and each File Transfer Utility connects to the Server via the TSX-Plus message communications facility.

Because FTP-TSX is designed to take advantage of the PDP-11 architecture and the TSX-Plus operating system, it provides good throughput with low CPU overhead and minimum memory resources. A debugging module is also provided to optionally display detailed communications information that can help isolate problems and eliminate network communications failures.

FTP-TSX is a field-proven product that is easy to install and operate. FTP-TSX works with all standard DEC Ethernet controllers, and it includes all needed software components for installation and user-operation.

DOCUMENTATION:

Fully documented; FTP-TSX is supplied with a User's Guide. An on-line HELP facility is also provided.

2.7.2.11. Proteon, Inc. Venix/11

PRODUCT-OR-PACKAGE-NAME: Venix/11 TCP/IP

DESCRIPTION:

This is based on the "UNIX V6" implementation available from the MIT Laboratory for Computer Science. [Editor's Note: The MIT UNIX V6 implementation is no longer available.] It has been ported to a V7 UNIX system, in particular VenturCom's Venix/11 V2.0.

As little of the processing as possible takes place in the kernel, to minimize the code space required. It fits comfortably on I&D machines, but is almost hopeless on the smaller machines. The kernel includes a ProNET device driver, IP fragment reassembly, IP header processing, local-net header processing, and simple routing. The rest of the IP processing, and all of the UDP and TCP functions, are in user libraries. The pseudo-teletype driver is also in the kernel, and is used by Server TELNET.

User programs handle ICMP processing: User and Server TELNET, SMTP, TFTP, Finger, and Discard. There are User programs for Nicname and Hostname. IEN-116 nameservers are used by all programs, and an IEN-116 nameserver is also provided. A minimal domain name resolver is included. The TCP used is very simple, not very fast, and lies about windows. No FTP is available, nor is one planned.

DOCUMENTATION:

There is a full set of manual pages, and some internals documentation. The kernel code is well commented.

CPU:

PDP-11/44, 45, 70, 73, 84

O/S:

Venix/11 V2.0, should be simple to port to other V7 UNIX systems.

INFORMATION-UPDATED:

February 1988

2.7.2.12. U. of Delaware DCN/Fuzzball System

PRODUCT-OR-PACKAGE-NAME: DCN/Fuzzball System for the PDP11

DESCRIPTION:

The Fuzzball Internet software system was developed with DARPA sponsorship beginning in 1978 and continuing to the present. It runs in a sizable number of PDP11s and LSI-11s with varying configurations and has been used extensively for testing, evaluation and experimentation with other implementations. The system is designed to be used with the DCnet local network protocols as described in RFC-891 and the Fuzzball operating system for a multi-media internet workstation (also called a Fuzzball), which operates using emulation techniques to support the DEC RT-11 operating system and application programs. However, the system has also been used on other networks, including ARPAnet and SATNET, and with other operating systems, including RSX-11. An RSX-11 based version incorporating only the IP/TCP modules is presently used to support the INTELPOST electronic-mail network. The system has been used for the last two years to support the NSFNET Backbone Network.

The software system consists of a package of MACRO-11 and C modules structured into levels corresponding to local-net, IP, TCP and application levels, with user interfaces at each level. The local-net level supports several communication devices, including synchronous and asynchronous serial lines, 16-bit parallel links, Ethernet and 1822 interfaces. Hosts using these devices have been connected to ARPAnet IMPs, Satellite IMPs, BBN Internet Gateways, SRI Port Expanders and to standard Ethernets, DECnets and X.25 public networks, as well as several DCnet local networks. The system supports subnets as described in RFC-950, as well as network-level type-of-service routing, local-level dynamic routing and extensive time-synchronization and error-reporting functions, including drivers for several types of radio clocks. Ethernet support includes the Address Resolution Protocol (ARP) with a dynamic cache suitable for multiple-gateway and multiple-net cables.

The IP level conforms to the RFC-791 specification, including fragmentation, reassembly and the source-route option. A full set of ICMP features compatible with RFC-792 includes error-reporting, timestamp, redirect and source-quench messages. Robustness and fairness is maintained with selective-preemption, congestion-control and precedence-queueing features. Internet gateway (routing and non-routing) facilities conforming to the Exterior Gateway Protocol (EGP) RFC-904 specification can be included on an optional basis.

The TCP level conforms to the RFC-793 specification, including PUSH, URGENT and options. Its structure is based on circular buffers for reassembly and retransmission, with repacketizing on each retransmission. Retransmission timeouts are dynamically determined using measured roundtrip delays, as adjusted for backoff. Data flow into the network is controlled by measured network bandwidth, and adjusted by source-quench information. Features are included to avoid excessive segment fragmentation and retransmission into zero windows. The user interface level provides error and URGENT notification, as well as a means to set outgoing IP/TCP options.

A raw-datagram interface is available for non-TCP protocols such as UDP (RFC-768). It includes internal congestion and fairness controls, multiple-connection management and timestamping. Protocols above UDP supported in the present system include Network Time Protocol (RFC-958), Time Server (RFC-868), Name Server (IEN-116), Domain Name Server (RFC-883), Trivial File-Transfer Protocol (RFC-783) and Statistics Server (RFC-996). Other raw-datagram services include XNET (IEN-158), Exterior Gateway Protocol (RFC-904), PING (ICMP Echo utility) and several experimental services.

A number of user-level protocol modules above TCP have been built and tested with other internet hosts, including TELNET (RFC-854), File Transfer Protocol (RFC-959), Simple Mail Transfer Protocol (RFC-821), Multi-Media Mail Protocol (RFC-759) and various other file-transfer, debugging and control/monitoring protocols. A network-spooling system can be used to move files between DCnet hosts and is compatible with Unix systems.

Code sizes and speeds depend greatly on the system configuration and features selected. A typical 30K-word LSI-11/2 single-user configuration with all features selected and including the operating system, device drivers and all buffers and control blocks, leaves 16K-20K words for user-level application

programs and protocol modules. The same service is provided for up to eight individually relocated users in a 128K-word LSI-11/23 configuration and up to 32 users in a 1024K-word LSI-11/73 configuration. A diskless version can be configured for stand-alone gateway applications. Disk-to-disk FTP transfers across a DMA interprocessor link between LSI-11/73s operate in the range 80-100 Kbps with 576-octet packets. The 256K-word LSI-11/73 NSFnet gateway supports up to three 56-Kbps lines and an Ethernet controller, while the 124K-word PDP11/34 INTELPOST system supports two 56-Kbps lines and a number of lower-speed lines. Typical throughputs range from 100 to 400 packets per second, depending on processor and interface type.

For additional information see: Mills, D.L. The Fuzzball. Proc. ACM SIGCOMM 88 Symposium, Palo Alto CA, August 1988.

2.7.2.13. USENIX Association 2.10 BSD

PRODUCT-OR-PACKAGE-NAME: UNIX 2.10 BSD

DESCRIPTION:

DESCRIPTION:

2.10 BSD TCP/IP is a fairly complete port of 4.3 BSD and includes the 4.3 BSD TCP/IP, with minor exceptions, and a few programs eliminated due to address space considerations. It provides support for TCP, IP, ICMP, and UDP with user and server programs for Telnet, FTP, TFTP and SMTP. Hardware supported includes 10M bit/s Ethernet (5 different controllers), 3M bit/s Ethernet, and SLIP. The 2.10 BSD TCP/IP runs in supervisor mode. Drivers for Proteon ProNET and ACC and DEC/CSS IMP Interfaces are provided, although some work will be required to integrate them into the system. 2.10 BSD only runs on split I/D machines; it could probably be made to run on non-split I/D PDP-11's, although such a system could not include networking.

2.7.3.2. 3Com Corporation V/IP

PRODUCT-OR-PACKAGE-NAME: V/IP for DEC/VMS

DESCRIPTION:

3Com provides V/IP, a software communications product that supports Telnet, FTP, and SMTP for DEC VAX computers running the VMS operating system. SMTP support is fully integrated with VMS Mail on the DEC VAX systems. V/IP uses standard DEC Ethernet interface hardware and drivers, which can simultaneously be used to run DECnet, and runs lower level protocols in a kernel-level process. The V/IP product is integrated with 3Com network management capabilities, including network audit trail. 3Com sells and supports the V/IP product directly in the U.S. and international markets.

2.7.3.4. v Digital Equipment Corporation ULTRIX-32

PRODUCT-OR-PACKAGE-NAME: The ULTRIX-32 System

DESCRIPTION:

The ULTRIX-32 System, Version 1.2 is a native UNIX operating system for DEC's VAX hardware. The system is derived from the 4th Berkeley Software Distribution, 4.2 BSD developed by the Computer Systems Research Group of the Department of Electrical Engineering and Computer Science at the University of California at Berkeley. 4.2 BSD is an augmented version of AT&T Bell Laboratories UNIX 32V system for VAX hardware. The Berkeley enhancements to UNIX 32V include the addition of support for the VAX virtual architecture and a set of functional additions to the basic AT&T Bell Labs UNIX product, notably TCP/IP. In addition, the ULTRIX-32 system now incorporates AT&T System V Interface Definition (SVID) source code compatibility as defined by Section 2 (Base System) and Section 3 (Kernel Extensions) of the SVID. Finally, selected kernel enhancements from 4.3 BSD are also included.

Along with functionality of the Berkeley system, DEC has added the following features to the ULTRIX-32 Version 1.2 product:

- New system and device support
- New networking features
- New commands and programming languages
- New reliability and maintainability features
- Wide range of Support Service options
- Improved technical documentation including System Management Guidelines
- Installation and configuration without source code
- UNIX sub-licensing for object code directly from DEC
- System V source code compatibility
- 4.3 Kernel Enhancements

The network support includes the standard UNIX uucp facility as well as Ethernet support using TCP/IP and UDP/IP. Options include the DEC NSP network protocol (via DECnet-ULTRIX). All protocols can operate on a single Ethernet physical link concurrently. ULTRIX-32 now also supports Internet subnet routing functionality. Finally, ULTRIX-32 will allow users on ULTRIX-11 Version 3.0 systems who use local TCP/IP support to pass through into a DECnet-ULTRIX network. This support facilitates file transfer, remote execution and remote login capabilities.

PRODUCT-OR-PACKAGE-NAME: FUSION Network Software for VMS

DESCRIPTION:

Network software providing interoperability in multi-vendor networks. Supports industry standard protocols TCP/IP, XNS, NFS, and NetBIOS. Provides file transfer, remote execution and remote terminal (Telnet), network management. Interoperates with UNIX 4.2 BSD socket calls. Compatible with standard DECnet controllers, DMR-11, DMV-11, Excelan, Talon Technology, and 3Com. (See also entry for FUSION IBM-PC).

2.7.3.10. Network Solutions OPEN-Link for VAX/VMS

PRODUCT-OR-PACKAGE-NAME: OPEN-Link for VAX/VMS

DESCRIPTION:

OPEN-Link is a series of communications software and hardware products which meet the Defense Communications Agency MIL-STDs for the Defense Data Network, for use on any of the DDN networks, such as ARPANET, MILNET, etc. These products also conform to the conventions of the UNIX 4.2 BSD implementation of these protocols for use with the many popular UNIX based graphic workstations.

OPEN-Link supplies TCP/IP communication protocol software products, an Application Programming Interface to TCP functions for PASCAL, C and Assembly, and the MIL-STD applications File Transfer (FTP), Virtual Terminal (TELNET), and Simple Mail Transfer (SMTP).

OPEN-Link for VAX and MicroVAX VMS systems support Ethernet and DDN X.25 communications links. Ethernet attachment is through DEUNA, DELUA, DEBNT, or DEQNA controller boards. DDN X.25 attachment is through a "standard" certified ACC board (ACC 6250 or 5250). DDN LHDH attachment is also supported through the ACC LHDH controller. The X.25 connection can also be made certifiable to certain commercial X.25 networks such as GTE TELENET, TYMNET and others.

OPEN-Link software can concurrently operate with DECNET in a single VAX or MicroVAX system sharing a single DEUNA or DEQNA board Ethernet connection. This enables a low cost bridge function to operate between the two Ethernet networks.

Similarly, OPEN-Link supports both an X.25 and Ethernet connection in the same system, enabling operation of a LAN to Wide Area Network bridge function.

2.7.3.11. Process Software FTP-VMS

PRODUCT-OR-PACKAGE-NAME: FTP-VMS

DESCRIPTION:

FTP-VMS is a high performance, low cost TCP/IP networking software product designed exclusively for the VAX/VMS environment. FTP-VMS implements the FTP, UDP, TCP, IP, ARP, and ICMP protocols. FTP-VMS supports any number of simultaneous users with any number of simultaneous FTP, UDP, TCP, or IP connections, limited only by available VAX system resources. Both client (user) and server FTP protocols are provided.

Because FTP-VMS is designed to take advantage of the VAX architecture and the VMS operating system, it provides high thruput with low CPU overhead and minimum memory resources. The UDP, TCP, and IP protocol layers (together with ARP and ICMP) are implemented as true VMS I/O drivers running in kernel mode, linked via DEC's fast driver interface. FTP-VMS has been shown to operate faster than several software and hardware implementations.

FTP-VMS is easy to install and operate, and it uses DEC's recommended VMSINSTAL procedure for automatic user installation. FTP-VMS also supports full file protection (both ACL and UIC) exactly as DECnet does, preventing unauthorized file access from remote users.

FTP-VMS works with all standard DEC Ethernet controllers, and it includes all needed software components for installation, user-operation, TCP, UPD, and IP programmed I/O, network monitoring and management, and system administration. FTP-VMS can optionally share Ethernet controllers concurrently with DECnet, LAT, and LAVC. FTP-VMS also works with several companion products, called TELNET-VMS and SMTP-VMS, to form a complete DoD TCP/IP protocol suite.

DOCUMENTATION:

Fully documented; FTP-VMS is supplied with a User's Guide and a Reference Manual. A complete on-line HELP facility is also provided.

CPU:

Any DEC VAX or MicroVAX, including the VAXstation 2000 series

O/S:

2.7.3.12. Process Software TELNET-VMS

PRODUCT-OR-PACKAGE-NAME: TELNET-VMS

DESCRIPTION:

TELNET-VMS is a high performance, low cost TCP/IP networking software product designed exclusively for the VAX/VMS environment. TELNET-VMS implements the TELNET, UDP, TCP, IP, ARP, and ICMP protocols. TELNET-VMS supports any number of simultaneous users with any number of simultaneous TELNET, UDP, TCP, or IP connections, limited only by available VAX system resources. Both client (user) and server TELNET protocols are provided.

Because TELNET-VMS is designed to take advantage of the VAX architecture and the VMS operating system, it provides high thruput with low CPU overhead and minimum memory resources. The UDP, TCP, and IP protocol layers (together with ARP and ICMP) are implemented as true VMS I/O drivers running in kernel mode, linked via DEC's fast driver interface. TELNET-VMS has been shown to operate faster than several software and hardware implementations.

TELNET-VMS is easy to install and operate, and it also uses DEC's recommended VMSINSTAL procedure for automatic user installation. TELNET-VMS supports application programmers with a set of library routines that can establish and maintain TELNET connections with remote hosts

TELNET-VMS works with all standard DEC Ethernet controllers, and it includes all needed software components for installation, user-operation, TCP, UPD, and IP programmed I/O, network monitoring and management, and system administration. TELNET-VMS can optionally share Ethernet controllers concurrently with DECnet, LAT, and LAVC. TELNET-VMS also works with several companion products, called FTP-VMS and SMTP-VMS, to form a complete DoD TCP/IP protocol suite.

2.7.3.13. Proteon, Inc. ULTRIX-32 Device Driver for ProNET networks

PRODUCT-OR-PACKAGE-NAME: ULTRIX-32 Device Driver for ProNET networks

DESCRIPTION:

The ProNET-10 and ProNET-80 Token Ring networks offer advantages of speed, distance, and media flexibility over the Ethernet supported by the Digital VAX and MicroVAX computers. The ULTRIX-32 device drivers connect the ProNET-10 and ProNET-80 boards to ULTRIX's TCP/IP code, allowing all the existing software (including NFS in Version 2.0) to operate over ProNET.

There are ProNET boards for the UNIBUS and Q-Bus VAX processors. The p5205 device driver supports the p1000 ProNET-10 UNIBUS System or the p1080 ProNET-80 UNIBUS System on VAX processors. MicroVAX-I and MicroVAX-II processors use the p1100 ProNET-10 Q-Bus System or the p1180 ProNET-80 Q-bus System.

2.7.3.14. SRI MultiNet

PRODUCT-OR-PACKAGE-NAME: MultiNet

DESCRIPTION:

MultiNet is a VAX/VMS kernel resident Multi-Protocol network environment currently supporting the TCP/IP family of protocols, the Xerox NS (XNS) protocol, the Xerox PUP protocol and the CHAOSnet protocol. The TCP/IP and XNS protocol modules are derived from the Berkeley UNIX 4.3 BSD system. The CHAOSnet protocol is supported on both 10Mb Ethernet and 3Mb CHAOSnet hardware.

A full suite of user/server programs are provided for all the protocol families. In particular, the TCP/IP family (TCP, UDP, ICMP and IP) provides programs for FTP, SMTP, TFTP, TELNET, FINGER, Domain Name Service, Gateway Service (EGP, RIP and HELLO), Network Time (NTP), SUN Remote Procedure Call (RPC), SUN Network File System (NFS) and many other minor application protocols.

This product supports the full range of VAX processors running VAX/VMS version 4.4 or greater, including VMS version 5. All DEC ethernet interfaces (eg. DEUNA, DEQUNA, DEBNT) are supported and can be shared with other VMS protocols (eg. DECnet, LAT and LAVC). Other network interfaces supported are:

- 10Mb Ethernet: Interlan NI1010 and NP100, 3Com and Excelan EXOS 204
- Xerox 3Mb Ethernet
- ACC LH-DH (1822)
- ACC FDH (1822-J)
- ACC ACP6250 and ACP5250 X.25
- DEC DMR-11/DMC-11
- NSC Hyperchannel
- Proteon ProNET Ring
- Ungermann-Bass (Using DR11-W Unibus interface)
- DEC CSS PCL-11B Parallel Communications Interface
- CHAOS 3Mb Interface
- IP over DECnet links
- DECnet over IP

2.7.3.16. U.C. Berkeley UNIX 4.3 BSD

PRODUCT-OR-PACKAGE-NAME: UNIX 4.3 BSD

DESCRIPTION:

This implementation was developed by the Computer Systems Research Group of the University of California at Berkeley as part of a number of research projects. It is a revision of 4.2 BSD, which in turn was based on the BBN TCP/IP implementation for the VAX. It provides support for TCP, IP, ICMP, and UDP with user and server programs for Telnet, FTP, TFTP and SMTP. Hardware supported includes ACC and DEC/CSS IMP Interfaces, 10M bit/s Ethernet (5 different controllers), 3M bit/s Ethernet, and Proteon ProNET.

DOCUMENTATION:

Online documentation of user programs, system call interfaces, changes from 4.2 BSD, etc.: "Networking Implementation Notes, 4.3BSD Edition"

2.7.3.17. U. of Texas, Austin CYGNUS

PRODUCT-OR-PACKAGE-NAME: Cyber TCP/IP, CYGNUS, NIP

DESCRIPTION:

CYGNUS is a central processor program which implements TCP, UDP, and IP. NIP is a peripheral processor program which acts as the network device driver for CYGNUS. Communication with the rest of the Internet is accomplished using a Cyber channel adapter which connects the Cyber with a VAX 11/780 system. The VAX acts as a front-end processor for the Cyber: ARP is implemented there and standard Ethernet hardware is used to physically connect to the network. This implementation is now available for general release.

DOCUMENTATION:

No published documentation currently exists; internal documentation is available.

CPU:

Cyber 170/750 with VAX 11/780 as front-end

2.7.3.18. UNIQ System V

PRODUCT-OR-PACKAGE-NAME: PASSAGE TCP/IP

DESCRIPTION:

PASSAGE TCP/IP is a complete implementation of TCP/IP that allows a UNIX System V (5.2.2) or UNIQ V.3 to participate as a routing or nonrouting (end) host over a wide spectrum of communication systems ranging from hard-wired connections to packet-switched or circuit-switched networks. It communicates with adjacent hosts over synchronous communication lines, Ethernet, LANs, and standard 1822 interface to an IMP. Features include TCP/IP, ICMP, Telnet, FTP, UDP, SMTP, and popular 4 BSD UNIX R-utilities. Product is available in source or binary form.

2.11. HARRIS CORPORATION

2.11.1. Harris X.25 with TCP/IP

PRODUCT-OR-PACKAGE-NAME: X.25 with TCP/IP Protocols (DDN)

DESCRIPTION:

The Harris X.25 with DDN products provides the necessary software and hardware to connect to the Defense Data Network (DDN).

The following DoD protocols are supported:

- Transmission Control Protocol MIL STD 1778 - The Internet TCP protocol is the transport protocol supported for the DoD network.
- Internet Protocol (IP) MIL STD 1777 - IP is an internetwork protocol that provides datagram service, a virtual network service, and an error reporting service to transport layer protocols.
- Internet Control Message Protocol - ICMP provides information useful to the higher layer (TCP) in recovering from network failures.
- File Transfer Protocol - The File Transfer utility program uses the TCP/IP protocols to provide reliable and efficient file transfer between two Internet hosts.
- Telnet - Virtual Terminal - Telnet allows users to sign on and execute applications on any host on the Internet. The Telnet protocol handles the conversions necessary for terminal-to-host compatibility.
- Simple Mail Transfer Protocol - SMTP supports electronic message transfer over the DDN network and relies on the provisions of the protocol for the exchange of messages between dissimilar mail application programs.

DOCUMENTATION:

2.13. HONEYWELL INFORMATION SYSTEMS

2.13.1. Honeywell DDN6

PRODUCT-OR-PACKAGE-NAME: DDN6

DESCRIPTION:

The Honeywell DDN6 provides the necessary software, hardware and technical support services for connecting a DPS 6 computer system to the Defense Data Network.

Sixty-four simultaneous sessions are multiplexed over one HDLC link between the Communications Server/1 DDN (CS/1-DDN) and DPS 6. This product currently supports TELNET, SMTP and FTP functionalities. A list of hardware and software components follows:

- LCU1026 CS/1-DDN Communications Server: 68000 based micro-processor with 684 KB RAM; V.35 high speed physical interface.
- CS/1-DDN EXEC Executive software on CS/1-DDN Communications Server hardware; includes TCP/IP, Honeywell Service Access Protocol (SAP), HDLC-LAP-B, and Federal Standards 1041/FIPS 100 certified X.25.
- SS-6 Virtual Terminal Interface, Honeywell SAP, and HDLC-LAP-B facilities on the DPS 6.
- SMTP-6 Simple Mail Transfer Protocol Facility for the DPS 6.
- FTP-6 File Transfer Protocol Facility for the DPS 6.
- TEL-6 TELNET (Virtual Terminal) Facility for the DPS 6.

TELNET (Virtual Terminal) software supports asynchronous terminals. In addition, application development tools such as Virtual Network Interface (VNI) are available to allow for customizing application packages to run under MOD 400 over the DDN.

DOCUMENTATION:

Operator's Guide and Installation Manual for the CS/1-DDN; Software release bulletins, which provide installation instructions, as well as user's guides are provided for TELNET, SMTP and FTP; Application Programmer's Guide for the Virtual Network Interface (VNI) routines.

CPU:

Honeywell DPS6 Family of mini computers: 6/42, 6/45, 6/70, 6/75, 6/85, 6/95, or 6/98

O/S:

GCOS 6 Mod 400, Release 3.1 Update 3 or later

2.13.2. Honeywell DDN8

PRODUCT-OR-PACKAGE-NAME: DDN8

DESCRIPTION:

The Honeywell DDN8 provides the necessary software, hardware and technical support services for connecting a DPS 8 computer system to the Defense Data Network.

Sixty-four simultaneous sessions are multiplexed over one HDLC link between the Communications Server/1 DDN (CS/1-DDN) and DPS 8/DATANET 8 (DN 8). This DDN8 currently supports TELNET, SMTP and FTP functionalities. A list of hardware and software components follows:

- LCU1026 CS/1-DDN Communications Server: 68000 based micro-processor with 684 KB RAM; V.35 high speed physical interface.
- CS/1-DDN EXEC Executive software on CS/1-DDN Communications Server hardware: includes TCP/IP, Honeywell Service Access Protocol (SAP), HDLC-LAP-B, and Federal Standards 1041/FIPS 100 certified X.25.
- SS-8 Virtual Terminal Interface, Honeywell SAP, and HDLC-LAP-B facilities on the DPS 8.
- SS-DN Standard Service software for the DN 8.
- SMTP-8 Simple Mail Transfer Protocol Facility for the DPS 8.
- FTP-8 File Transfer Protocol Facility for the DPS 8.
- TEL-DN TELNET (Virtual Terminal) Facility for the DN 8.

TELNET (Virtual Terminal) software supports asynchronous terminals. In addition, application development tools such as Virtual Network Interface (VNI) are available to allow for customizing application packages to run under GCOS 8 over the DDN.

DOCUMENTATION:

Operator's Guide and Installation Manual for the CS/1-DDN; Software release bulletins, which provide installation instructions, as well as user's guides are provided for TELNET, SMTP and FTP; Application Programmer's Guide for the Virtual Network Interface (VNI) routines.

CPU:

Honeywell DPS8, DPS 88 and DPS 90 Family of Large Scale Computers; DATANET 8 FEP is required.

2.14. IBM/COMPATIBLES

2.14.1. PC/COMPATIBLES

2.14.1.1. Amateur Radio IBM-PC

PRODUCT-OR-PACKAGE-NAME: KA9Q/NET

DESCRIPTION:

This package provides the Internet protocols on the IBM PC running MS-DOS. It was designed primarily for amateur packet radio use. Except where otherwise noted, it was designed and written by Phil Kam, KA9Q (kam@louie.udel.edu).

The following protocols are included:

1. SMTP client and server. The server does not support aliasing or forwarding; all recipients must be local. A standalone command for sending mail is included in the distribution; it was written by Bdale Garbee, N3EUA (bdale%winfree.uucp@flash.bellcore.com).
2. FTP client and server. Image and ASCII types are supported. There is no access control as yet on the server (this is difficult to do under MS-DOS).
3. Telnet client and "server". The client understands the ECHO option. The "server" merely allows for keyboard-to-keyboard chatting, since MS-DOS isn't a timesharing system.
4. TCP echo and discard servers.
5. TCP. Multiple connections are supported. A lot of work has gone into tuning the implementation for operation over a VERY bad path, namely the amateur packet radio channel.
6. UDP.
7. IP/ICMP. At present only manually specified default and host-specific routing table entries are supported ("fully connected subnets" do not as yet exist in amateur packet radio). Most of the useful IP and ICMP options are supported.
8. Ethernet/ARP, for the 3-Com 3C-500 controller.
9. SLIP, compatible with Rick Adam's driver under Berkeley UNIX. The PC's regular asynchronous adapter ports are used.
10. AX.25/ARP, a special serial line mode for operation atop the amateur packet radio link level protocol AX.25. IP datagrams are encapsulated in AX.25 UI (connectionless) frames. ARP resolves IP addresses into AX.25 callsigns. The resulting packets are sent out the asynch port in SLIP-style framing to a TNC (Terminal Node Controller) which reformats them in HDLC and does the actual transmission. "KISS TNC" code by Mike Chepponis, K3MC (chepponis@xx.lcs.mit.edu) for the TAPR TNC-2 is included in the distribution.

There is as yet no support for domain names; hosts are specified by their IP addresses. Internally, the package is structured as a simple commutator loop with extensive use of upcalls between adjacent layers. Additional applications are fairly easy to add if they are structured as event-driven state machines.

DOCUMENTATION:

Several text files (user's guide, programming reference, etc) are included in the distribution.

CPU:

IBM PC, PC/XT, PC/AT and compatibles, with either a 3-Com 3C-500 (for Ethernet) or the standard 8250 IBM serial I/O ports (for SLIP and KISS/AX.25). The code has been successfully ported to other processors, including big-endian machines such as the 68000.

O/S:

MS-DOS

IMPLEMENTATION-LANGUAGE:

Almost all C; minimal 8088 assembler

DISTRIBUTOR:

Complete sources, objects and documentation is available.

ARPA: by anonymous ftp from louie.udel.edu (10.0.0.96) as /pub/net.tar.Z. This is a compressed UNIX tar archive.

non-ARPA: on two 5.25" DSDD MS-DOS floppies by sending \$5 for costs to:

Brian Lloyd, WB6RQN
19200 Tilford Way
Germantown, MD 20874

CONTACT:

Phil Karn, KA9Q
Internet: karn@louie.udel.edu
US Snail: 25-B Hillcrest Rd
Warren, NJ 07060

PROPRIETY-STATUS:

While I have copyrighted this code, I grant blanket permission for free NONCOMMERCIAL, NONGOVERNMENTAL copying and use. Amateur radio and educational use is particularly encouraged.

2.14.1.2. Beame IBM-PC

PRODUCT-OR-PACKAGE-NAME: BW?TEL/BWKTEL, BWCOM, BWFTP, BWNETBIOS, BWSOCKETS and related products.

DESCRIPTION:

BW?TEL provides a VT102/VT52 emulator that runs (TELNET) TCP/IP protocol on ethernet. True VT102 emulation is provided, with speed a major consideration. TFTP and Kermit/Xmodem file transfer is included.

BWCOM allows most serial terminal emulators to run (TELNET) TCP/IP on an ethernet network. The program simulates a Hayes modem through the serial port.

BWFTP is a thorough implementation of the FTP protocol. Many other standard networking programs are available through the socket level interface.

BWNETBIOS conforms to RFC1001/1002 for NetBios over TCP/IP.

BWSOCKETS is a set of "C" routines which implement a sockets compatible interface to the Terminate and Stay Resident TCP/UDP/IP code. Many standard network programs have been made to run on the PC without ANY changes to the source. Direct calling to the TSR routines is also provided. The source for the socket routines also includes many utility routines not available from PC based "C" compilers.

DOCUMENTATION:

A set of documentation is available.

CPU:

IBM-PC and TI/PC and true compatibles

O/S:

MS-DOS or PC-DOS Version 2.0 and above

IMPLEMENTATION-LANGUAGE:

2.14.1.3. CMU IBM-PC

PRODUCT-OR-PACKAGE-NAME: CMU PC/IP

DESCRIPTION:

CMU PC/IP is a version of MIT PC/IP (see MIT IBM-PC) that can be compiled using standard MS-DOS compilers available from the Microsoft Corporation. The original PC/IP code was developed using a cross-compiler on a VAX running UNIX. Using a PC native compiler makes development easier.

DOCUMENTATION:

User and programmer manuals available with source via FTP

CPU:

IBM-PC family and other hardware-compatibles, such as Compaq

O/S:

DOS 2.0, 2.1, 3.0, or 3.1

IMPLEMENTATION-LANGUAGE:

C: Microsoft Corp. C Compiler Version 3.00 or higher

Assembler: Microsoft Corp. Macro Assembler Version 3.00 or higher

DISTRIBUTOR:

Available via anonymous FTP, see ORDERING-PROCEDURE

CONTACT:

Drew D. Perkins, (Drew.Perkins@andrew.cmu.edu)
Carnegie Mellon University
4910 Forbes Avenue
Pittsburgh, PA 15213
(412) 268-6628

ORDERING-PROCEDURE:

To get the CMU Microsoft C version of the PCIP package from the arpanet, connect to host "te.cc.cmu.edu" with FTP (no quotes when you really type it). This machine is a TOPS20 system. Login in as user "anonymous", password "guest". Next, use the "cd" command to change your working directory to "pk:<pcip>". Now if you do a "dir" command you will get a listing of all the necessary files. First, "get" the files "readme" and "install.bat" in netascii mode. The rest of the files must be retrieved in binary/octet mode. On a UNIX system use the command "tenex" to tell TOPS20 to use a local byte size of 8 bits. Now retrieve the files "tarread.exe", "root.tar", "include.tar", "srcdev.tar", "srclib.tar" and "srccmd.tar". The file "doc.tar" is also available if you want the scribe documentation.

Alternatively, you can now retrieve the files via anonymous FTP from host "lancaster.andrew.cmu.edu". This host is not yet in the NIC tables, but should be resolvable via the domain name system. It's IP address is "128.2.13.21". This machine is a 4.2 bsd UNIX system. After you log in, use the "cd" command to change your working directory to "pub". You will have to retrieve the same set of files as above.

Once you have these on your local machine, use TFTP or some other file transfer program to get them to your PC. Put the files under a subdirectory such as c:\pcip. Make sure you do the transfers in the proper mode (octet or ascii, as above). The file "readme" explains what you have, and how to proceed farther. We would appreciate it if you would avoid transfers during prime-time hours.

2.14.1.-.. Excelan EXOS 8000S - TCP/IP Network Software Source Package

PRODUCT-OR-PACKAGE-NAME: EXOS 8000S - TCP/IP Network Software Source Package

DESCRIPTION:

The EXOS 8000S TCP/IP Network Software source package provides the source code to port the EXOS TCP/IP Network Software to a Unix-derived operating system or to adapt it to run under a non-Unix operating system. The EXOS 800S Network Software contains a set of protocol software modules and network utilities for connecting host systems to an Ethernet network through an EXOS 200 Series or EXOS 300 series Intelligent Ethernet Controller.

Porting or adapting the software requires an Ethernet/IEEE 802.3 network, two computer systems running the target operating system and suitably attached to the network through EXOS Intelligent Ethernet Controller boards, and knowledge of Unix and the C programming language.

2.14.1.10. FTP Software PC/TCP

PRODUCT-OR-PACKAGE-NAME: PC/TCP

DESCRIPTION:

PC/TCP is a TCP/IP implementation for the IBM PC and compatibles. It includes Telnet (with terminal emulation for vt100, h19, and IBM 3270), finger, whois, mail, ping, the 4BSD UNIX protocols (rlogin, rexec, rsh, rcp, lpr), client and server ftp, tftp, and smtp, and a number of other miscellaneous protocols. It supports IEN 116 host name resolution, the domain name protocol, and local 4BSD-format host tables. PC/TCP is also available in a terminate and stay resident (TSR) memory-resident version, which includes a Berkeley-style sockets programming interface and supports multiple network connections. Drivers are available for a variety of network interfaces, including the 3COM 3C500, 3C501, 3C503, and 3C505, Western Digital WD8003E Ethernet and WD8003S Starlan, MICOM-Interlan NI5010 and NI5210, Proteon ProNET-4 and ProNET-10, Excelan EXOS205, BICC 4117 ISOLAN Ethernet (BICC 4110 and MS-NET), IBM Token Ring adapter, Serial Line IP, Scope X.25 DDN Microgateway, Ungermann-Bass NIC Ethernet, Banyan Vines Ethernet, National Semiconductor DP839EB, Novell Ethernet, and a generic Ethernet interface (customer provides device driver).

DOCUMENTATION:

Binaries come with installation notes, a user's guide, and a command reference. The Programming Libraries, Development Kit, and source code come with a programmer's manual.

2.14.1.12. IBM Corporation TCP for PS/2

PRODUCT-OR-PACKAGE-NAME: IBM TCP for PS/2

DESCRIPTION:

IBM TCP for PS/2 Release 1 has a DOS user interface that provides access to the File Transfer Protocol (FTP), Trivial File Transfer Protocol (TFTP), Post Office Protocol (POP2), and TELNET facilities over Ethernet, IBM Token-Ring, or IBM PC network.

File Transfer Protocol:

TFTP client/server and FTP client support is provided to allow you to transfer both ASCII and image files to/from a remote system, using the same command syntax as the UNIX FTP or TFTP commands.

Simple Mail Transfer Protocol:

SMTP client and POP2 allow you to transfer mails from/to a remote system on an IP network.

TELNET:

TELNET allows a user to remotely log on to another IP system, either in 3270 screen mode or in line mode with Heath H-19 emulation.

Remote Execution Daemon:

A Remote Execution Daemon client is provided to allow you to initiate execution of VM EXECs, as well as the CP and CMS commands.

DOCUMENTATION:

2.14.1.13. MIT IBM-PC

PRODUCT-OR-PACKAGE-NAME: PC/IP

DESCRIPTION:

A set of PC-DOS commands that allow the IBM-PC to be a client of several TCP/IP-based network services, and to be used for network monitoring and maintenance. The TCP, UDP, and IP layers are designed with specific tailoring to the requirements of their known customers, user Telnet and user/server tftp. Drivers have been implemented for the 3COM Etherlink card, the Interlan Ethernet card, and the Proteon ProNET card. This package is the outgrowth of an MIT research project exploring networking of small personal computers.

DOCUMENTATION:

2.14.1.14. Microport Systems, Inc. System V/AT Complete 286

PRODUCT-OR-PACKAGE-NAME: System V/AT Complete 286

DESCRIPTION:

Microport System V/AT is the price and performance choice: complete, AT&T certified UNIX operating system for the AT with full DOS compatibility. The system includes 3 modules: runtime, software development and text preparation systems, and is licensed for 2 users. An unlimited user license is available for an extra charge. Most popular UNIX applications are available for the System V/AT, including DOSMerge 286, which allows DOS and System V/AT to run simultaneously without partitioning the hard disk. This is the only genuine UNIX operating system for 80286 AT machines.

Networking can be achieved by adding TCP/IP software and Ethernet controller boards to the system; network access is available to all users of a given machine, including the system console and remote terminals.

Note: System modules are available separately. Minimum RAM is 1 MB; 2.5 MB is recommended.

2.14.1.15. Microport Systems, Inc. System V/386 Complete

PRODUCT-OR-PACKAGE-NAME: System V/386 Complete

DESCRIPTION:

This is AT&T certified UNIX V.3 for 386 processors. It is a fast, sophisticated system with many extensions and utilities such as Korn shell, an emacs editor, superfast C compiler and more. It provides streams, virtual memory, full 32-bit processing, and is fully compatible with DOS. The system is licensed for 2 users; an Unlimited User license is available at an extra charge. A variety of optional packages, such as DOSMerge 386, network extensions (TCP/IP, NFS and RFS), high performance compilers and applications are also available. Further, applications written for System V/AT 286 are fully upward compatible.

Networking can be achieved by adding TCP/IP software and Ethernet controller boards to the system; network access is available to all users of a given machine, including the system console and remote terminals.

2.14.1.18. SCO XENIX-NET

PRODUCT-OR-PACKAGE-NAME: SCO XENIX-NET

DESCRIPTION:

SCO XENIX-NET is a local area network for computers running XENIX that allows easy integration of multiple XENIX Systems, or mixed PC-DOS, MS-DOS and XENIX systems. As a "resource sharing" system, it lets a group of computers share peripherals, such as printers and mass storage devices, permitting users to share information files stored on hard disk based computers working as file servers. SCO XENIX-NET provides SMB protocol-based distributed file system support, and requires NETBIOS session-layer facilities provided by a network transport subsystem such as Excelan's 8011-04 or 8011-05 packages.

2.14.1.19. Sirius Systems, Inc. Internet-PC

PRODUCT-OR-PACKAGE-NAME: Internet-PC

DESCRIPTION:

A full implementation of TCP/IP for the IBM-PC and compatible computer systems. This package includes the following link level drivers: IEEE 802.3 (Ethernet using 3Com 3C501, 3C503, and 3C523 controllers), SLIP, and AX.25 (packet radio). Full IP/ICMP is provided and can serve as both host and gateway.

The standard applications FTP and TELNET are provided. Both host and client operations are fully supported allowing the PC to be a fully functional host on the internet. This package is also unique in that it supports multiple concurrent TELNET and FTP sessions.

Internet-PC includes extensive packet tracing features making it useful for troubleshooting TCP/IP based networks.

Support and updates are provided for one year from date of purchase. Extended update and support service may be purchased. On-site training and installation service is also available.

DOCUMENTATION:

A user's manual including tutorial is provided with each copy of the software. Additional copies of the documentation may be purchased separately.

2.14.1.20. Stanford IBM PC

PRODUCT-OR-PACKAGE-NAME: SU-PC/IP

DESCRIPTION:

Version 3.0 of SU-PC/IP, Stanford University's TCP/IP protocol package for IBM PC family of computers, is based on driver-level implementation of TCP/IP/UDP. The package includes the following clients: FTP; TELNET; FINGER; WHOIS; LPR; POP2; SMTP; RARP; and BOOTP. Both IEN 116 and domain name resolvers are supported. A total of four concurrent sessions (up to three TELNET sessions and one FTP session) are supported. PCMH, the mail program, provides a RAND Mail Handler type of interface and allows users to select the editor of their choice for composing mail. Currently, drivers are available for 3Com 3C500/3C501, 3C503, and 3C523 (for microchannel) EtherLink cards; and Western Digital's WD8003E Ethernet card. Additional applications, including TN3270 and NETBIOS on TCP (RFC 1001, 1002), are planned for the next release.

2.14.1.21. Sun Microsystems IBM-PC (PC-NFS 2.0)

PRODUCT-OR-PACKAGE-NAME: Sun Microsystems PC-NFS 2.0
PC-NFS Programmer's Toolkit 1.0

DESCRIPTION:

PC-NFS is a client implementation of the Sun Microsystems' ONC (Open Network Computing) architecture for the IBM PC, PC-XT, AT, PS/2, AT&T 6300, Compaq 386 and compatible systems. It includes client NFS (Network File System) support, network printer redirection, and client Telnet, FTP, rsh and rcp services. Applications developed with the PC-NFS Programmer's Toolkit (see below) can also be run. PC-NFS implements ARP, RARP, IP, UDP, TCP, RPC/XDR and YP (Yellow Pages) protocols. Name resolution can be via local host files or YP; when YP is used in conjunction with RARP and RFC950 ICMP subnet mask acquisition, no configuration information need be stored on the PC. Drivers are available for the 3Com 3C500/3C501, the Ungermann-Bass NIC and the Micom-Interlan NI5010.

The PC-NFS Programmer's Toolkit provides a near-emulation of the SunOS network programming interface, including BSD-style TCP and UDP sockets, RPC/XDR, YP and network database library routines. Applications developed with the Toolkit can run on any PC running PC-NFS 2.0 or higher.

DOCUMENTATION:

PC-NFS comes with a User's Manual. The PC-NFS Programmer's Toolkit comes with a Reference Manual. Hardware/software packages include a hardware installation manual.

CPU:

IBM PC, PC-XT, PC-AT and PS/2; AT&T 6300; Compaq 286 and 386 Deskpro; other compatibles

INFORMATION-UPDATED:

February 1988

2.14.1.22. Sun Microsystems IBM-PC (PC-NFS 3.0)

PRODUCT-OR-PACKAGE-NAME: Sun Microsystems PC-NFS 3.0
PC-NFS Programmer's Toolkit 1.0
PC-NFS LifeLine Mail and Backup 1.0

DESCRIPTION:

PC-NFS is a client implementation of the Sun Microsystems' ONC (Open Network Computing) architecture for the IBM PC, PC-XT, AT, PS/2, AT&T 6300, Compaq 386 and compatible systems. It includes client NFS (Network File System) support, network printer redirection, and client Telnet, FTP, rsh and rcp services. Applications developed with the PC-NFS Programmer's Toolkit (see below) can also be run. PC-NFS implements ARP, RARP, IP, UDP, TCP, RPC/XDR and YP (Sun Yellow Pages) protocols. Name resolution can be via local host files or YP; when YP is used in conjunction with RARP and RFC950 ICMP subnet mask acquisition, no configuration information need be stored on the PC. Drivers are available for the 3Com 3C500/3C501/3C503/3C505, as well as the 3C523 MicroChannel board; the Ungermann-Bass NIC and NIU; the Western Digital WD8003E, and the Micom- Interlan NIS010. Hard-wired and dial-up serial IP (SLIP) is also supported.

The PC-NFS Programmer's Toolkit provides a near-emulation of the SunOS network programming interface, including BSD-style TCP and UDP sockets, RPC/XDR, YP and network database library routines. Applications developed with the Toolkit can run on any PC running PC-NFS 2.0 or higher.

PC-NFS LifeLine is an application package developed with the Programmer's Toolkit. It provides electronic mail and network backup services. The email subsystem integrates a multiwindow User Agent with SMTP and POP2 Transfer Agent capability. RFC822 messages can be received via POP2 (using the server developed by Bob Braden at ISI and enhanced by Ron Broersma at NOSC San Diego) or by an SMTP server daemon. Mail is sent via SMTP. A queuing system allows the user to read and compose mail while the (typically portable) PC is not connected to the network. The network backup facility utilizes the Berkeley Unix "rcmd" mechanism to store and retrieve file hierarchies on a server disk or tape in "tar" format for maximum portability.

DOCUMENTATION:

PC-NFS and PC-NFS LifeLine each come with a User's Manual. The PC-NFS Programmer's Toolkit comes with a Reference Manual. Hardware/software packages include a hardware installation manual.

2.14.1.23. Ungermann-Bass IBM-PC Name Service

PRODUCT-OR-PACKAGE-NAME: Net/One TCP Name Service

DESCRIPTION:

The TCP-PC Name Service is an optional component of the TCP-PC base product described in this guide. The TCP-PC Name Service serves as an assistant in locating remote resources for both PC Networking and PC to host access from Net/One TCP products. For PC networks the Net/One TCP Name Service extends the reach of PC Networking across subnetworks and to multiple networks. An additional benefit of the Name Service is the reduction of broadcast traffic in large PC network configurations. As an assistant in PC to host access centralized administration of the information maintained in UNIX /etc/host files.

DOCUMENTATION:

A Net/One TCP Name Service Guide is included with the product. It is intended for a site network administrator and sophisticated users who require detailed knowledge of installation and operation of the Name Service product.

2.14.2.1. ACC ACCES/MVS

PRODUCT-OR-PACKAGE-NAME: ACCES/MVS

DESCRIPTION:

The ACCES/MVS software program is a full-service communication sub-system for the DoD Internet protocols, which execute on an IBM type mainframe under the MVS operating system. ACCES/MVS includes all Internet-specific protocol code which when combined with ACC's ACS 9305 or ACS 9310 provides a full-service host interface to the DDN or to a Ethernet local area network. Services supported include client and server SMTP, client and server FTP, client and server Telnet, TCP and IP, ICMP and UDP. ACCES/MVS can be installed under either MVS/SP or MVS/XA with no operating system modification. Interprocess communication is accomplished with ACF/VTAM.

2.14.2.2. ADVINTECH MVS HFS

PRODUCT-OR-PACKAGE-NAME: HFS

DESCRIPTION:

ADVINTECH corporation builds and supports products that extend the Defense Data Network (DDN). The ADVINTECH TAC, FEP and HFS interconnect IBM 3270 or compatible SNA/SDLC or BSC terminal controllers and devices to IBM or PCM MVS-VTAM computer systems on the DDN providing native mode terminal operation (3270 Data Stream) with the host and the full suite of Department of Defense (DoD) protocols. ADVINTECH also provides products that connect IEEE 802.3 Local Area Networks with IBM MVS systems and the DDN. These products are TCP/IP based and fully interoperable.

Host Full Service (HFS) software runs on an IBM computer that utilizes the IBM MVS operating system and the ACF/VTAM communications access method. HFS provides the TCP/IP (thru Service Access Protocol Interface (SAPI)), Telnet NVT, FTP and SMTP protocols needed for the host computer to deliver a "Full-Service" DDN offering. HFS also provides support services for ADVINTECH's TAC and FEP in the form of the software downline loading, statistics gathering capability, and remote maintenance commands.

HFS Product Summary:

The DoD upper layer protocols adhere to a User-Server structure where (in each of the three upper layer protocols, Telnet NVT, FTP and SMTP). The User process, usually in one computer, initiates a dialog (following the upper layer protocol) with a Server process, usually in another computer. By following the conventions defined in each upper layer protocol these User-Server process pairs accomplish their data communications tasks. Telnet Network Virtual Terminal (NVT) allows a terminal user in one system to have terminal-to-host dialog with another system regardless of the real terminal attributes. File Transfer Protocol (FTP) allows files to be transferred between two computer systems. Simple Mail Transfer Protocol (SMTP) transfers mail to and from user mailboxes (on files) on cooperating systems.

Within IBM's MVS operating system, under TSO (Time-Sharing Options), ADVINTECH's HFS software provides Telnet NVT User, FTP User and SMTP User processes as TSO commands. This permits interactive users on one MVS computer system to directly utilize these DDN Full Service capabilities in communication with other DDN Full Service host computers. Within the HFS subsystem, ADVINTECH's HFS software provides the Telnet NVT Server, FTP Server and SMTP Server processes so users on other DDN Full Service computer systems can communicate with this MVS host using these higher level communications services. ADVINTECH's TAC provides a Telnet NVT User process so terminals attached to the TAC can utilize the higher level protocol to communicate with DDN Full Service hosts regardless of the manufacturer.

HFS uses the Service Access Protocol (SAP) via two dedicated VTAM 3270 SNA sessions between the FEP3270 and HFS for data paths in support of these server facilities in the host. One data path is for inbound ADVINTECH DDN traffic and one data path is outbound for ADVINTECH DDN traffic.

This basic structure allows the TCP/IP control to be resident in the FEP, yet the session startup/shutdown and data I/O is available in the host. Once in the host at that level, the higher level protocols are implemented.

HFS also contains DDN data communication support for MVS application programs through dialog with the HFS subsystem as a sequential file (VSAM ESDS, BSAM or QSAM). This I/O capability is accomplished through the use of the MVS SubSystem Interface (SSI). The HFS subsystem, using the SSI in concert with its Job Control Language (JCL) exit and I/O reaction capabilities, builds and responds to the key control block parameters. The session establishment parameters are placed on the Job Control Language (JCL) statements using the SUBSYS= capabilities.

This combination allows these file access methods (VSAM ESDS, BSAM and QSAM) to accomplish their open, close, read, write (e.g. GET, PUT, CHECK) functions without any modifications. The HFS subsystem allows the I/O to be transmitted as DDN TCP/IP sessions across the DDN. The HFS subsystem and the user interface are built on IBM-supported interfaces without modifications to MVS. The application programming interface (API) uses standard file access methods.

DOCUMENTATION:

2.14.2.3. Fibronics KNET TCP/MVS

PRODUCT OR PACKAGE NAME: KNET TCP/MVS

DESCRIPTION:

KNET TCP/MVS is a TCP/IP-based network software package supporting the Ethernet local area network and all SNA supported links. KNET conforms to the ISO/OSI Reference Model for layered network architecture and runs as a started task under the control of MVS. (See also, "Fibronics K200" and/or "Fibronics K310" described in the Hardware Section of this document).

Services supported include client and server TELNET, client and server FTP, and client and server TFTP. An application interface to TCP virtual circuits and UDP datagram circuits is also available. In addition, the following small servers are available for UDP: time, discard, echo, name, and quote of the day. Support for TCP echo and discard services is also provided. Telnet access to all MVS services is provided via 3270 emulation. Telnet access support for "TN3270 mode" is also provided. Support is provided under FTP for both binary mode and for NETASCII. Automatic data conversion to/from ASCII to EBCDIC is supported. No modification of MVS is required.

2.14.2.4. Fibronics KNET TCP/VM

PRODUCT-OR-PACKAGE-NAME: KNET TCP/VM

DESCRIPTION:

KNET TCP/VM is a TCP/IP-based network software package supporting the Ethernet local-area network, Bisync and CTCA links. KNET conforms to the ISO/OSI Reference Model for layered network architecture and runs as an application on the mainframe. (See also "Fibronics K200" and/or "Fibronics K310" described in the Hardware Section of this document).

Services supported include client and server Telnet, client and server FTP, client and server SMTP (interfaced to VM NOTE), and client and server TFTP. An application interface to TCP virtual circuits and UDP datagram circuits is also available. In addition, the following small servers are available for UDP: time, discard, echo, name, and quote of the day. Support for TCP echo and discard services is also provided. Telnet access to all VM services is provided via 3270 emulation. Support is provided under FTP for both binary mode and fo. NETASCII. Automatic data conversion to/from ASCII to EBCDIC is supported. No modification of VM/SP is required. All services run either under CMS or as a guest operating system under CP. SMTP option is available.

2.14.2.6. IBM Corporation VM

PRODUCT-OR-PACKAGE-NAME: IBM TCP/IP for VM

DESCRIPTION:

IBM offers the TCP/IP protocol family products on its VM and DOS operating systems for the interoperability of IBM systems with multivendor systems on TCP/IP networks interconnected via Ethernet or IEEE 802.3 LAN, X.25 network, HYPERchannel (4), IBM Token-Ring network, or IBM PC network, or SNA(LU-0/VTAM).

Currently supported DARPA protocols are TELNET, FTP, TFTP, SMTP, TCP, UDP, IP, ICMP, ARP, etc. as well as Network File System (NFS) (1), X Window System (3), Domain name server and resolver, and Remote execution daemon.

The NFS feature provides VM systems a network file server capability for AIX 2.2, UNIX (2) and other systems that have the NFS 3.2 client function installed.

The X Window System feature provides VM systems an X Window System client capability for AIX 2.2, UNIX (2) and other systems that have the X Window System (V X.11) server program running.

1. Trademark of Sun Microsystems Inc.
2. Registered trademark of American Telephone and Telegraph
3. Trademark of Massachusetts Institute of Technology
4. HYPERchannel is a trademark of Network Systems Corporation

IBM TCP/IP for VM Release 1.2 has a CMS user interface that provides access to the File Transfer Protocol (FTP), Trivial File Transfer Protocol (TFTP), Simple Mail Transfer Protocol (SMTP), and TELNET facilities.

File Transfer Protocol:

FTP client and server support is provided to allow you to transfer both ASCII and image files to/from a remote system, using the same command syntax as the UNIX FTP commands.

Simple Mail Transfer Protocol:

SMTP client and server allows you to transfer mails from/to a remote system on an IP network.

The PROFS Extended Mail Product Offering (5798-FBJ) allows you to send/receive electronic mail to/from other users on IP networks as well as on RSCS networks using NOTE or SENDFILE command.

TELNET:

TELNET allows a user to remotely log on to another IP system, either in 3270 screen mode or in line mode.

Network File System:

The Network File System (NFS) feature provides file server support for the NFS 3.2 protocols developed by Sun Microsystems Inc. This support enables the VM system to act as a file server for vendor systems that have the NFS 3.2 client function installed. NFS has been implemented on the IBM AIX systems as well as many other vendor's systems.

Remote Procedure Call:

The Remote Procedure Call (RPC) makes remote procedures appear as if they were local. Both the NFS and RPC protocols adhere to the External Data Representation (XDR) specification, which allow the protocols to be independent of machine internal formats.

RPC is implemented as a library of procedures that interface the customer's program with the communications services provided by TCP/IP.

Socket Interface:

The feature is modeled after Berkely Unix C-Socket interface and allows end users to program directly to the TCP, UDP, or IP boundaries either in C or Pascal language.

9370 X.25 Communications Subsystem:

A driver is provided to support connection of the IBM TCP/IP for VM program offering to an X.25 network or the Defense Data Network using the 9370 X.25 Communications Subsystem.

Domain Name Server and Resolver:

The Resolver provides an automatic mapping between host names and Internet addresses in networks using domain naming. The Domain Name Server feature enables VM to provide name services to the Resolvers and other name servers in a network.

Remote Execution Daemon:

A Remote Execution Daemon (server) (REXECD) is provided to allow remote execution of VM EXECs, as well as the CP and CMS commands. Systems with the Remote Execution (REXEC) client function installed may execute the VM EXECs from the remote system. IBM AIX/RT and IBM TCP for the PS/2 are two programs that have the client REXEC function available.

X Window System (Version X.11):

The CMS X Window System provides consistent user interfaces to X Window System client applications running on heterogeneous systems for access, display and manipulation of multiple remote and local applications in multiple windows. The CMS X Window System Application Program Interface (API) allows the development of code which is portable across operating systems and displays.

2.14.2.7. Mitek Systems TELNET/FTP CLIENTS, FTP SERVER and FTP BATCH

PRODUCT-OR-PACKAGE-NAME: TELNET/FTP CLIENTS, FTP SERVER and FTP BATCH
ENHANCEMENT FOR MVS

DESCRIPTION:

Mitek's TELNET/FTP Clients are IBM host software options that execute as TSO commands. Since both applications reside under TSO, the standard IBM environment is preserved. Communication is provided to the IBM systems through VTAM. Mitek's SNA Network Server attaches to the IBM host as an IBM PU type 2 device and provides the SNA to TCP/IP network interface.

Mitek's TSO TELNET Client application allows a 3270 terminal to emulate a line-mode terminal on the TCP/IP network. In this mode, the 3270 terminal has access to all applications on any of the TCP/IP network processors or other gateways such as DDN that support TELNET terminals. The TELNET Client application is accessible from any terminal on the SNA network.

With Mitek's TSO FTP Client application, files can be transferred to or from any processor on the TCP/IP network. Any 3270 on the SNA network, any terminal using Mitek's PS 3270 emulation on the TCP/IP network, or any terminal using Mitek's TELNET Server can initiate the FTP File Transfer. The FTP File Transfer feature had options for source or binary code transmission and for insertion or stripping of carriage returns.

Like the FTP Client, the FTP Batch enhancement under MVS is used to transfer files to or from any processor on a TCP/IP network. However, FTP Batch allows the user to sequentially transfer numerous files automatically, rather than interactively transfer one file at a time.

Mitek's FTP Server resides on the IBM host and carries out file transfer requests from Ethernet hosts.

2.14.2.8. Mitek Systems TELNET Server Version 2

PRODUCT-OR-PACKAGE-NAME: TELNET Server Version 2

DESCRIPTION:

TELNET Server Version 2 is an optional software feature available for Mitek Systems' SNA Network Server Models M2030 and M2120. This option permits terminals or systems on a TCP/IP network which support a TELNET client to connect to the SNA Network Server and use the full-screen SNA 3270 emulation in the Server to access IBM mainframes or midrange systems on an SNA Network. TELNET Server Version 2 emulates an IBM 3278 Model 2.

Most importantly, TELNET Server Version 2 allows asynchronous applications on the IBM mainframe to access asynchronous terminals on a TCP/IP network. The product provides high-speed graphics passthru from IBM mainframes to any asynchronous terminal or workstation.

TELNET Server Version 2 supports Tektronix CX graphics applications on the IBM host, which means that any user who is operating a computer running TCP/IP and a telnet client with a terminal capable of interpreting Tektronix graphics can have access to the graphics applications on the IBM mainframe. Telnet Server Version 2 high-speed graphics passthru can operate under either MVS or VM. Telnet Server Version 2 also supports TN3270.

2.14.2.9. Mitek Systems Control Program Full Screen Option

PRODUCT-OR-PACKAGE-NAME: Control Program Full Screen Option

DESCRIPTION:

Up until now, in order to have full screen access to asynchronous networks or computer systems, you needed to have an asynchronous terminal installed alongside your IBM 3270-type terminal.

Not any more.

With Mitek's Control Program Full Screen software (MCP/FS), you can allow your IBM 3270 to connect to asynchronous systems on the Ethernet Network, whenever you choose.

Mitek's MCP/FS is the software innovation that enables any IBM 3270 terminal to have full screen access to asynchronous computer applications on an Ethernet Network. When Mitek's MCP/FS software is installed, the asynchronous system residing on the Ethernet Network sees your IBM 3270 as if it were an asynchronous ASCII terminal.

MCP/FS resides on IBM systems which run the VM and MVS operating systems as well as VTAM. MCP/FS also supports the TN3270 Client.

2.14.2.10. Network Solutions OPEN-Link for IBM/MVS

PRODUCT-OR-PACKAGE-NAME: OPEN-Link for IBM/MVS

DESCRIPTION:

Network Solutions, Inc. provides the DoD Community with OPEN-Link, a fully integrated DDN and Ethernet interface solution that provides the DoD Internet protocols (TCP/IP, FTP, TELNET and SMTP) and technical support services for IBM host computers running the MVS operating system. Additional features include a programmatic interface to FTP, interfaces to standard MVS security packages, and support for 3270 full screen terminal emulation over TELNET. The interface solution is composed of OPEN-Link host resident software, pre-installation site survey, installation, integration support, maintenance, technical services and a 90 day warranty. OPEN-Link is hardware independent and is currently working with ACC, Comten, IBM Series/1 hardware interfaces. All of these provide the user with a DCA fully qualified X.25 interface. Ethernet support is provided by the channel-attached OL/1220 Ethernet LAN controller.

2.15. NCR TOWER SYSTEMS

2.15.1. Excelan NCR Tower Software

PRODUCT-OR-PACKAGE-NAME: EXOS 8012-01 TCP/IP Network Software for
NCR Tower Systems

DESCRIPTION:

Excelan's EXOS 8012-01 implements DoD TCP/IP protocols to connect NCR Tower Systems to Ethernet networks. EXOS 8012-01 is a front-end TCP/IP implementation that operates in conjunction with an EXOS 201 Intelligent Ethernet Controller for multibus. The TCP/IP protocols (TCP, IP, UDP, ICMP, ARP) and Telnet/rlogin servers run on the controller and the user applications (FTP, Telnet, ud, and R-utilities) run on the NCR Tower. EXOS 8012-01 user applications also include C program socket library and network administration utilities.

2.17. PYRAMID TECHNOLOGY

2.17.1. Pyramid NSP

PRODUCT-OR-PACKAGE-NAME: Pyramid's Networking Software Package (NSP)

DESCRIPTION:

The Pyramid system is based upon the RISC (Reduced Instruction Set Computer) design implementing pipelining and a large number (528) of registers to maximize performance and reduce context switching. The Pyramid system has grown into a family of computer products. They range from the entry level 9805, to the Series 9000-TA symmetric multiprocessor family 9815 through 9845. Pyramid systems support high capacity online storage (up to 48 G bytes) and high performance (40 M bytes/sec.) extend bus I/O interface.

All Pyramid systems offer Pyramids dualPort OSx operating system which supplies users with both UNIX standards (Berkeley 4.3 BSD and AT&T System V, release 3) concurrently. NSP implements the TCP/IP protocols under OSx. These protocol implementations are based upon the 4.3 BSD implementation of the MIL-STD protocols. They include TELNET (remote login), FTP (file transfer), and SMTP (mail). In addition to the standard internet protocols, Pyramid supports the following TCP/IP services: netstat, rcp, rdump, rlogin, rrestore, rsh, ruptime, and rwho.

Pyramid's NSP product is available to implement point-to-point internetwork links over ASCII asynch serial lines at speeds from 1200 bps to 19.2 Kbps. NSP offers full networking support for Ethernet (10 Mbps), and HYPERchannel (50 Mbps). Pyramid's X.25 passed DDN certification in April of 1986. The certification was for standard service at 56 Kbps.

Pyramid has implemented the Network File System (NFS) protocol to allow computer systems, workstations, and personal computers to share file systems across the network. The NFS is implemented on a Remote Procedure Call protocol, and External Data Representation (RPC and XDR) standard, to allow portability across different computer architectures.

2.19.1. Proteon, Inc.

2.19.1.1. Proteon ProNET Device Drivers

PRODUCT-OR-PACKAGE-NAME: Sun Device Drivers for ProNET-10 & 80 networks

DESCRIPTION:

The ProNET-10 and ProNET-80 Token Ring networks offer advantages of speed, distance, and media flexibility over the Ethernet supported by the Sun Microsystems workstations. The Sun device drivers connect the ProNET-10 and ProNET-80 boards to Sun's TCP/IP code, allowing all the the existing software (including NFS) to operate over ProNET.

There are ProNET boards for the Multibus and Sun VMEbus processors. The p5203 device driver is for Multibus Sun-2 processors, and supports the p1200 ProNET-10 Multibus System or the p1280 ProNET-80 Multibus System. The p5204 device driver is for VMEbus Sun-2 and Sun-3 processors, and supports the p1503 ProNET-10 Sun VMEbus System or the p1583 ProNET-80 Sun VMEbus System.

PRODUCT-OR-PACKAGE-NAME: SunLink DDN

DESCRIPTION:

SunLink DDN is a member of the SunLink product family. The SunLink products implement industry and de-facto standard protocols to provide wide-area and multivendor networking. SunLink DDN includes the host-PSN protocol layers below IP, allowing Suns to provide DDN host services to a multivendor Ethernet network or internetwork which supports the TCP/IP protocol suite. SunLink DDN includes the three major interfaces defined by DoD: DDN Standard X.25, DDN Basic X.25 and 1822 HDH/HDLC. The software runs on Sun-2 or Sun-3 processors with an available local port at speeds up to 19.2 Kbps or on a Sun system equipped with the MCP board for higher speeds.

2.19.2.2. Sun TCP/IP and Network Services

PRODUCT-OR-PACKAGE-NAME: TCP/IP and Network Services

DESCRIPTION:

Sun Microsystem's native networking architecture includes the 4.2 BSD TCP/IP protocols in conjunction with a 10 Mbit/second Ethernet local area network. In addition to the standard internet protocols, Sun supports the same services as the 4.2 BSD VAX UNIX network software: rlogin, rsh, rwho, ruptime, routed, and rexecd.

Sun's network services let users establish consistent directory and file structures on distinct machines. These network services, such as Network File System (NFS) and Yellow Pages (YP), are based upon Sun's Remote Procedure Call (RPC) protocol and External Data Representation (XDR) standard to allow portability across different computer architectures. NFS allows workstations to share file systems across the network; the YP protocols are used to provide domain-wide distributed administrative databases, such as user names and mail aliases.

2.19.2.3. Sun SunLink X.25

PRODUCT-OR-PACKAGE-NAME: SunLink X.25

DESCRIPTION:

SunLink X.25 allows Sun systems to establish virtual circuit connections to remote Sun or non Sun systems via X.25 Public Data Networks for IP/ISO routing and/or virtual terminal (X.29/X.3) applications. SunLink X.25 also contains two levels of programmatic interfaces: an X.25 packet level interface for application-to-application protocols and a HDLC device driver interface for reliable point-to-point protocols without the overhead of the X.25 packet level. The software runs on Sun-2 or Sun-3 processors with an available local port at speeds up to 19.2 Kbps or on a Sun system equipped with the MCP board for higher speeds.

2.19.2.4. Sun SunLink IR

PRODUCT-OR-PACKAGE-NAME: SunLink IR

DESCRIPTION:

SunLink Internetwork Router permits point-to-point routing links between networks of Sun workstations to create a transparent internetwork. Routing of IP packets by SunLink IR is done dynamically. It supports a variety of serial media such as leased lines, broadband, satellite and PBX circuits allows users to use TCP/IP applications such as telnet, rlogin, ftp, and smtp transparently between remote machines. The software runs on Sun-2 and Sun-3 systems with an available local port at speeds of up to 19.2 Kbps or on a Sun equipped with an MCP at up to 500 Kbps.

2.19.2.5. Sun SunLink OSI

PRODUCT-OR-PACKAGE-NAME: SunLink OSI

DESCRIPTION:

SunLink OSI conforms to the MAP 2.1/TOP 1.0/NBS Phase I specifications. On a TOP network, SunLink OSI implements layers 2 through 7 of the OSI model over Sun's integrated Ethernet/802.3 controller; no additional hardware is required. SunLink OSI also can be used with 802.4 controllers available from various vendors for connection to a MAP network, or over SunLink X.25 for connection to X.25 networks. SunLink OSI and TCP/IP can run concurrently over 802.3, 802.4, and X.25 networks. SunLink OSI implements both an end system and an intermediate system. As an end system, SunLink OSI supports FTAM, MAP Network Management, MAP Directory Services, TP4/CLNS, TP0/CONS, and support for 802.3, 802.4, and X.25 networks. As an intermediate system, SunLink OSI supports routing among 802.3 and 802.4, routing over SunLink X.25, and turnkey support for OSINET. For programmers, SunLink OSI includes interfaces to LLC, CLNS, TP4 Session BCS, FTAM Phase I, MAP 2.1 CASE, MAP 2.1 Directory Service, and MAP 2.1 Network Management.

2.19.2.6. Sun SunLink MHS

PRODUCT-OR-PACKAGE-NAME: SunLink MHS

DESCRIPTION:

SunLink MHS supports local or wide area interchange of electronic messages between Sun systems and other systems that support X.400 messaging conventions. SunLink MHS is a gateway among UNIX mail (SMTP and UUCP) and X.400 that supports bi-directional exchange of messages. It conforms to the CEN/CENELEC A/3211, CEPT A/311, and NBS profiles. Messages may be sent by (or received from) Sun users or any user that can send messages to Sun mail systems. The messages may address (or originate from) users on other systems, either X.400-native systems or the native mail systems of a vendor that supports an X.400 gateway. Mappings of addresses and other message elements are a superset of RFC 987. SunLink MHS requires SunLink OSI, and may run over SunLink X.25 for wide area messaging.

2.20. SYMBOLICS, INC.

2.20.1. Symbolics LISP Machine

PRODUCT-OR-PACKAGE-NAME: Symbolics TCP/IP

DESCRIPTION:

An implementation of the Internet protocol family for Symbolics 36xx Machines running release 5.2 or later. This includes IP, ICMP, TCP, and UDP. Higher level protocols supported include Telnet, SUPDUP, FTP, SMTP and TFTP. TCP/IP is completely integrated in the Lisp Machine generic network system and will be used by the system automatically whenever necessary. As of Release 7.2 also provides TCP/IP bridging via serial line.

DOCUMENTATION:

Use of the generic network system is documented in standard manuals and is available online through a keyword lookup system.

2.22. UNISYS CORPORATION

2.22.1. Chi Corporation

2.22.1.1 Chi CCP TCP/IP

PRODUCT-OR-PACKAGE-NAME: Chi Communications Processor (CCP) TCP/IP

DESCRIPTION:

TCP/IP is implemented in the CCP for use as a front-end to Unisys/Sperry 1100 series machines. The CCP channel connects to the Unisys/Sperry and also provides, through TCP/IP, connectivity to IBM and DEC hosts. The implementation supports TCP, IP, UDP, FTP, TELNET, SMTP, and ICMP. The data link and physical layer protocols are implemented as specified in IEEE 802.3 (10 Base 5). The CCP interfaces to a TCP/IP network through a Series 3200 Ethernet Controller and Chi's Ethernet driver software. These communicate with the IP layer. A DCA certified X.25 network interface is available for connection to the DDN. The CCP can be configured as a remote concentrator, providing yet another method by which remote terminals can access DDN hosts. Chi also offers technical support for interfacing Unisys/Sperry computing environments to the DDN.

DOCUMENTATION:

Technical manuals provided with product; descriptive literature available

CPU:

2.22.2. Unisys Corporation

2.22.2.1. Unisys A Series Systems

PRODUCT-OR-PACKAGE-NAME: A Series TCP/IP

DESCRIPTION:

The Unisys A Series TCP/IP product augments the BNA network products by supporting communication with other Unisys systems and other vendor systems employing DDN protocols. DDN software is implemented partly in the mainframe and partly in the CP2000 communications processor. The DDN connections provided are the standard X.25 IMP and other X.25 packet network interfaces at speeds up to 64 Kbps, and IEEE 802.3 local area network interfaces at 10 Mbps. Telnet, FTP, and SMTP protocols and programmatic interfaces to multiple layers are supported above TCP/IP and are integral to BNA Host Services. Several mainframes may access the DDN through the same CP2000 via an IEEE 802.3 LAN, in which case the communications processor supports the EGP protocol. Multiple IMP connections may be supported by a single CP2000 communications processor. In addition, the CP2000 communications processor can support attachment to an IEEE 802.3 LAN and uses Ethernet compatible frames and the ARP protocol. BNA sessions are supported using the DDN or IEEE 802.3 LAN for transport between BNA nodes.

2.22.2.2. Unisys 1100 and 2200 Systems

PRODUCT-OR-PACKAGE-NAME: DDN-1100, DCP DDN Gateway

DESCRIPTION:

The Unisys OS1100 TCP/IP products augment the DCA network products by supporting communication with other Unisys systems and other vendor systems employing DDN protocols. DDN software is implemented partly in the mainframe and partly in the Distributed Communications Processor (DCP). The DDN connections provided are the DDN Standard X.25 IMP and other X.25 packet network interfaces at speeds up to 64 Kbps, and IEEE 802.3 local area network interfaces at 10 Mbps. The IP, ICMP, TCP and Telnet protocols are implemented in the DCP. FTP and SMTP protocols and programmatic interfaces to multiple layers are implemented in the mainframe and are integral to Distributed Systems Services (DSS) of OS1100. Multiple IMP connections may be supported by a single DCP. In addition, the DCP can support attachment to an IEEE 802.3 LAN using Ethernet compatible frames and the ARP protocol. DCA sessions are supported using the DDN or IEEE 802.3 LAN for transport between DCA nodes.

2.22.2.3. Unisys DDN5000, DDN7000

PRODUCT-OR-PACKAGE-NAME: DDN5000, DDN7000

DESCRIPTION:

The Unisys DDN5000 and DDN7000 products support communication with other Unisys systems and equipment of other vendors via DDN protocols and R-utilities over a DDN standard X.25 IMP interface at from 19.2 Kbps to 56K bps. The IP, ICMP, TCP, Telnet, FTP and SMTP protocols are implemented along with R-Utilities. Programmatic interfaces, including BSD 4.2 via sockets library, are available to multiple layers. In addition, DDN7000 supports the UDP protocol. Series 5000 systems also support DCA sessions using the DDN for transport between DCA nodes.

2.22.3. University of Maryland

2.22.3.1. U. of Maryland IP/TCP-1100

PRODUCT-OR-PACKAGE-NAME: IP/TCP-1100 -- Current level 2R2Q5

DESCRIPTION:

The University of Maryland Computer Science Center has implemented TCP/IP for the Unisys 1100 Series computer systems. The implementation currently supports IP, ICMP, TCP, server TELNET, server FTP, user and server SMTP, user and server MDQS. The link level connection is via a 40KB synchronous link or Unisys word channel. Direct connection to an Ethernet is under construction. Currently running on at least 3 Internet hosts including UMD2.UMD.EDU.

DOCUMENTATION:

Installation, configuration and operation documentation is provided in both printed and machine readable form. No internals documentation is currently available. Package is distributed in source form.

2.24. XEROX CORPORATION

2.24.1. Xerox XDE

PRODUCT-OR-PACKAGE-NAME: XDE (Xerox Development Environment) 5.0 Desktop

DESCRIPTION:

The TCP/IP package in XDE 5.0 supports the use of the TCP/IP family of networking protocols. It supports the application protocols of FTP, TFTP, SMTP and Telnet and the networking protocols of IP, TCP, UDP and ARP, as outline by various RFCs. This package also provides for window-based user interfaces to the above application protocols and Mesa language programming interfaces to the above protocols.

DOCUMENTATION:

Programmer level documentation to each of the individual application level protocols as well as network level protocols is given and user interface documentation for the tools which use these applications.

CPU:

This software is for use on the 8010 and 6085 processors. These are proprietary processors optimized for the running of the Mesa language.

2.25. SOFTWARE MULTIPLE-MACHINE IMPLEMENTATIONS

2.25.1. BANYAN SYSTEMS, INC.

2.25.1.1. VINES TCP/IP Routing Option

PRODUCT-OR-PACKAGE-NAME: VINES TCP/IP Routing Option

DESCRIPTION:

Banyan Systems Inc. develops and markets VINES -- virtual networking software that allow network resources to appear as transparent extensions to local PCs. VINES integrates multiple communications technologies, including local- and wide-area network, mini and mainframe links. The company also markets high-performance, multi-function network servers which run the VINES network operating system while providing internetwork support for a variety of popular local area networks.

The VINES TCP/IP Routing option allows a Banyan Server (VINES/386, DTS, BNS or CNS) to route IP frames. This enables a single Banyan server or a network of Banyan servers to connect multiple TCP/IP hosts or networks.

This option supports connections between TCP/IP networks and Banyan servers over Ethernet (3Com 3C501 and 3C505, Micom- Interlan NIS010 and NIS210, and Ungermann-Bass NIC), IEEE 802.5 Token Ring (IBM and Proteon ProNET-4), and Proteon ProNET-10.

This option is available with VINES Release 3.0.

DOCUMENTATION:

A complete set of documentation is included.

CPU:

80286, 80386, or Banyan proprietary servers: DTS, BNS, CNS

2.25.1.2. VINES TCP/IP Server-to-Server Option

PRODUCT-OR-PACKAGE-NAME: VINES TCP/IP Server-to-Server Option

DESCRIPTION:

Banyan Systems Inc. develops and markets VINES -- virtual networking software that allow network resources to appear as transparent extensions to local PCs. VINES integrates multiple communications technologies, including local- and wide-area network, mini and mainframe links. The company also markets high-performance, multi-function network servers which run the VINES network operating system while providing internetwork support for a variety of popular local area networks.

The VINES TCP/IP Server-to-Server option allows two or more Banyan servers to communicate across a TCP/IP network. IP intermetting is available across Ethernet (3Com 3C501 and 3C505, Micom-Interlan NI5010 and NI5210, and Ungermann-Bass NIC), IEEE 802.5 Token Ring (IBM and Proteon ProNet-4), and Proteon ProNET-10 networks.

This option is attractive to customers with access to a TCP/IP backbone who need to connect remote Banyan servers. VINES packets originating from one Banyan server and destined for a remote Banyan server are encapsulated in IP protocol headers to be routed by non-Banyan IP routers through a TCP/IP network.

This option is available with VINES Release 3.0.

2.25.4. CONCURRENT COMPUTER CORPORATION

2.25.4.1. Network Solutions OPEN-Link for OS/32

PRODUCT-OR-PACKAGE-NAME: OPEN-Link for OS/32

DESCRIPTION:

OPEN-Link is a series of communications software and hardware products that meet the Defense Communications Agency MIL-STDs in use on the DDN networks, such as ARPANET and MILNET. These products are also interoperable with the UNIX BSD 4.X implementations of these protocols used by many popular UNIX based graphics workstations.

OPEN Link supplies TCP/IP communication protocol software products, Application Programming Interfaces to the TCP functions for PASCAL, FORTRAN VII, C, and CAL, and the MIL-STD File Transfer (FTP), Virtual Terminal (TELNET) and Simple Mail Transfer (SMTP) applications.

OPEN-Link for Concurrent Computer OS/32 systems uses the Concurrent Computer Ethernet Data Link Controller.

2.25.5. DATA GENERAL

2.25.5.1. Data General Workstation Transport System (WTS)

PRODUCT-OR-PACKAGE-NAME: Data General Workstation Transport System (WTS)

DESCRIPTION:

WTS is an OSI transport system that implements OSI transport, internet, data link and physical layer protocols. It supports IEEE 802.3 local area networks. WTS provides transport services for personal computers as part of Data General's PC*Integration product line, which offers file, print, application, and communication sharing capabilities for PCs utilizing a DG MV/Family minicomputer as a server.

DOCUMENTATION:

Full documentation is provided.

CPU:

Data General Dasher 286, DG/One Models 2 and 2T laptops, and IBM PC, XT, and AT

O/S:

DOS rev 3.1 or higher

IMPLEMENTATION-LANGUAGE:

A mixture of Assembly language, PL/1 and C

DISTRIBUTOR:

Data General
4400 Computer Drive
Westboro, MA 01580

CONTACT:

Any local Data General sales office

ORDERING-PROCEDURE:

WTS may be ordered through any Data General sales office or representative.

PROPRIETY-STATUS:

Data General Proprietary

INFORMATION-UPDATED:

February 1988

2.25.6. ISODE

2.25.6.1. The ISO Development Environment (ISODE 4.0)

PRODUCT-OR-PACKAGE-NAME: The ISO Development Environment (ISODE 4.0)

DESCRIPTION:

This software supports the development of certain kinds of ISO/CCITT/ECMA protocols and applications.

Current modules include:

- OSI transport service (TP0 on top of TCP, X.25, and CONS; TP4 for SunLink OSI)
- OSI session, presentation, and association control services
- ASN.1 abstract syntax/transfer notation tools, including:
 - remote operations stub-generator (front-end for remote operations)
 - structure generator (ASN.1 to C)
 - element-parser (basic encoding rules)
- OSI reliable transfer and remote operations services
- OSI DIS file transfer, access and management

ISODE 4.0 consists of final "IS" level implementations with a few exceptions. FTAM is still DIS, and ROSE and RTSE are current to the last circulated drafts (March, 1988). ISODE also contains implementations of the 1984 X.400 versions of ROS and RTS. ISODE is aligned with the U.S. Government OSI Profile (GOSIP).

Future modules planned for the next release include:

- OSI message handling system
- OSI directory
- OSI virtual terminal ("telnet" class)
- MHS/SMTP gateway
- FTAM/FTP gateway

Although the ISODE is not "supported" per se, it does have a problem reporting address, Bug-ISODE@TWG.COM. Bug reports (and fixes) are welcome by the way. The discussion group ISODE@SRI-NIC.ARI.A is used as an open forum on ISODE. Contact ISODE-Request@SRI-NIC.ARPA to be added to this list.

DOCUMENTATION:

Three volume User's Manual (approx. 800 pages, sources in LaTeX); UNIX manual entries (sources in roff); other miscellaneous documents in LaTeX or SLiTeX format

CPU:

Any

O/S:

BSD 4.2 or 4.3 UNIX, AT&T SVR2 or SVR3 UNIX, and various other UNIX-based operating systems.
No kernel modifications are required.

IMPLEMENTATION-LANGUAGE:

C

CONTACT:

Bug-ISODE@TWG.COM

ORDERING-PROCEDURE:

Send a check or purchase order to one of the distribution facilities listed above. Do not send tapes or envelopes.

North America: \$350.00 US Dollars for source and documentation (documentation only is also 350 US Dollars)

Europe: 200 Pounds Sterling for source and documentation (documentation only is also 200 Pounds Sterling)

Europe (tape only):

90 Dutch Guilders for 1600bpi 1/2-inch tape
120 Dutch Guilders for 800bpi 1/2-inch tape
150 Dutch Guilders for Sun 1/4-inch cartridge tape
150 Dutch Guilders for 1/4-inch cartridge (QIC-11)
(EUUG members enclose copy of membership, non-EUUG members add 300 Dutch Guilders)

Australia: 150 dollars Australian for source and documentation (documentation only is also 150 dollars Australian)

FTP: If you can FTP to the DARPA/NSF Internet, you can use anonymous FTP to spam.istc.sri.com [10.2.0.107] and retrieve the file portal/isode-4.tar. This is a 9.25MB tar image. The file portal/isode-4.tar.Z is the tar image after being run through the compress program (approx. 3MB).

NIFTP: If you run NIFTP over the public X.25 or over JANET, and are registered in the NRS at Salford, you can use NIFTP with username "guest" and your own name as password, to access UK.AC.UCL.CS to retrieve the file <SRC>isode-4.tar. This is a 9.25MB tar image. The file <SRC>isode-4.tar.Z is the tar image after being run through the compress program (approx. 3MB).

FTAM on the JANET or PSS: The sources are available by FTAM at UCL over X.25 using JANET (00000511160012) or PSS (23421920030013) with TSEL "256" (ascii encoding). Use the "anon" user-identity, supply any password, and retrieve the file src/isode-4.tar. This is a 9.25MB tar image. The file src/isode-4.tar.Z is the tar image after being run through the compress program (approx. 3MB).

FTAM on the DARPA/NSF Internet: The sources are available by FTAM at SRI over the DARPA/NSF Internet at host spam.istc.sri.com [10.2.0.107] (TCP port 102 selects the ISO transport service) with TSEL 256 (numeric encoding). Use the "anon" user-identity, supply any password and retrieve the file portal/isode-4.tar. This is a 9.25MB tar image. The file portal/isode-4.tar.Z is the tar image after being run through the compress program (approx. 3MB).

For distributions via FTAM, the file service is provided by the FTAM implementation in ISODE 4.0, which is a DIS implementation with a few pieces of critical information taken from the IS. Note that although this FTAM is a DIS implementation, the rest of the stack (i.e., association control, presentation, and so on) is composed of an IS implementation.

If you wish to use the FTAM implementation in ISODE 3.0, which was a DIS implementation both of FTAM and the rest of the stack, use TSEL 256 instead (ascii encoding at UCL, and numeric encoding at SRI). This older service is temporary and is provided for bootstrap purposes only.

For distributions via either FTAM or FTP, there is an additional file available for retrieval, called isode-ps.tar.Z which is a compressed tar image (2.75MB) containing the entire documentation set in PostScript format.

PROPRIETY-STATUS:

Openly available under a "hold harmless" clause

INFORMATION-UPDATED:

2.25.7. MARI ADVANCE MICROELECTRONICS LTD.

2.25.7.1. The Newcastle Connection

PRODUCT-OR-PACKAGE-NAME: The Newcastle Connection

DESCRIPTION:

The Newcastle Connection is a software sub-system that can integrate a number of UNIX computers to provide a fully transparent distributed environment, termed "UNIX-United". It was developed in the Computing Laboratory at the University of Newcastle upon Tyne, England.

Under this arrangement each computer within the system will appear as a directory in a large UNIX file system. Thus, full functionality is provided through a strict adherence to UNIX semantics. There is no need for remote login - the user is able to simply change directory in the standard manner to access the file system of a remote machine (subject to permissions granted).

The Newcastle Connection allows the user to access remote files and execute programs upon the machine in whose file store they are contained. This important feature overcomes the limitations inherent in a number of current Virtual File Systems which involve copying of file systems back to the local file store for processing.

The Newcastle Connection is designed to be Network Independent, and as such has been implemented across a number of media - Ethernet, X.25, RS232, Cambridge Ring, and Omninet.

The Newcastle Connection has been implemented on a number of major machine architectures including:

- Sun Workstation - co-existing with the Sun Network File System
- VAX - running under UNIX 4.2 BSD and UNIX System V
- Perq Workstations - running under PNX

In addition, The Newcastle Connection is available as an In-Kernel implementation for Uniplus+ - based machines. This product, bundled with TCP/IP networking software is available through UniSoft/Root as ROOTnet. This uses the Uniform Datagram Service (UDS) over UDP.

Prices are available on application for Porting and License requirements.

2.25.8. MARBLE ASSOCIATES INC.

2.25.8.1. Marble CONNECT

PRODUCT-OR-PACKAGE-NAME: Marble CONNECT

DESCRIPTION:

CONNECT is a small collection of utility programs that run under the various Berkeley releases of UNIX for PDP-11's, VAXen, SUN Workstations, ISI Optima, and so forth. CONNECT creates and monitors a serial line connection for the purpose of maintaining continuous networking over often unreliable serial lines. After establishing the connection (it understands a wide variety of autodialer protocols, and it operates over leased- or hard-wires as well), CONNECT listens for loss-of-carrier and, in the event that the carrier is dropped, it re-establishes the connection ASAP. Currently CONNECT is being used with SLIP and Marble Serial IP to maintain ARPA-Ethernet connections over long distances using normal phone lines.

DOCUMENTATION:

2.25.9.1. BEANSTLK™ Micro-to-Mainframe product

PRODUCT-OR-PACKAGE-NAME: BEANSTLK™ Micro-to-Mainframe product

DESCRIPTION:

BEANSTLK is a terminal emulation product that allows you to link IBM PCs and existing data center mainframes across an X.25 packet switched network. Two versions of BEANSTLK are available: BEANSTLK/SPERRY emulates the Sperry Uniscope UTS20 terminal; BEANSTLK/IBM emulates an IBM 3270 terminal.

BEANSTLK offers cost effective integration of geographically dispersed terminals into an existing data network. BEANSTLK's IBM PC display terminals share databases and communication lines with terminal populations already in place, which optimizes PC utilization and avoids the enormous costs of adding equipment to the network.

In addition, BEANSTLK offers built in security with a configurable call password, and the capability to easily define and design a keypad customized to specific needs. With BEANSTLK, the keyboard utility also offers the opportunity to use either the standard or custom keyboard during terminal emulation.

Development of additional BEANSTLK versions are available. Call contact for more information.

2.25.10. RESEARCH TRIANGLE INSTITUTE

2.25.10.1. Research Triangle Institute FREEDOMNET

PRODUCT-OR-PACKAGE-NAME: FREEDOMNET

DESCRIPTION:

FREEDOMNET is a software subsystem developed by the Research Triangle Institute that can be added to physically interconnected, heterogeneous UNIX-based computers to allow a user to access the resources of all of the computers in the network in a transparent manner. FREEDOMNET hides issues of inter-processor communications and network protocols from the user and is applicable to a wide variety of both local and wide-area networks.

All standard UNIX features are unchanged by FREEDOMNET software in form and meaning, with inter-machine communication taking place as necessary. With FREEDOMNET software, it is possible, for example, for a user to access files and peripheral devices on a remote machine by specifying a directory on a remote machine as being his current working directory, requesting execution of a program on a remote machine, or redirecting input and/or output. These standard UNIX features can be used without the user's conscious concern for the fact that several machines and their peripherals may be involved. FREEDOMNET preserves all UNIX semantics in order to achieve transparency.

Because FREEDOMNET preserves all UNIX semantics, it provides true transparency from the user's point of view. This includes transparency in a heterogeneous environment where differences in machine architecture (and UNIX implementation) must be masked. The FREEDOMNET "stateful" server approach allows for remote device sharing and for remote execution of programs. The fact that the standard UNIX file naming syntax is used to refer to remote files and devices makes FREEDOMNET very easy to learn and use effectively. In addition, existing programs (UNIX commands and user-written applications) can be made "distributable" without modification due to the consistent naming scheme and preservation of all UNIX semantics. FREEDOMNET provides a basis for implementing high-performance, fault tolerant, and secure distributed computing systems.

FREEDOMNET is added to the UNIX kernel much like a standard device driver. No kernel source changes are required. FREEDOMNET uses the User Datagram Protocol (UDP) on Ethernet, but is implemented so as to be independent of network hardware and protocols.

2.25.11. SRI INTERNATIONAL

2.25.11.1. SRI TENEX/FOONEX/AUGUST

DESCRIPTION:

SRI has implemented TCP/IP for the TENEX (FOONEX and AUGUST) operating system running on DEC-10 KA or KI and F2, F3 or F4 Foonly processors. It was adapted from the BBN and ISI versions of TENEX TCP/IP, with contributions from Ed Taft of Xerox and Phil French of Tymshare, and resides in the operating system. It is largely upward-compatible with TOPS-20 implementations and fully compatible with AUGMENT. Telnet, FTP, SMTP, ICMP, ECHO, TIME, WHOIS, and NAME service are available although some are still under development.

This is an implementation done at BBN. DARPA has dropped funding for continued support for Tenex development, and thus the latest versions done for BBN and DEC for TOPS-20 are not available for Tenex.

2.25.12.1. Sirius Systems Internet-CT

PRODUCT-OR-PACKAGE-NAME: Internet-CT

DESCRIPTION:

A full implementation of TCP/IP for the Convergent Technologies workstation product line. This package includes the following link level drivers: IEEE 802.3 (Ethernet), SLIP, AX.25, and X.25 (Q4 1988). Full IP/ICMP is provided and can serve as both host and gateway.

A set of library routines is provided to permit user-written applications to make use of TCP and UDP. FTP, TELNET, and SMTP clients are provided as are FTP and SMTP servers. An OS specific peer-to-peer networking module is also available. VT-100 support is also available as an optional TELNET client.

Support and updates are provided for one year from date of purchase. Extended update and support service may be purchased. On-site training and installation service is also available.

DOCUMENTATION:

A user's manual including tutorial is provided with each copy of the software. Additional copies of the documentation may be purchased separately.

2.25.13. THE SOFTWARE GROUP LIMITED

2.25.13.1. The Software Group Limited X.25 Interface Package (XIP)

PRODUCT-OR-PACKAGE-NAME: X.25 Interface Package (XIP)

DESCRIPTION:

XIP is a portable implementation of the CCITT (1980 and 1984) X.25 protocol. It is a full implementation of the protocol, allowing not only full negotiation of per-call facilities, but also configuration via registration packets and operation in a multi-link environment using MLP.

Implementations of XIP have been certified in Europe (DATEX-P, PSS), North America (Tymnet, GTE Telenet), and the Far East (KDD).

DOCUMENTATION:

Functional Specification:

Describes the functional characteristics of the protocol implementation.

Porting Guide:

Defines the engineering steps to follow in porting XIP to a new hardware/software environment.

Internals Documentation:

Full description of the protocol implementation: state machines, buffer handling, code flow, process dispatching conditions and utility routines are all covered.

CPU:

XIP has been implemented on the following microprocessors: Intel 8086 family, Zilog Z8000, and Motorola 68000 family.

O/S:

Various real-time schedulers

IMPLEMENTATION-LANGUAGE:

C; some assembler for hardware handling

2.25.14.1. SpiderTCP Streams Implementation

PRODUCT-OR-PACKAGE-NAME: SpiderTCP Streams Implementation

DESCRIPTION:

SpiderTCP is a very high performance TCP/IP protocol running in the UNIX V.3 streams environment and supporting IP, ICMP, TCP, UDP and ARP. The utilities FTP, Telnet, and r-utilities are also supported. In the UNIX environment, these protocols form the basis of the Sun Network file system. The package also offers full gatewaying.

A unique streams emulator is available for any environment.

Also, to aid with testing Spider provides automated Alpha tests.

DOCUMENTATION:

Functional Specification: Implementation and Porting: Alpha test plan and report: Release note.

End-user documentation is provided in hardcopy and machine readable form. Purchasers of the software are able to modify the software to their own requirements.

CPU:

New release of software are developed on an AT&T 3B2. However, the software has been ported to the following environments: 286: 386: 6800: Cliper. Spider will consider porting to any environment.

2.25.14.2. SpiderX.25 Streams Implementation

PRODUCT-OR-PACKAGE-NAME: SpiderX.25 Streams Implementation

DESCRIPTION:

The world's first streams-based X.25 package. Spider X.25 provides a PAD, X.25 level III and LAPB. Both CCITT 1980 and 1984 specifications are fully supported. Also provided is LLC-2, which allows X.25 (84) to run over Ethernet. This is the Pink Book protocol set used by the UK Academic Community. To complete the package is an IP to X.25 raiter module which allows SpiderTCP (Spider's Streams based TCP/IP implementation) to interface with SpiderX.25.

DOCUMENTATION:

Functional Specification: Implementation and Porting: Alpha test plan and report: Release note.

End-user documentation is provided in hardcopy and machine readable form. Purchasers of the software are able to modify the software to their own requirements.

PRODUCT-OR-PACKAGE-NAME: ISONET

DESCRIPTION:

An advanced communications package which conforms to all OSI standards, ISONET provides a solid foundation on which to build your application. ISONET includes layers 1-5 of the OSI reference model. It contains a complete session layer which supports all functional units and subsets, including BAS, BCS, and BSS; a complete transport layer supporting all classes, 0 through 4; as well as optional support for X.25, IP (ISO 8473) and LLC (IEEE 802.2). ISONET is designed to be portable. With the protocol code separated from the working environment, only the system dependent part of the code need be modified when porting ISONET to a new operating system.

PRODUCT-OR-PACKAGE-NAME: Messenger 400

DESCRIPTION:

Messenger 400 is a multi-vendor communications program based on the CCITT recommendation for electronic messaging, X.400. It is compliant with NBS, CEPT, CEN/CENLEC standards and the OSI reference model. Messenger 400 includes all components of X.400: the Message Transfer Agent, User Agent and Reliable Transfer Service, plus session and transport layers, directory and distribution lists. It is available for use in X.25, DECnet, Bisync, Asynchronous and TCP/IP networks. Gateways have also been developed to such non-X.400 systems as PROFS, UUCP, and ARPAnet as well as having connected to public mail systems worldwide. Messenger 400 goes beyond electronic mail to allow application to application communications with or without human intervention.

2.25.16. U.C. BERKELEY

2.25.16.1. TN3270

PRODUCT-OR-PACKAGE-NAME: TN3270

DESCRIPTION:

A new version of tn3270, a program which emulates an IBM 3270 over the ethernet, has been available since August of 1987.

Significant changes to tn3270 are:

- Error messages, in English, overlay a portion of the screen when the user types an erroneous entry (invalid control sequence, attempt to enter data in an "input disallowed" field, etc.).
- Ability to "escape to shell". This, by itself, is mostly useful in an MS-DOS (or non-BSD) system.
- An Application Programming Interface (API). This allows programs, running under Unix or MS-DOS, to read and write the 3270 screen, and to send keystrokes (3270) to tn3270. This makes use of the "escape to shell" feature. Included in the (beta) distribution is a program which uses the API to receive files sent from the IBM host (we don't supply the IBM side at this point, and the rather stupid protocol is likely to change in the future).
- Yale ASCII/7171/4994 "transparent" mode should now be fully implemented. SAS-Graph, for example, supports doing graphics to TEK terminals over this interface. Locally, we use the X windowing system terminal emulator (xterm), which provides some TEK emulation, to display SAS-Graph graphics on our workstations.
- Mset now prints out program function (PF) keys in numerical order.
- Various bugs have been fixed.

DOCUMENTATION:

On-line manual pages contained in the distribution

CPU:

For BSD UNIX: Any

For MS-DOS: One needs to have the Ungermann-Bass smart TCP/IP board ("NIU").

O/S:

BSD UNIX or MS-DOS

IMPLEMENTATION-LANGUAGE:

For BSD UNIX: C

For MS-DOS: Microsoft C, version 4.0; Microsoft ASM, version 4.0; Polymake from Polytron (Hillsboro, Oregon)

DISTRIBUTOR:

Campus Software Office, UC Berkeley.

The new version is also available for anonymous ftp from host arpa.berkeley.edu, in directory pub, in file tn3270.tar or tn3270.tar.Z. The file should be retrieved in "binary" mode. These are large files (700 Kbytes and 300 Kbytes respectively), so requestors should consider ordering the product by mail instead of using ftp.

CONTACT:

2.25.17. UniSoft SYSTEMS

2.25.17.1. UniSoft Systems B-NET

PRODUCT-OR-PACKAGE-NAME: B-NET

DESCRIPTION:

B-NET is an enhanced implementation of 4.3BSD-compatible networking software for UNIX System V, Releases 2 and 3. It provides support for IP, ICMP, TCP, UDP, and ARP with user and server programs for Telnet, FTP, TFTP, and SMTP as well as the normal Berkeley UNIX tools for remote copy, execution, and login.

B-NET is designed to be compatible with RFCs and makes no claim of conformance to Military standards. There follows a table giving the standard to which each protocol (and client/server programs if appropriate) has been implemented:

IP	RFC 791
ICMP	RFC 792
TCP	RFC 793
UDP	RFC 768
ARP	RFC 826
subnet addressing	RFC 950
FTP	RFC 959
SMTP	RFC 821
TELNET	RFC 854
TFTP	IEN 133

DOCUMENTATION:

Documentation includes manual pages for the user programs, system calls, and library interfaces as well as programming and system administration guides.

CPU:

Currently supported on the Motorola 68000 family. Ports to other architectures are in progress. Contact our sales and marketing organization for current status (see "Sales/Marketing" in the CONTACT section).

O/S:

2.25.18. UNISYS CORPORATION

2.25.18.1. Network Solutions OPEN-Link for Unisys/Sperry OS1100

PRODUCT-OR-PACKAGE-NAME: OPEN-Link for Unisys/Sperry OS1100

DESCRIPTION:

OPEN-Link is a series of communications software and hardware products which meet the Defense Communication Agency MIL-STDs for the Defense Data Network, for use on any of the DDN networks, such as ARPANET, MILNET, etc. These products also conform to the conventions of the UNIX 4.2 BSD implementation of these protocols for use with the many popular UNIX based graphic workstations.

OPEN-Link supplies TCP/IP communication protocol software products, an Application Programming Interface to TCP functions for PASCAL and MASM, and the MIL-STD applications File Transfer (FTP), Virtual Terminal (TELNET), and Simple Mail Transfer (SMTP).

OPEN-link connects the Unisys/Sperry 1100 host to Ethernet or DDN X.25 networks through a channel attached Front End Processor. The X.25 connection can also be made certifiable to certain commercial X.25 networks such as GTE TELENET, TYMNET and others.

3. HARDWARE IMPLEMENTATIONS

3.1. AT&T TECHNOLOGIES

3.1.1. Advanced Computer Communications

3.1.1.1. ACC ACP 2250

PRODUCT-OR-PACKAGE-NAME: ACP 2250

DESCRIPTION:

This is a full-duplex communication front-end, utilizing 68000 microprocessor technology which attaches a AT&T 3B2 computer to a DDN PSN supporting Standard Mode X.25. The ACC implementation is in conformance at the link level to FED-STD-1041, FIPS PUB 100 and at the packet level to the DDN Host Interface Specification, Dec 1983. By using DMA data transfers directly across the 3B2 I/O bus and off-host protocol processing the ACP 2250 yields dramatic savings in host CPU loading.

When combined with hosts communication utilities such as the WIN/3B TCP/IP software package, the ACP 2250 provides a complete solution for 3B2 communication across the DDN.

DOCUMENTATION:

Fully documented vendor product; descriptive literature available

CPU:

68000 Processor for the ACP 2250. Interfaces directly to the 3B2 INPUT/OUTPUT Bus and will support 3B2/300, 3B2/310, 3B2/400, 3B2500, 3B2700, 3B4000 hosts

O/S:

3.2. ADVANCED COMPUTER COMMUNICATIONS

3.2.1. ACC ECU-11

PRODUCT-OR-PACKAGE-NAME: ECU-II

DESCRIPTION:

The Error Control Unit provides an error-controlled link for long distance connection of 1822 devices to PSNs. Data transfer between ECU-II units can take place at 1.5Mb/s when directly connected by a 4-pair low capacitance cable up to 914 meters (3000 feet) in length. Lower rates can be selected or determined by attached modem types 303, 209, V.35, or 188-114. Units are in pairs, one at each end of the communication link. The data rate is enhanced by elimination of the need for inter resource "handshaking" on every bit transferred. The units serve as store-and-forward buffers, receiving and buffering resource-generated data in semi-conductor RAMs, then forwarding it by special protocol to the ECU near the other resource device. Since the ECUs have two separate buffers they are capable of simultaneous receipt and transmission in each direction. ECUs communicate with the IMP via direct cable or modems.

3.2.2. ACC ACS 4020

PRODUCT-OR-PACKAGE-NAME: ACS 4020 DDN Transparent Gateway

DESCRIPTION:

The ACS 4020 is a standalone communications system which enables Ethernet hosts supporting the DoD standard Internet Protocol (IP) to communicate with users on the Defense Data Network (DDN), ARPAnet, NSFnet, or compatible networks. The ACS 4020 provides this access in a manner which is transparent to the hosts it is serving, without the need for complex routing protocols.

The ACS 4020 allows all systems attached to the LAN to share a single physical port on the DDN Packet-Switch Node (PSN). In effect, the ACS 4020 is a DDN "port expander" enabling the Ethernet to appear as part of the Internet environment. Multiple ACS 4020's can also be used to provide load-leveling and redundancy over the DDN.

DOCUMENTATION:

Fully documented vendor product; descriptive literature available

CPU:

Multiple 68000 Processors are used to optimize network connectivity.

3.4.2. Kinetics AppleTalk-Ethernet Gateway

PRODUCT-OR-PACKAGE-NAME: Kinetics FastPath/Standalone (KFPS)

DESCRIPTION:

The Kinetics FastPath/Standalone (KFPS) is a programmable AppleTalk-to-Ethernet gateway. Current gateway programs include AppleTalk protocols and IP protocols. In the IP version, IP packets originating from the Macintosh and encapsulated within AppleTalk protocols are decapsulated at the KFPS and routed using IP routing. Appletalk protocols originating from a Macintosh are encapsulated in IP protocols and routed to the destination, where they are decapsulated.

The KFPS is packaged in a 5.5" x 9.0" case, which contains power supply, a main logic board (Motorola 68008 CPU, Intel 82586 Ethernet chip, Zilog 8530 Serial Controller chip), a piggyback memory board (48K static RAM standard, expandable to 112K; 8K PROM standard, expandable to 128K), and a battery to backup the program and data in RAM.

Each KFPS is delivered with a Macintosh disk which contains both gateway program versions, and a configuration program which may be used to set network parameters and to download the gateway program to the KFPS. Kinetics supplies a Network Utilities disk which contains tools to help users to troubleshoot the AppleTalk network. In addition, users are supplied with a copy of NCSA Telnet, from the University of Illinois, which is TCP/IP Terminal Emulation and File Transfer package for the Macintosh.

DOCUMENTATION:

KFPS is shipped with a User Manual which describes its operation and its configuration within both AppleTalk and IP networks. Instructions for IP addressing and MacIP are also included.

PROPRIETY-STATUS:

KFPS and the AppleTalk gateway program are proprietary products of Kinetics, Inc. The IP gateway program contains code copyrighted by Stanford and Kinetics; it may be used, but not sold without permission. MacIP is Copyright 1985 (Carnegie-Mellon University); 1983, 1984 (Massachusetts Institute of Technology); and 1984 (Mark Sherman).

INFORMATION-UPDATED:

January 1988

3.4.3. Stanford Ethernet Appletalk Gateway

PRODUCT-OR-PACKAGE-NAME: Stanford Ethernet Appletalk Gateway (SEAGATE)

DESCRIPTION:

SEAGATE is a gateway that connects an Ethernet using the internet protocols, to an applebus (AppleTalk) using Apple or IP protocols. With such a gateway in place, it becomes possible to create server daemons to provide file, printing, mail, etc. services for Macintoshes.

This distribution of SEAGATE provides all the information and software you should need to setup your own gateway. Please bear in mind that this distribution is not "supported" and that we can't give extensive help about the mechanics of putting your gateway together. We would like to hear about bug reports or enhancements however.

To assemble your own gateway, you will need at least the items below:

- The hardware is a 3 card multibus system: A "SUN" (or Forward) 68000 CPU board, an Interlan NI3210 Ethernet card, and a homemade applebus card (about 8 chips) which takes an afternoon to wirewrap.
- A UNIX (usually VAX) running 4.2 BSD, 4.1 BSD or Eunice. This is because the source distributed is written in the PCC/MIT 68000 C compiler. [This is the same compiler included with the SUMACC Mac C cross development kit.] You can probably substitute any 68K C compiler and assembler, but it will be harder.
- Inside Mac, update service, and the Mac software supplement.
- Applebus Developer's Kit, includes: protocol manual, applebus taps and interconnecting cable, Mac applebus drivers on SONY disks.

Software usable through the gateway includes:

- MAT (Mac / ATP transfer program). A simple file transfer utility and daemon. Also serves as a skeleton application for general Mac transaction services. For example you could easily build a Mac program to read and create "internet mail" containing pictures and speech.
- EFS (external file system). Allows UNIX to act as a general file server for the Macintosh. The Mac user sees the standard "desktop" iconic model of his remote directory on UNIX. This software was written by John Seamons of LucasFilm and adapted by us for AppleTalk.
- TELNET and TFTP. These correspond to the UNIX programs used to access virtual terminal and file transfer services. The Mac programs here were developed by MIT (Romkey) / Dartmouth (Mark Sherman) and CMU (Tim Maroney). This software has been released by Tim to net.sources.mac (usenet) and is FTPTable from CMU.

The released material for all of the above includes source code and documentation. These files are currently publicly accessible on-line via FTP to our SUMEX host, in the <info-mac> directory. There are also tar magtapes available of SUMACC and INFO-MAC (which contains the seagate files). Magtape info:

The tape duplication company below charges \$65 to send each tape. This includes the new reel of tape and surface (book rate) postage. They will accept prepaid checks or money orders. Call the number below for additional info about postage for airmail or international mail.

Maria Code
Data Processing Services
Info-Mac TAR tape, and/or SUMACC TAR tape
1371 Sydney Drive
Sunnyvale, CA 94087
(408) 735-8006

DOCUMENTATION:

On [SUMEX]<info-mac> the files are:

seagate.ms documentation in -ms format

seagate.hard the wirelist for the applebus interface

seagate.shar1 the main gateway sources (including above docs)

seagate.shar2 the ddt, dlq, testsc, and tftp subdirectories

seagate-efs.shar the file service (client and server)

seagate-mat.shar the MAT service

All these files are plain ASCII and can be FTP'd from SUMEX with the "anonymous" login. The shar (shell archive) files are large so we would appreciate it if you would avoid transfers during 9 AM to 5 PM PST.

3.5. AYDIN MONITOR SYSTEMS

3.5.1. Mini TAC Model 4200

PRODUCT-OR-PACKAGE-NAME: Network Access Controller (AYNAC) Model 4200

DESCRIPTION:

The Aydin Monitor Systems' Network Access Controller (AYNAC) (trademark of the Aydin Corporation) is one of several models in Aydin's AYNAC product family. It provides a convenient way to interface subscribers terminals to the DDN. Its 16 subscriber ports can be individually configured for any combination of synchronous or asynchronous terminals. The AYNAC's User TELNET, a compatibility protocol, transforms a diversity of asynchronous conventions into a single, standard format. This format is acceptable to all DDN access controllers that support asynchronous hosts and terminals. It includes SNA/SDLC support.

3.5.2. TEP Model 4220

PRODUCT-OR-PACKAGE-NAME: Terminal Emulation Processor Model 4220

DESCRIPTION:

Aydin's TEP is the compliment of the Aydin Mini-TAC (AYNAC). The TEP provides a vehicle for interfacing subscriber hosts to the DDN. To a host computer, each port on the TEP looks and acts like a terminal. The TEP's 16 ports can be individually configured for any combination of synchronous or asynchronous hosts. The host needs no additional software or hardware: by emulating the distant terminal, the TEP makes itself and the DDN completely transparent. The TEP's Server TELNET, a compatibility protocol, transforms a diversity of asynchronous conventions into a single, standard format. This format complements the Mini-TAC's (AYNAC) User TELNET. When operating with an IBM host, the TEP emulates an IBM 327x controller. The TEP responds negatively to the host's general poll until receipt of a terminal service request message from a distant Mini-TAC (AYNAC). Only then is an end-to-end connection established. SNA/SDLC support is included.

3.6. BOLT BERANEK AND NEWMAN INC.

3.6.1. BBN-C/30

PRODUCT-OR-PACKAGE-NAME: BBN-C/30

DESCRIPTION:

The Terminal Access Controller (TAC) is a user Telnet host that supports the TCP/IP host-to-host protocols. It runs in a 64K C/30 computer. It supports up to 63 terminal ports, and connects to a network via an 1822 or HDH host interface. The TAC TCP/IP conforms with RFC791 and RFC793 specifications with the following exceptions:

- IP options are accepted but ignored.
- All TCP options except maximum segment size are not accepted.
- Precedence, security, etc. are ignored. The TAC also supports Packet core, TAC Monitoring, Internet Control Message Protocol (ICMP), and a subset of the Gateway-Gateway protocols.

For more information on the TAC's design, see IEN-166. All major features have been implemented except Class B and C addressing, IP reassembly, and TCP Urgent handling. These will be done in the near future.

PRODUCT-OR-PACKAGE-NAME: Terminal Servers

DESCRIPTION:

cisco Terminal Servers support from 16 to 96 RS-232 lines serving any combination of terminals, modems, PC's, serial printers, or RS-232 multiplexor ports. Up to 4 parallel printers may be attached. All standard RS-232 parameters may be configured on a per line basis. Data rates up to 38.4 kilobaud are supported, with autobaud detection from 300 to 19200 baud.

The servers support the TCP/IP and X.25 protocol suites. Telnet, rlogin, and SLIP protocols are supported as are domain style and IEN-116 name lookup services. PAD support is available for connection to X.25 networks. ISO terminal service will be available in Q3 '88.

Terminal Servers are available in 19-inch rack-mountable chassis with four (MSM model) or nine (ASM model) backplane slots. The four slot chassis will support up to 32 RS232 lines.

Ethernet/IEEE 802.3 or synchronous serial attachments at up to T1 speeds are available. All forms of DDN attachment are available, including DDN X.25 Standard and 1822-LH/DH, making the cisco terminal server function as a TAC. A cisco Terminal Server may be attached to any commercial X.25 network for PAD function. A Terminal Server may also act as a protocol translating gateway for Telnet and PAD terminal sessions.

3.8.2. cisco Systems Gateways

PRODUCT-OR-PACKAGE-NAME: cisco Multi-Protocol Gateway Servers

DESCRIPTION:

The cisco family of gateways are multi-protocol routers linking networks of heterogeneous hosts and media. All Gateway Servers are fully compliant with RFC 1009, "Requirements for Internet Gateways". In addition to the Internet Protocol, the cisco Gateway Server will route the DECnet, Chaosnet, and XNS protocols. The supported IP routing protocols are IGRP (cisco proprietary), EGP, RIP, and HELLO. cisco Gateway Servers may also be attached to X.25 networks to pass all the upper-level supported protocols (e.g. IP, DECnet). Upper-level ISO protocol support will be provided with the ISO release: ISO routing protocols will be added as they are defined.

cisco Gateway Servers are available in 19-inch rack-mountable chassis with four (MGS model) or nine (AGS model) backplane slots, in a portable 4-slot suitcase-enclosed chassis (PGS model), or a two-slot nonexpandable unit (CGS model).

Media: Ethernet/IEEE 802.3, 1822-LH/DH, HDH or 1822J, DDN X.25 Standard DTE and DCE, commercial X.25, synchronous serial at 2.4 to 56 kilobit and T1 (1.544 megabit) data rates.

3.9. COMMUNICATION MACHINERY CORPORATION

3.9.1. CMC-DRN-3200

PRODUCT-OR-PACKAGE-NAME: CMC DRN-3200 Ethernet to DDN Gateway

DESCRIPTION:

The CMC DRN-3200 DDN/Ethernet Gateway is a high performance network node which gives Ethernet-TCP/IP users access to the resources of the Defense Data Network (DDN), ARPAnet, or compatible networks. Messages from either DDN or Ethernet are sent to the DRN-3200, which reformats the communication for transmission over the other network. The Exterior Gateway Protocol (EGP) maintains routing tables and communicates with other known gateways to manage routing information. The Internet Protocol uses the routing tables to determine the next stop on the way to the message's final destination.

3.11.3. Software Kinetics, Ltd.

3.11.3.1. Software Kinetics X.Calibre Plus

PRODUCT-OR-PACKAGE-NAME: X.Calibre Plus

DESCRIPTION:

X.Calibre Plus package includes hardware and software to provide an interface between a host with TCP/IP and X.25 network. In addition, the X.Calibre Plus provides a software interface to ISO Level 1, 2, and 3 as specified in X.25. The software was implemented following the guidelines of RFC877 for the *Transmission of IP Datagrams over Public Data Networks* and is compliant with the DDN Standard X.25 Service.

The X.Calibre board contains a 68000 processor, up to 1 Mbyte of ram, two serial ports and a WD2511 X.25 Packet Network Interface to control a third serial port to the X.25 network or line.

Host level software support programs include a board loading utility, a network address table loading utility, a status monitoring utility, and device driver code to support Berkeley sockets and direct access to ISO (X.25) board functions. Current host operating systems supported include 4.2 BSD UNIX and DEC ULTRIX. The device driver is delivered in source form while utilities are binaries.

Board level software support includes interface to Levels 1, 2 and 3 of X.25, queue management, virtual circuit management, diagnostics, statistics, Internet to X.25 address resolution and host level interface. Board level software is delivered as binary that is loaded from the host. Diagnostics and test software for board functions is in ROM.

The X.Calibre Plus Package is available for DEC VAX QBUS and UNIBUS.

3.12. ENCORE COMPUTER CORPORATION

3.12.1. Annex-UX

PRODUCT-OR-PACKAGE-NAME: Annex-UX

DESCRIPTION:

The Annex-UX is a terminal server for Ethernet that uses TCP/IP. It has 16 or 32 asynchronous serial ports and one parallel printer port. Each serial port can support an auto-answer modem. Both rlogin and telnet protocols are supported, and each port can have up to three virtual terminal connections. The IP implementation interprets both ICMP redirects and 4.2 route daemon messages.

The Annex-UX has been successfully tested with 4.2 and 4.3bsd UNIX. Also included are IP subnet support, security features, and a editing front end capable of offloading standard Unix machines by handling simple editing operations within the Annex-UX.

DOCUMENTATION:

A two manual set is shipped with each Annex-UX. It consists of a Hardware Installation Guide and a Users Guide. A Network Administrators Guide is available for a nominal charge.

PRODUCT-OR-PACKAGE-NAME: Ford Multinet Gateway

DESCRIPTION:

The Ford Multinet Gateway development has been sponsored by the USAF Rome Air Development Center as a high performance multilevel secure communications gateway and is currently under evaluation by the Computer Security Center for A1 security status. The Multinet Gateway was designed to interconnect dissimilar networks and protocols using the DoD reference model for layered network architecture. The implementation supports IP, EGP, ICMP, X.25, 1822, HDH (message mode), IEEE 802.3/Ethernet and HDLC. The Multinet Gateway is available with end-to-end encryption. The DDN X.25 interface is certified at 56K BPS by the Defense Communications Agency. The Man-Machine interface includes a terminal and a printer for control and statistics.

3.14. HONEYWELL INFORMATION SYSTEMS

3.14.1. Protocom Devices

3.14.1.1. Protocom Devices P-Series PAD - Honeywell VIP/RLP/G115/HDLC/7700/7800

PRODUCT-OR-PACKAGE-NAME: P-Series PAD - Honeywell VIP/RLP/G115/HDLC/7700/7800

DESCRIPTION:

The Protocom P-Series PAD allows you to run Mapper, Demand, Sperrylink and the full range of Honeywell equipment over public and private packet switched networks that support CCITT X.25 1980/1984. The P-Series PAD is standard certified for up to 64 Kbps on all products for DDN. The Protocom P-Series PAD involves the TCP/IP protocol. P-Series PADs can be monitored and configured locally or remotely. Local area networking is supported via a line interface module for all P-Series PADs. The P-Series PADs are available in four versions:

- P250: 10 devices/printers are supported on 1 synchronous port
- P2500: Up to 40 terminals/printers are supported on 4 synchronous ports
- P160: This model consists of a varying number of protocol modules, each of which supports a separate protocol and up to 40 devices. Up to 240 sessions and six different protocols can be realized simultaneously at speeds reaching 56 Kbps. A network allows load sharing and call hunting.
- PC Based: A personal computer based PAD is also available that operates on IBM PC/XT compatibles and allows simultaneous emulation of multiple protocols on the PC Based network. This line of dual-ported interface cards supports up to 40 devices per card at speeds up to 19.2 Kbps. Two network ports are available to support redundancy and load sharing at speeds up to 64 Kbps.

All P-Series PADs offer the following features:

Independently mapped terminal and host addresses permit communication between any terminals and/or printers and any Honeywell application on the network. Three possible connections, two simultaneous user sessions on a single terminal, and host originated calls to shared printers are all supported. TurboMode (Protocom's proprietary data streaming) provides unequalled response time. Configurable user screens, mnemonic addressing and user defined function keys are also available.

3.15. IBM/COMPATIBLES

3.15.1. 3Com Corporation

3.15.1.1. 3Com PCS/1

PRODUCT-OR-PACKAGE-NAME: PCS/1 (Personal Communications System/1)

DESCRIPTION:

3Com offers the PCS/1, a high-performance TCP/IP LAN system for the PC. The PCS/1 provides TCP/IP, Telnet, FTP, and NetBios over Ethernet, Thin Ethernet, and broadband Local Area Networks for PCs running DOS. LAN support is provided through the 3Com Intelligent LAN Adapter, which features a 68000 microprocessor, 512K bytes of RAM, an 82586 LAN co-processor, and the choice of AT (16-bit) or XT (8-bit) bus interface. Protocol processing is off-loaded to the ILANA, increasing performance and reducing PC memory usage. Telnet features a unique programmatic interface that allows PC terminal emulation products to operate over Telnet, allowing many terminal types to be emulated, including VT100, VT220, VT240, HP, DG, and many others. IBM 3270 PC emulation, offering 3278/3279 emulation and IBM file transfer services, is also available for the PCS/1. PCS/1's NetBios support is compliant with RFC 1001 and 1002. 3Com network management capabilities are integrated into the PCS/1 product, including network audit trail. 3Com sells and supports the PCS/1 directly in the U.S. and international markets.

3.15.3.1. Frontier PC/AT-DDN

PRODUCT-OR-PACKAGE-NAME: Frontier PC/AT-DDN

DESCRIPTION:

Frontier Technologies Corporation has introduced a hardware and software package that allows IBM-AT's and compatibles to communicate over DDN. The hardware consists of an intelligent communications controller (AdCom2-I) with 1/2 Megabyte of local RAM and MIL-188-144, Mil-188C interfaces. The X.25 resides in the RAM on board and is executed by the local CPU (80188). The TCP/IP is loaded in the local RAM from the PC. The resident real time operating system (VRTX) allows the highest performance execution of X.25 and TCP/IP. The ADCom2-I also runs 3270 SNA/SDLC, 3270 Bisync, and Async terminal emulations. Implementation of FTP/TELNET/SMTP is done on the PC/AT side. The software is certified by DCA and runs on 386 machines such as Zenith Z386.

3.15.3.2. Frontier PS/2-DDN

PRODUCT-OR-PACKAGE-NAME: PS/2-DDN

DESCRIPTION:

Frontier's DCA Certified X.25 software is implemented to operate in the PS/2 microchannel architecture. The user could use only X.25 or X.25 with TCP/IP downloaded to the card. Driver's for different operating systems are provided. The DDN implementation has C2 security features available as options. The hardware consists of an intelligent communications controller with 1/2M RAM available for X.25 and TCP/IP code. Multitasking is provided on the card. FTP/SMTP/TELNET are available as an application program.

3.15.3.3. Frontier RT-DDN

PRODUCT-OR-PACKAGE-NAME: RT-DDN

DESCRIPTION:

Frontier Technologies Corporation has interfaced a hardware and software package that allows the IBM-RT's to be connected to the DDN. The hardware consists of an intelligent communications controller that executes the DCA certified X.25. The AIX driver is executed by the RT CPU. TCP/IP and FTP/TELNET/SMTP are installed on top of Frontier's DDN driver and are supplied with AIX from IBM. The X.25 code is downloaded to the card.

3.15.5. Proteon, Inc.

3.15.5.1. Proteon ProNET-4 Network

PRODUCT-OR-PACKAGE-NAME: ProNET-4 Network

DESCRIPTION:

The ProNET-4 network is a Token Passing Ring Network compatible with the IEEE 802.5 standard and the IBM Token-Ring Network standard. It operates at 4 megabits/second over the IBM cabling system or telephone cabling.

There are ProNET-4 network interfaces for:

- IBM PC
- IBM AT
- Multibus
- VMEbus

Some of the interfaces are intelligent, incorporating a 68020 processor to perform protocol processing.

TCP/IP implementations will be available for these boards, for a variety of operating systems.

The product line also includes Multi-Station Wire Centers, as well as interfaces supporting fiber optic links.

DOCUMENTATION:

All boards contain installation and programming manuals. Source code of device drivers is available for some boards as programming examples, a program development environment will be available for the intelligent interfaces.

3.15.6. The Software Group Limited

3.15.6.1. The Software Group Limited Netcom I

PRODUCT-OR-PACKAGE-NAME: Netcom I

DESCRIPTION:

Netcom I is a PAD (Packet Assembler/Disassembler) for IBM PC console users. It adheres to the X.25, X.3/X.29 protocols for communicating with a remote host, using its own easy-to-use command processor. Consisting of a Serial Controller and software to run it, it provides a multi-session PAD/intelligent terminal at the PC console.

DOCUMENTATION:

User manual supplied with the product covers installation, use and configuration

CPU:

Intel 8086/8, 286, Intel 386: IBM PC series or compatible machine

O/S:

PC-DOS or MS-DOS 2.1 or higher

IMPLEMENTATION-LANGUAGE:

C; Some Intel 8086/8 assembler for hardware handling

3.15.6.2. The Software Group Limited Netcom II

PRODUCT-OR-PACKAGE-NAME: Netcom II

DESCRIPTION:

Netcom II connects 286 or 386-based computers running the SCO Xenix operating system to public packet-switched networks around the world. Netcom II is a complete implementation of the X.25 protocol for AT-bus machines. Netcom II can run under any of the following operating systems: SCO Xenix (286), SCO Xenix (386), Interactive Systems 386/ix, or Microport System V/386. Netcom II can operate as either a packet-mode DTE or DCE, using either the 1980 or 1984 versions of the X.25 protocol.

CONNECT REMOTE USERS A remote user with access to a public data network can make a call to a Xenix host equipped with Netcom II and log in.

CONNECT USERS TO REMOTE HOSTS talkt, The Software Group's Packet Assembler/Disassembler (PAD) program, makes calls to remote hosts under a terminal user's control.

AUTOMATIC FILE TRANSFERS We supply software which allows the UNIX utility uucp to use X.25 Switched Virtual circuits to connect to other uucp hosts.

ELECTRONIC MAIL Using our uucp support, inter-machine electronic mail is simply a matter of identifying the machine (or path to the machine) as well as the username when invoking the mail utility.

OPEN SYSTEMS INTERCONNECTION (OSI) PROTOCOLS X.25 corresponds to the lowest three levels (Physical, Link, and Network) of the Open Systems Interconnection communications architecture. As Netcom II supplies an application interface which gives the programmer full control over Switched Virtual Circuit connections, it greatly reduces the effort required to develop OSI applications.

INCOMING CALL CONTROL A UNIX application can arrange to be informed of each and every call which arrives from the network. The application can choose to clear or accept the call, pass it to another application, or switch it to login.

FACILITY NEGOTIATION PC applications which use our X.25 application programming interface can access, without exception, any and all per-call optional facilities of CCITT X.25 1980 or 1984. In addition, Netcom II supports the additional features added in the 1984 version of the protocol (Multi-Link Support, Registration Packets, and OSI addressing extensions).

TECHNICAL DETAILS: Communications Hardware: 8 MHz Intel 80186, 512K RAM, 64K ROM
Multiple Links: two per communications card, up to 8 per system Data Rates: up to 64K bits per second (1 link)

DOCUMENTATION:

User manual supplied with the product covers installation, use and configuration. Source code examples provided illustrate the programmer interface.

CPU:

Intel 286, Intel 386: IBM PC-AT series or compatible machine

O/S:

SCO Xenix 2.1 or 2.2, for either the 286 or 386 processor in native mode, or Interactive Systems 386/ix or Microport System V/AT.

3.15.7. Ungermann-Bass, Inc.

3.15.7.1. Ungermann-Bass TCP-PC NETBIOS

PRODUCT-OR-PACKAGE-NAME: TCP-PC

DESCRIPTION:

TCP-PC is a combined software and hardware product for a personal computer. TCP-PC integrates both PC Networking and PC to host access into the autonomous personal computer environment. The Ungermann-Bass Personal NIU™, an intelligent communications controller, fits in a slot of any IBM compatible PC workstation. The NIU is used for protocol processing without requiring use of workstation resources. UNIX style user applications deliver File Transfer and remote login or Telnet capabilities. These facilities become a part of the extended MS-DOS or PC network environment. This is possible due to the NETBIOS interface that is an integral part of TCP-PC. Through NETBIOS a variety of network operating systems and applications can be supported. Finally a powerful Name Service extends the reach of PC Networking across subnetworks and even to multiple networks. Two optional components, a Name Service and C-Toolkit programmers library further enhance the ability of TCP-PC to enable the PC workstation to participate as an equal in the host-to-host TCP/IP environment.

DOCUMENTATION:

Four documents are available with the product set:

- Net/One TCP-PC Users Guide is appropriate for every PC user.
- Net/One TCP-PC Programmers Reference Manual is useful for technical staff writing to either the C-toolkit procedure library or the NETBIOS/assembler language style interface.
- Net/One TCP-PC Administrator's Guide and TCP Name Service Guide are intended for a site network administrator and sophisticated users who require detailed knowledge of installation and operation of the TCP-PC base and Name Service products.

3.15.7.2. Ungermann-Bass TCP-PC C-Toolkit

PRODUCT-OR-PACKAGE-NAME: TCP-PC C-Toolkit

DESCRIPTION:

The TCP-PC C-Toolkit is an optional component of the TCP-PC base product described earlier in this guide. The C-Toolkit provides "UNIX like" network programmatic access under MS-DOS by implementing all necessary 4.2 BSD procedure calls in compiler specific library modules. Programs can be ported from a Berkeley UNIX environment to MS-DOS with minimal effort. Four types of access are supported. The most common use is the TCP connection oriented interface. A transaction interface is also available at three levels: UDP, IP or raw data link packet formats. Additional advanced features in areas such as receive packet masks are useful in developing advanced applications using the PC as a platform. Separate libraries are available to support popular compilers, and different memory models for each compiler.

The base product is a combined software and hardware product for a personal computer. In addition to software it includes an Ungermann-Bass Personal NIU TM, an intelligent communications controller, fits in a slot of any IBM compatible PC workstation. The NIU is used for protocol processing without requiring use of workstation resources.

DOCUMENTATION:

The Net/One TCP-PC Programmers Reference Manual is intended for programmers writing to the C-Toolkit interface. In addition it contains information on the NETBIOS/assembler language style interface and other useful information on TCP/IP and the use of the Ungermann-Bass implementation.

February 1988

3.15.7.3. Ungermann-Bass TCP-PC/XENIX

PRODUCT-OR-PACKAGE-NAME: TCP-PC/XENIX

DESCRIPTION:

TCP-PC/XENIX is a combined software and hardware product for personal computers using the XENIX operating system. It is designed to work in cooperation with XENIX-NET (R) - which is available from the Santa Cruz Operation. SCO XENIX-NET, SCO'S packaged version of Microsoft(R) Networks for XENIX Systems, provides a transparent distributed file system for multiple XENIX and DOS machines on a local-area network. TCP-PC/XENIX and XENIX-NET provide a seamless server and workstation network for MS-DOS based computers. The combination of TCP-PC and SCO XENIX-NET makes available an integrated file system between MS-DOS (R) and XENIX environments. In addition, the extended features of TCP-PC provide internetwork access to users of both operating systems. XENIX-NET version 1.2 supports an interface to the Ungermann-Bass Net/One PC network operating system as well as other products supporting the MS-NET redirector. In addition a NETBIOS interface allows porting of MS-DOS applications directly to the XENIX environment. This will allow communication among a wide variety of applications that can be hosted on XENIX-based systems and MS-DOS based computers when both are equipped with Ungermann-Bass Network Interface Units. An additional feature of TCP-PC/XENIX is that XENIX based stations can take advantage of the powerful Name Service capabilities of Net/One TCP that extends the reach of PC Networking across subnetworks and to multiple networks.

DOCUMENTATION:

XENIX-NET is supplied with a user manual. TCP-PC/XENIX will include a hardware installation manual and software installation instructions.

3.16. IBM MAINFRAMES

3.16.1. Advanced Computer Communications

3.16.1.1. ACC IF-370/DDN

PRODUCT-OR-PACKAGE-NAME: IF-370/DDN

DESCRIPTION:

The IF-370/DDN provides a full-service interface between an IBM MVS or VM host and the DDN. Its hardware and software subsystems connect the IBM block multiplexer channel to the DDN PSN, supporting DDN Standard Mode X.25 and HDH (1822-J) protocol access. The IF-370/DDN is capable of supporting T1 access to the PSN, through the use of 68000 microprocessor technology. The hardware interface is a front-end processor that performs three levels of protocol functions and interfaces to host-resident software sub-system implementing the high-level DoD protocols. These software modules can be either the ACCES/MVS package for MVS systems, or the IBM VM Interface Program for TCP/IP.

CPU:

IBM-370, 43xx, 30xx, and any IBM-compatible machine which supports a FIPS-60 channel interface.

3.16.1.3. ACC ACS 1030

PRODUCT-OR-PACKAGE-NAME: ACS 1030

DESCRIPTION:

The ACS 1030 is a stand-alone communications system that allows standard IBM SNA devices to access the DDN, in a totally transparent manner. Connecting to existing line sets on IBM 37x5 front-end processors (or compatible) at the host site(s), and to the RS232 port on a remote device (e.g. 3274), the ACS 1030 permits the replacement of existing leased line communications facilities with the DDN. TCP/IP is fully supported and is implemented in sub-system firmware. The ACC implementation is in conformance at link level to FED-STD-1041, FIPS PUB 100 and at packet level to DDN X.25 Host Interface Specification, Dec. 1983. Network and host data rates supported are in excess of 64 Kbps.

3.16.2. ADVINTECH Corporation

3.16.2.1. ADVINTECH FEP

PRODUCT-OR-PACKAGE-NAME: ADVINTECH FEP

DESCRIPTION:

ADVINTECH Corporation builds and supports products that extend the Defense Data Network (DDN). The ADVINTECH TAC, FEP and HFS interconnect IBM 3270 or compatible SNA/SDLC or BSC terminal controllers and devices to IBM or PCM MVS-VTAM computer systems on the DDN providing native mode terminal operation (3270 Data Stream) with the host and the full suite of Department of Defense (DoD) protocols. ADVINTECH products also connect IEEE 802.3 Local Area Networks with IBM MVS systems and the DDN. These products are TCP/IP based and fully interoperable.

FEP models connect IBM or plug compatible MVS-ACF/VTAM host computers to the DDN, IEEE 802.3 LANs and/or T-1 circuits. The FEP is a Front-End Processor communications control unit (FEP) that appears to MVS as a 3274 channel attached terminal control unit. It can readily co-exist with other vendors FEPs or other ADVINTECH FEPs on the host computer. The FEP has full TCP/IP capability used in support of DDN protocols and the 3270 native mode protocols. The FEP provides a direct host connection for native modes 3270 terminals via ACF/VTAM. The terminals appear as 3270 Display Stations or Printers. Users are provided a full service DDN interface to all facilities on the host. ADVINTECH's HFS manages these connections through the Service Access Protocol Interface (SAPI).

FEP Product Summary:

The FEP is a data communications front-end processor that connects to an IBM or PCM (Plug Compatible Manufacturer) MVS ACF/VTAM computer system via a Multiplexer Channel utilizing one subchannel address. It connects to the DDN via an RS-449/422 or RS-232-C interface utilizing X.25 Standard and TCP/IP Protocols. The FEP has a power switch, a reset switch, twelve indicator lights, two Asynchronous ASCII Maintenance Ports (RS-232-C) and a four foot 110 volt power cord with a three pronged (grounded) plug.

The FEP hardware is built on a Multibus (IEEE 796 BUS) structure utilizing Motorola 68000 technology. Two single board computers are utilized with an IBM channel interface board as the core of each FEP model. Additional boards and interfaces are added to provide the different models.

ADVINTECH FEP models include:

- FEP-01: one LAN interface using IEEE 802.3 standard Baseband connection via a Transceiver and 50 foot cable provided with the unit.
- FEP-10: one DDN interface using RS-449/422 at 56 Kbps.
- FEP-10C: one DDN interface using RS-232-C (up to 19.2 Kbps) externally clocked.
- FEP-11: one DDN interface using RS-449/422 at 56 Kbps and one Local Area Network (LAN) interface utilizing the IEEE 802.3 standard.
- FEP-11C: provides one DDN interface using RS-232-C (up to 19.2 Kbps) externally clocked and one Local Area Network (LAN) interface utilizing the IEEE 802.3 standard.

DOCUMENTATION:

FEP Systems Reference Guide

CPU:

No CPU requirement. ADVINTECH's FEP products are Motorola 68000 based and is coupled with ADVINTECH hardware for interfacing to the DDN and other media.

O/S:

ADVINTECH's FEP is based on RTOS, an ADVINTECH proprietary operating system.

3.16.2.2. ADVINTECH TAC

PRODUCT-OR-PACKAGE-NAME: ADVINTECH TAC

DESCRIPTION:

ADVINTECH Corporation builds and supports products that extend the Defense Data Network (DDN). The ADVINTECH TAC FEP and HFS interconnect IBM 3270 or compatible SNA/SDLC or BSC terminal controllers and devices to IBM or PCM MVS-VTAM computer systems on the DDN providing native mode terminal operation (3270 Data Stream) with the host and the full suite of Department of Defense (DoD) protocols. ADVINTECH products also connect IEEE 802.3 Local Area Networks (LAN) with IBM MVS systems and the DDN. These products are TCP/IP based and are interoperable.

The ADVINTECH TAC connects IBM 3270 or compatible terminal control units and devices (Display Stations and Printers) to the DDN. Support is provided for 3270 control units and terminals as native mode devices connecting across the DDN (using TCP/IP) to any ADVINTECH FEP at the host, or as a Telnet Network Virtual Terminal (NVT) for access to any DDN host computer supporting Telnet NVT.

TAC3270 Product Summary:

The ADVINTECH TAC is a data communications controller for use on the DDN (or directly attached to an IEEE 802.3 Baseband LAN). Up to 128 terminal devices can be connected to the TAC via IBM 3270 terminal control units attached to the six Terminal Ports. These ports support point-to-point or multidrop configurations at speeds up to 19.2 Kbps using either SDLC or BSC protocols on an RS-232-C interface. It connects to the DDN via an RS-449/422 or RS-232-C interface utilizing X.25 Standard and TCP/IP Protocols. The TAC has a power switch, a reset switch, twelve indicator lights, two Asynchronous ASCII Maintenance Ports (RS-232-C) and a four foot 110 volt power cord with a three pronged (grounded) plug.

The ADVINTECH TAC hardware is built on a Multibus (IEEE 796 BUS) structure utilizing Motorola 68000 technology. Two single board computers are utilized with a port extension card as the core of each TAC model.

ADVINTECH TAC models include:

- TAC-01: one LAN interface using IEEE 802.3 standard Baseband connection via a Transceiver and 50 foot cable provided with the unit. It is a companion unit to the FEP, and the FEP-31, all of which provide IBM host computer connection to an IEEE 802.3 Baseband LAN (available in the 2nd quarter 1988).
- TAC-10: one DDN interface using RS-449/422 at 56 Kbps.
- TAC-10C: one DDN interface using RS-232-C (up to 19.2 Kbps) externally clocked.
- TAC-11: one DDN interface using RS-449/422 at 56 Kbps and one Local Area Network (LAN) interfacing utilizing the IEEE 802.3 Standard.

DOCUMENTATION:

TAC Systems Reference Guide

CPU:

No CPU requirement. The FEP and TAC ADVINTECH products are Motorola 68000 based and are coupled with ADVINTECH hardware for interfacing to the DDN and other media.

O/S:

ADVINTECH's TAC is RTOS based, an ADVINTECH proprietary operating system.

3.16.3. Fibronics International, Inc.

3.16.3.1. Fibronics K200

PRODUCT-OR-PACKAGE-NAME: K200

DESCRIPTION:

The K200 Ethernet controller provides a high-speed interface between an IBM 370, 30xx or PCM and the Ethernet local-area network. The K200 is a microprocessor driven control unit that attaches to IBM's block multiplexer channel using standard IBM bus and tag cables. K200 implements the physical and data link layers of the ISO/OSI Reference Model for network architecture and conforms to the specifications for Ethernet, version 1.0. Maximum throughput is in excess of 2.5 megabits per second.

3.16.3.2. Fibronics K310 T1/Ethernet System

PRODUCT OR PACKAGE NAME: K310 T1/Ethernet System

DESCRIPTION:

The K310 Ethernet controller pair provides a high-speed interface between an IBM 370, 30xx or PCM and a remote Ethernet local-area network over T1 or high-speed communication lines. The K310H is a microprocessor driven control unit that attaches to IBM's block multiplexer channel using standard IBM bus and tag cables and to a communication link. The K310E attaches to a high-speed communication link on the Ethernet. The K310 implements the physical and data link layers of the ISO/OSI Reference Model for network architecture and conforms to the specification for Ethernet, Version 1.0. Please see KNET VM and/or KNET MVS in the Software section.

3.16.4. Protocom Devices

3.16.4.1. Protocom Devices P-Series PAD - IBM 3270BSC/SNA-SDLC/2780/3780

PRODUCT-OR-PACKAGE-NAME: P-Series PAD - IBM 3270 BSC/3270, SNA-SDLC/2780/3780, HASP, SNA Fid 3, SDLC

DESCRIPTION:

Protocom P-Series PADs allow you to run a full range of IBM equipment over public and private packet switched networks that support CCITT X.25 1980/1984. The P-Series PAD is standard certified for up to 64 Kbps on all products for the DDN. The Protocom P-Series PAD involves the TCP/IP protocol. P-Series PADs can be monitored and configured locally or remotely. Local area networking is supported via a line interface module for all P-Series PADs. The P-Series PADs are available in four versions:

- P250: 10 devices/printers are supported on 1 synchronous port
- P2500: Up to 40 terminals/printers are supported on 4 synchronous ports
- P160: This model consists of a varying number of protocol modules, each of which supports a separate protocol and up to 40 devices. Up to 240 sessions and six different protocols can be realized simultaneously at speeds reaching 56 Kbps. A network allows load sharing and call hunting.
- PC Based: A personal computer based PAD is also available that operates on IBM PC/XT compatibles and allows simultaneous emulation of multiple protocols on the PC Based network. This line of dual-ported interface cards supports up to 40 devices per card at speeds up to 19.2 Kbps. Two network ports are available to support redundancy and load sharing at speeds up to 64 Kbps.

All P Series PADs offer the following features:

Independently mapped terminal and host addresses permit communication between any terminals and/or printers and any IBM application on the network. Three possible connections, two simultaneous user sessions on a single terminal, and host originated calls to shared printers are all supported. TurboMode (Protocom's proprietary data streaming) provides unequalled response time. Configurable user screens, mnemonic addressing and user defined function keys are all available.

3.17. IMAGEN CORPORATION

3.17.1. Imagen ImageServer 2308

PRODUCT-OR-PACKAGE-NAME: ImageServer XP Model 2308 TCP/IP Ethernet

DESCRIPTION:

All products in the ImageServer XP Series achieve true page throughput rates with its proprietary Real-Time Rasterization process which lets you print at full speed because processing and printing are handled simultaneously. All models in this series are compatible with a broad choice of interfaces including Ethernet, RS-423, IBM 3270 and 2780/3780, Centronics, Dataproducts and Versatec. IMAGEN offers a large selection of optional fonts on all products including Lucida, Lucida Sans, Helvetica, Times Roman, and Century Schoolbook.

The ImageServer XP Model 2308 8PPM 300 DPI laser printer includes a Canon LBP-CX print engine, an IMAGEN IP/II Image Processor, a single floppy disk drive and one 8 1/2 x 11" input cassette tray. The 2308 is available in 1, 2, and 3 Mbyte configurations with memory options to include up to 3 additional megabytes of RAM. An optional 20 Mbyte Winchester can be included to allow faster access of fonts and storage of forms or special document formats. The ImageServer XP Model 2308 desktop laser printer is IMAGEN's versatile entry level document processing system designed to meet the publishing needs of small work groups requiring high-quality printing of text and graphics.

3.17.2. Imagen ImageServer 3320

PRODUCT-OR-PACKAGE-NAME: ImageServer XP Model 3320 TCP/IP Ethernet

DESCRIPTION:

All products in the ImageServer XP Series achieve true page throughput rates with its proprietary Real-Time Rasterization process which lets you print at full speed because processing and printing are handled simultaneously. All models in this series are compatible with a broad choice of interfaces including Ethernet, RS-423, IBM 3270 and 2780/3780, Centronics, Dataproducts and Versatec. IMAGEN offers a large selection of optional fonts on all products including Lucida, Lucida Sans, Helvetica, Times Roman, and Century Schoolbook.

The ImageServer XP Model 3320 20PPM 300 DPI laser printer includes a Canon LBP-20 print engine, an IMAGEN IP/II Image Processor, a single floppy disk drive and two 8 1/2 x 11" input cassette trays. The 3320 is available in 2 or 3 Mbyte configurations with memory options to include up to 3 additional megabytes of RAM. An optional 20 Mbyte Winchester can be included to allow faster access of fonts and storage of forms or special document formats. The 3320 is driven by a page description language and can handle 11 x 17" paper format. This unit is perfect for use as a proofing device in CAE/CAD applications and for large volume document processing applications where high duty cycle, offset quality printing, and low cost of operation are important.

3.17.3. Imagen ImageServer 4324

PRODUCT-OR-PACKAGE-NAME: ImageServer XP Model 4324 TCP/IP Ethernet

DESCRIPTION:

All products in the ImageServer XP Series achieve true page throughput rates with its proprietary Real-Time Rasterization process which lets you print at full speed because processing and printing are handled simultaneously. All models in this series are compatible with a broad choice of interfaces including Ethernet, RS-423, IBM 3270 and 2780/3780, Centronics, Dataproducts and Versatec. IMAGEN offers a large selection of optional fonts on all products including Lucida, Lucida Sans, Helvetica, Times Roman, and Century Schoolbook.

The ImageServer XP Model 4324 24PPM 300 DPI laser printer includes a Xerox SP-24 print engine, an IMAGEN IP/II Image Processor, a single floppy disk drive and two 8 1/2 x 11" input cassette trays. The 4324 is available in 2 or 3 Mbyte configurations with memory options to include up to 3 additional megabytes of RAM. An optional 20 Mbyte Winchester can be included to allow faster access of fonts and storage of forms or special document formats. With superior paper management capabilities including 11 x 17" paper handling and offset stacking the 4324 is designed to meet the needs of work group document processing and CAE/CAD applications.

3.18. MITRE CORPORATION

3.18.1. Mitre NAC

PRODUCT-OR-PACKAGE-NAME: Mitre Network Access Component

DESCRIPTION:

This is MITRE's second generation network controller (see ZILOG-Z8000). Using an expanded hardware base, industry standard backplanes and multiple microprocessor boards, MITRE has built a MCS-68000-based network access component. This network component has both MULTIBUS and VERSABUS form factors and broadband, Ethernet and 1822 network interfaces.

The standard MULTIBUS network component contains an OMNIBYTE-dual-ported 68000, with 128K bytes dynamic RAM, and 96K bytes EPROM, a memory board, and a Bridge serial i/o (SIO) interface board. The SIO board has its own 68000 cpu, 8 serial ports, 4K bytes RAM and 32K bytes ROM. The long-haul network version contains an ACC MULTIBUS-1822 interface. The VERSABUS version supports an ACC VERSABUS-1822 interface. In addition, the VERSABUS version supports an ACC VERSABUS-UNIBUS interface for host-interfacing to DEC machines.

The software is written in "C" and runs under CMOS, a "C" version of SRI's Micro Operating System. In addition to supporting TCP, IP, ICMP, and the appropriate network level protocol, the network front-end version (aka a host interface unit for the LAN environment) supports both the DTI-Host-to-Front-End Protocol and a MITRE Network Access Protocol.

INFORMATION-UPDATED:

February 1988

3.18.2. Mitre Z8000

PRODUCT-OR-PACKAGE-NAME: MITRE Zilog Z8000

DESCRIPTION:

This is MITRE's first generation network controller. It is the product of a series of MITRE projects aimed at making network access (both local and long-haul) as straightforward as computer peripheral access. Microprocessors make it possible to construct a "network controller" that handles the particulars of packet ordering and flow control in the same way that hardware controllers handle the particulars of disk cylinder centerline or an end of tap sensor. This TCP/IP network controller, supported by a Z8000 microprocessor box, is currently interfaced to a number of UNIX systems via a UMC-Z80. The outboard box is accessed by a set of I/O-like management calls (open, close, read, write, and special) which transport TCP requests via a network access protocol.

The outboard box has 64K bytes of RAM, 32 bytes of ROM, a Z8002 micro, and a serial USART (880K BPS max.) All of the software was written in C using an in-house version of the portable C compiler. The unit interfaces as easily to a local network as it does to the DDN. All that is necessary for this conversion is the addition of an ACC-1822 hardware device and a new device driver. Other than different round trip delays, host user-level software sees no difference between the two network devices. The resulting set of Z8000-based building blocks supports host interface unit and a terminal concentrator on the local net.

Performance with TCP/IP has been measured with two user processes talking via TCP/IP over the cable at 350K BPS. Rates as high as 450K BPS occur when user I/O buffer sizes are set at 8K bytes per I/O. The Internet Protocol contains the lowest level of addressing. This allows for local units to be addressed in the same way remote units, two or three networks away, are addressed. The effect of 300 bit TCP/IP headers has negligible impact on performance.

3.18.3. Mitre CMOS

PRODUCT-OR-PACKAGE-NAME: TCP/IP for CMOS systems

DESCRIPTION:

An implementation of Department of Defense (DoD) communication protocols Internet Protocol (IP) and Transmission Control Protocol (TCP) which implement options specified in MIL-STD 1777 and MIL-STD 1778. IP options STREAM, ROUTING, TIMESTAMPS, and new draft SECURITY are implemented. TCP option MAX SEGMENT LENGTH is implemented as well as precedence.

DOCUMENTATION:

Documents describing the OS and the TCP/IP implementation can be obtained from MITRE document control.

DISTRIBUTOR:

The Mitre Corporation
7525 Colshire Drive
McLean, VA 22102

CONTACT:

The current contact(s) for the TCP/IP & CMOS distribution tape are:

Manette Charny, (charny@mitre-gateway.arpa), (703) 883-6728 Mailstop: W425, The Mitre Corp (see address above); and Daryl Crandall, (daryl@mitre-gateway.arpa), (703) 883-7278 Mailstop: H4132, The Mitre Corp (see address above)

ORDERING-PROCEDURE:

The requester should send to MITRE:

1. 2400 foot reel of 1/2 inch magnetic tape capable of handling 1600 bpi
2. Letter indicating the following:
 - Who they are
 - What our software is to be used for; equipment and operating system being used by them.
 - Tape format desired: only format possible is Berkeley 4.2 UNIX tar, 1600 bpi, and any blocking factor 1 through 20. (20 by default)
 - They agree to the four conditions listed below.

The software is distributed free of charge with the following conditions:

1. The MITRE TCP/IP source files won't be passed on to third parties. If someone wants them, have them contact us. We just want to know who has what, and what it is being used for.
2. MITRE will be credited should the software be used in a product or written about in any publication. However, MITRE will not be referenced as the source in advertisements.
3. MITRE assumes no legal responsibility for source code and its subsequent use. No warranty is expressed or implied.
4. If any bugs or problems are found then they should be reported back to MITRE.

NOTE:

It takes a good "hacker" to interpret and install the software provided from this office.

3.20. PROTEON, INC.

3.20.1. Proteon p4200 Gateway

PRODUCT-OR-PACKAGE-NAME: Proteon p4200 Gateway

DESCRIPTION:

The p4200 gateway is a multiprotocol router, supporting (among other protocols) TCP/IP. It is a complete system consisting of a CPU, memory, and a wide variety of LAN and WAN interfaces. The LAN interfaces include:

- ProNET-4
- ProNET-10
- ProNET-80
- Ethernet

The WAN interfaces include:

- DDN 1822 (LH & DH)
- Synchronous up to 64 kbaud (for DDS)
- Synchronous up to 2.048 Mbaud (for T1)

The hardware is based on a Multibus 68010, with a watchdog timer that prevents hung software from taking the gateway out of service. The unit boots over one or more of the LAN interfaces, using TFTP, to avoid the unreliability of floppy disks.

All configuration information is stored in battery-backed-up static RAM, allowing user-reconfiguration. The support code for the interfaces includes periodic self-testing, so that failed interfaces or networks will be disabled, allowing the routing protocols to find new routes.

The TCP/IP implementation includes support for IP, ICMP, EGP, and presently uses the RIP protocol as an internal routing protocol. A server Telnet module allows access to the console capabilities, providing statistics, logging, and tracing capabilities. The IP includes support for subnetting.

Additional protocols can be added to the software, such as DECnet or XNS, to allow one backbone network to serve all of the protocols in use on a given internetwork.

DOCUMENTATION:

Documentation includes full manuals on the software, including all trace messages.

3.22. SCOPE INCORPORATED

3.22.1. Scope DDN MicroGateway

PRODUCT-OR-PACKAGE NAME: DDN MicroGateway

DESCRIPTION:

The DDN MICROGATEWAY is a single board product which implements the MIL Standard TCP/IP as well as ICMP and lower layer link and network protocols - either FIPS 100/X.25 or 1822/HDH.

Using a Motorola 68008 microprocessor, the DDN MICROGATEWAY provides full-service host support at 56K bits per second, and it will accommodate up to 64 TCP/IP sessions with its shared memory interface.

A companion DDN MICROGATEWAY software product support host TELNET, FTP, and SMTP applications, thus offering a total turn-key solution for certain UNIX operating system environments.

DOCUMENTATION:

A user's manual describes product design and provides information on how to integrate the DDN MICROGATEWAY into the user's host hardware and operating system environment.

CPU:

Single board implementations for MULTIBUS, IBM-PC Bus, VMEBus and Concurrent Computer MUX Bus

O/S:

Board product is not O/S specific. ULPs are based on UNIX 4.2 BSD or UNIX System V. Other O/S's are available.

3.23. SPIDER SYSTEMS LIMITED

3.23.1. SpiderPort

PRODUCT-OR-PACKAGE-NAME: SpiderPort

DESCRIPTION:

SpiderPort with TCP/IP software is an Ethernet based terminal and peripheral concentrator with permanent virtual circuits. It allows up to 10 asynchronous devices (e.g. terminals, printers) to access host computers that support TCP/IP and Telnet.

There are 5 types of line connection, Terminal, Slave, Bothway, Demand, and Permanent. All lines are serial and support speeds up to 38.4 Kbps with automatic baud rate detection.

User control allows Local or Remote Network Management with password protected access so that Ethernet, Error, and Connection status reports can be viewed continually.

A Test and Configure Mode can be selected at power up or from a boot request. A Boot Server enables SpiderPort to boot from its own memory or load software across the network.

3.24. TANDEM COMPUTERS

3.24.1. Fail-safe Computer Systems TCP/LINK

PRODUCT-OR-PACKAGE-NAME: TCP/LINK

DESCRIPTION:

The TCP/IP protocol family is a collection of individual protocols that implement a solution for high speed multi-vendor connectivity problems. Each individual protocol addresses a distinct aspect of the total network solution. The TCP/LINK product provides support for the following individual protocols:

File Transfer Protocol (FTP) provides for the transfer of files between the Tandem file system and other hosts or workstations on the network. Other FTP operations such as rename, delete, etc. are supported.

TELNET Protocol allows for the connection of a user on another host or workstation to the Tandem-based TCP/LINK environment. This TELNET session is typically employed to allow user entry of the FTP commands.

Transmission Control Protocol (TCP) is a reliable connection oriented transport protocol. Both FTP and TELNET employ the TCP protocol for their transport mechanism.

User Datagram Protocol (UDP) is a datagram oriented transport layer protocol, offering higher transfer speeds than TCP.

Internet Protocol (IP) is oriented to the interconnection of communications subnetworks.

Using the TCP/LINK product, your Tandem system may now achieve high speed connectivity to a wide range of other systems such as UNIX-based workstations or personal computers, MS-DOS based PC's, and a wide variety of mainframes.

This family of protocols had rapidly become the leading vendor independent means of interconnecting dissimilar computer systems. TCP/IP is widely used in many industries such as government, manufacturing, brokerage, securities, and education to name just a few.

Using the TCP/LINK product, your Tandem system may now fully participate in any existing TCP/IP network, or a new network may be deployed to achieve connectivity with other computer systems.

The TCP/LINK product is completely compatible with the Tandem product line and is implemented in conjunction with Tandem's MULTILAN product. A high speed IEEE 802.3 network adapter card is placed in each MLAD, providing the low-level interface to a baseband ETHERNET local area network.

3.25. TEKTRONIX, INC.

3.25.1. Tektronix 6130 Intelligent Graphics Workstation

PRODUCT-OR-PACKAGE-NAME: 6130 Intelligent Graphics Workstation

DESCRIPTION:

The Tektronix Model 6130 is a UNIX 4.2 BSD & System V based workstation that has a 32-bit processor, 1 megabyte of parity memory (with 16 MB virtual addressability), 20 megabyte winchester (expandable to 40 or 80 MB), dual RS-232-C interfaces, Local Area Network (LAN) interface and ethernet TCP/IP with Distributed File System (DFS) software and a General Purpose Interface Bus (GPIB) all standard. The system can be expanded with additional disks, interfaces, streamer tape drives and software products.

The 6130 uses the ethernet standard (IEEE 803.2) with Transmission Control Protocol/Internet Protocol (TCP/IP) which handles the communications between a users program and other processes executing on the same workstation, at a different workstation on the LAN, or on a different network. The 6130 supports the File Transfer Protocol (FTP), the Simple Mail Transfer Protocol (SMTP) and the Virtual Terminal (Telnet). Tektronix has implemented a Distributed File System that allows a workstation to access files on other workstations as though they were resident locally. The 6130 can support up to 14 RS-232 terminals although 2 or 3 users per system is recommended.

DOCUMENTATION:

The documentation set that is included with the 6130 consists of ten well written manuals which cover system installation, operations, system administration, and extensive reference material. Over 40 other manuals are available which describe the language compilers, statistical software, spreadsheet programs, and other software and enhancement products.

CPU:

The 6130 uses the National Semiconductor 32000 Family of processors; the CPU is the NS 32016 with the NS 32081 Floating Point Unit.

3.26. UNISYS CORPORATION

3.26.1. Protocom Devices

3.26.1.1. Protocom Unisys/Burroughs P-Series PAD - Unisys/Burroughs Poll/Select

PRODUCT-OR-PACKAGE-NAME: P-Series PAD - UNISYS/BURROUGHS RJE/BDLC, POLL SELECT SYNCHRONOUS AND ASYNCHRONOUS/POLL SELECT TO SPERRY DTP

DESCRIPTION:

Protocom P-Series PADs allow you to run a full range of Burroughs equipment over public and private packet switched networks that support CCITT X.25 1980/1984. The P-Series PAD is standard certified for up to 64 Kbps on all products for the DDN. P-Series PADs can be monitored and configured locally or remotely. Local area networking is supported via a line interface module for all P-Series PADs. The P-Series PADs are available in four versions:

- P250: 10 devices/printers are supported on 1 synchronous port
- P2500: Up to 40 terminals/printers are supported on 4 synchronous ports
- P160: This model consists of a varying number of protocol modules, each of which supports a separate protocol and up to 40 devices. Up to 240 sessions and six different protocols can be realized simultaneously at speeds reaching 56 Kbps. A network port allows load sharing and call hunting.
- PC Based: A personal computer based PAD is also available that operates on IBM PC/XT compatibles and allows simultaneous emulation of multiple protocols and allows simultaneous emulation of multiple protocols on the PC Based network. This line of dual-ported interface cards supports up to 40 devices per card at speeds up to 19.2 Kbps. Two network ports are available to support redundancy and load sharing at speeds up to 64 Kbps.

All P-Series PADs offer the following features:

Independently mapped terminal and host addresses permit communication between any terminals and/or printers and any Burroughs application on the network. Three possible connections, two simultaneous user sessions on a single terminal, and host originated calls to shared printers are all supported. TurboMode (Protocom's proprietary data streaming method) provides unequalled response time. Configurable user screens, mnemonic addressing and user defined function keys are also available.

3.26.2. Unisys Corporation

3.26.2.1. Unisys SDC CP8001

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT LAN Network Front End (CP8001)

DESCRIPTION:

The MIL/INT Product Line includes network front ends, terminal concentrators and gateways implementing DoD protocols for DDN, broadband, and baseband LANs. The LAN NFE provides access to a broadband LAN for a host computer implementing the DoD Host to Front End Protocol (HFP). The NFE implements HFP, TCP, IP, ICMP, and the LAN access protocol. Connection to the host is via HFP with X.25 LAPB at speeds up to 600 Kbps. The host must implement HFP and any application protocols desired (Telnet, FTP, SMTP). The LAN interface is a proprietary CSMA/CD network access protocol on industry standard broadband cable (CATV) systems. The data rate on each channel of the LAN is 2 Mbps.

3.26.2.2. Unisys SDC CP8040

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT LAN Terminal Concentrator (CP8040)

DESCRIPTION:

The MIL/INT Product Line includes network front ends, terminal concentrators and gateways implementing DoD protocols for DDN, broadband, and baseband LANs. The LAN TC provides access to a LAN for up to eight asynchronous terminals operating at speeds up to 19.2 Kbps. The TC may also be configured as a Terminal Emulation Processor (TEP) to attach asynchronous ports on a host to the network. The LAN operates using a proprietary CSMA/CD network access protocol on industry standard broadband cable (CATV) systems. The data rate on each channel of the LAN is 2 Mbps. The TC also implements Telnet, TCP, IP, and ICMP, to support terminal communication with other DoD compatible devices.

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT LAN Terminal Bus Interface Unit (CP8050)

DESCRIPTION:

The MIL/INT Product Line includes network front ends, terminal concentrators and gateways implementing DoD protocols for DDN, broadband, and baseband LANs. The Terminal BIU provides a compact, low cost LAN interface for two asynchronous terminals via two RS-232 ports operating at speeds up to 19.2 Kbps. The BIU implements a proprietary CSMA/CD network access protocol on industry standard broadband cable (CATV) systems. The data rate on each channel of the LAN is 2 Mbps. The BIU also implements Telnet, TCP, IP, and ICMP, to support terminal communication with other DoD compatible devices.

3.26.2.4. Unisys SDC CP8060

PRODUCT-OR-PACKAGE-NAME: SDC MIL/INT Long Haul Network Gateway (CP8060)

DESCRIPTION:

The MIL/INT Product Line includes network front ends, terminal concentrators and gateways implementing DoD protocols for DDN, broadband, and baseband LANs. The Long Haul Network Gateway interconnects the long haul backbone network of DDN (or any network based on IMP type switches) with a broadband LAN. Dynamic routing is supported using both an internal Gateway-to-Gateway (GGP) protocol with other LAN gateways in the local system, and the DoD External Gateway Protocol (EGP) with the core DDN system. IP, ICMP, and network access protocols are also supported. The LAN employs a proprietary CSMA/CD network access protocol on industry standard broadband cable (CATV) systems. The data rate on each channel of the LAN is 2 Mbps. DDN access may be either local or remote (via modems) using either X.25 or HDH protocols at speeds up to 56 Kbps. The MIL/INT DDN TC has been certified by DCA for DDN access.

3.27. HARDWARE MULTIPLE-MACHINE IMPLEMENTATIONS

3.27.1. ADAX INC.

3.27.1.1. Adax STANDARD DDN

PRODUCT-OR-PACKAGE-NAME: STANDARD DDN

DESCRIPTION:

STANDARD DDN is a DCA certified interface to the Defense Data Network standard service offering the DDN utilities TELNET, FTP, and SMTP over TCP/IP/X.25. STANDARD DDN also supports the Berkeley communication utilities rsh, rlogin, and rcp over TCP/IP/X.25.

STANDARD DDN runs under the UNIX or Xenix operating system and offers a convenient user interface with local shell escape and quote command.

For the PCbus, STANDARD DDN requires the Adax PC-SDMA communication board offering a jumper selectable RS-232C interface and RS-449/422 interface with data rates up to 1M bit per second.

For Multibus I, STANDARD DDN requires the Adax SSC communication board offering either an RS-232C interface or RS-449/422 interface with data rates up to 1 Mbit per second.

STANDARD DDN runs on the Plexus, Arix, NCR Tower, Counterpoint, and the Unisys 68000 series CPU Multibus I computers.

STANDARD DDN also runs on PC/386 configurations under UNIX or XENIX, including Microport UNIX V.3, SCO XENIX/386, Interactive Systems 386/ix, and Convergent Technologies Server PC.

3.27.3. AYDIN MONITOR SYSTEMS

3.27.3.1. Aydin LAN Asynchronous Attachment Unit - Model 4310

PRODUCT-OR-PACKAGE-NAME: LAN Asynchronous Attachment Unit - Model 4310

DESCRIPTION:

The Aydin Model 4310 provides IEEE 802.3 connectivity for asynchronous devices to a local area network (LAN). Communication costs are significantly reduced due to reliable data transfer across shared communication networks and unattended operation of this device. Data is transferred among different host operating systems under the control of TCP/IP communication.

3.27.4. CHI CORPORATION

3.27.4.1. ChiLAN PC Terminal and Host Uniscope Servers

PRODUCT-OR-PACKAGE-NAME: ChiLAN PC Terminal and Host Uniscope Servers

DESCRIPTION:

These products, used in conjunction with a TCP/IP board, permit UTS terminals to communicate over a TCP/IP network with a Unisys/Sperry host. The products, which each consist of the Chi CS-1 intelligent communications board and portions of the ChiLAN PC Uniscope Server software, maximize network throughput by localizing polling activity. Up to 16 Unisys/Sperry UTS terminals can be connected through a T-MUX to the ChiLAN PC Terminal Uniscope Server. This server polls the attached terminals and only passes actual traffic over the network to the ChiLAN PC Host Uniscope Server. The host server, which appears to the host to be a Unisys/Sperry Terminal Multiplexer with several terminals attached, has terminal sessions established with the Unisys/Sperry host. This server creates a virtual network of Uniscope and UTS terminals. Since the host polls the server, the network is relieved of this communications activity. Chi's Uniscope handler uses a NetBIOS interface or TCP for establishing a session on an Ethernet-TCP/IP network. For access to the DDN, a TCP session must be used.

3.27.6. MICOM-INTERLAN

3.27.6.1. MICOM-Interlan NP-series Protocol Processors

PRODUCT-OR-PACKAGE-NAME: MICOM-Interlan NP-series Protocol Processors

DESCRIPTION:

Intelligent Ethernet interface boards that support both on-board (layers 1-4) and link-level protocol implementations.

DOCUMENTATION:

Diagnostics, installation, and user's manuals are included.

CPU:

DEC UNIBUS-based systems (NP100), DEC Q-bus based systems (NP200). MULTIBUS-based systems (NP300) and IBM-PC/AT based systems (NP600)

O/S:

Based on buses as described above, including VMS, MicroVMS, and MS-DOS

DISTRIBUTOR:

MICOM-Interlan
155 Swanson Road
Boxboro, MA 01719

3.27.7. MITEK SYSTEMS CORPORATION

3.27.7.1. Mitek SNA Network Server

PRODUCT-OR-PACKAGE-NAME: SNA Network Server

DESCRIPTION:

The SNA Network Server is a high performance hardware/software set of products which permits the workstations of systems attached to a TCP/IP IEEE 802.3 LAN to connect to an IBM mainframe as SNA3270 or SNA3770 devices. The system supports 64 LU's of terminal emulation, PC file transfer and API's for both 3270 and 3770. No mainframe software is added or changed.

The SNA Network Server consists of a hardware Control Unit and software (Presentation Services) for the LAN attached computers. The Control Unit is a M68000 based system which connects the LAN TCP/IP 802.3 network to an IBM mainframe as a PU2 device via direct channel attach or via SDLC data link.

Presentation Services is a software applications package which is executed on the LAN attached computers such as VAX, PC's, 3B's, Apollo, Sun or HP to provide network administration and the user interface for SNA3270 and 3770 emulation. Several enhancement features such as color and extended highlighting are included.

DOCUMENTATION:

Available from vendor

CPU:

M680X0

O/S:

The Control Unit O/S is proprietary. The O/S's supported on the LAN Computers are Berkeley Unix 4.2, VMS, DOS and AEGIS.

3.27.7.2. Mitek Presentation Services

PRODUCT-OR-PACKAGE-NAME: Presentation Services

DESCRIPTION:

The SNA Network Server/Presentation Services (SNS/PS) are Mitek Systems' licensed software products. These products enable workstation users on an Ethernet TCP/IP local area network (LAN) to connect to IBM SNA mainframe systems via Mitek's SNA Network Server hardware products. SNS/PS is workstation executable software which runs on all UNIX-based computers and workstations as well as many others. Collectively, these include devices manufactured by SUN, Apollo, Counterpoint, Hewlett-Packard, Digital Equipment Corp. and IBM. Mitek's Presentation Services software products enable users to transfer files from computers on a LAN to an SNA mainframe computer, to access IBM 3270 applications, and to emulate 3770 Remote Job Entry (RJE). The software also provides an Applications Program Interface (API), which allows user applications on the workstation access to the SNA mainframe computer. The use of these products does not require special software nor does it require software change in the IBM SNA mainframe operating system.

3.27.7.3. Mitek Connectivity Solutions for the IBM Application

PRODUCT-OR-PACKAGE-NAME: Connectivity Solutions for the IBM Application
System/400 (AS/400)

DESCRIPTION:

Mitek extends connectivity from your AS/400 to TCP/IP networks with a special line of hardware and software solutions. These product solutions provide bi-directional logon and bi-directional file transfer capabilities. Mitek utilizes the government standard communications architecture known as TCP/IP (Transmission Control Protocol/Internet Protocol) which can coexist on an Ethernet LAN along with other protocols such as DECnet. The Ethernet hosts supported by Mitek's software products include: DEC VAX, AT&T 3B, SUN Microsystems, Apollo, Tektronix, Hewlett-Packard, IBM PC, AT, RT, XT, and PS/2. You choose the solution that's right for your configuration:

- **SNA Network Server Model M2130** Mitek's M2130 provides a physical gateway between the AS/400 and an Ethernet LAN. The M2130 appears to the AS/400 as a standard SNA control unit and performs data translation between the SNA and the TCP/IP protocols. Speeds up to 256K bps are supported.
- **TELNET Client (TERMINAL APPLICATION ACCESS)** Telnet client resides on the AS/400 and provides access capability to the TCP/IP host applications. This product communicates with the standard TCP/IP terminal application, TELNET Server.
- **FTP Client (FILE TRANSFER)** FTP Client resides on the AS/400 and provides you with the capability to create, delete, and extend files with options for ASCII text conversions or binary data transmission. Exits are provided so that you may write you own data base access routines as part of the file transfer. The security systems of the AS/400 and the TCP/IP network hosts are supported.

FTP Client also includes an extended command feature which allows you to enter a simple *command* in order to transfer multiple files between multiple systems. This feature can be used interactively as well as in a batch environment.

- **TELNET Server** Telnet Server is an optional feature that resides on the M2130. This application provides 3270 terminal emulation. TELNET Server allows TCP/IP Ethernet hosts to have access to the AS/400. The server handles requests from a TELNET Client on any TCP/IP hosts and translates the ASCII data stream into a 3270 data stream.
- **3270 Presentation Services** 3270 Presentation Services resides on TCP/IP Ethernet hosts and provides enhanced 3270 emulation. A special feature of this product is the Application Program Interface (API). A user written program using the API can access the AS/400 as if the application were an operator at a local display station. It allows emulator sessions to runh unattended. 3270 Presentation Services is a family of products designed to ooperate with specific operating systems.

3.27.7.4. Mitek Connectivity Products for the IBM System/3X

PRODUCT-OR-PACKAGE-NAME: Connectivity Products for the IBM System/3X

DESCRIPTION:

Mitek extends IBM System/3X connectivity across Ethernet TCP/IP networks with a specialized line of hardware and software solutions. TCP/IP (Transmission Control Protocol/Internet Protocol) is a government standard communications architecture that can coexist on Ethernet along with other protocols such as DECnet. Mitek's products have the flexibility to reside on a System/3X on an M2130 Network Server, or on TCP/IP hosts, such as the VAX, SUN, Apollo, and so on. We offer you a variety of solutions in order to meet the particular needs of your configuration.

Mitek's SNA Network Server model M2X30 is available to you in both a high-speed and a low speed version to meet your specific data rate requirements.

Our TCP/3X software line features IBM host offerings which include the File Transfer Protocol (FTP) application and the TELNET Client application. You may run both of these applications in an APPN (advanced peer-to-peer networking) environment on any System 3x. Also included in Mitek's software line for the System/3x is the TELNET Server application which is available on an M2X30, and our SNA3270 Presentation Services which resides on the TCP/IP host.

3.27.8. PROTEON, INC.

3.27.8.1. Proteon ProNET-10 Network

PRODUCT-OR-PACKAGE-NAME: ProNET-10 Network

DESCRIPTION:

The ProNET-10 network is a 10 megabit/second Token Passing Ring network providing high performance combined with media flexibility and maintainability. It is a star-shaped ring using Wire Centers to attach nodes.

The media options include:

- Copper (IBM Type 1 and Type 6)
- Fiber optic (multimode fiber, up to 2.5 kilometers/hop)
- Infrared (aerial)
- Microwave (up to 10 kilometers)
- Broadband

These media options may be used on any link in the network, either between wire centers or in the wiring to a node.

There are ProNET-10 interfaces for:

- UNIBUS
- Q-Bus
- Multibus
- IBM-PC and AT
- VMEbus
- VMEbus/9U (Sun and Silicon Graphics)
- "Universal Bus" (a building block)

4. ANALYSIS TOOLS

4.1. COMMUNICATION MACHINERY CORPORATION

4.1.1. CMC DRN-1700 LanScan Ethernet Monitor

PRODUCT-OR-PACKAGE-NAME: DRN-1700 LanScan Ethernet Monitor

DESCRIPTION:

The CMC DRN-1700 LanScan Ethernet Monitor (known as "SpiderMonitor" in Europe) is a standalone system which can be used to monitor network usage and locate networking faults. LanScan conforms to the IEEE 802.3 standard for Ethernet and has built-in decoders for the TCP/IP, XNS, and ISO protocols. Network performance can be monitored both on a single machine basis and on the total network. These data are presented numerically and in bar-graph format. Counts of all packets sent and received, together with byte-counts, are maintained continuously for each machine on the network. Of special interest are the statistics on bad packets each station sends, as this is important for measuring networking system reliability. The LanScan will identify the location of cable faults (short or open circuit). It also tests the network stations, singly or in groups, by routing test packets through the specified stations and highlighting any errors on the route. The LanScan monitor a sophisticated set of packet-tracing facilities by which network failures caused by incorrect protocol software are identified. The packets are displayed in the selected protocol format. Up to 192 KB of trace data can be held at any one time. The LanScan Ethernet Monitor is supplied complete with a video display screen and detachable keyboard. Users can get a hard copy of any statistics or trace information via the standard serial printer interface.

4.2. DIGILOG, INC.

4.2.1. Digilog X.25 DTE Certification (Siemens)

PRODUCT-OR-PACKAGE-NAME: X.25 DTE Certification (Siemens)

DESCRIPTION:

Digilog, Inc. provides for the DoD community a X.25 qualification test designed to run on Digilog 620/820/900 models of Protocol Analyzers. It is designed for use by individuals responsible for pre-qualification testing. The program was designed for testing both Link and Packet levels in DTE configuration.

All tests are based on the CCITT Recommendations X.25 October 1984.

There are seven frame level tests and six packet level tests. The 7 frame level tests will test the link access procedure across the DTE/DCE interface. The packet level tests are a test of action taken by the DTE on receipt of packets in a given state.

After execution of selected tests, the error report can be displayed on the Digilog 620/820/900 sent to a printer or saved on disk storage for future.

DOCUMENTATION:

4.2.2. Digilog X.75 Certification (Siemens)

PRODUCT-OR-PACKAGE-NAME: X.75 Certification (Siemens)

DESCRIPTION:

Digilog, Inc. provides for the DoD community a X.75 qualification test designed to run on Digilog 620/820/900 models of Protocol Analyzers. It is designed for use by individuals responsible for pre-qualification testing. The program was designed for testing both test Link and Packet levels in DTE configuration.

All tests are based on the CCITT Recommendations X.75 October 1984.

There are 17 programs that emulate an X.75 DTE device. This package allows user testing of STE to STE connection. The frame level tests will test the terminal and transmit call, control procedures. The packet level tests are a test of action taken by the STE on receipt of packets in a given state.

After execution of selected tests, the error report can be displayed on the Digilog 620/820/900 sent to a printer or saved on disk storage for future.

4.2.3. Digilog FIPS100/DDN Certification

PRODUCT-OR-PACKAGE-NAME: FIPS100/DDN CERTIFICATION

DESCRIPTION:

Digilog, Inc. provides for the DoD Community a Defense Data Network (DDN) X.25 Qualification test designed to run on the Digilog Models 620/820/900. It is designed for use by individuals responsible for pre-qualification testing. The program was designed for testing both the Link and Packet levels in either DTE or DCE configurations. All tests are based on the Defense Data Network Host Interface Qualification Testing link and Network Layers document (DCAC 370-P195 ()). The tests are grouped into two types: Valid and Invalid. The Valid group tests protocol scenarios that could occur normally. The Invalid group tests situations outside those which should occur during normal message exchanges.

After execution of selected test, the error report can be displayed on the Digilog model 620/820/900 sent to a printer, or saved on disk storage for future use.

4.3. DEFENSE COMMUNICATIONS AGENCY

4.3.1. DCA Upper Level Protocol Test System Software

PRODUCT-OR-PACKAGE-NAME: DCA Upper Level Protocol Test System Software

DESCRIPTION:

The test system performs functional testing over a packet switched network (or internet) of upper level protocol (TCP, IP, SMTP, FTP and TELNET) implementations against DoD standardized reference implementations

DOCUMENTATION:

1. Functional Description
2. Installation and Operations Manual
3. Test Operator's Guide
4. Test Traceability Index for each protocol (5). Each document lists all scenarios/tests executed for the protocol and cross references the applicable areas of the Mil Spec.
5. Remote Driver Specifications for each protocol (5). The driver is coded for and executed on the remote host computer where the implementation under test (IUT) will run.

CPU:

DEC VAX series w/8MB main memory (minimum) and .8 MIPS (minimum) and 456 MB disk storage space (minimum).

O/S:

Ulrix version 1.1 (DEC's 4.2BSD product). The test software required kernel modifications to 1.1.

4.4. EXCELAN, INC.

4.4.1. Excelan LANalyzer EX 5000E Ethernet Network Analyzer

PRODUCT-OR-PACKAGE-NAME: LANalyzer EX 5000E Ethernet Network Analyzer

DESCRIPTION:

Excelan's LANalyzer EX 5000E Ethernet Network Analyzer transforms an IBM PC/XT/AT/compatible running DOS into a powerful tool for monitoring, debugging, and characterizing local area networks. It is designed for use on networks based on Ethernet/IEEE 802.3 standards.

The LANalyzer EX 5000E consists of three logical components: the EXOS 225 Ethernet Network Analyzer board, the LANalyzer software, and the associated hardware to connect the PC to the network. These components install on an IBM-PC/XT/AT/compatible running DOS 2.0 or higher. The LANalyzer components are available both as a kit and pre-installed in a COMPAQ PORTABLE 286 computer.

The PC provides a screen-oriented interface for creating tests and for displaying results. Tests can be created to capture packets from the the network or to transmit packets to the network under a variety of criteria. Test results are displayed in real-time or can be saved in DOS files. Although the generic design of the LANalyzer EX 5000E allows it to monitor network traffic on any Ethernet/IEEE 802.3 network, collected Ethernet packets can be later parsed into associated higher layer protocols such as TCP/IP, ISO, XNS and DECnet.

Additionally, a StarLAN adapter board is available for monitoring of StarLAN networks, and EXOS TCP-IP Network Software for DOS can also be run on any PC LANalyzer.

4.5. FTP SOFTWARE, INC.

4.5.1. FTP Software LANWatch

PRODUCT-OR-PACKAGE-NAME: LANWatch

DESCRIPTION:

LANWatch is a software local area network analyzer for the IBM PC and compatibles. LANWatch has two modes: Display Mode, which captures and displays packets in real time, and Examine Mode, which allows the user to scroll back through stored packets and inspect them in greater detail. LANWatch retains a buffer of 254 packets at any given time, and can store more to disk. LANWatch recognizes a variety of protocols, and can be programmed to recognize additional protocol types. Symbolic filters to selectively examine IP family and other types of packets are included. Additional filters can be written and added. LANWatch is available for a variety of network interface cards, including the 3COM 3C500, 3C501, and 3C505, MICOM- Interlan NI5010 and NI5210, Western Digital WD8003, BICC 4100 ISOLAN, Excelan EXOS205/EXOS205T, and Proteon ProNET-10.

DOCUMENTATION:

LANWatch comes with an installation guide, a user's guide, and a programmer's guide.

4.6. LAWRENCE BERKELEY LABORATORY

4.6.1. LBL tcpdump

PRODUCT-OR-PACKAGE-NAME: tcpdump

DESCRIPTION:

This program passively monitors an ethernet and displays information about the packet traffic. It will display time and ethernet protocol information (source, destination, protocol and size) for any type of packet. In addition it will display all the protocol information in TCP, IP, UDP and ICMP packets. The output may be captured on a file for later analysis. A simple expression language allows a user to selectively dump only "interesting" traffic (e.g., "tcpdump host foo and net arpanet" to watch only the traffic between host "foo" and hosts on the ARPANET).

4.7. NETWORK GENERAL CORPORATION

4.7.1. Network General Model PA-401

PRODUCT-OR-PACKAGE-NAME: Model PA-401 IBM Token-Ring Network Portable Protocol Analyzer

DESCRIPTION:

Network General's portable LAN protocol analyzer, the Sniffer™, captures a bit-by-bit sample of network traffic, then translates all protocol information to English for analysis and display in various formats, including SUMMARY, DETAIL, and HEX windows. Protocol Interpreter software suites decoding all seven layers of the OSI model are available for Appletalk (on Ethernet), DECnet, IBM, ISO/MS-NET, Nestar Plan Series, Novell Netware, SUN Microsystems, TCP/IP, Banyan VINES, and XNS protocol families as appropriate. Sniffers are set up and controlled by a three-window, four level, synchronously scrolling menuing system. The Model 401 instrument may be upgraded to accommodate an additional LAN interface for Ethernet, StarLAN, or ARCNET topologies.

4.8. PROTOCOM DEVICES, INC.

4.8.1. Protocom Devices APB1000 Network Control System

PRODUCT OR-PACKAGE-NAME: APB1000 Network Control System

DESCRIPTION:

APB1000 is a software based system that allows you to monitor and control an entire Protocom P-Series PAD network. The system also provides and stores records used for billing purposes. APB1000 operates on IBM PC/XTs and compatibles and allows simultaneous emulation of all protocols on the P-Series PAD network. Specialized APB1000 hardware is available to meet the high throughput required by the system.

APB1000 is designed to prevent security breaches by offering dual level network security for all P-Series PADs on the network as well as for host applications. All unauthorized attempts to access the network are rejected and reported automatically to a database, at a specified location, which is available to the network manager.

APB1000 monitors all P-Series PADs and devices and network. Statistical reports provided include the status of the X.25 line, PAD resets, flow control situations, packet and frame level results and status of all ports and devices.

APB1000 generates a billing record for each transaction on the APB1000 network that contains the caller's user ID, the service requested, the caller's PAD address and the date and time connected/disconnected.

APB1000 is designed for use with Protocom P-Series PADs, which offer the following features:

- Independently mapped terminal and host addresses permit communication between any terminals and/or printers and any protocol application on the network.
- Three possible connections, two simultaneous user sessions on a single terminal and host originated calls to shared printers are all supported.
- TurboMode (Protocom's proprietary data streaming method) provides unequalled response time.
- Configurable user screens, mnemonic addressing and user defined function keys are also available.

4.8.2. Protocom Devices PCS1000 Network Management System

PRODUCT-OR-PACKAGE-NAME: PCS1000 Network Management System

DESCRIPTION:

PCS1000 is a software based system that allows you to manage, monitor and control an entire Protocom P-Series PAD network. The system operates on IBM PC/XTs and compatibles and allows simultaneous emulation of all protocols on the P-Series PAD network. With PCS1000, configuration is performed locally or remotely and is stored in database format at a specified location. Uploading and downloading is performed easily and efficiently.

PCS1000 collects statistical information, including EIA signals, and provides detailed performance reports automatically at specified intervals. Outputs can be sent automatically or on request to printer or disk file. Security control features include the PCS1000 system file which maintains a log of all user transactions and the User Access Database which allows the network manager to delimit access to PCS1000 itself. To eliminate duplicity in network equipment, the PCS1000 personal computer also serves as an asynchronous terminal for manual access to the network.

PCS1000 is designed for use with Protocom P-Series PADs, which offer the following features:

- Independently mapped terminal and host addresses permit communication between any terminals and/or printers and any protocol application on the network.
- Three possible connections, two simultaneous user sessions on a single terminal and host originated calls to shared printers are all supported.
- TurboMode (Protocom's proprietary data streaming method) provides unequalled response time.
- Configurable user screens, mnemonic addressing and user defined function keys are also available.

4.9. SPIDER SYSTEMS LIMITED

4.9.1. Spider Monitors

PRODUCT-OR-PACKAGE-NAME: SpiderMonitors

DESCRIPTION:

The SpiderMonitor P200 is a compact, high performance, portable Ethernet monitor ideal for network System Managers, Supports Organizations and System Developers. It includes an IBM PC/AT compatible computer running MS-DOS, 20 MB hard disk, 1.2 MB floppy disc and LCD screen.

The SpiderMonitor K150 is an Ethernet board kit suitable for installation into any suitable IBM PC/AT compatible computer. It offers comprehensive monitoring and analysis capabilities combined with sophisticated trouble shooting facilities while maintaining ease of use. Data can be read in by Lotus 1-2-3 for presentation of results.

Both SpiderMonitors conform to IEEE 802.3 and are fully Multi-Tasking which allows Packet filtering, Summary information and Statistics collection to run while in other modes. They are easy to use, function driven, and require no complex training. Each monitor offers 6 major monitoring and analysis functions for up to 1024 stations on a network. TCP/IP, DECnet, XNS, and ISO protocols are decoded. Both units have an Intel 80186 processor and 82586 Ethernet controller.

DDN Protocol Implementations and Vendors Guide

August 1988

To request inclusion of your product in the next edition, please complete and submit this template by US mail (detach and fold), or by electronic mail (to NIC@SRI-NIC.ARPA). This template is available online via anonymous FTP from the host SRI-NIC.ARPA and is called NETINFO:VENDORS-TEMPLATE.TXT. You may provide any additional information on a separate or continuing page. The following products are suitable for inclusion: TCP/IP and related (e.g. protocol analyzers); OSI; and X.25. This guide is published twice a year (February and August) in both hardcopy (DDN Protocol Implementations and Vendors Guide) and online versions (NETINFO:VENDORS-GUIDE.DOC) by the DDN Network Information Center, SRI International, 333 Ravenswood, Menlo Park, CA, 94025. Direct questions or comments to either Dan Oakley (technical), Room EJ274 (415 859-5905), or Nan Dorio (general), EJ209 (415 859-6310).

Note: This registry in no way constitutes an endorsement of any product listed, by either SRI International, the DDN NIC, or any U.S. Government agency.

PRODUCT-OR-PACKAGE-NAME: (EXAMPLE: Sam TCP/IP for SunOS.)

PRODUCT-CATEGORY: (Select all that apply; please use a lower case "x" as your indicator)

HARDWARE _____ SOFTWARE _____ NETWORK-ANALYZER _____
TCP-IP _____ X.25 _____ OSI _____ OTHER _____

DESCRIPTION: (Specify in your description how your product relates to TCP/IP, OSI and/or X.25.)

DOCUMENTATION: (Specify the documentation such as Installation and Operations Manual, Command Reference Manual, etc., part #'s for manual's, and whether they are included or optional.)

MACHINE TYPE:

CRAY _____ DEC VAX _____ MICROVAX _____ PDP11 _____ SUN _____ APOLLO _____
WANG _____ UNISYS _____ HONEYWELL _____ XEROX _____ AT&T _____ TANDEM _____
NCR _____ IBM 370 _____ IBM PC, PS/2 _____ APPLE _____ IBM compatible _____
OTHER _____ (Specify machine type and series.)

O/S (OPERATING SYSTEM):

UNIX _____ LISP _____ SUNOS _____ VMS _____ DOS _____ ULTRIX _____
OTHER _____ (Specify operating system, releases and versions.)

IMPLEMENTATION-LANGUAGE:

C _____ LISP _____ PASCAL _____ OTHER _____
(Specify implementation-language.)

DISTRIBUTOR:

EXAMPLE: Sam Smith Systems _____
000 North Street _____
Smithville, SV 00000 _____

CONTACT: (EXAMPLE: Sam Smith, Program Manager, (000) 000-0000. Specify a personal contact to use for technical information.)

ORDERING-PROCEDURE: (Specify Product Name / Operating System, Product No.)

PROPRIETY-STATUS: (Specify if it is a proprietary product of your company.)

DDN-QUALIFIED: YES ___ NO ___

DATE-UPDATED:

Fold this flap first
