INTRODUCTION

The Air Force Office of Scientific Research Technical Report Summaries are published quarterly as of March, June, September, and December of each calendar year. They consist of a brief summary of each AFOSR technical report received in the Technical Information Division and submitted to the Defense Technical Information Center (DTIC) for that quarter. The summaries contain two indexes for easily locating the technical reports that may be of interest to the user. These are followed by abstracts of the reports.

1) SUBJECT INDEX

- a. Subject Field
- b. Title of Report
- c. AD Number (Accession Number)

2) PERSONAL AUTHOR INDEX

- a. Primary Author
- b. Title of Report
- c. AD Number

AFOSR does not maintain copies of technical reports for distribution. However, you may obtain any of these reports if you are a registered government agency or government contractor with DTIC, by requesting the AD number of that report from the DTIC, Cameron Station, Alexandria, Virginia, 22314.

PURPOSE

The purpose of this report is to inform Air Force Laboratories about the science that the Air Force Office of Scientific Research is supporting.

AFOSR MISSION

The Air Force Office of Scientific Research (AFOSR) is the Single Manager of the Air Force Defense Research Sciences Program (Program Element 61102F) and the primary Air Force agency for the extramural support of fundamental scientific research. The AFOSR is organizationally under the DCS/Science and Technology, Air Force Systems Command.

AFOSR awards grants and contracts for research in areas of science relevant to the needs of the Air Force. Research is selected for support from proposals received in response to the Broad Agency Announcement originating from scientists investigating problems involving the search for new knowledge and the expansion of scientific principles. Selection is on the basis of scientific potential for improving Air Force operational capabilities, originality, significance to science, the qualification of the principal investigators, and the reasonableness of the proposed budget.

KEY TO READING THE DATA

The summaries consist of two indexes and the abstracts. From one of the two indexes, locate the AD number of the report that is of interest to you. Use this number to locate the abstract of the report in the abstracts section. The first report submitted to DTIC during the quarter (the one with the lowest AD number) appears on the last page of the abstracts section. The last report submitted to DTIC during the quarter (the one with the highest DTIC number) appears on the first page of the abstracts section. The following terms will give you a brief description of the elements used in each summary of this report.

DTIC Report Bibliography - DTIC's brief description of a technical report.

Search Control Number - A number assigned by DTIC at the time a bibliography is printed.

AD Number - A number assigned to each technical report when received by the DTIC.

Field & Group Numbers - (appearing after the AD number) First number is the subject field and the second number after the slash is the particular group under that subject field.

Corporate Author/Performing Organization - The organization; e.g., college/university, company, etc., at which the research is conducted.

Title - The title of the technical report.

Descriptive Note - Gives the type of report; e.g., final, interim, etc., and the period of the time of the research.

Date - Date of the technical report.

Pages - Total number of pages contained in the technical report.

Personal Author - Person or persons who wrote the report.

Contract/Grant Number - The instrument control number identifying the contracting activity and funding year under which the research is initiated.

Project Number - A number unique to a particular area of science; e.g., 2304 is the project number for mathematics.

Task Number - An alphanumeric number unique to a specific field of the main area of science; e.g., 2304 is the project number for mathematics and A3 is the task number for computational sciences.

Monitor Number - The number assigned to a particular report by the government agency monitoring the research. The number consists of the government monitor acronym, the present calendar year and the technical report assigned consecutively; e.g., AFOSR-TR-83-0001 is the first number used for the first technical report processed for Calendar Year 1983.

Supplementary Note - A variety of statements pertaining to a report. For example, if the report is a journal article, the supplementary note might give you the journal citation, which will include the name of the journal the article it appears in, and the volume number, date, and the page numbers of the journal.

Abstract - A brief summary describing the research of the report.

Descriptors - Key words describing the research.

Identifiers - Commonly used designators, such as names of equipment, names of projects or acronyms, the AFOSR project and task number, and the Air Force Research Program Element number.

AD-A191 285
- *RESONANCE
Reprint: Organic Polymers as Nonlinear Optical Materials.
AD-A191 810
Reprint: Surface-Enhanced Correlations between Polarized Photons in Resonance Fluorescence.
AD-A192 880
- *RIBONUCLEIC ACIDS
Modulating Transfer RNA anticodon Modifications and Biologic Responses in Human Cells.*
AD-A190 825
- *RISK
Reprint: Asymptotic Bias of the Product Limit Estimator under Dependent Competing Risks.
AD-A190 214
- *ROBOTICS
Electromagnetic Sensor Arrays
- for Nondestructive Evaluation and Robot Control.*
AD-A190 210
Robotics with Natural Language Comprehension and Learning Abilities.*
AD-A190 851
The Vite Model: A Neural Command Circuit for Generating Arm and Articulator Trajectories.*
AD-A192 715
- *ROCK
Experimental and Theoretical Response of Multiphase Porous Media to Dynamic Loads.*
AD-A188 791
- *RODS
Reprint: Characterization of Rigid-Rod Molecular Composites by Photothermal and Ultrasonic Imaging.
AD-A192 065
- *SAMPLING
Reprint: Analysis of Adaptive Differential PCR (Pulse-Code Modulation) of a Stationary Gauss-Markov Input.
AD-A190 324
Instrumentation for Ultrafast Electronics.*
AD-A191 378
Asynchronous Optical Sampling for Laser-Based Combustion Diagnostics in High Pressure Flames.*
AD-A192 920
- *SAND
Undrained Stress-Strain Behavior of Unsaturated Sands. Volume 1.*
AD-A191 924
- *SATURATION
Micromechanics Models for Unsaturated, Saturated, and Dry Sands.*
AD-A189 727
- *SCALING FACTORS
Evolution of Hardening and Damage during Viscoplastic Deformation.*
AD-A190 714
- *SCANNING
Scanning Tunneling Microscopy as a Surface Chemical Probe.*
AD-A192 710
- *SCHRÖDINGER EQUATION
Reprint: A Random Schrödinger Equation: White Noise Model.
AD-A191 860
- *SEGMENTED
Texture Perception and Shape from Texture.*
AD-A192 923
- *SEISMIC REFLECTION
Reprint: Recovery of the Elastic Parameters of a Layered Half-Space.
AD-A189 838
- *SELENIUM
Reprint: Evidence for the Formation of Diethylselenolone: A Reactive Intermediate with a Silicon-Selenium Double Bond.
AD-A191 830
- *SEMICONDUCTING FILMS
Gas Source MBE (Molecular Beam Epitaxy).
AD-A189 783
Reprint: Ion Beam Enhanced Grain Growth in Thin Films.
AD-A190 193
Epitaxial Iron Films.*
AD-A191 815
- *SEMICONDUCTOR DEVICES
Topical Meeting on Picosecond Electronics and Optoelectronics.*
AD-A189 888
Epitaxial Iron Films.*
AD-A191 815
- *SEMICONDUCTOR DIODES

Semiconductors.*
AD-A190 196
Interface Formation and
Precursory Dynamics.*
AD-A190 741
Mathematical Models for VLSI
device Simulation.*
AD-A191 128
Investigation of Non-Linear
Optical Behavior of Semiconductors
for Optical Switching. Volume I.*
AD-A191 297
An Investigation of II-VI
superlattice Deposition by Laser
Photochemical Techniques.*
AD-A191 547
- *SENSES(PHYSIOLOGY)
The Vite Model: A Neural Command
Circuit for Generating Arm and
Articulator Trajectories.*
AD-A192 715
- *SEQUENCES(MATHEMATICS)
Almost Sure L(Gamma)-Norm
Convergence for Data-Based
Histogram Density Estimates.*
AD-A189 944
- *SERIES(MATHEMATICS)
Reprint: Consequences of
- Departures from Independence in
Exponential Series Systems.
AD-A190 078
- *SERVOMECHANISMS
Optical Multiple Targets
Surveillance, Pointing,
Acquisition, and Tracking Sensors.
Phase I.*
AD-B120 071L
- *SHEAR PROPERTIES
Instruments for Use in
Experimental Studies of Complex
Turbulent Shear Flow - Three
Component LDV's.*
AD-A190 528
- *SIGNAL PROCESSING
Topical Meeting on Picosecond
Electronics and Optoelectronics.*
AD-A188 886
Space-Variant Optical Systems.*
AD-A188 987
Research on Materials and
Components for Opto-Electronic
Signal Processing and Computing.*
AD-A190 130
Efficient Algorithms and
Structures for Robust Signal
Processing.*
AD-A190 311
Selective Mechanisms in Auditory
and Bimodal Signal Processing.*
AD-A190 528
Signal Processing with
Degenerate Four-Wave Mixing.*
AD-A191 496
- *SIGNAL TO NOISE RATIO
Reprint: Analysis of Adaptive
Differential PCM (Pulse-Code
Modulation) of a Stationary Gauss-
Markov Input.
AD-A190 334
- *SILANES
New Approaches to the Synthesis
of Novel Organosilanes.*
AD-A190 042
Reprint: Evidence for the
- Formation of Diethylsilanes: A
Reactive Intermediate with a
Silicon-Selenium Double Bond.
AD-A191 530
Reprint: Preparation of the
First Stable Forrysilane, (Me3Si)
3SiCH3, from a Zirconium eta 2-
Silacyl Complex.
AD-A192 048
- *SILICA GEL
Reprint: Solid-State 20Si NMR
study of Polycondensation During
Heat Treatment of Sol-Gel-Derived
Silicas.
AD-A192 818
- *SILICA GLASS
Novel Fiber Preforms: Rare Earth
Doping.*
AD-A191 548
- *SILICATES
Novel Fiber Preforms: Rare Earth
Doping.*
AD-A191 548
- *SILICON
Summary of the 1987 Gordon
Research Conference on Corrosion.*
AD-A189 737
New Approaches to the Synthesis
of Novel Organosilanes.*
AD-A190 042
Reprint: Chemistry of the
Silicon-Silicon Double Bond.
AD-A191 200
Reprint: Evidence for the
Formation of Diethylsilanes: A
Reactive Intermediate with a
Silicon-Selenium Double Bond.
AD-A191 530
Reprint: Production of Si(1D2)
from Electronically Excited SiH2.
AD-A191 732
- *SILICON COMPOUNDS
Reprint: Disiloxanes:
Synthesis and Crystal Structure.
AD-A190 904
Reprint: Chemistry of the

- Silicon-Silicon Double Bond.
AD-A181 200
- *SILICON DIOXIDE
Reprint: Siloxane Modified SiO₂-TiO₂ Glasses Via Sol-Gel.
AD-A189 713
- *SOIL MECHANICS
Micromechanics Models for Unsaturated, Saturated, and Dry Sands.*
AD-A189 727
- *SOILS
Micromechanical Modeling of Granular Soil at Small Strain by Arrays of Elastic Spheres.*
AD-A181 827
- *SOLID ROCKET PROPELLANTS
Chemical Kinetics of Nitramine Propellant Combustion.*
AD-A181 858
- *SOLID STATE ELECTRONICS
Topical Meeting on Picosecond Electronics and Optoelectronics.*
AD-A189 888
Instrumentation for the Characterization and Development of Millimeter Wave Components Compatible with Monolithic Integration.*
AD-A189 724
Joint Services Electronics Program.*
AD-A182 078
- *SOLID STATE PHYSICS
Reprint: Phonon Spectroscopy of Organic Solid State Reactions.
AD-A181 811
- *SOLIDIFICATION
Laser Photodeposition and Etching Study.*
AD-A190 838
Solidification Fronts/Viscous Phase Transitions Forwards-Backwards Heat Equations.*
- AD-A190 839
Effect of Alloying, Rapid Solidification, and Surface Kinetics on the High Temperature Environmental Resistance of Niobium.*
AD-A192 093
- *SOOT
Soot and Radiation in a Gas Turbine Combustor.*
AD-A181 881
Reprint: The Transport and Growth of Soot Particles in Laminar Diffusion Flames.
AD-A182 733
- *SPACE ENVIRONMENTS
Theory and Simulation of Relaxed Plasmas.*
AD-A182 884
- *SPACE PERCEPTION
Interactions between Brief Flashed Lines at Threshold.*
AD-A182 207
The Interaction of Sensory and Perceptual Variables: Spatial, Temporal and Orientation Response to Figure and Ground.*
AD-A182 897
- *SPACE PROPULSION
Unified Study of Plasma-Surface Interactions for Space Power and Propulsion.*
AD-A182 043
- *SPACE STATIONS
Vibrations of Structures with Parametric Uncertainties.*
AD-A190 400
Electromagnetic Damping and Vibration Isolation of Space Structures.*
AD-A181 492
- *SPACE SYSTEMS
Vibration Control of Large Structures.*
AD-A181 358
- *SPACE TECHNOLOGY
Wave Propagation and Dynamics of Lattice Structures.*
AD-A190 037
- *SPACECRAFT
Feedback Control of Distributed Parameter Systems with Applications to Large Space Structures.*
AD-A190 836
Wave Propagation and Dynamics of Lattice Structures.*
AD-A190 811
Travelling Wave Concepts for the Modeling and Control of Space Structures.*
AD-A181 238
Estimation and Control of Distributed Models for Certain Elastic Systems Arising in Large Space Structures.*
AD-A182 120
- *SPACECRAFT COMPONENTS
Nonlinear Analysis and Optimal Design of Dynamic Mechanical Systems for Spacecraft Application.*
AD-A190 844
Experimental Study of Active Vibration Control.*
AD-A181 484
- *SPARK SHADOWGRAPH PHOTOGRAPHY
Reprint: Explosive Vaporization of a Large Transparent Droplet Irradiated by a High Intensity Laser.
AD-A182 748
- *SPATIAL DISTRIBUTION
A Sensor with Biological Preprocessing Features.*
AD-A181 387
- *SPECTRA
Reprint: Laser Excitation Spectra for Matrix Isolated IF: Observation of New Low-Lying Electronic States.
AD-A190 274

Kinetics of the Interhalogens.*
AD-A192 103
- *SPECTRUM ANALYSIS
Efficient Algorithms and
Structures for Robust Signal
Processing.*
AD-A190 311
- *SPEECH
The Vite Model: A Neural Command
Circuit for Generating Arm and
Articulator Trajectories.*
AD-A192 715
- *SPEECH RECOGNITION
Auditory-Acoustic Basis of
Consonant Perception.*
AD-A190 524
- *SPHERES
Reprint: Dynamical Analysis of
Molecular Decay at Spherical
- Surfaces.
AD-A190 735
- Micromechanical Modeling of
Granular Soil at Small Strain by
Arrays of Elastic Spheres.*
AD-A191 927
- *SPINNING(MOTION)
Reprint: On the Characterization
of the Dipolar Spin-Spin
Interaction in Molecular Systems: A
Symbolic Matrix Element Approach.
AD-A189 782
- *SPRAYS
Dense-Spray Structure and
Phenomena: Part 2 - Pressure-
Atomized Sprays.*
AD-A190 312
- Reprint: Unsteady Flame
Propagation in a Two-Dimensional
Spray with Transient Droplet
Vaporization.
AD-A191 886
- *STABILITY
Continuity of Symmetric Stable
Processes.*
AD-A190 324
- Two Classes of Self-Similar
Stable Processes with Stationary
Increments.*
AD-A192 842
- *STABILIZATION SYSTEMS
Pointwise Stabilization for
Coupled Quasilinear and Linear Wave
Equations.*
AD-A190 031
- *STALLING
Oscillating Airfoils -
Achievements and Conjectures.*
AD-A190 490
- *STATIONARY
Efficient Algorithms and
Structures for Robust Signal
Processing.*
AD-A190 311
- On the Exceedance Random Measures
- for Stationary Processes.*
AD-A192 838
- *STATISTICAL ANALYSIS
Reprint: A Comparison of Several
Methods of Estimating the Survival
Function When There Is Extreme
Right Censoring.
AD-A190 078
- Diffusion Approximations and
Nearly Optimal Maintenance Policies
for System Breakdown and Repair
Problems.*
AD-A190 184
- Reprint: Reply to the 'Comment

Fatigue '87. Papers presented at the International Conference on Fatigue and Fatigue Threshold (3rd) Held in Charlottesville, Virginia on June 28-July 3, 1987. Volume 3.
AD-A190816 REPORT DATE: 15 OCT 87 FINAL REPORT

Feedback Control of a Hyperbolic Partial-Differential Equation with Viscoelastic Damping.
AD-A192896 REPORT DATE: 15 APR 88 FINAL REPORT

Feedback Control of Distributed Parameter Systems with Applications to Large Space Structures.
AD-A190638 REPORT DATE: 15 OCT 87 FINAL REPORT

Filtering of Jump Processes.
AD-A199701 REPORT DATE: 30 OCT 87 ANNUAL REPORT

Final Report on AFOSR (Air Force Office of Scientific Research) Contract F49620-83-C-0084 on Massachusetts Institute of Technology, Cambridge. Volume 1.
AD-A191253 REPORT DATE: MAY 87 FINAL REPORT

Final Report on AFOSR (Air Force Office of Scientific Research) Contract F49620-83-C-0084 on Massachusetts Institute of Technology, Cambridge. Volume 2.
AD-A191254 REPORT DATE: MAY 87 FINAL REPORT

Final Report on AFOSR (Air Force Office of Scientific Research) Contract F49620-83-C-0084 on Massachusetts Institute of Technology, Cambridge. Volume 3.
AD-A191255 REPORT DATE: MAY 87 FINAL REPORT

Finite Element Approximation of a Reaction-Diffusion Equation. Part 1. Application of Topological Techniques to the Analysis of Asymptotic Behavior of the Semidiscrete Approximations.
AD-A190808 REPORT DATE: JUL 88

Finite Element Approximation of a Reaction-Diffusion Equation. Part 2. Approximation of the Spontaneous Bifurcation and Error Estimates Uniform in Time.
AD-A199970 REPORT DATE: 87

Fluid Dynamics of High Performance Turbomachines.
AD-A192073 REPORT DATE: DEC 87 ANNUAL REPORT

Fluids, Gels and Glasses under Extreme Conditions of Pressure and Temperature.
AD-A190655 REPORT DATE: 22 JAN 88 FINAL REPORT

Fluoride Glasses from Sol Gels.
AD-A190100 REPORT DATE: 15 SEP 86 FINAL REPORT

Fluxions and Order in Long Josephson Junctions.
AD-A190879 REPORT DATE: 28 DEC 87 ANNUAL REPORT

Fracture Mechanics Analysis for Short Cracks.
AD-A192002 REPORT DATE: 27 AUG 87 ANNUAL REPORT

Fracture Physics of Delamination of Composite Materials.
AD-A192021 REPORT DATE: OCT 87 FINAL REPORT

ABSTRACT: (U) For the space-based strategic defense system, conventional optical beam pointing/steering/tracking system using mechanical gimbals has numerous shortcomings, such as heavy weight, high probability of errors, long acquisition time, and large frictional and bearing noise. The conventional mechanical servo cannot track multiple targets simultaneously, and cannot perform wide angle surveillance due to limited bandwidth of servo loops. To reduce or eliminate these shortcomings, a wide view, fast steering optical surveillance, acquisition, pointing, and tracking sensors for multiple targets is required. To address this need, multiaperture compound eye configurations and optical multibeam phased steering arrays for multiple targets surveillance, acquisition, pointing, and tracking were investigated, analyzed, and compared against derived design parameters. Optical power combining and beam sharpening can be achieved using phased-array techniques. The investigation results indicate that both linear and planar optical phased-array

UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of this program was to develop a fundamental understanding of the mechanisms which limit the power density and risetime of light activated junction semiconductor switches for extremely fast pulsed power applications. The investigators were able to theoretically establish and experimentally confirm several critical aspects of switch operation. Specifically, they conducted a theoretical and experimental program to demonstrate the solid state switches are capable of achieving pulse risetimes below 100 ps and power densities on the order of 10(10) W/cm(3). Keywords: Lase, Switch, Semiconductor.

DESCRIPTORS: (U) SWITCHES, DENSITY, LIMITATIONS, OPERATION, POWER.

ABSTRACT: (U) The burning rates for 17 trinitromethyl-, halodinitromethyl-, and dinitromethylene-substituted solid oxidizers were determined as neat pellets. In general, the highest burning rates were observed for trinitromethyl-compounds (0.88 to 1.82 inch/second). Replacement of nitro by methyl or halogen reduced the burning rates (0.16-0.82 inch/second). A correlation of the observed burn rates with structure and physical data, including melting point, a decomposition kinetics, is described. Keywords: Oxidizers; Pyrolysis products.

ABSTRACT: (U) Progress towards the realization of an
efficient and high performance all-niobium superconductor-
insulator-superconductor mixer assembly is described in
this first yearly report. To date, optimization of the
fabrication process for the superconducting devices has
received a major amount of effort and a new fabrication
technique which promises lower parasitic capacitance has
been developed. The new process is based on lift-off
patterning of low dielectric constant dual ion beam
deposited silicon dioxide. In conjunction with the
National Radio Astronomy Observatory, a mask set
containing a wide variety of mixer structures has been
designed. Device testing has been restricted to low
frequency and the new mask will allow testing at the
design frequency of 100 GHz. The electrical properties of
the fabricated mixer junctions have been studied in order
to extract parameters necessary for the design of useful
mixer systems. Transmission structures which are capable
of carrying wide bandwidth signals with minimal thermal
conduction have been characterized with a 40 GHz scalar
network analyzer, with positive results.

ABSTRACT: (U) Dense plasmasoid bodies may provide an effective means for transport of lethal energies over large distances if suitable modes of stable propagation can be realized. The problem underlying propagation resides in the fact that such plasmasoids, being a collection of ionized matter consisting of ions and electrons, have no inherent material structure to hold them together and, if unaided, ballistically disassemble in flight. Criteria for effective propagation of plasmasoids across an ambient Earth strength magnetic field have been developed, both for the case of vacuum propagation in a tenuous atmosphere. Requirements of vacuum propagation are extremely stringent and in many cases probably preclude use of this mode of propagation. Inclusion of an ambient background, however, can result in radially confined plasmasoid propagation which satisfies the Virial Theorem and whose parameter requirements may be compatible with existing plasmasoid sources. These

complex atmospheric aided propagation equilibria merit further investigation. In particular, the question whether the requisite confining axial current in the shock and diffusion models can be maintained collisionally or by other means has yet to be addressed. The relation of the effective coupled density to the ambient ionized and neutral atmospheric densities must also be established to accurately define the altitude windows where atmospheric aided propagation might be applicable. Keywords: Mass loss; Drag forces; Earth magnetic field deflection.

ABSTRACT: (U) For the past two decades optical data processing (ODP) has promised a vast increase in processing capacity and speed over conventional electronic techniques. This promise has never been fulfilled for several reasons, most notably because of the lack of a practical real-time image modulator, or light valve, and because optical techniques were almost exclusively limited to linear operations. These restrictions have been removed by the development of the liquid-crystal light valve (LCLV) by Hughes Research Laboratories (HRL), and by nonlinear parallel-processing techniques developed by the University of Southern California (USC). Thus, it is important to determine how successfully nonlinear parallel-processing techniques can be implemented in real time with the various LCLVs. In addition, other new optical technologies, highly developed at HRL, such as four-wave mixing and phase conjugation have inspired a novel research direction for this program in the field of optical associative memories and neural networks as models for computing. Here the

phase conjugation provides the desired nonlinearities.

UNCLASSIFIED REPORT

ABSTRACT: (U) During the research period starting January 1, 1985 and ending December 31, 1987 the following research objectives were achieved: (1) the Proto II facility is operating according to original specifications, including its capability of reaching temperatures sufficiently low (approximately -36 C) to homogeneously nucleate ice from supercooled water drops; (2) the warm cloud experiments, designed to measure the condensation coefficient of water, have been completed as well as the analysis. It has been found that the condensation coefficient tends to decrease from a value near unity to a significantly low value, approximately 0.1, as the drop grows from submicron size range to several microns, radius; (3) the problem of chamber humidification, the resolution of which became a major research objective during the course of these investigations, has been solved and we are now able to determine initial relative humidities to required accuracy; (4) the larger Rosulus chamber is now producing cloud. The scavenging experiment has not been completed, although considerable progress has been made in its design and implementation. We should be producing results on scavenging by summer 1988.

UNCLASSIFIED REPORT

ABSTRACT: (U) The theoretical and experimental investigations on the instability, routes to chaos and transition to turbulence of an axisymmetric jet flow has been investigated. The first general task has involved the search for evidence of strange attractors in the unsteady dynamics of naturally (stochastically) and periodically excited jets. A special case of the acoustically excited jets were ones having enhanced acoustic feedback. As part of this effort, substantial computer software was developed to analyze velocity time-series to determine attractor dimensions, Lyapunov exponents and topological entropy. Under conditions with strong feedback and without forcing, long highly sampled time-series were analyzed. Using independent measures of attractor dimension by a modified Grassberger-Procaccia algorithm and the singular decomposition method of Broomehead and King, the low-dimensional nature of the dynamics of the initial shear layer up to the point of pairing were confirmed. On the theoretical front, the first part of the work, now completed, dealt with the instability of thin inviscid circular shear layers.

ABSTRACT: (U) The major purpose of the spectrometer was to support research on low temperature molten salts. Specifically, to be used in the determination of the composition of the salt solutions (1H and 13C) and as a probe in the determination of the nature of complexation of metal complexes. In the case of the latter, the instrument was used to probe the nature of octahedral cationic complexes of aluminum and gallium in the molten (the first such observations). Some of the aluminum work has been in support of our work at the University of Michigan and some of the aluminum and all of the gallium work is collaboration with the F.J. Sellaer Research Laboratory (AFSC) at the Air Force Academy. Keywords: Military procurement, Procurement document.

EVI128

UNCLASSIFIED REPORT

ABSTRACT: (U) This research was motivated by a growing consensus that design specifications for projected controlled flexible aerospace structures, which are becoming larger and more flexible while performance requirements are becoming more stringent, can only be satisfied through an integrated design approach in which one determines simultaneously both structural and control system parameters. The work dealt with nonsmooth optimization techniques for the integrated design of flexible structures and their control systems. Nonsmooth optimization is an ideal tool for integrated design because it allows dynamic constraints and imposes no distinction between control system and structural variables. Major accomplishment include the development and testing of an optimal control algorithm which can be used to solve both free and fixed time optimal control problems, such as the problem of moving a flexible structure, modeled by a partial differential equation, from an initial to a final position in minimum time, while guaranteeing upper bounds on the controls and deformations of the structure over the entire maneuver; and laying the ground-work for the frequency domain design of finite dimensional feedback controllers for flexible structures, without resorting to modal

ABSTRACT: (U) The main result of our research is the establishment of a general relationship for fluctuation of the spectral density of the chaotic motion which is similar to the Einstein fluctuation formula in statistical mechanics. A Gibbs-type partition of the chaotic motion is introduced. The distribution function of the spectral density defined on such partition is Gaussian. The variance of this distribution is the Fourier transform of the correlation function. This is demonstrated by direct numerical computations for the simple models of chaos. These results are the consequence of translational invariance and should be valid for the general case of chaotic motion described by differential equations.

ABSTRACT: (U) Research has been carried out on two families of solids. This first one involves solids made by the sol gel process and includes composites. The second one involves non-oxide glasses based on fluorides, chalcogenides and chalcogen halides. The structures of oxide gels were studied by X ray photoelectron spectroscopy, and the gelation of gels investigated as a function of temperature and catalyst. A new theory was developed on gel transformations. A number of new composites made by the sol gel route were examined including the using of SiC and diamond powder as fillers and some triphasic solids. The viscosity and viscoelasticity of fluorozirconate glasses and glass fibers have been studied. New chalcogenide glasses were prepared and their optical properties evaluated. Structural information was derived from Raman spectra. Keywords: Halide glasses, Porous glass-polymer composites, Fluorozirconate glasses, Porous glass ferroelectric composites.

ABSTRACT: (U) Among the problems associated with long-term high temperature service of hybrid material systems is interdiffusional compatibility of the system's component materials. Efforts in this program have focussed on several areas of this problem. One of the areas being examined are alkali metal and alkali earth metal diffusion barriers. These barriers are being applied by two different methods: ion implantation and a sol suspension slurry technique. For both methods, the system being utilized as a model is the tungsten/nickel system. Preliminary results of barrier effectiveness are given. Also being studied are the interdiffusional kinetics of metal/intermetallic and intermetallic/intermetallic ternary systems. Hybrids being examined include W/Ni3Al and TiAl/Ni3Al. Keywords: Nickel aluminides, Titanium aluminide.

ABSTRACT: (U) This report describes progress on the development of a new laser based combustion diagnostic for the quantitative measurement of both major and minor species in high pressure flames. The technique, Asynchronous Optical Sampling (ASOPS), is a state-of-the-art improvement in picosecond pump/probe spectroscopy. The timing parameters for the current ASOPS instrument are described and consideration is given to the optimization of these parameters. The first ASOPS measurements in a combustion environment have been made on atomic sodium. These measurements are compared with laser induced fluorescence measurements to demonstrate the viability of ASOPS as a combustion diagnostic.

ABSTRACT: (U) Solid state magic angle spinning (MAS) and cross polarization Si NMR spectroscopy was used to monitor polycondensation in alkoxide-derived silica gels during thermal treatment from 25 to 800 C. Gels prepared from tetramethylorthosilicate under both neutral and basic conditions were studied, and differences in the evolution of chemical structure during thermal treatment are readily observed by NMR. As thermal treatment proceeds the extent of condensation parallels the BET surface area. For uncatalyzed gels, the amount of cross linking increases, and the BET surface area decreases on each step of heating through 800 C. The base catalyzed gel depolymerizes slightly on heating from 150 to 450 C, accompanied by a slight increase in BET area, then undergoes extensive cross linking on heating from 450 to 800 C, with a large decrease in surface area. After heating to 800 C both gels have similar degrees of cross linking and surface area.

ABSTRACT: (U) Cyclotron resonance with observed electric
field fluctuations is demonstrated to be responsible for
production of the oxygen ion conics that are observed by
the DE-1 satellite in the CPS region of the Earth's
auroral zone. The ion velocity distribution is described
by a quasilinear diffusion equation which we solve using
the Monte Carlo technique. The acceleration produced by
the observed wave spectrum agrees well with the ion
observations, in both form and magnitude. To our
knowledge, this represents the first successful
comparison of an observed conic with any theoretical
model. Keywords: Monte Carlo modeling, Oxygen ion conics,

ABSTRACT: (U) A new finite difference scheme is
presented for solving two dimensional, transient,
incompressible, Navier Stokes problems on a bounded
simply connected region for which there exists a C-2
invertible mapping onto the unit square. The method is
proven to be unconditionally stable and convergent, and
reduces to the well-known Krzhivitsky and Ladyzhenskaya
scheme for rectangular domains.

ABSTRACT: (U) There are algorithms for finding zeros of
fixed points of nonlinear systems of equations that are
globally convergent for almost all starting points, i.e.,
with probability one. The essence of all such algorithms
is the construction of an appropriate homotopy map and
then tracking some smooth curve in the zero of this
homotopy map. HOMPACK provides three qualitatively
different algorithms for tracking the homotopy zero curve:
ordinary differential equation-based, normal flow, and
augmented Jacobian matrix. Separate routines are also
provided for dense and sparse Jacobian matrices. A high-
level driver is included for the special case of
polynomial systems.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report summarizes the results of a two-phase study involving (1) experimental characterization and analytical modeling of fatigue crack tip micromechanics in aerospace structural aluminum alloys, and (2) identification and modeling of key microstructural factors controlling fracture in aluminum-iron-x alloys. Dynamic load cycling within the SEM and stereomaging strain analysis have been used to characterize crack opening loads, strains, and effective stress intensity (delta/Keff) values for large and small cracks in a variety of alloys; both constant amplitude and overload/underload situations were studied. It was found that delta/Keff based on local crack tip opening load was not an adequate crack growth rate correlating factor. Instead, it was necessary to use a new driving force term which includes both closure and local crack tip plasticity. The latter was computed by calculating delta/J integrals within the crack tip plastic zone using local crack tip strain data obtained via high resolution SEM of loaded and unloaded cracks.

UNCLASSIFIED REPORT

ABSTRACT: (U) Theoretical and experimental research has been conducted to elucidate the basic physics behind the properties of superconductor-insulator-superconductor (SIS) tunnel junction receiving devices. The saturation of the gain of the SIS mixer was measured using both monochromatic and thermal signals, and these experiments dramatically verified the theoretical expression derived in the previous report period. A study of the role of the image termination for SIS mixer behavior found that the nonlinear quantum resistance results in an effective time delay at the input port of the mixer. Many aspects of the operation of SIS mixers at submillimeter wavelengths were clarified, including a discussion of the potential of the new oxide superconductors for this field. The goal of the realization of high quality niobium nitride edge junctions was advanced by optimizing the edge profile and by improving the insulating barrier.

UNCLASSIFIED REPORT

ABSTRACT: (U) Bulk samples of the new oxide superconductors were prepared and some of their properties measured. Thin films of yttrium-barium-copper-oxide, completely superconducting below 80K, were prepared by both sputtering and evaporation. The sputtered films on (100) and (110) strontium-titanium-oxide substrates were epitaxial. A correlation between oxygen content in as-deposited films and the formation of non-superconducting surface layers was established. The thickness of these layers was greatly reduced by sputtering in argon and oxygen gas mixtures. The presence of fluorine in the evaporated films was also found effective in minimizing the barium segregation which produces such layers. Zero resistance gold contact layers were obtained on Y-Ba-Cu-O-sputtered films which were processed entirely in situ. Tunneling data using a low-temperature tunneling microscope were obtained on both evaporated and sputtered Y-Ba-Cu-O films. A new surface characterization capability based on the analysis of (Low Energy Electron Diffraction) or (Reflection High Energy Electron Diffraction) diffraction spot intensity was developed.

UNCLASSIFIED REPORT

ABSTRACT: (U) Studies of near infrared light scattering changes in disk membrane suspensions revealed three novel phenomena. The light induced scattering changes observed in the presence of Guanosine triphosphate and Cyclic guanosine monophosphate were produced by aggregation/disaggregation of the membrane vesicles. This aggregation/disaggregation process was correlated with activation of phosphodiesterase and a change in its apparent solubility. That is, PDE became more tightly bound to the membrane when it was activated. We have begun preliminary studies of near infrared scattering signals in the isolated retina. In this preliminary work, we have observed that IBMX, an inhibitor of phosphodiesterase activity, profoundly affects the infrared light scattering signal in the isolated retina. It seems likely that the in vitro and in vivo signals may share a common origin. In a separate series of experiments, we have purified opsin, the opoprotein of the visual pigment protein, and reconstituted it into phospholipid vesicles. We used patch clamp recording to demonstrate that the purified, reconstituted protein exhibits cGMP-activated single channel activity. These results suggest that opsin, in addition to performing its function as the receptor molecule, may be the light-sensitive pore in the plasma membrane of the rod outer segment.

ABSTRACT: (U) Numerous experimental observations support the principal investigator's conjecture that human visual segmentation of figure and ground is partly determined by properties of the visual scene. Support derives from observations that: figure and ground occupy different perceptual depth planes; perceived differences of depth are necessary for figure-ground segmentation; patches of an image are assigned to depth planes partly on the basis of their relative spatial frequency content, temporal frequency content (distinguished from perceived velocity), and retinal disparity. Details of these and other experiments are included with discussion and references. Keywords: Space perception.

UNCLASSIFIED REPORT

ABSTRACT: (U) The Lebesgue decomposition of measures induced by symmetric stable process is considered. An upper bound for the set of admissible translates of a general p th order process is presented, which is a partial analog of the reproducing kernel Hilbert space of a second order process. For invertible processes a dichotomy is established: each translate is either admissible or singular, and the admissible translates are characterized. As a consequence, most continuous time moving averages and all harmonizable processes with nonatomic spectral measure have no admissible translate. Necessary and sufficient conditions for equivalence and singularity of certain product measures are given and applied to the problem of distinguishing a sequence of random vectors from affine transformations of itself; in particular sequences of stable random variables are considered and the singularity of sequences with different indexes of stability is proved. Sufficient conditions for singularity and necessary conditions for absolute continuity are given for the p th order processes. Finally the dichotomy 'two processes are either equivalent or singular' is shown to hold for certain stable processes such as independently scattered random

ABSTRACT: (U) Necessary conditions are given for a symmetric alpha-stable (SaS) process, $1 < \alpha < 2$, to be Markov. These conditions are then applied to find Markov or weakly Markov processes within certain important classes of $S/\alpha/S$ processes; time changed Levy motion, sub-Gaussian processes, moving averages and harmonizable processes. Two stationary $S/\alpha/S$ Markov processes are introduced, the right and the left $S/\alpha/S$ Ornstein-Uhlenbeck processes. Some of the results are in sharp contrast to the Gaussian case $\alpha = 2$. Keywords: Harmonizable process; Stable conditional distribution.

p431-448, 14 Feb 88.

ABSTRACT: (U) Correlations between photons emitted by an atom in a laser field and near a metal surface are studied. With polarization-dependent degenerate substates. Both the Einstein coefficient for spontaneous decay of a particular excited substrate and its branching towards the various ground states depend on the distance between the atom and the surface. A combination of these notions to design a geometry for the correlated detection of polarized photons is employed, in order to predict a strong dependence of the correlation functions on the atom-surface distance. In general, an enhancement of the correlations between emitted photons due to the presence of the metal surface is found, if the atom-surface distance is (roughly) less than 20% of the wavelength of the fluorescence radiation. Especially the correlations between circularly-polarized photons with the same helicity is modified dramatically, and the correlation time tends to infinity if the atom approaches the surface. If it is pointed out how the different photon correlations can be understood from a simple interpretation of transition diagrams. Keywords: Resonance fluorescence; Polarized photons; Reprints; Correlations; Metal surface.

ABSTRACT: (U) The detailed molecular structures including the equilibrium conformations and energies of the four prototype phosphorus compounds exhibiting a phosphorus oxygen phosphorus(P-O-P) interconnection, HAP202n-1 for n=1 to 4, were determined by ab initio quantum chemical calculations. The size, bending force constant, and barrier to linearity of the P-O-P angle were investigated for the n=1 to 3 species and found to be consistent with the large (up to 180) angles seen in pyrophosphate salts. The enthalpies and free energies of the hydrolysis reactions, replacing P-O-P linkage with two P-O-H groups to form the monoacids, were found to increase slightly with increasing numbers of substituents, being positive or close to zero in the gas phase.

ABSTRACT: (U) Vibrational circular dichroism (VCD)
spectra of optically active tartaric acid and its
dimethyl, diethyl and diisopropyl esters were measured.
It is found that VCD associated with the C-O stretching
vibrations is identical in all species and reveals a
configurational correlation. Ab initio calculations of
the energies of several conformers in three levels of
approximation indicated that the trans COOH conformation
with hydrogen bonding between OH and C=O groups on the
same chiral carbon is invariably of lowest energy. This
then permits an explanation of the experimental
absorption and VCD intensities.

UNCLASSIFIED REPORT

ABSTRACT: (U) Two disjoint classes of self-similar symmetric stable processes with stationary increments are studied. The first class consists of linear fractional stable processes, which are related to moving average stable processes, and the second class consists of harmonizable fractional stable processes, which are connected to harmonizable stationary stable processes. The domain of attraction of the harmonizable fractional stable processes is also discussed. Keywords: Self similar processes; Stable processes; Harmonizable fractional processes; Domain of attraction; Linear fractional process.

ABSTRACT: (U) Two common approaches to extremal theory for stationary processes involve (a) consideration of point processes of upcrossings of high levels and (b) use of the total exceedance time above such levels. The approach (a) yields a greater variety of interesting results regarding the global and local maxima, but requires more by way of regularity conditions on the sample paths, than does the approach (b). This work combines both approaches by consideration of the exceedance random measure thereby obtaining general results under weak conditions on the sample functions. These include previously known results in the case where more sample function regularity is assumed.

ABSTRACT: (U) When growing on methane and oxygen, methanotrophic bacteria possess a non-specific enzyme, methane monooxygenase, that has been shown to oxidize halogenated solvents in cell extracts. Methanotrophic bacteria were cultured in batch & column reactors to test their ability to oxidize a number of organic contaminants. Transformation pathways and rates will be determined using the instrumentation funded by OSR. The fundamental concepts derived from laboratory experiments and data are being formulated into a computer biofilm model to predict regions in a contaminated subsurface where the proper environment occurs for contaminant biotransformation. This model will aid the design of biological in situ treatment processes that hold promise to permanently clean up contaminated aquifers.

UNCLASSIFIED REPORT

ABSTRACT: (U) The cytochrome P450IIC2 (previously designated P-450P5c) subfamily of the phenobarbital-inducible family of cytochromes P-450 contains several closely related members. We have reported previously the characterization of complementary deoxyribonucleic acids for four of these P-450's, partial characterization of three of the corresponding genes and have shown that phenobarbital-induction can largely be accounted for by an increase in transcription rates. In year 3 we have continued our analysis of the genes of this subfamily concentrating on the 5' flanking regions which probably contain regulatory regions. To complement our previous characterization of the 3' end of the P450IIC3 gene we have isolated a lambda phage clone containing the 5' portion of the gene. This cloned genomic fragment contained exons 2-6 and combined with the earlier work defines the structure of exons 2-6 into the 3' flanking region spanning more than 25 kilobase pairs. We are continuing our search for a cloned genomic fragment containing exon 1 and the 5' flanking region. We have also characterized a genomic fragment containing exons 1-5 of the phenobarbital-inducible P450IIC4 gene. We are presently continuing the isolation and characterization of the genes and have begun to study the effect of phenobarbital on the chromatin structure of these genes and to characterize nuclear proteins that bind to the genes.

Pub. in Applied Optics, v26 n22 p4731-4737, 15 Nov 87.

ABSTRACT: (U) Shadowgraph studies of the explosive vaporization of a transparent water droplet after irradiation by a high intensity beam show that dielectric breakdown occurs within the droplet shadow face and generates a dense plasma which absorbs the laser pulse. The convective forces expel the vapor from the droplet shadow face. We have induced (1) the vapor propagation velocities, (2) the recoil velocity of the remaining droplet, and (3) the deformation rate of the illuminated face. Droplets are noted to eject fingerlike material from the surface facing the single laser-vaporized droplet when the asymmetrical vapor intercepts the neighboring droplets. Keywords: Explosive vaporization, Vapor propagation velocity, Droplet deformation rate, Shadowgraphs, Recoil velocity.

Pub. in Jnl. of the Optical Society of America B. V4 n11
p1816-1820 Nov 87.

ABSTRACT: (U) Laser induced breakdown of a transparent micrometer sized H₂O droplet can be initiated only in the Ar gas in a strip outside the droplet shadow face. At a higher input 0.532 micro q switched laser intensity, breakdown can also occur within the droplet. The resultant internal plasma blocks the laser from reaching the region outside the shadow face and absorbs more of the laser pulse to produce a shock wave and/or a laser-supported detonation wave. Various combinations of liquid and surrounding gas were investigated at different input intensities in order to provide information on the breakdown processes in a transparent droplet. Keywords: Laser induced breakdown, Location, Transparent liquid droplets, Internal plasma.

SUPPLEMENTARY NOTE: Pub. in Combustion Science and Technology, v53 p89-115 1987.

ABSTRACT: (U) The formation, growth and burnout of soot particles is examined in a series of ethene/air laminar diffusion flames. Detailed particle, temperature and velocity field measurements are utilized to investigate soot growth along individual particle paths. The importance of changes in the particle residence time, flame geometry and growth rates are evaluated as a function of fuel flow rate. Emphasis is given to the soot volume fraction measurements in two characteristic regions of the flame: the annular region near the flame front where soot is first observed to form, and the center line of the flame. In the annular region, increases in the residence time with increasing fuel flow rate are found to be the major reason for increased soot formation. The rates of soot formation are found to be similar in this region for the range of flow rates investigated. Along the center line, the soot formation processes are observed to be very similar for different flow rates if differences in the temperature-time history are taken into account by introducing a minimum temperature at which soot formation is observed. In the present work this temperature was found to be near 1300K. From these results, it is concluded that processes occurring in the annular region are controlling the

ABSTRACT: (U) A framework for studying asymptotic orders of reachability in perturbed linear, time-invariant systems is developed. The systems of interest are defined by matrices that have asymptotic expansions in powers of a perturbation parameter about the point 0. The reachability structure is exposed via the Smith form of the reachability matrix. The approach is used to provide insight into the kinds of inputs needed to reach weakly reachable target states, into the structure of high-gain feedback for pole-placement, and into the types of inputs that steer trajectories arbitrarily close to almost (A,B)-invariant subspaces and almost (A,J)-controllability subspaces.

ABSTRACT: (U) Many neural network models capable of content-addressable memory are shown to be special cases of the general model and Global Lisapunov function. These include examples of the additive, brain-state-in-a-box, McCulloch-Pitts, Boltzmann machine, shunting, masking field, bidirectional associative memory, Volterra-Lotka, Gilpin-Ayala, and Eigen-Schruster models. The Cohen-Grossberg model thus defines a general principle for the design of content addressable memory; that is shared by all model exemplars of such a general design constitutes a computational invariant. Such a general model and analytic method defines a computational framework within which specialized model exemplars may be compared to discover which models are best able to explain particular parametric data about brain and behavior, or to solve particular technological problems.

UNCLASSIFIED REPORT

ABSTRACT: (U) A major issue in research on the neural basis of motor control is the nature of movement planning in systems with many degrees of freedom; for example, an arm with many controlling muscles acting at several joints or a speech system with many articulators. All solutions to the planning problem depend upon assumptions about both the mechanics of the effectors and the sensory and computational resources. For example, if an arm has few mechanical degrees of freedom, then the serial replanning required to work around the arm's inherent constraints becomes a salient issue. Alternatively, if the arm has many degrees of freedom, the computational load imposed by the need for simultaneous coordination becomes a salient issue. If the arm is part of a body that grows, or if a robotic arm must remain in service without external maintenance despite unpredictable changes in its mechanical parameters, then yet another issue comes into view: autonomous recalibration.

ABSTRACT: (U) Average cost per unit time (over an infinite time horizon) optimal control problems for diffusion and other Markov models have been dealt with in various ways. We treat such a problem for 'wideband noise driven' and related systems, which are 'close' to a diffusion, and when the average is in the pathwise but not necessarily in the mean value sense. The general method works for many other classes of processes which are suitable approximated by an appropriate controlled Markov process. The results have applications to many other problems where pathwise averages are important, and the noises are 'wideband'.

UNCLASSIFIED REPORT

ABSTRACT: (U) The electronic properties of Nb(100) are studied using angle-resolved photoemission. Several surface resonances are identified. One surface resonance exhibits significant enhancement of the photoemission cross section at the bulk plasma energy suggesting a novel probe of surface resonances having high degree of second-layer charge density. We report the observation of bulk plasmon enhanced photoemission from Nb(100) surface resonances. This effect offers a sensitive direct probe of the spatial extent of surface states and surface resonances at metal surfaces in cases where a high degree of second-layer charge density exists in the two-dimensional Brillouin zone. A related enhancement effect has been recently reported by Drube and Himpel for inverse photoemission. Photoemission cross section resonances associated with surface states which arise from final state effects have also been observed on silver and copper surfaces. However, these resonances are produced by a distinctly different mechanism than the one described in this paper.

ABSTRACT: (U) Certain design restrictions growing out of antenna theory yield a beautiful class of complex variables problems. Our work was devoted to formulating these problems in mathematical terms, solving some of them, and beginning work on the others. One important result achieved was the development of a new method of estimating Gaussian-type exponential sums. Improvements of our previous results in null steering and notch filtering were also attained. Other findings were obtained in the areas of: the robustness of polynomials with unimodular coefficients; the effect of errors in such standard and crucial approximations as the far-field, Fresnel, and Doppler compensation; the effect of errors in the noise covariance matrix; and the Parabolic Equation Method in underwater acoustics.

ABSTRACT: (U) The morphology of a droplet enhances the internal and external intensities at specific locations and produces high Q-factor feedback for specific wavelengths of emission generated inside a droplet. Coherent nonlinear emissions have been observed from micrometer-size droplets along with other nonlinear effects such as wavelength broadening due to the intensity-dependent refractive index. Physical and chemical properties of the droplet can be reduced from such coherent emissions. Laser-induced droplet explosion and a laser-supported detonation wave result at input intensity levels higher than those necessary to observe such nonlinear effects. The use of spatially resolved spectroscopy to analyze emissions resulting from microexplosion has provided some preliminary details about droplet and air breakdown mechanisms. Keywords: Morphology dependent resonances; Nonlinear optical effects; Spatially resolved spectroscopy; Q factor of cavity; Laser induced breakdown; Reprints.

UNCLASSIFIED REPORT

ABSTRACT: (U) Mixing in simple turbulent flows has been investigated using 64 cubed and 128 cubed Direct Numerical Simulations. In turbulent combustion, mixing by molecular transport is an essential process that is not well understood. Because mixing occurs on the smallest length and time scales it is difficult to study experimentally. Instead, we have employed direct numerical simulation of turbulence, initially for a conserved passive scalar in homogeneous isotropic turbulence. The Eulerian velocity and scalar fields are calculated from the exact evolution equations, and both Eulerian and Lagrangian statistics are deduced from the computed fields. A particle-tracking scheme, needed to extract Lagrangian information, has been implemented. The testing of a number of such particle tracking schemes has been completed with good results: accurate Lagrangian information can be extracted at a modest computational cost. In order to study processes in stationary turbulence, a forcing algorithm has been implemented. Tests on this scheme are complete, again with good results: the small scales are unaffected by the details of the forcing. Studies have been performed of: the mixing of a passive scalar; Lagrangian velocity; Acceleration and dissipation statistics; and Mixing and combustion problems viewed in terms of surfaces.

ABSTRACT: (U) Internal gravity waves, with their induced stress divergence and turbulence induced are essential components of the atmospheric and oceanic general circulations. Theoretical studies have not yet reached a consensus as to how gravity waves transport and deposit momentum. The two best-known theories, resonant interaction and Eikonal saturation, yield contradictory answers to this question. In resonant interaction theory, an energetic, high-frequency, low-wavenumber wave is unstable to two waves of approximately half the frequency and is backscattered by a low-frequency wave or mean finestructure of twice the vertical wavenumber. By contrast, the Eikonal saturation model, as it is commonly used, ignores reflection by assuming a slowly varying basic state and does not question the longevity of the primary wave in the presence of local Kelvin-Helmholtz or convective instabilities. The resonant interaction formalism demands that the interactions be weakly nonlinear instability with respect to other horizontal wavenumbers by invoking the linear of quasi-linear assumption. To help bridge the gap between the two theories, results from prototype nonlinear numerical simulations are presented. Attention is directed at the nonlinear instability of gravity waves in a slowly varying basic state. Parametric instability theory yields

ABSTRACT: (U) The subtropical mesospheric jet observed by the Nimbus 7 Limb Infrared Monitor of the Stratosphere in late 1978 was flanked to the north and south by regions of reversed potential vorticity gradient. In mid-December, enhanced planetary wave activity propagating upward into the mesosphere led to visible overreflection from the low-latitude reversed gradient region and rapid deceleration of the jet. It is argued, first, that the overreflection visible in the geopotential height field was probably genuine, and not likely to have been due to Rossby waves incident on an inertially unstable region. Nor was it due to the opposing mean meridional circulation. Second, the observed dominance of wave 1 in the overreflected flux may have been attributable to hemispheric barotropic instability: a low-wavenumber type of instability on the sphere related to the midlatitude modes discovered by Hartmann. In comparison to the barotropically unstable eigenmodes for higher zonal wavenumbers, the wave 1 mode has a slower growth rate but larger spatial extent. For practical purposes, it is a radiating mode excitable by sources in the far field. Equally important, the phase speed of the eigenmodes can be made exactly zero when the mean flow vanishes just within this region, as observed in mid-December 1978. Resonant excitation is therefore possible. Realistic

opposing mean meridional advection has only a slight effect on the barotropic eigenmode, provided that high-wavenumber oscillations are filtered out of the calculation, acting to reduce the growth rate and shift the subtropical secondary amplitude maximum a few degrees towards the pole.

ABSTRACT: (U) An axisymmetric jet flow facility with a laser fluorescence flow visualization system has been developed. Advanced techniques in nonlinear optics and spectroscopy are being used to track oxygen molecules for velocity measurements. Similar techniques are being used to determine the distribution of energy states of oxygen molecules for temperature measurements. Density can also be measured by observing the direct light scattering from both oxygen and nitrogen. The great advantage of these techniques is they are non-obtrusive, instantaneous, two-dimensional and require no seeding of the flow with foreign material. SUPPLEMENTARY NOTE: Pub. in Jnl. Chemical Physics, v88 n2 p1284-1271, 15 Jan 88.

ABSTRACT: (U) A previously formulated and semiclassical wave packet method is used to investigate the importance of different surface phonon modes and the Debye surface temperature upon inelasticity in atomic gas-surface collisions. Desorption rates are calculated as a function of potential-well depth and the rate law for process is examined. The incident beam is represented by a quantum mechanical wave packet whose momentum distribution is nearly square. This wave packet is coupled to a three-dimensional model lattice through a time-varying potential field obtained by solution of the classical motion equations for the lattice. Calculated final-state momentum and energy distributions are found to be strongly dependent upon the particular surface phonon mode into which the initial lattice energy is partitioned. In general, energy transfer occurs predominantly to and from those modes for which the lattice atom in the impact region have motion in the direction of the momentum vector of the incoming wave packet. The inelasticity of the collision is found to increase as the lattice force constants and the surface Debye temperature decrease. The peak spacings in the final-state momentum and energy distributions are found to correlate well with the surface phonon frequencies. Desorption is found to be

UNCLASSIFIED

AD-A192 450 11/6.2

well described by a first-order rate law for small potential-well depths. For larger well depths, the first-order decay plots begin to show an increasing amount of curvature. Desorption rate coefficients obtained from the slopes of the decay plots show an approximate exponential dependence upon the potential-well depth.

SUPPLEMENTARY NOTE: Pub. in High Temperature Technology, v5 n3 p131-138 Aug 87.

ABSTRACT: (U) In situ Ni-Cr-Al-Hf alloy has been developed by laser surface cladding with a mixed powder feed for improved high temperature oxidation resistance. Oxidation-resistant materials for operation at elevated temperatures must satisfy two requirements: diffusion through the oxide scale must occur at the lowest possible rate, and the oxide scale must resist spallation. Formation of an Al₂O₃ protective scale fulfills the former requirement but its adherence is poor. A reactive metal such as Hf is added to improve adhesion. A 10 kW CO₂ laser was used for laser cladding. Optical, SEM and STEM microanalysis techniques were employed to characterize the different phases produced during the cladding process. Microstructural studies showed a high degree of grain refinement, increased solid solubility of Hf in the matrix and the formation of Hf-rich precipitates. A thermogravimetric analysis was carried out to determine the oxidation properties of these clad alloys with an extended solid solution of Hf. Considerable improvement over the base metal was observed. This paper discusses microstructural development in this laser clad alloy and its effect on oxidation. Keywords:

ABSTRACT: (U) The objective of the past research was the development of some mathematical and computational tools that are appropriate to the next generation of CACE (Computer-Aided-Control-Engineering) environments. These CACE packages will be radically different than the present analysis packages in that they will truly be able to perform control system synthesis. In order for this ideal situation to come about, it is necessary first to solve some important problems in the mathematics of control systems as well as in computational techniques. Phase I of the research program addressed the feasibility of solving some of the problems. Phase II will extend the results of Phase I as well as developing primitives for performing robust and adaptive control design. In particular, we will address the following control problems: (i) synthesis of linear control systems, (ii) analysis of transfer function estimation, (iii) analysis of parameter adaptive control, and (iv) language architecture for control design.

ABSTRACT: (U) Our goal has been to study the mechanism
by which non-genotoxic chemicals act. To this end, we are
testing the hypothesis that chemical modulation of gap
junctional intercellular communication can lead to many
toxic endpoints, such as teratogenesis, tumor promotion,
immune-, reproductive and neurotoxicities. Our aims have
been (a) to study the biochemical mechanisms by which
inhibitors of gap junctions work; (b) to develop and
apply new in vitro techniques to measure gap junction
function; and (c) to test if known non-genotoxic
chemicals inhibit gap junctions in various cell types.
Results to date have validated the fluorescence recovery
after photobleaching, and scrape-loading/dye transfer
techniques for measuring gap junction function. In
addition, we have shown that protein kinase C, the ras
oncogene and the neurotoxicant, heptachlor, all seem to
work via different mechanisms to block intercellular
communication. Results described in this report have been
communicated at several meetings, while abstracts,
preprints and reprints of these reports are attached to
the progress report.

UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of the research in this program was to develop Lagrangian methods on triangular grids and apply these methods to the calculation of life history and dynamics of fuel droplets. With respect to numerical technology, the two-dimensional code SPLISH was converted to a VAX and then to a CRAY computer. New graphics systems were developed. Further testing of the basic SPLISH hydrodynamic algorithms as well as the surface tension algorithm were performed on internal gravity and capillary waves. A reorganization of the computer code will make the code user-friendly and portable. Now it should be much easier to use, and therefore useable on many new kinds of problems. First previously calculated flows of the distortion and breakup of a droplet due to differences in flow velocities between the droplet and the external media were recomputed to verify the conversion. Then a number of calculations of droplet distortion and breakup due to shear flows were made. Qualitative comparisons to experimental results were made for the case when the droplet density and external fluid density were nearly equal. Our calculation and the experiments by Mason and coworkers showed small droplets torn off the large drop by the forces in the shear flow. A preliminary calculation of a droplet-droplet collision shows the distortion of droplets before they collide. Forced-flow

ABSTRACT: (U) This conference will focus on nonlinear partial and integrodifferential equations by considering them as infinite-dimensional dynamical systems. One day will be devoted to new classes of equations that arise via mathematical modelling of large flexible space structures. Some of the topics which will be represented are: Nonlinear Semigroups; Dynamical Systems; Attractors; Reduction to Finite Dimensional Systems; Inertial Manifolds; Bifurcation Theory; Control Theory; Compensated Compactness; Nonlinear Evolution Equations; Reaction-Diffusion Equations and Stability Analysis of PDE's.

DESCRIPTORS: (U) *PARTIAL DIFFERENTIAL EQUATIONS, CONTROL THEORY, DYNAMICS, EQUATIONS, EVOLUTION(GENERAL), FLEXIBLE STRUCTURES, INERTIAL SYSTEMS, INFINITE SERIES, MATHEMATICAL MODELS, NONLINEAR ALGEBRAIC EQUATIONS, SIZES(DIMENSIONS), SPACECRAFT, STABILITY, SYMPOSIA, THEORY, MAPPING(TRANSFORMATIONS).

SUPPLEMENTARY NOTE: Prepared in cooperation with North Star Research Corp., Albuquerque, NM.

ABSTRACT: (U) Simple analytical considerations suggest that for certain parameter regimes for co-streaming ion and electron beams, radial equilibrium can be expected without charge or current neutrality. To investigate these predictions experimentally, a pulsed power system comprising separate anode and cathode pulsers was designed and assembled. A double diode was developed to produce the plasmoids, and its steady-state space charge limited current researched over modest distances in terms of net current transport, radial profile, and beam front velocity. The results described in this report include the analysis and methodology leading to the successful production of nonneutral plasmoids and their propagation over distances up to several drift tube radii at currents more than an order of magnitude larger than predicted for either electron or ion constituents separately. Keywords: Plasmoids; Charged particle beams; Beam propagation; Ion diodes; Pulsed power.

UNCLASSIFIED REPORT

ABSTRACT: (U) Five experiments are described that study the relationship between measures of working memory and reading comprehension. Two experiments investigated whether the complex span measure must be similar to the reading comprehension task to be predictive of comprehension. The correlation found between reading comprehension and two reading-related complex spans was similar to those found between two arithmetic-related complex spans and comprehension. The relationship remained significant when quantitative skills were factored out. The simple digit and word spans (measured without a background task) did NOT correlate with reading comprehension. The complex span/comprehension correlations were a function of the difficulty of the background task. When the difficulty level of the reading-related or arithmetic-related background tasks was moderate, the span/comprehension correlations were higher in magnitude than when the background tasks were simple or very difficult. The third experiment showed that if serial recall was required in the span tasks, simple word span did significantly predict reading comprehension but not as well as the sentence span. The fourth experiment showed that the ordering of list lengths in the span tasks had little influence on the correlation between span scores and comprehension. The fifth experiment is

UNCLASSIFIED REPORT

ABSTRACT: (U) Given two Banach spaces X and Y over $K = \mathbb{R}$ or \mathbb{C} and a parameterized family $A(\mu)$ an element of $L(X, Y)$ with μ an element of K , partial and algebraic multiplicities of any value μ sub 0 an element of K such that $A(\mu$ sub 0) is Fredholm with index zero are defined by the means of generalized Jordan chains. These notions are developed in close connection with bifurcation problems and we show that partial and algebraic multiplicities are not affected by Lyapunov-Schmidt reduction. Properties of invariance under equivalence are also established. These general results are used to give a proof of Magnus' generalization of the classical bifurcation theorem by Krasnoselskii through a somewhat more natural approach than his. But the convincing evidence of the usefulness of the notions developed here has to be found in a new and wide extension of the Boehmer-Marino-Rabinowitz theorem on bifurcation for gradient operators, the ancestor of which is also due to Krasnoselskii.

ABSTRACT: (U) This final report summarizes progress on a basic research effort to determine three-dimensional aspects of the relationship between applied load and fatigue crack face separation. The research was motivated by the well known crack closure phenomenon, which indicates that naturally occurring fatigue cracks are physical held shut (or propped open) at zero load, so that crack surfaces do not separate in a linear elastic manner. Although prediction of fatigue crack opening behavior is of fundamental importance to many aspects of crack growth, relatively little is known about the three-dimensional character of closure. The research employed experimental and numerical procedures to develop predictive techniques for this important aspect of crack closure. Optical interference was used to measure crack opening in transparent polymer specimens, along with conventional crack opening and back face strain techniques for measuring crack closure. A numerical algorithm was developed to predict opening loads in surface flawed plates, and was compared with the experimental results. Keywords: Crack propagation, Cracking(Fracturing).

ABSTRACT: (U) Four inbred strains of mice, BALB/cByJ,
C3H/21bg, C57BL/61bg, and DBA/21bg, were tested for their
learning ability in the Morris water maze. Two forms of
learning were examined: cue learning, in which the mice
were required to swim toward a submerged platform marked
by a proximal visual cue; and place learning, in which
the animals were required to use distal visual cues to
find a submerged platform. C3H and BALB mice, which lack
good visual acuity, were incapable of either form of
learning. Both C57 and DBA mice were capable of cue
learning, but DBA mice performed poorly at the place
learning task. A selective impairment in place learning
is typical of rats with disrupted hippocampal function. A
similar impairment in DBA mice may indicate that abnormal
hippocampal function exists under baseline conditions in
this strain.

ABSTRACT: (U) Intracellular injection of antibodies to the 27-kDa liver gap junction polypeptide have been shown previously to uncouple pairs of cultured mammalian hepatocytes, cardiac myocytes, and ganglionic neurons. In confluent primary cultures of astrocytes, similar injections significantly reduced dye coupling for cells closer than 80 micrometers to the injected glial cell. Western blots identified a 27-kDa protein in extracts of the astrocyte cultures that cross-react with the gap junction-specific antibodies. These results suggest that homologous gap junction polypeptides exist in liver and glial cells.

ABSTRACT: (U) Our results are concentrated in seven basic areas: 1) We find that masking is subject to considerable learning effects. Weber's Law is only observed--when proper controls are used--in the relatively uninteresting case where it is inherent in the stimulus, and is unaffected by visual physiology. 2) There is a region of space/time separations wherein two flashed lines will show lateral facilitation, rather than inhibition, suggesting the action of a motion-detector. 3) Substantial modelling of line interactions confirmed our conclusion that this facilitation was a nonlinear effect, and not predictable from current probability-summation models. 4) Spatial summation and 2-line acuity change very differentially with retinal eccentricity; it may be that one taps primarily receptor size while the other taps receptor separation. 5) It is possible to observe visual aliasing in the parafovea without the use of interference fringes. This aliasing appears to be neural, rather than receptor. 6) Flashed presentations produce a large transient change in the area of spatial summation and in the amount of lateral inhibition. Keywords: Vision; Visual masking; Spatial sampling; Spatial summation; Motion detection.

ABSTRACT: (U) This program was designed to investigate the fundamental properties of ultrathin layers and the devices that would be fabricated from them. We have concentrated our investigations on the influence of growth conditions on the interfaces between AlGaAs and GaAs and the effect these properties have upon device performance. This has allowed us to optimize the techniques for interface formation to the point that low interface state densities can be achieved for both normal and inverted heterojunctions. We have also determined the optimal conditions for the growth of quantum well structures and have achieved state of the art low temperature PL linewidths for MOCVD-grown quantum wells (QW). We also investigated and analyzed the design of heterojunction bipolar transistors during the course of this program. Our studies pointed out that a significant opportunity to increase the capabilities of bipolar circuits through the use of complementary device designs had been overlooked. We developed a methodology for device analysis that showed that Pnp HBT's could be designed that were comparable in performance to the Npn designs used by most workers. The realization of this analysis would allow designers to consider low power complementary bipolar circuits in GaAs for the first time. We have proceeded to fabricate Pnp devices that show the expected performance and will continue to optimize them until the current program ends.

ABSTRACT: (U) A computer simulation code has been developed. The physical transport processes of radiation transport, viscosity, electrical and thermal conductivity and turbulence were included in the study. The code benchmarked against material erosion experiments with metals and insulators. The processes occurring near the bore wall of an electrothermal gun have been evaluated. The studies have demonstrated the utility of a gun system redesign which lowers the propelling gas temperature near the wall. This has resulted in the experimental reduction of gun bore erosion to levels at or below the erosion in conventional powder guns. The code results have also been interpreted for the electromagnetic (rail) gun case. Here the unavoidable high propelling gas temperatures cause a more severe erosion problem.

ABSTRACT: (U) The overall objective of this research program was to quantitatively investigate the fundamental phenomena relevant to aero-thermodynamic distortion induced structural dynamic blade responses in multi-stage gas turbine engine components. The technical approach involved both experiment and analysis. (1) The flow physics of multi-stage blade row interactions has been experimentally investigated, with unique high reduced frequency unsteady aerodynamic data obtained to understand, quantify, and discriminate the fundamental flow phenomena as well as to direct the modeling of advanced analyses. (2) The development of an unsteady viscous flow analysis appropriate for aerodynamic forced response predictions was initiated. (3) A structural dynamics model based on an energy balance techniques coupled with the unsteady aerodynamic analyses under development is being utilized to investigate aerodynamically forced response of turbomachine blade rows. Keywords: Gas turbine, Aeroelasticity structural dynamics, Unsteady aerodynamics.

ABSTRACT: (U) Significantly greater weight loss was observed in PFDA-treated rats than in pair controlled rats. These data indicate that the wasting syndrome cannot be explained entirely by lack of food intake. Additionally, a precipitous fall in serum thyroxine was observed as early as 12 hours following PFDA. Early experiments indicated that a hypothyroid-like state resulted from PFDA treatment. PFDA induced decreases in serum thyroid hormones, anorexia, bradycardia, hypothermia, as well as alterations in myocardial catecholamine metabolism. Liver enzymes alpha-glycerolphosphate dehydrogenase and malic enzyme were measured to evaluate tissue thyroid state, the activity of both enzymes was significantly elevated as early as 24 hours and remained so throughout the experiment. A possible conclusion based on interpretation of these data is the PFDA alters biochemical processes at the cellular level which produces confused messages concerning metabolic status, thus leading to anorexia and metabolic inefficiency which results in severe body wasting and hypothermia.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report describes the research work on cathode phenomena and presents the development work and the results of several model calculations by means of which the performance of coaxial MPD thrusters can be predicted. Electrode effects like spot formation and spot motion can cause high erosion on the cathode and backplate of an MPD thruster. These effects are qualitatively and partially quantitatively explained by means of a unique theoretical approach. By means of these performance calculations the onset conditions were calculated based on the fact that due to magnetic contraction (pinch effect) the plasma density becomes zero at the anode (onset theory of Hugel). The results of these calculations are in excellent agreement with those of the experiments. Keywords: Magnetoplasma dynamic thruster, Electrode phenomena, Flow arc discharge, Calculations, Onset.

ABSTRACT: (U) The electronic spectra and energy transfer pathways of matrix isolated iodine monofluoride and diatomic iodine have been investigated. Laser excitation of matrix isolated IF revealed the presence of three electronic states which had not been observed previously. The lowest energy state was identified as A(3)pi(2). Determination of the position and lifetime of this state has provided a means for assessing its role in the chemical excitation of the B state. The higher energy states have been tentatively assigned to a doubly excited electronic configuration. The I2 A yields X system was studied in Argon, Krypton, and Xenon matrices. Analyses of the emission spectra showed that previous vibrational assignments were in error. The A state lifetime was found to be 50 + or - 15 microseconds in all three matrix hosts. Continuous wave excitation and wavelength-resolved fluorescence techniques were used to study the self-quenching and energy transfer kinetics of diatomic bromine (B).

ABSTRACT: (U) The behavioral and neural substrate for motor processing of vocalizations exists in an animal model (the zebra finch). What had been considered a simple vocalization, learned from one model and carrying one message, proves to consist of compound sound units (syllables) arranged in a complex structure. The syllables in each vocalization are learned from several different sources or improvised, and are assembled to form a new vocalization. The vocal motor neurons have an auditory function (the muscles of the vocal organ contract slightly when the animal is presented with an auditory stimulus), the vocal motor neurons are spatially ordered according to their target muscle (and hence their vocal function), and vocal motor neurons in different pools have different auditory responses. Behavioral experiments to test whether the vocal motor system is involved in perception have been initiated. A new method for visual analysis of sounds is being tested. Keywords: Auditory processing, Synchron, Song, Auditory perception, Hearing.

UNCLASSIFIED REPORT

ABSTRACT: (U) An improved understanding of factors governing the selective oxidation of aluminum to form continuous alumina scales on modified niobium-aluminum alloys has been established. It has been demonstrated that highly protective alumina scales can be formed on niobium-titanium-chromium-vanadium-aluminum alloys without transient oxidation products at temperatures of 1400 to 1600 C in air. Aluminum content has been identified as the critical factor controlling single layer alumina formation. It also has been shown that the N sub Al(crit) for the formation of a continuous alumina scale is 0.375 - 0.38 at 1400 C, decreasing slightly with increased Nb-Ti ratio in the alloy. A fourth element must be added to niobium-titanium-aluminum for effective alumina formation. It has been established that this element should be from a group that can reduce the solubility-diffusivity at 1400 - 1600 C. Alumina can be formed at 1400 C by substituting V or Ti but a liquid transient oxide is produced. A high rate of transient oxidation relative to alumina formation in this range accelerated transient oxidation and precluded alumina

UNCLASSIFIED REPORT

ABSTRACT: (U) Considerable success was achieved relative to the goals of this project. Most importantly, a new generic class of high performance polymer blends was discovered. It is believed that polybenzimidazoles and polyimides are miscible over a wide range of compositions, structural variations and temperature regimes. This assertion is based on work with the blends described in this report, utilizing commercially available materials. Evidence for their miscibility was displayed in their glass transition behavior, as elucidated by DSC and DMA, and in their IR spectral properties. Their phase behavior was also examined. Several blend combinations have been scaled up for evaluation to delineate technologically useful systems. The synthesis and properties of two high performance ionomers were also investigated: sodium sulfonate (Udel) polysulfone (Na-SPSF) and sodium sulfonate poly(ether ether ketone) (Na-SPEEK). Improved and novel synthetic techniques were developed so that random, homogenous copolymers could be prepared. Their glass transition behavior and thermal stabilities were assessed. Their blend properties were also assessed and analyzed theoretically in terms of a mean-field treatment. Interaction parameters were calculated.

UNCLASSIFIED REPORT

ABSTRACT: (U) There is currently an urgent need for alternate channels for communication. The large variety and quantity of users throughout the world have caused all of the existing channels to become extremely congested. A world wide search for such alternate channels is now being conducted for both present day and future communication systems through the use of different types of channels such as optical, laser, cable, satellite, etc. The particular application of Beyond-Line-of-sight (BLOS) communications, which uses the High Frequency (HF) spectral band from 3 to 30 MHz, is very important to many current and potential users. However, HF is very sensitive to solar disturbances such as sunspot activity, solar storms and other galactic phenomena, as well as multipath returns from both ground and atmosphere, weather related attenuation, and other degrading factors. Because of these factors a channel for communication is needed which has low congestion, is robust and relatively indestructible, has very little outside interference and does not compete for bandwidth with existing communication systems.

ABSTRACT: (U) From September through November the author concentrated on the development of an Integrated Image Understanding Benchmark for computer vision architectures. Unlike previous vision benchmarks, this new benchmark is designed to test machine performance on a complete interpretation task. The task chosen will require not only that common low-level vision operations be performed, but that intermediate-level operations and interactions between operations be tested as well. In fact, the emphasis of the benchmark is on intermediate - or high-level processes controlling lower level processing in a top-down manner. The goal of the interpretation task is to recognize a modeled object in a cluttered environment. The input to the system is a set of models, any one of which may be present in the scene, and a pair of registered images. One of the images is from a black and white 8-bit intensity sensor, and the other is from a 32-bit floating-point range sensor. For the purposes of the benchmark, the images are artificially created.

SUPPLEMENTARY NOTE: Pub. in Proceedings of the ESA Symposium on European Rocket and Balloons Programmes and related Research (8th), p169-174 Aug 87.

ABSTRACT: (U) Two rockets containing dc probes were launched at Poker Flat, Alaska to measure electron density irregularities with high spatial resolution. They were launched at times when the MST radar showed regions of intense backscatter in the mesosphere. Large changes and strong gradients in the electron density are observed in the region of most intense backscatter. The electron density profiles show different characteristics in the peak scattering region. Spectra of the spatial density fluctuations are derived. In the region of most intense backscatter, the power is up over the whole frequency range by almost 5 orders of magnitude. A detailed intercomparison of the probe data is given, followed by a comparison between the measured radar echo power and calculated echo power based on the in situ rocket measurements.

DESCRIPTORS: (U) *ELECTRON DENSITY, *RADAR REFLECTIONS, ALASKA, BACKSCATTERING, DENSITY, DIRECT CURRENT, ECHOES, ELECTRON PROBES, FREQUENCY, HIGH RESOLUTION, INTENSITY, LAUNCHING, MEASUREMENT, MESOSPHERE, PEAK VALUES, POLAR REGIONS, POWER, PROBES, PROFILES, RADAR, REGIONS, ROCKETS, SCATTERING, SPATIAL DISTRIBUTION, VARIATIONS, REPRINTS.

ABSTRACT: (U) This Annual Report covers the twelve month period ranging from January 1, 1987 through December 31, 1987. The progress reported herein was accomplished during the second year of our current triennial technical program. Ten faculty members and approximately twenty graduate students from the Department of Electrical and Computer Engineering and the Department of Physics are conducting the research described in this report. The University of Texas DoD JSEP program is a broad-based program with four research units in Solid State Electronics, two in Electromagnetics, two in Quantum Electronics, and two in Information Electronics. The Solid State Electronics program involves the fundamental issues in semiconductor physics and technology and is designed to address basic problems which must be solved for the development of the next generation of electronic and optical devices. In the following significant accomplishments section, we summarize recent advances in molecular beam epitaxy for ultra-high speed device applications and ion implantation of InP. In the Electromagnetics area several novel monolithic millimeter-wave integrated circuit structures are being investigated for use as quasi-optical array elements.

UNCLASSIFIED REPORT

ABSTRACT: (U) The following report describes our present understanding and recent results from an analysis of the effects of elastic scattering on neutral beam penetration. The important factors affecting neutral beam propagation in the upper atmosphere at altitudes of 200-250 km are discussed. Two primary factors affecting the beam quality are the accuracy of beam collimation and the effect of atmospheric particles. A further factor is ionization of collisions between the beam particles and the background atmospheric particles. The beam factor is ionization of the beam particles in terms of radiation or waves and instabilities that may result from the collective interaction between the ionized beam particles and the charged particles in the background atmosphere.

DESCRIPTORS: (U) *ELASTIC SCATTERING, *PARTICLE BEAMS, ACCURACY, ATMOSPHERES, BACKGROUND, COLLIMATORS, ELECTROMAGNETIC WAVE PROPAGATION, INTERACTIONS, IONIZATION, NEUTRAL, PENETRATION, PLASMAS(PHYSICS), BEAM RADIATION, UPPER ATMOSPHERE, ATMOSPHERIC PHYSICS, BEAM FORMING, BOLTZMANN EQUATION.

IDENTIFIERS: (U) Neutral particle beams, Rarefied gas dynamics, PE63221C, WJAFOSR5812G1.

ABSTRACT: (U) Within the general topic, four separate tasks are specified. These are, in brief: I. Loss mechanisms and loss migration in transonic compressors, including development of advanced instrumentation for measurements of wake radial transport and analysis of unsteady vortical wake structures. II. Experimental and theoretical study of flows in casing and hub treatment, including mechanisms for stability enhancement in compressors and unsteady fluid dynamic interactions between passage and groove flows. III. Computational techniques for turbomachinery, including inverse (design) calculation procedures for transonic turbomachine blades accounting for viscid/inviscid interaction. IV. Theoretical modelling of stability and unsteadiness in transonic compressor flow fields, including analyses of unsteady fluctuations due to vortex shedding.

DESCRIPTORS: (U) *COMPRESSORS, *FLUID DYNAMICS, *TURBOMACHINERY, COMPUTATIONS, FLOW, GROOVING, HUBS, INSTRUMENTATION, INTERACTIONS, INVISCID FLOW, LOSSES, MIGRATION, OPTIMIZATION, STABILITY, TRANSPORT, VISCOUS FLOW, VORTEX SHEDDING, WAKE, TRANSONIC FLOW, UNSTEADY FLOW.

UNCLASSIFIED REPORT

ABSTRACT: (U) Naturally-derived microbial microcosms were used to evaluate general responses of aquatic communities to stress. Laboratory toxicity tests examined structural and functional responses of microbial communities to six pure compounds (chlorine, zinc, phenol, ammonia, Atrazine, and sulfuric acid), mixtures of ammonia and chlorine, and two complex effluents. In addition, field validation studies compared laboratory responses of microbial communities to effects in the receiving system. For all six pure compound studies, estimates of permissible concentrations from microcosm tests were similar to more expensive conventional estimates. Changes in species composition, species loss, and changes in dissolved oxygen concentrations were the most consistent indicators of system stress, responding across types of toxicants. Structural measures were more sensitive than most functional measures. Early field validation studies indicated the degradation of effluent was an important factor in predictive success. In situ toxicity test results corresponded well to effects on native macroinvertebrates and later, modified laboratory tests successfully predicted some in-stream environmental effects within 15%.

SUPPLEMENTARY NOTE: Pub. in Jnl. of the American Chemical Society, v110 p313-314 1988.

ABSTRACT: (U) Despite intent interest in the chemistry and properties of acylsilane derivatives (R2OSiR3), little has been reported regarding formylsilanes (R3SiCHO). Early attempts to prepare formylsilanes led to the conclusion that they were unstable under a variety of reaction conditions. Hydrolysis of the ozonide adduct of vinyltrimethylsilane with zinc dust gave trimethylsilyl alcohol and formaldehyde, possibly via Me3SiCHO. The pink silaacyl complex obtained by carbonylation reacts with anhydrous HCl in toluene at -78 C to afford the first stable formylsilane, (Me3Si)3SiCHO. The compound is a colorless oil, characterized by 1H NMR, 13C NMR, 28Si NMR, IR, and mass spectroscopy. It is reduced by NaBH4 to the alcohol (Me3Si)3SiCH2OH, by (Cp2ZrHCl)n to the zirconium alkoxide Cp2Zr(OCH2Si(SiMe3)3Cl), and by MeMgBr to (Me3Si)3SiCH(Me)OH.

UNCLASSIFIED REPORT

ABSTRACT: (U) The research addresses a single, free, round turbulent jet expanding into a quiescent environment, and deals with the large scale motions through large eddy simulation and the small scale motions through subgrid-scale turbulence modeling. The computational fluid dynamic investigation of the nearfield downstream of an axisymmetric nozzle is based on a two dimensional procedure involving a variable reduction method, with the farfield fully developed flow structure analyzed by matched asymptotic expansions for large Reynolds numbers. The numerical algorithm development examines vectorization, three dimensional flowfield, and the construction of weakly dissipative difference methods. Keywords: Asymptotic structure. Circular jet; Fair field development; Fast algorithm; Free jet; Large eddy simulation.

UNCLASSIFIED REPORT

ABSTRACT: (U) A study is made of interaction between plasmas, whose parameters are typical of high specific power, high specific impulse devices, and various conducting and insulating surfaces. This study is carried out using metallic and dielectric surfaces arranged perpendicular (facing upstream and downstream) and parallel to phenomena, when they have been investigated at all, have been studied under the parameter constraints of particular devices, usually under conditions of poor diagnostic accessibility. The present study is carried out under conditions that allow better diagnostic examination of the plasma-surface region with the ability to vary plasma parameters, flow relative to the samples, electrical conduction to the (metal) samples, etc. The aim is to delineate the basic physics of plasma-surface interaction under conditions applicable to the design of space power and propulsion systems. The arcjet will be installed and tested; the downstream plasma flow will be examined and its parameters (temperature, composition, density, flow velocity, etc.) will be correlated with the variation in the discharge energy and other parameter of the thruster.

TASK NO. A1

MONITOR: AFOSR
TR-88-0131

UNCLASSIFIED REPORT

ABSTRACT: (U) Water surface temperatures can be obtained from satellite thermal remote sensing. Landsat and other satellites sense emitted thermal infrared radiation on a regular basis over much of the earth's surface. Evaporation is accomplished by the net transport of mass from the water surface to the atmosphere. Energy for the change of state in part comes from the subsurface and passes through the surface conduction layer. The latent transfer (evaporation) predominantly determines the water surface temperature. There should be good correlations between evaporation and surface temperatures. Satellite thermal data and evaporation data from four different years were obtained for the Great Salt Lake and surrounding region. More than 350 correlation and linear regression analyses were performed on the temperature and evaporation data. These included daily, multiple-day, and monthly values from measurements and modeling for the whole lake and areas within the lake using both day and night observations. The lake salt concentrations were also factored into the analyses in several different ways. The correlation results were generally very good and a methodology for using satellite-derived water surface temperatures along with salt concentrations were developed to estimate evaporation. Continuing efforts now include acquiring thermal data at less cost, more frequently and more quickly in order to apply the temperature evaporation models in near real time to lakes

ABSTRACT: (U) The speakers gave reports on their research to-date concerning nonlinear Partial Differential Equations and possible systems of Ordinary Differential Equations which faithfully capture their essential behavior, particularly in terms of chaotic behavior.

ABSTRACT: (U) The research has aimed at defining data structures and completing tools for a new flexible approach to scientific programming and problem solving. Both problems of program complexity associated with changing models and physics as well as joined and disjoint multiple independent patched domain decompositions for treating complex geometries can be systematically organized within the context of the directed graph programming concept being explored. Problems and parts of problems having geometric connectivity or its analogs such as precedence relationships are naturally exhibited and easily debugged or modified in the graph. The solution of problems is literally to traverse the graph. For the planned prototype aerodynamic simulation facility the graphs which are to embody grid generation and Navier Stokes solution procedures are to be constructed with a graphical editor hosted in a high performance graphics workstation. Keywords: Adaptive gridding; Navier Stokes; Patched grids, Upwind methods.

ABSTRACT: (U) The objective of the program's second year research work was to examine the validity of the constant probability crack growth model while refining the transition intensity parameter. This work has been completed, thus leading to a crack growth rate equation with an explicit probability term. Furthermore, work extending the applicability of the model to variable loading required the determination of the delay-time associated with a single overload. An experimental test program was carried out on a titanium alloy using a potential drop technique to record crack length increments as function of overload characteristics. This program has been completed and results will be incorporated into the basic stochastic model.

UNCLASSIFIED REPORT

ABSTRACT: (U) The first year of the grant was spent in setting up the laboratory, and in starting research on a number of different projects. All are concerned with the visual processing of information in the perception of objects. A series of experiments has explored the perception of conjunctions of features, attempting to determine what makes this difficult or easy. A new method (detection of apparent motion) was tested and a modification of feature-integration theory was developed to accommodate the new results. Other projects have been concerned with coding of features, finding evidence for modularity, testing the level of abstraction at which features (such as orientation) are coded, the different media which support the coding of shape, and the space in which they are represented (retinal or three-dimensional). Another project has probed the effects of perceptual learning with extended practice at detecting particular sets of targets; the results suggest that automated task in search is highly specific to the practiced task and has little effect on other perceptual tests. Six graduate students are at present, working on projects wholly or partly supported by the grant.

SUPPLEMENTARY NOTE: Pub. in IEEE Transactions on Reliability, VR-36 nA p392-398 Oct 87.

ABSTRACT: (U) A compound (mixed Poisson distribution is sometimes used as an alternative to the Poisson distribution for count data. Such a compound distribution, which has a negative binomial form, occurs when the population consists of Poisson distributed individuals, but with intensities of each system are different. A more general situation is considered where the system failures are distributed according to nonhomogeneous Poisson processes having Power Law intensity functions with gamma distributed intensity parameter. If the failures of each system in a population of repairable systems are distributed according to a Power Law process, but with different intensities, then a compound Power Law process provides a suitable model. A test which is based on the ratio of the sample variance to the sample mean of count data from s-independent systems provides a convenient way to determine if a compound model is appropriate. When a compound Power Law model is indicated, the maximum likelihood estimates of the shape parameters of the individual systems can be computed and a test for homogeneity can be conducted. If equality of the shape parameters is indicated, then it is possible to test whether the systems are homogeneous Poisson processes versus a nonhomogeneous alternative.

ABSTRACT: (U) Real time observations in the scanning electron microscope have delineated the details of the fracture processes that result in mode I and mode II delamination of composite materials. These observations give clear explanation of why GI/GIC ratio for brittle materials is three times that for ductile materials. These in situ observations of fracture also indicate that distinctively different damage zone develops ahead of growing cracks for mode I and mode II delamination. Two techniques have been developed to measure the strain field around a crack tip. Stereo imaging and direct measurement of distortion of a fine array of dots placed on the surface. Both are effective in measuring the strain field around a crack tip. A surprising result which emerged from these measurements is that the local strain to failure at the crack tip is much greater than the elongation measured in a tensile test (up to six times as high). A linear, orthotropic finite element code has been used to calculate the stress fields around the crack tip for mode I and mode II loading. A J-integral approach for mode I has been used to investigate the

UNCLASSIFIED REPORT

ABSTRACT: (U) Sample path properties of Poissonian type stochastic integral processes are studied. It is proven that various properties of the sections of the deterministic kernel (as, for example, unboundedness, discontinuity, etc.) are inherited by the sample paths of the corresponding stochastic integral process. An analogous statement for Gaussian processes is false. As a main tool, a series representation of stochastic integral processes is fully developed and this may be of independent interest. Keywords: Infinitely divisible processes; Symmetry.

UNCLASSIFIED REPORT

ABSTRACT: (U) This is a report of a pilot experiment, which took place at the AFGL site in Sudbury, MA. This experiment was concerned with the testing and operation of a 94 GHz radar to be used in a project devoted to the study of stratiform rain characteristics and evolution. Some of the data collected during the test are presented. The main experiment involving several radars operating at different wavelengths is scheduled to take place in November 1987 at the same site.

UNCLASSIFIED REPORT

ABSTRACT: (U) The goal of this program is to develop a concept for an optical computer architecture for symbolic computing by defining a computation model of a high level language, examining the possible devices for the ultimate construction of a processor, and by defining required optical operations. This quarter we investigated the implementation alternatives for an optical shuffle exchange network (SEN). Work in previous quarter had led to the conclusion that the SEN was most appropriate optical interconnection network topology for the symbolic processing architecture (SPARO). A more detailed analysis was therefore conducted to examine implementation possibilities. It was determined that while the shuffle connection of the SEN was very feasible in optics using passive devices, a full-scale exchange switch which handles conflict resolution among competing messages is much more difficult. More emphasis was therefore given to the exchange switch design. The functionalities required for the exchange switch and its controls were analyzed. These functionalities were then assessed for optical implementation. It is clear that even the basic exchange switch, that is, an exchange without the controls for conflict resolution, delivery, etc... is quite a difficult problem in optics. We have proposed a number of optical techniques that appear to be good candidates for realizing the basic exchange switch. A reasonable

UNCLASSIFIED REPORT

ABSTRACT: (U) This study addresses the development of the Surface-Integral and Finite Element ((SAFE) hybrid method for the analysis of short or physically small cracks. In this report, a brief review of representative research papers on fracture mechanics of short cracks is provided. The development of the SAFE hybrid method for materially nonlinear analysis is discussed. Motivation for the use of lumped plasticity models via modeling shear bands at the crack tip is given. Work in progress and future research tasks to be performed under this contract are outlined. Keywords: Fracture; Short cracks, Finite element; Integral equation; Fatigue(Mechanics).

DESCRIPTORS: (U) *CRACKS, *FINITE ELEMENT ANALYSIS, *INTEGRAL EQUATIONS, *MODELS, FRACTURE(MECHANICS), HYBRID SYSTEMS, MOTIVATION, NONLINEAR ANALYSIS, PLASTIC PROPERTIES, SAFETY, MATHEMATICAL MODELS, CRACK PROPAGATION, SHORT RANGE(DISTANCE).

ABSTRACT: (U) A useful function for analyzing burn-in, residual life function. Other functions, such as the reliability or the failure rate functions, are of course important also. Discrete data arises naturally in various ways: from discretizing or grouping continuous data, devices operate by cycles (e.g., a copier's cycle is a copy, its lifelength the total number of copies), etc. This paper develops a general approach to modeling discrete bathtub and upside down bathtub mean residual life functions. Because the approach allows parametric modeling of the mean residual life, parametric models for complete discrete data, as well as right censored discrete data. A simple, perhaps surprising, example is presented where the mean residual life increases, then decreases; however, the hazard rate also increases, drops suddenly at one cycle, then increases again. The authors discuss two reasonable industrial explanations of such unusual behavior.

DESCRIPTORS: (U) *FAILURE, *LIFE EXPECTANCY(SERVICE LIFE), *STATISTICAL PROCESSES, CYCLES, FUNCTIONS, HAZARDS, MATHEMATICAL MODELS, PARAMETRIC ANALYSIS, RATES, RELIABILITY, LIFE TESTS.

UNCLASSIFIED REPORT

ABSTRACT: (U) The authors consider univariate nonparametric regression. Two standard nonparametric regression function estimates are kernel estimates and nearest neighbor estimates. Mack noted that both methods can be defined with respect to a kernel or weighting function, and that for a given kernel and a suitable choice of bandwidth, the optimal mean squared error is the same asymptotically for kernel and nearest neighbor estimates. Yang defined a new type of nearest neighbor regression estimate using the empirical distribution function of the predictors to define the window over which to average. This has the effect of forcing the number of neighbors to be the same both above and below the value of the predictor of interest; we call these symmetrized nearest neighbor estimates. The estimate is a kernel regression estimate with predictors given by the empirical distribution function of the true predictors. We show that for estimating the regression function at a point, the optimum mean squared error of this estimate differs from that of the optimum mean squared error for kernel and ordinary nearest neighbor estimates. No estimate dominates the others. They are asymptotically equivalent with respect to mean squared error if one is estimating the regression function at a mode of the predictor.

UNCLASSIFIED REPORT

ABSTRACT: (U) The effects of pressure, inlet air temperature, and fuel type on the soot threshold or critical equivalence ratio, are presented. Higher pressures yield lower soot thresholds, while no dependence on fuel type, as described by either the fuel hydrogen-to-carbon ratio, fuel molecular weight, number of carbon atoms, or number of carbon-carbon bonds, is observed. Variations in inlet air temperature have a complex effect; however, the results clearly show that the experimentally measured flame temperature is central to a description of the incipient soot formation process. The critical equivalence ratio dependence on pressure and temperature is shown to agree with a two-step semi-global model for soot precursor evolution for pressures between 1800 to 0.8 MPa, and measured flame temperatures between 1800 and 2400K. The effects of equivalence ratio, pressure, and fuel chemistry on total non-luminous flame radiation were also studied. Radiant intensity was highest for an equivalence ratio of unity and increased linearly with pressure from 0.4 to 0.8 MPa. Keywords: Incipient soot formation, Flame radiation and emissivity, Premixed flames, Pressure dependence.

ABSTRACT: (U) A finite dimensional control theory is developed for the design of a proportional plus integral control law for tracking step command inputs in general autonomous time-lag systems with distributed heredity in state, control and output variables. With respect to an ordinary differential equation describing the delay system unstable modes, an auxiliary tracking problem is posed. This auxiliary problem derives its importance from the fact that its solution directly yields a solution to the original tracking problem. This point of contact with a finite dimensional system permits the application of well-tested ordinary systems tracking theory to the tracking problem in time-lag systems.

ABSTRACT: (U) Analytical modeling and several experimental diagnostics were applied to an experimental flow in a two-dimensional subsonic windtunnel with a backward facing step and provision for injection of inerts and combustibles through the porous floor behind the step. The analytical techniques were based on a two equation modeling of turbulence with several variants of near wall models and numerical approaches. Conventional experimental techniques, where applicable in the cold flow, included hot film and pitot and anemometry. Laser-based diagnostics in the cold and hot flows for velocity and species concentration measurements (both mean and instantaneous) included laser velocimetry in two components and Rayleigh molecular scattering. Major findings in this complex turbulent flow with chemical reactions were a) there was a general agreement between analysis and experiment in cold flow both with and without wall injection, b) this agreement occurred at the most detailed level of turbulent shear stress and mass transport, c) in hot flow there was acceptable agreement as to the gross features of the mean flow field, but some theoretical details, such as reattachment length, vent counter to experimental results.

ABSTRACT: (U) This thesis uses results on the aggregation of singularly perturbed Markov chains to analyze manufacturing systems. The basis for this analysis is the presence in the system of events and processes that occur at markedly different rates - operations on machines, set-ups, failures and repairs, etc. The result of the analysis is a set of models, each far simpler than the full model, describing system behavior over different time horizons. In addition, a new theoretical result is presented on the computation of asymptotic rates of particular events in perturbed Markov processes, where an event may correspond to the occurrence of one of several transitions in the process. This result is used to compute effective production rates at different time scales, taking into account the occurrence of set-ups and failures.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report describes progress in measuring and modeling the nonlinear optical properties of and picosecond carrier dynamics in bulk ternary alloys and multiple quantum wells (MQWs). Studies of the bulk alloy Al(x)Ga(1-x)As have been produced the first experimental isolation of the electron exchange energy in a dense electron-hole plasma, and the observation of enhanced band-gap renormalization as a consequence of alloy disorder, stimulated emission from the indirect gap for x-values as large as 0.52, and large optical nonlinearities from band filling, band-gap renormalization, and screening of the excitonic continuum states. The latter appear promising for room temperature absorptive and dispersive optical bistability. An exact theory of the influence of an intense radiation field on the excitonic energy levels of a MQW has been developed and has led to the prediction of two-wave mixing gain. Keywords: Nonlinear optics; Ultrafast phenomena; Multiple quantum wells; Band gap renormalization; Alloy disorder; Optical bistability.

ABSTRACT: (U) This final report provides the details of an investigation on the undrained stress strain behavior of partly saturated sands under controlled laboratory conditions. A new triaxial test setup was developed during the previous years of this research study. Thus, the two purposes of the investigation reported in this report were a) to evaluate the usefulness of the new soil unsaturated sand samples. An axis translation technique test procedure, and b) to determine the behavior of the the tests and this appeared to work well. A special ceramic porous stone was used to be able to measure pore water and air pressures separately. The conclusions drawn from this research are that the stress-strain behavior changes little with respect to saturation level until the level approaches about 95%. The initial tangent modulus decreased with an increase in saturation. For lower saturated samples, there seems to be no difference between an undrained and a drained test. The dilation potential of the sand increased with strain rate. The strain rate had some effect on the initial modulus of only the dense samples of sand.

SUPPLEMENTARY NOTE: Pub. in AIAA Aerospace Sciences Meeting (28th), p1-8, 11-14 Jan 88.

ABSTRACT: (U) A finite-difference solution of the problem of unsteady droplet vaporization and spray combustion in an idealized configuration consisting of parallel droplet streams is presented. A simplified flow field of uniform velocity is assumed in order to place particular attention on the mass and energy interactions between the fuel droplets and the gas flow. One-step finite-rate kinetics are employed so that an adequate description of the reaction zones and the mechanism of flame propagation can be obtained. Transient heating and drag acceleration of the droplets are taken into account. The transition from the initial conditions to the formation of the reaction zones is investigated as well as the effect of the intermittency effect caused by the discrete injection frequency of the droplets. Individual envelope flames or group combustion can be observed depending on the flow parameters, mainly the separation between droplets. In general, a premixed reaction zone is formed which then acts as the ignition source for the droplets. Keywords: Spray combustion; Ignition; Sprays; Flame propagation.

ABSTRACT: (U) During the second year of our reporting
period we continued our close cooperation with the NDE
Branch on the Material's Lab at Wright-Patterson Air
Force Base. For our part, we continued developing
analytical and computational methods on the modeling of
the mechanical behavior of fibrous composites for
applications in the NDE field. Specifically, we extended
our theoretical models which were developed to describe
the behavior of single unidirectional fiber-reinforced
plates, to more general plates. These included single and
multilayered plates. For the single laminated plate the
solutions are extended for arbitrary azimuthal angles and
hence resulted in three dimensional analysis.

ABSTRACT: (U) A monograph entitled, Unimodality,
Convexity and Applications was written. It provides a
systematics approach to important tools in reliability.
Other results include a sharpening of Ichebyshev
inequality and development of dependence concepts for
reliability.

ABSTRACT: (U) The polymer structure determination and refinement of flexible coil poly-2,5-benzoxazole (ABPBO) and poly-2,6-benzothiazole (ABPBT) were performed. Refinement of the unit cell structure of poly(p-phenylene benzobisthiazole) (PBO) and poly(p-phenylene benzobisthiazole) (PBT) in a nonprimitive monoclinic unit cell was carried out in a similar fashion. Initial structural models were derived from x-ray studies of model compounds. Experimental structure factors were incorporated into the Linked-Atom Least-Squares (LALS) refinement method. The structure of the benzimidazo-isoquinoline ladder polymer (BBL) was also investigated. BBL shows potential as an organic conducting polymer. The feasibility of BBL and similar systems to act as conducting polymers requires accurate molecular structure and crystallographic data for an understanding of the mechanical, optical and electro-optic properties. Keywords: Order polymers, Rigid rod polymers, Ladder polymer, Fiber structure, Polybenzothiazoles, Polybenzoxazoles.

ABSTRACT: (U) Research is being conducted on adaptive time series methods for detecting and tracking both abrupt and slow changes in both structure and parameters. The methods are based on a unified statistical frame work which is motivated by statistical inference and entropy arguments. The method yields estimates of input/output dynamics and noise statistics. An integrated approach which combines canonical variates analysis and maximum likelihood estimation has been developed and tested. Specific attention is given to the problem of parameter truncation in both a linear predictor and Kalman filter framework.

ABSTRACT: (U) The dissociative recombination of molecular ions with electrons determines many of the properties of the Earth's ionosphere under both quiescent and disturbed conditions. However, in spite of its importance, there has never been an experimental measurement of dissociative recombination rates from individual excited ion vibrational levels. Completed are large scale ab initio calculations of cross sections and rates for the dissociative recombination of the molecular oxygen ion leading to excited oxygen atoms in the 1S and 1D states, the upper states of the well known green and red lines, respectively. A new method for calculating electronic autoionization widths using high Rydberg state wave functions to represent the inner part of the free electron wave function has been used and tested on the molecule where the widths can be calculated to an expected accuracy of about 15%. The widths have been used to determine dissociative recombination cross sections as a function of electron energy. Large windows have been discovered in the cross sections from excited vibrational levels. The windows, at which the cross sections drop precipitously, are due to the overlap of the peak in the continuum vibrational wave functions.

ABSTRACT: (U) The whole-cell gigaseal voltage clamp technique has been used to investigate the timing of expression and type of voltage-dependent ionic currents in dissociated primary cultures of fetal rat (E17) diencephalic neurons grown in a serum-free defined medium. The expression of membrane currents varied among cells at any particular time in culture. Despite this variability, certain characteristics of the appearance of ionic currents emerge from this study. These are: (i) The earliest appearing membrane current is a voltage-dependent outward current carried by potassium K+. In some cells, it is the classical delayed rectifier current, whereas in others it is the transient outward current (IA). (ii) The earliest appearing inward current is carried by Sodium Na+. In some cells the channels are first expressed in the neurites and then in or near the cell body. The early neuritic Na+ channels are blocked by cobalt or cadmium as well as by tetrodotoxin (TTX). In others, the early Na+ channels appear in or near the cell body and are only blocked by TTX. (iii) With additional time in culture, a majority of cells exhibit a Ca2+ current at the time of Na+ channel appearance in or near the cell body as well as a transient calcium Ca2+-dependent outward current. The Ca2+ current is only a

ABSTRACT: (U) A completely analytic method for evaluating three-center nuclear attraction integrals for STOS is presented. The method exploits a separation of the STO into an evenly loaded solid harmonic and a OS STO. The harmonics are translated to the molecular center of mass in closed finite terms. The OS STO is translated using the Gegenbauer addition theorem; 1s STOS are translated using a single parametric differentiation of the OS formula. Explicit formulas for the integrals are presented for arbitrarily located atoms. A numerical example is given to illustrate the method. Keywords: Slater, Type orbitals, Reprints.

ABSTRACT: (U) A displaced STO can be expanded in spherical harmonics with the coefficient function or Loewdin or functions characterized by a C matrix. These or functions themselves may be expanded in a Taylor series that is characterized by its own E Matrix. This expansion is necessary for the representation of the or function by a power series and for its evaluation about the origin. As an application, we find the power series for the molecular charge density in the vicinity of the center of a model diatomic molecule. Our analytic approach is general and yields excellent results.

ABSTRACT: (U) The growth properties and magnetic properties of iron films grown by molecular beam epitaxy were studied. The iron film growth was first studied by growing iron on iron whiskers. This work and previous work determined the growth parameters for nearly dislocation free growth. This information was then used to grow iron films on Gallium Arsenide/Indium Arsenide alloy substrates. As determined by electron diffraction, layer by layer growth was observed when the iron films were grown. The magnetic properties of the iron films were found to be dependent up on the substrate surface morphology and lattice constant. In particular the coercivity of epitaxial iron film was found to vary by roughly a factor of four when grown on different surface morphologies and substrate lattice spacings. Other research focused on the magnetotransport and magneto-optic properties of the iron film and the effects of the substrate lattice properties on them.

ABSTRACT: (U) This is the final status report on the DoD-URIP grant for instrumentation to support research in distributed operating systems, fault-tolerant distributed computing, object-oriented computing and other related facets of distributed computing. The Distributed Systems Laboratory was established in the Computer Science Department of the University of Minnesota for this purpose. Currently this laboratory is supporting experimental research in the area fault-tolerant distributed operating systems, specifically to support development of the NEXUS distributed operating system. Currently this laboratory has a total of 12 workstations and 2 file servers with total storage capacity of 2 gigabytes. All these workstations are connected by an ethernet local area network that supports the Computer Science Department.

SUPPLEMENTARY NOTE: Pub. in Jnl. of the Americal Chemical Society, v109 n23 p7095-7099 1987.

ABSTRACT: (U) Syntheses of several new substituted pentacyclo undecanes are described. Photoelectron (PE) spectra have been obtained for compounds 1-10. Molecular orbital calculations on systems 1-3 were performed by using a minimum STO-3G basis set. Infrared vibrational frequencies and absorption intensities were calculated for 1-3. Extended Huckel theory (EHT) calculations were performed on a model geometry derived from that of 1-methylpentacyclo undecane-8,11-dione. The PE spectroscopic results, together with the results of ab initio and EHT calculations, support the following conclusions: (i) oxygen lone pair interactions in 1 are mainly through-bond, where pi and pi* C=O bond interactions in 1 occur via a mixture of through-space and through-bond mechanisms; (ii) mixing with the sigma-framework orbitals plays an important role in delocalizing the oxygen lone pair in 2; (iii) lone pair delocalization in 1 and 2 occurs primarily via 1,3- rather than 1,2-interactions, and (iv) both through-bond and through-space mechanisms play a role in 3. Keywords: Electronic structures.

ABSTRACT: (U) Technological applications of solid state reactions are more recognized now than ever before. A recent symposium on the solid state polymerization was a witness of the growing importance of reactions in condensed phase whereby novel products of potential application could be synthesized. One example is a group of polymers called polydiacetylenes which can only be synthesized by reactions in the solid state. Proposed applications of this group of polymers range from temperature indicators and lithography to nonlinear optical devices. The term crystal engineering has been introduced to emphasize the importance of the highly selective reaction pathway which solid state chemistry offers. An exciting prospect has been the introduction of chirality by using solid state chemistry. Solid state reactions are also significant to pharmaceutical industries. Since most drugs are marketed in the solid dosage form, environmental effect on the chemical stability of solid materials are of significant consequence.

ABSTRACT: (U) Defying the traditional perception of plastics as structural materials, organic polymeric systems containing conjugated structures have emerged as exciting nonlinear optical materials. The reason lies in their highly polarizable pi-electron clouds, which yield the largest observed nonresonant third-order optical susceptibility and the fastest (femtoseconds) response times. High non-resonant optical nonlinearity is desirable for wave building in integrated optics applications. Polymeric systems also offer the flexibility of tailoring the structure by molecular engineering whereby a rich variety of nonlinear polymeric systems can be synthesized and fabricated in various shapes such as films, fibers, slabs, etc. In addition, polymer films with monolayer thickness (approximately 12 angstroms) can be prepared and transferred by the Langmuir-Blodgett technique. SUPPLEMENTARY NOTE: Pub. in Thin Solid Films, v152 p275-294 1987. Presented at the Workshop on the Molecular Engineering of Ultrathin Polymeric Films, Davis, CA, 18-20 Feb 87.

ABSTRACT: (U) In this paper a comprehensive account is presented of research work carried out in the author's laboratory in the areas of design of polymeric thin films, investigation of their ultrastructure and studies of non-linear optical effects. Thin film design and fabrication involve two approaches: electrochemical polymerization and the Langmuir-Blodgett technique. Application of laser Raman optical wave-guides, inelastic electron tunneling, picosecond transient gratings and surface plasmon coupling techniques for the study of ultrastructure is discussed. Results are presented from picosecond and subpicosecond degenerate four-wave mixing, time-resolved coherent Raman spectroscopy, surface plasmon non-linear optical and bistability behavior at a non-linear interface to elucidate the nature of third-order non-linear optical effects in thin films of pi electron conjugated polymeric systems.

DESCRIPTORS: (U) *OPTICAL PROPERTIES, *POLYMERIC FILMS, *THIN FILMS, COHERENCE, COUPLING(INTERACTION), ELECTROCHEMISTRY, ELECTRONS, GRATINGS(SPECTRA), INELASTIC SCATTERING, INTERFACES, LABORATORIES, LASERS, NONLINEAR SYSTEMS, ORGANIC MATERIALS, PLASMONS, POLYMERIZATION,

ABSTRACT: (U) In acetone the salts N(PPh₃)₂W(Triple bond C₆H₄Me-4)(CO)₂ eta-C₂B₉H₇Me₂) and PtH(Me₂CO)(PEt₃)₂-BF₄ yield the novel dimetal compound PtW(CO)₂(PEt₃)₂ eta C₂B₉H₈(CH₂C₆H₄Me-4)Me₂, the structure of which has been established by X-ray diffraction. With electron pair donor molecules (PMe₃, CO, CNBut) the Pt-W compound forms compound PtW mu-H (sigma eta 5 - C₂B₉H₇(CH₂ C₆ H₄ Me-4) Me₂(CO)₂)(PEt₃)₂ containing a B-Pt sigma bond. The properties of the compounds are reported. Keywords: Platinum; Tungsten; Carbaborane; Metal complexes. Carbenes; Carbynes; Ligands; Organometallic compounds; Cyclic compounds; Crystal structure.

Dalton Transactions, p2177-2187 1987.

ABSTRACT: (U) Addition of Platinum (cod)2 (cod = cyclo-
octa-1, 5-diene) to the compound Pt2W3(mu-CMe)2(mu3-CMe)
-(CO)6(eta-C5Me5)3 affords the hexanuclear metal complex
PtW3(mu-CMe)2(CO)8(cod)-(eta-C5Me5)3. A related
compound Pt3Mo2(mu3-CMe)(mu3-CC8H4Me-4)2(CO)8(cod)(eta-
C5H5)3 can be prepared by displacing a cod ligand from
Pt3Mo2(mu3-CC8H4Me-4)2(CO)4(cod)2(eta-C5H5)2 with W
triple bond CMe(CO)2(eta-C5H5). Several heptanuclear
mixed-metal compounds have been prepared. Thus the
hexanuclear metal compound Pt3W3(mu-CMe)(mu3-CMe)2(CO)
8(cod)(eta-C5Me5)3 reacts with W(triple bond CMe)(CO)
2(eta-C5H5) to afford Pt3W4(mu-CMe)2(mu3-CMe)2(CO)8(eta-
C5H5)(eta-C5Me5)3. Complexes containing chains of seven
metal atoms incorporating nickel in place of platinum, or
molybdenum for site which could be occupied by tungsten,
have also been prepared. Keywords: Carbenes; Carbynes;
Organo-Metallic compounds; Cyclic compounds; Crystal
structure.

DESCRIPTORS: (U) *CARBENES, *CYCLIC COMPOUNDS, *LIGANDS,
*METAL COMPLEXES, *ORGANOMETALLIC COMPOUNDS, *PLATINUM,

SUPPLEMENTARY NOTE: Pub. in Jnl. of the Chemical Society:
Dalton Transactions, p2189-2200 1987.

ABSTRACT: (U) In preceding papers we have described methods for synthesizing polynuclear metal complexes containing up to seven metal atoms in a chain. In these compounds platinum-tungsten, Pt-molybdenum, or nickel-W bonds are held together by bridging alkylidene groups. The syntheses depend on a stepwise combination of the reagents $(M(cod)_2)$ ($M = Ni$ or Pt , $cod = cyclo-octa-1,5-$ diene) with molecules containing reactive C-W(Mo) or C triple bond W(Mo) sites. The methodology employed is based on the isolobal model, leading in specific instances to carbon-metal double or triple bonds displaying ligating properties towards metal centres similar to those of alkenes or alkynes. Thus the compounds $(W(triple\ bond\ CR)(CO)_2L)$ ($R = Me, Ph$, or C_6H_4Me-4 ; $L = eta-C_5H_5$ or $eta-C_5Me_5$) will displace the cod ligands from $(Pt(cod)_2)$ to give trimetal complexes $(PtW(mu-CR)_2(CO)_4L_2)$. Keywords: Metal complexes, Clustering, Carbenes, Carbynes, Organometallic compounds, Cyclic compounds.

DESCRIPTORS: (U) *ALKENES, *ALKYNES, *CARBENES, *CYCLIC COMPOUNDS, *METAL COMPLEXES, ATOMS, BRIDGES, CHEMICAL

ABSTRACT: (U) The salts (X)(W)(triple bond CR)(CO)2(eta5-C2B9H9Me2) (1, R = Me, Ph, or C6H4Me-4; X = NEt4, N(pPh)3 or P(CH2Ph)Ph3, or pPh4) are becoming useful reagents for preparing dimetal compounds with bridging alkylidyne groups. Treatment of the compound (NEt4)(W triple bond CMe)(CO)2(eta5-C2B9H9Me2) with (Fe2(Monocarbonyl-iron)9) in tetrahydrofuran at room temperature affords the trimetal compound (NEt4)(Fe2W(mu3-CMe)(mu sigma-sigma, eta5-C2B9H7Me2)(CO)8). Similar reactions between (Fe2(CO)9) and the salts (NEt4)(W(triple bond CR)(CO)2(eta5-C2B9H9Me2)) (R = Ph or C6H4Me-4) afford mixtures of the di- and tri-metal compounds (NEt4)(FeW(mu-CH(R))(mu-sigma-eta5-C2B9H8Me2)(mu-CO)(CO)5) and (Ne4)(Fe2W(mu3-CR)(mu-sigma:sigma', eta5-C2B9H7Me2)(CO)8). ABSTRACT: (U) Measurements of the effect of uniaxial stress on the frequency of the zone center optical phonons in heat-treated benzene-derived graphite fibers have been performed using first-order Raman scattering. Application of uniaxial stress along the fiber axis was found to cause polarization-dependent splittings and shifts of the Raman peaks of the zone center doubly degenerate optical phonons. From these observed splittings and shifts, experimental values for the phenomenological coefficients which describe the changes in the elastic constant of these phonons with strain were determined. It is concluded that Raman spectroscopy can be used to characterize the local stress or strain conditions of graphite fibers nondestructively. Keywords: Effect of uniaxial stress, Raman spectra of carbon fibers, Raman microprobe spectroscopy, Single carbon fibers.

ABSTRACT: (U) Room temperature Raman microprobe x-ray diffraction and electrical resistivity measurements have been performed on carbon/carbon composites made from mesophase pitch which were heat treated at temperatures above 2880 Celsius. Results of these measurements indicate that both the ex-pitch carbon fiber and mesophase pitch matrix constituents of the composites were highly graphitic, exhibiting in-plane crystallite dimensions greater than 1000 Angstroms. The c-axis crystallite dimensions were determined by analysis of x ray diffraction peak widths to be approximately 150 Angstroms. Copper chloride was successfully reacted with these carbon-carbon composites forming a stage three graphite intercalation compound in both the fibers and the matrix, as determined by their Raman spectra. Communications Research, Murray Hill, NJ.

ABSTRACT: (U) Photoconductivity has been observed in
vapor grown graphite fibers with a high quantum
efficiency of carriers generated by photons. The
photocurrent varies approximately as the square root of
the intensity of illumination. No change in the growth or
decay time of the photocurrent is observed as a function
of illumination intensity or of the temperature. The
photocurrent observed in semi-metallic graphite fibers is
attributed to transitions between localized defect states
which act as traps for photo-excited carriers. As the heat
treatment temperature is raised above 1500 Kelvin, vapor
grown graphite fibers show a decrease in the photocurrent
due to the annealing of defects and an increase in the
electron-hole recombination time. Keywords:
Photoconductivity, graphite fibers, Effect of heat
treatment temperature.

ABSTRACT: (U) Sound wave propagation in thin film carbon is investigated in the long wavelength approximation. Strain-free and stress-free boundary conditions lead to the same solution. The Rayleigh wave, with a small damping constant and with polarization perpendicular to the layer planes, has a small sound velocity. Since the long wavelength phonon energies associated with this wave are very small, these phonons are readily excited even at very low temperatures. Furthermore, these phonons strongly scatter carriers at low temperatures. Of particular interest for transport properties is the determination of the carrier relaxation time for very thin film thicknesses. These phonons are also responsible for the temperature dependence of the negative magnetoresistance of pregraphitic carbons at low temperatures. Keywords: Interaction of electrons, Rayleigh waves graphite films, Electron scattering.

UNCLASSIFIED REPORT

ABSTRACT: (U) The interaction between electrons and phonons in a thin carbon film is investigated. Sound wave propagation in a thin carbon film has a small sound velocity and small damping. The scattering of electrons by phonons associated with the Rayleigh wave is found to be responsible for the anomalous temperature dependence of the resistivity and for the negative magnetoresistance of pregraphitic carbons at low temperatures. Keywords: Low temperature conduction pregraphitic films, Rayleigh waves thin carbon film, Negative magnetoresistance pregraphitic carbons.

ABSTRACT: (U) Some kinds of pregraphitic carbons exhibit temperature-dependent negative magnetoresistance even at helium temperatures. To account for this anomalous behavior, two assumptions have been introduced. First the sample is composed of an assembly of many thin films which are nearly independent of each other elastically. Secondly, ionized impurity scattering makes an important contribution to the resistivity. Rayleigh waves with small damping and small sound velocity propagate through each film and the scattering due to the Rayleigh wave phonons gives rise to a carrier relaxation rate which decreases as the square of the thin film thickness. Since the screening length of an ionized impurity potential decreases with magnetic field, this process leads to a negative magnetoresistance. Combining these two effects, the qualitative features of the temperature dependent negative magnetoresistance can be explained within the framework of Bright's Theory. Keywords: Negative magnetoresistance, Pregraphitic carbons, Effect of Rayleigh waves, Negative magnetoresistance.

ABSTRACT: (U) A brief study has been carried out to investigate the structure of pristine and intercalated thin benzene derived graphite fibers. High resolution transmission electron microscopy techniques were used. The fibers used for this study were prepared by thermal decomposition of benzene onto a substrate seeded with metal particles. The unique feature of the fibers used in this study is that their diameter is only 170 nanometers. Fibers used in earlier studies and for most technological applications have generally had diameters more than an order of magnitude larger. Study of the physics of size effects in carbon fibers was a prime motivating force for the current investigation. ABSTRACT: (U) The temperature dependence of the electrical resistivity of carbon fibers has been measured at atmospheric pressure and for temperatures up to and above the melting point at 4450 Kelvin. Vapor-grown graphite fibers of different crystalline perfection were heated with electrical pulses 28 microseconds in duration. The transient reflectivity of graphite irradiated with picosecond laser pulses was also measured and the results show evidence for non-equilibrium heating. From this work, it is concluded that liquids carbon is metallic with a nearly temperature independent electrical resistivity of 30 micro-ohm centimeters. Keywords: Liquids carbon, High temperature resistivity of carbon fibers, Transient reflectivity of carbon fibers.

UNCLASSIFIED REPORT

ABSTRACT: (U) Heat treated benzene derived graphite fibers have been characterized by Raman spectroscopy as a function of applied uniaxial tensile stress. Linear shifts are observed in the frequency of the Raman lines as a function of the applied stress. Thus it is shown that laser Raman spectroscopy provides a powerful nondestructive technique for monitoring the local stress variations near the surface of carbon fibers. The Raman microprobe used in this experiment provides approximately two micrometers spatial resolution within the optical skin depth. This spatial resolution is much higher than conventional techniques such as x-ray analysis which typically has a spatial resolution of several millimeters. Stress measurements in semiconductors such as Silicon, Germanium and Gallium Arsenide by Raman spectroscopy have been previously reported. Since benzene-derived graphite fibers are typically between ten and 20 micrometers in diameter, Raman spectroscopy has been used to examine the stress variation within the optical skin depth (approximately 800 Angstroms for light scattering at 4880 Angstroms) of single carbon fibers. Keywords: Stress, Strain, Characterization, Carbon fibers, Raman microprobe studies, Stressed carbon fibers.

UNCLASSIFIED REPORT

ABSTRACT: (U) A great deal of attention has recently been focussed on the very high electrical conductivity reported in arsenic penta fluoride intercalated vapor grown graphite fibers, previously heat treated to high temperatures. To characterize individual arsenic penta fluoride intercalated vapor grown fibers for stage index and staging fidelity along the fiber length, Raman scattering measurements have been carried out. These results are discussed in terms of their high electrical conductivity and structural features. Keywords: Carbon fibers, Raman characterization of carbon fibers, Arsenic pentafluoride intercalated carbon fibers, Raman spectra arsenic pentafluoride intercalated carbon fibers.

DESCRIPTORS: (U) *ARSENIC, *CARBON FIBERS, *FLUORIDES, ELECTRICAL CONDUCTIVITY, FIBERS, GRAPHITE, LENGTH, LIGHT SCATTERING, RAMAN SPECTRA, CRYSTAL STRUCTURE, VAPOR PHASES, REPRINTS.

IDENTIFIERS: (U) *Arsenic pentafluorides, PE81102F, WUAFOSR2303A3.

UNCLASSIFIED REPORT

ABSTRACT: (U) Tahar and others in the Dresselhaus group previously reported a size effect in the electrical resistivity of benzene-derived carbon fibers with small diameters. A simple theory indicates that the resistivity has a linear dependence on the reciprocal diameter associated with boundary scattering together with a constant term due to a size-independent scattering process. The observed results are well represented by this relation if the diameter is large enough, while for samples with small diameter, the observed resistivity data are considerably smaller than the theoretical expectation. This discrepancy is removed by considering the correct boundary conditions and by solving the Boltzmann equation. Keywords: Carbon fibers, Size effect of carbon fibers, Electrical resistivity of carbon fibers.

DESCRIPTORS: (U) *CARBON FIBERS, *BENZENE, BOLTZMANN EQUATION, ELECTRICAL RESISTANCE, FABRICATION, REPRINTS.

UNCLASSIFIED REPORT

ABSTRACT: (U) A combined experimental and analytical program has been conducted to examine transitional, accelerating boundary layer flows with high levels of freestream turbulence. An earlier program focused on measurement of transitional heat transfer distributions for four combinations of streamwise acceleration and freestream turbulence. The present program was designed to document the boundary layer turbulence structure and spectral distributions for the same four test conditions. The results from the present program have shown that transition in accelerating flows consists of an acceleration dominated stage of slowly developing intermittency followed by a second stage with the same general characteristics as zero-pressure-gradient transition. Conditionally sampled fluctuating velocity profile measurements indicated that the boundary layer turbulence was highly anisotropic in the early stages of transition. Conditionally sampled mean velocity measurements showed that within the intermittent turbulent patches the mean velocity profiles were very similar to those of an equilibrium turbulent boundary layer. Spectral distribution data indicated that preferred amplification of the most unstable (as

ABSTRACT: (U) The design and technical capabilities of the following systems are described: (1) Copper Vapor Laser pulsed light source with spatial filter and collimator. (2) Proximity focussed diode intensified linear CCD camera. (3) High speed multiplexed Analog to Digital Conversion system. (4) Monochromator system for point or line imaging of chemiluminescence. This instrumentation has been assembled to exploit several nonintrusive optical techniques to make measurements in a wide range of turbulent flows. The primary, but not exclusive, measurement technique to be implemented was Rayleigh scattering, imaged along a line as a function of time. A slightly modified version of the same apparatus was to be used in performing scattering measurements or (liquid-phase) laser-induced fluorescence measurements with the same temporal and spatial resolution capabilities. A second technique was to make use of a monochromator to analyze, and possibly image, chemiluminescence in a reacting flow in a wavelength-specific fashion, either at a point or along a line. The light source, the detection systems, and the data acquisition systems assembled under this funding will each be described.

DESCRIPTORS: (U) *LASER INDUCED FLUORESCENCE.

ABSTRACT: (U) This paper presents a systematic study of p-(N, N-dimethylamino)benzonitrile (DMABN) both in a supersonic jet expansion and in a thermalized vapor. From the jet studies, the excited- and ground-state vibrational spectra of the isolated molecule are resolved, and the spectroscopy of the stoichiometric complex with water, methanol, ammonia, and acetonitrile in the beam is reported. It is concluded that 1:1 complexes are not sufficient for the local perturbation to cause charge separation. At higher temperatures in the jet, we observe emission that we attribute to DMABN self-complexes. Under high pressure and temperature vapor conditions (> 30 m Torr, 80 C), red-shifted fluorescence from DMABN is observed. This is attributed to the charge-transfer state of DMABN in self-complexes.

ABSTRACT: (U) It is difficult to find good mathematical models for many natural problems such as pattern recognition. Not only does this difficulty preclude finding good solutions for these problems, but it also precludes estimating their complexity using the standard tools of the theory of computational complexity (Traub, 1985). Part of the difficulty can be traced to symptoms such as ill-definition, fuzziness, and inexactness. However, the difficulty of modeling these problems may be inherent in some cases. Keywords: Photorefractive crystals; Adaptive optical networks; Connectivity; Entropy; Holograms.

UNCLASSIFIED REPORT

ABSTRACT: (U) Sensitivity analysis, which represents an integral part of virtually every study of system reliability, measures variation in this quantity in response to changes in component reliabilities or in system design. Replacing old components with new ones with higher reliabilities affects system reliability. As time elapses, system reliability deteriorates when a non replacement policy for components all affect system reliability. Sampling variation in component reliability estimates induce sampling variation in the corresponding system reliability estimate. Having access to a model that accurately predicts these changes in system behavior allows one to make considerably more well informed decisions for maintaining or enhancing performance. This paper presents a method for estimating variation in system reliability in response to variation in component reliabilities. It describes a Monte Carlo sampling plan that on each of w sets of distinct component reliabilities. It describes a Monte Carlo sampling plan that on each replication provides sample data that contribute to the estimation of system reliability for each w sets of distinct component reliabilities. The sets may represent alternative component replacement plans.

UNCLASSIFIED REPORT

ABSTRACT: (U) This paper concerns an analytical study of molecular mixing and finite rate chemical reactions in an infinite row of vortices representing a mixing layer. Diffusion equations for reacting and non-reacting species are solved locally in the Lagrangian frame of reference following material elements. The flowfield is a given for the problem. The concentration distributions in the vortex structure are composed from these analytical solutions and presented for several cases. The probability density functions constructed from these distributions are compared with the mixing layer experiments. For the cases studied, the comparisons indicate encouraging agreement for the reacting flow case. However, some differences are present for the non-reacting flows. Keywords: Turbulent reacting flows; Molecular mixing, Reaction in vortical structures.

DESCRIPTORS: (U) *CHEMICAL REACTIONS, *FLOW FIELDS, *LAYERS, *MIXING, DIFFUSION, EQUATIONS, FLOW, FRAMES, LAGRANGIAN FUNCTIONS, MOLECULES, PROBABILITY DENSITY FUNCTIONS, RATES, SOLUTIONS(GENERAL), STRUCTURES, VORTICES.

ABSTRACT: (U) The propagation of plasmoids (neutralized beams) in a vacuum transverse magnetic field has been studied in the UCI laboratory for several years. The most recent experiments are aimed at studying the plasmoid propagation dynamics and losses in the presence of a background, magnetized plasma which is intended to short the induced polarization electric field and stop the beam. Preliminary results indicate that the beam propagation losses increase with the background plasma density. Principal diagnostics include: magnetically insulated Faraday cups, floating potential probes, calorimeters, microwave interferometer, and thermal-witness paper. Experiments in the near future will use an improved accelerator and transverse-field coil system which allows higher energy, 500 keV, higher current density plasmoids to be studied; this generator will improve the beam uniformity and angular divergence to allow beam propagation for up to five meters and permit study of losses from surface erosion. Keywords: Plasmoids; Propagation; Magnetic field.

ABSTRACT: (U) This interim technical report presents results of research on the computer aided design of monolithic microwave and millimeter wave integrated circuits and subsystems. A specific objective is to extend the state-of-the-art of the computer aided design (CAD) of the monolithic microwave and millimeter wave integrated circuits (MIMIC). In this reporting period, we have derived a new model for the high electron mobility transistor (HEMT) based on a nonlinear charge control formulation which takes into consideration the variation of the 2DEG distance offset from the heterointerface as a function of bias. Pseudomorphic InGaAs/GaAs HEMT devices have been successfully fabricated at UCSD. For a 1 micron gate length, a maximum transconductance of 320 mS/mm was obtained. In cooperation with TRW, devices with 0.15 micron and 0.25 micron gate lengths have been successfully fabricated and tested. New results on the design of ultra-wideband distributed amplifiers using 0.15 micron pseudomorphic InGaAs/GaAs HEMT's have also been obtained. In addition, two-dimensional models of the submicron MESFET's, HEMT's and HBT's are currently being developed for the CRAY X-MP/48 supercomputer. Preliminary results obtained are also presented in this report.

ABSTRACT: (U) A comprehensive investigation has been carried out of the structure and statistical properties of unconfined turbulent flames, both V-shaped and conical. Measurement techniques included conditioned velocity measurements using two component LDV, flow visualization techniques, and Rayleigh scattering. Additionally, a new time resolved technique, LARS(Linear Array for Rayleigh Scattering) was developed which makes possible the determination of the instantaneous location of the flame sheet within the turbulent flame brush. A major objective of these flame studies was to access the appropriateness of models such as the Bray-Moss-Libby (BML) model for describing the structure of planar turbulent combustion zones. The results of these investigations have revealed that many of the predictions of the BML model accord reasonably well with experimental observations, although some of the constants chosen in the theory are not verified experimentally. Agreement is better for the V-shaped planar flame than for the conical flame, particularly in the vicinity of the flame tip. Studies of the flame stabilization region in the wake of flameholders showed evidence of vortex shedding in the wake and of diminished fluctuation intensity with increased heat release. It was also observed that reaction in the shear layer bounding the recirculating products does not occur until a finite distance

ABSTRACT: (U) Preparation of high quality GaAs/GaAlAs Multiple quantum wells (MQW) grown by Metalorganic Chemical Vapor Deposition on GaAs substrates and measurement of nonlinear saturation has been completed in this 18 month contract. The results show materials which rivals the highest quality MQW's grown by any technique. Preparation of GaAs/GaAlAs MQW's on GaP substrates and measurement of nonlinear saturation has been completed. It was shown that this material has high cw saturation intensity and, if used in a nonlinear Fabry-Perot, would be useful only in pulsed experiments. The material looks ideal for hybrid devices.

ABSTRACT: (U) The decomposition of many solid reactants during combustion leads to the formation of gaseous hydrocarbons and oxides of nitrogen which can react to support a flame above the surface of the solid. These flames can provide heat which is fed back to the propellant surface and thereby influence the burning rate of the solid. In the case of nitramine based solid rocket propellants, the gas phase decomposition products include significant amounts of formaldehyde. Nitrogen dioxide, Hydrogen Cyanide, Nitric oxide, Nitrous oxide, oxygen. This study is intended to provide experimental data on the structure of hydrocarbon flames supported by oxides of nitrogen in order to establish the reaction mechanism for such flames. Laminar, premixed, flat flames of methane/NO2/O2 and CH2O/NO2/O2 have been investigated and a reaction mechanism is suggested which accounts for all of the major observations in the data.

ABSTRACT: (U) Rare earth glasses have been studied with emphasis on those characteristics related to rare earth doping of optical fiber preforms for fiber sensor applications. Progress has been made in the following areas: further experience with the Modified Chemical Vapor Deposition (MCVD) preform facility, and the establishment of an optical draw tower provides the ability to create state-of-the-art fibers with a host of novel dopants. We will continue to concentrate on fibers doped with rare earth elements by several techniques, and to continue studies of bulk formation of rare earth glasses, and to study certain aspects of second harmonic generation in rare earth doped silica based fibers.

UNCLASSIFIED REPORT

ABSTRACT: (U) Al-Li alloy and the mechanically alloyed IN 91211 were investigated for superplasticity and enhanced plasticity. The deformation behavior of fine and coarse grains (coexisting in the same microstructure) was a function of strain rate. Both type of grains deformed in an intercrystalline manner in region II. In region III, only the fine grains deformed in this mode. The mechanically alloyed specimens revealed the high ductility of 500% elongation at the uncommonly high strain rate of 10 per sec. The stress exponent of strain rate for this alloy does not correlate with existing models for superplasticity. Additional mechanical and microstructural work underway are expected to shed more light on the micromechanism of deformation for this alloy. Keywords: Superplasticity, Aluminum Lithium alloys; Mechanically alloyed systems; Whisker reinforced matrix; Deformation mechanism; Silicon carbide whiskers.

ABSTRACT: (U) The objectives of this research program are to develop metalorganic chemical vapor deposition (MOCVD) techniques for Manganese-bearing II-VI ternary compounds epitaxially grown on Gallium Arsenide substrates, and to explore the usefulness of UV laser assist for deposition for superlattice structures of wider bandgap II-VI binary compounds. For the first time, high quality single-crystal (111) GaAs wafers with high conventional MOCVD on (100) GaAs wafers with high resolution cross-sectional transmission electron microscopy was used for structural characterization, showing atomically abrupt interfaces, but different microstructures within the epi-film depending on growth temperature. UV adsorption spectra of a number of metalalkyl sources for Cadmium, Zinc, Selenium, and Tellurium were measured and optical adsorption cross sections calculated. Preliminary depositions of Cadmium Telluride and Zinc telluride films on glass substrates were made at 200 C with UV excitation provided by an excimer gas laser operating at 193 nm and by using a parallel beam geometry. Some optical and X-ray diffraction data are presented as well as a description of the low pressure laser photochemical deposition system. Keywords: UV-Photolysis, Superlattices, Thin films, Epitaxy, II-VI Semiconductors.

SUPPLEMENTARY NOTE: See also Part 5, AD-A179 455.

ABSTRACT: (U) The research concerns the understanding of
3-D shock wave-turbulent boundary layer interactions. The
research activity has focused on several areas. First,
the 3-D swept compression corner has been computed at
Mach 3 for a sweep angle of 40 deg and compression angle
of 24 deg. The calculated flows are in good agreement
with experiment. Second, the flowfield structure of the 3-
D swept compression corner is dominated by a large
vortical structure. Third, the interaction has been found
quantitatively to be dominated by inviscid effects except
within a small fraction of the boundary layer. Fourth,
the effect of boundary layer bleed has been examined for
the 3-D shock wave-turbulent boundary layer interaction
generated by a sharp fin. The effects of bleed are
principally limited to the near surface region. The
overall vortical structure is insensitive to surface
bleed. Keywords: High speed flows; Viscous-inviscid
interactions; Computational fluid dynamics; Navier-Stokes
equations.

ABSTRACT: (U) Let D be a bounded, simply connected domain in the plane and let $F(\theta)$; k , α sub 1 be the far field pattern arising from the scattering of a time harmonic, acoustic plane wave $u \text{ sub } (x) = \exp(ikx + i\alpha t)$, where δ is a unit vector and k is the wave number and the time harmonic factor $e^{-i\omega t}$ has been factored out. It is assumed, in addition, that the total field satisfies homogeneous Dirichlet boundary conditions on δD . In this paper, a method is presented for recovering δD given the far field patterns $F(\theta)$; k , α sub 1), $l=1, \dots, N$, for all θ in some interval $(\alpha, \alpha + \delta)$ strictly contained in $(0, 2\pi)$. The method used is a generalization of the orthogonal projection approach of Colton and Monk for solving the full aperture problem. In addition, the above method is numerically implemented. These computations show that one can recover by this method the shape of δD if the length of the interval $(\alpha, \alpha + \delta)$ is as small as 180° .

ABSTRACT: (U) The original proposal was to add an array processor to the VAX 11/750, previously purchased with a DOD grant, in order to increase the throughput by a factor of five. However, after extensive comparative studies of array processors and stand-alone computers, it was concluded that none of the available array processors in the accessible price range were sufficiently reliable and that the desired factor of five increase in speed might not be achieved. Therefore, the alternative of trading in the VAX 11/750 on a new stand-alone computer was considered as an alternative. Benchmark tests were developed using the program GAMESS, and these benchmarks combined with known reliability led us to purchase a VAX 8530, manufactured by Digital Equipment Corporation. This computer, configured with 16 megabytes of real memory, 1.35 gigabytes of disk space, a tape drive, a printer, and a console, provides us with approximately six times the throughput of the 8530, thereby exceeding our expectations.

SUPPLEMENTARY NOTE: Pub. in Jnl. of Chemical Physics, v85 n3 p1710-1711, 1 Aug 86.

ABSTRACT: (U) Photolysis of hexamethylcyclotrisiloxane in the presence of hexamethylcyclotrisiloxane produces tetraethylcyclodisilanelane and 4,4,6,6,8,8-hexamethyl-2,2-dieethyl-1,5,7,3,2,4,6,8-trioxatetrasilanelane, diethylsilaneselone is postulated as an intermediate.

ABSTRACT: (U) In Troe's Comment, he points out that the SSE model, which fits our MCMO results very well, cannot provide accurate rate coefficients and does not fit the nascent state distributions for other unimolecular reactions such as H2O2 and CF3CN, which have been fit by SACM. He also discusses the most economical way to represent product distributions, and suggests the SACM is the best choice. It is important to not lose sight of the fact that statistical theories of unimolecular reactions are used for the rather practical reason that they are easy to implement and work well. There can be no first principles justification of their accuracy, regardless of how many parameters are used to fit experiments and calculations, and the parameters used in statistical models should not be assigned a physical significance that goes beyond their use. At present, it is not feasible to perform quantum scattering calculations on accurate potential energy surfaces (PES's), and even classical trajectories on accurate PES's are rare. Therefore, if the scientific community is to make useful extrapolations and predictions, it must presently rely on models which are mainly statistical. By their nature,

ABSTRACT: (U) The original goals of this program were: 1. To demonstrate degenerate four-wave mixing in planar waveguides. 2. To fabricate nonlinear organic waveguides using the Langmuir-Blodgett (L-B) technique, and 3. To demonstrate all-optical signal processing based on degenerate four-wave mixing. During the course of this program, it became clear that nonlinear organic waveguides based on L-B deposition techniques would never exhibit losses low enough for guided-wave degenerate four-wave mixing. As a result, it was decided: 4. To develop semiconductor-doped glass waveguides, 5. To demonstrate degenerate four-wave mixing in these waveguides, and 6. To demonstrate all-optical signal processing in semiconductor-doped waveguides.

UNCLASSIFIED REPORT

ABSTRACT: (U) An investigation of the interphase boundary structure of grain boundary alpha allotriomorphs in a Ti-7.15 W/O Cr alloy now in progress has established that complex, multiple sets of ledges are present at the interphase boundaries of allotriomorphs between not only the B grain with respect to which the allotriomorphs is Burgers oriented but also with respect to the adjacent B Burgers orientation relationship. Questions are arising, however, as to whether certain systems of ledges are (immobile) structural and growth ledges. Resolution of the misfit dislocations which must be present on the terraces of both types of ledges and distinguishing between misfit dislocations and ledges with short risers are important problems which have arisen in TEM studies of these interphase boundaries.

ABSTRACT: (U) This three-year contract originally had two tasks: to investigate the structure of flat plate supersonic turbulent boundary layers (Task A), and to investigate longitudinal curvature effects in turbulent boundary layers (Task B). As a result of the work performed under these task headings, we identified a need to study the structure of simple, wall-bounded vortex loops. This investigation (Task C) commenced in the third year, and we feel that it has made a major contribution to our understanding of the ensemble-averaged structure of low and high speed turbulent boundary layers. The progress reported here is that achieved in completing these three tasks. Keywords: Turbulent flow; Eddies(Fluid mechanics); Flow visualization.

UNCLASSIFIED REPORT

ABSTRACT: (U) Structures used in the vacuum, zero gravity environment of space are quite different from earth-bound system. Vibrations induced in a space structure by the operation of equipment internal to the structure should, to the greatest extent possible, be dissipated through heat generation so that this vibrational energy is not simply redistributed throughout the structure. The usual restricted fluid flow dashpot damping system has several serious drawbacks when operating within a space environment. Phase I proposed the quantitative assessment of electromagnetic damping that results when conducting but non-magnetic body moves through a region of localized magnetic field. It was shown theoretically in the Phase I proposal that this damping should depend quadratically upon both the velocity and the magnetic field seen by the moving conducting body. From this, it follows that electromagnetic damping (ED) has the potential for both large energy and power dissipation. Although our initial approximate theoretical estimate predicted strong damping under ideal circumstances, the appropriate partial differential equations (PDE) had not been solved at the onset of Phase I. Consequently, one could not calculate the damping magnitude that might be realized under

UNCLASSIFIED REPORT

ABSTRACT: (U) The general objective of the AFOSR URI Center at Rochester is to investigate the physics of electronic microstructures using ultrafast optical techniques. To achieve this goal, we have developed and improved state-of-the-art laser sources and diagnostic techniques so that optical or electrical measurements could be performed with unprecedented temporal resolution, typically in the picosecond or femtosecond domain.

DESCRIPTORS: (U) *ELECTRONICS, *LASERS, *MICROSTRUCTURE, *OPTICAL PROPERTIES, DIAGNOSIS(GENERAL), ELECTRICAL MEASUREMENT, HIGH RATE, MEASUREMENT, METHODOLOGY, OPTICS, PHYSICS, SOURCES, STATE OF THE ART.

IDENTIFIERS: (U) PE81102F, WUAFOSR3484A3.

ABSTRACT: (U) In turbulent reacting flows, completion of chemical reactions requires diffusion of reactive species at a molecular level. Eddies rich in one reactant can be present in many turbulent flows involving finite rate chemical reactions. Local species stratifications are dissipated by molecular diffusion and chemical reaction under the influence of the local flow field. In many turbulent flows, the local flow field has a strong rotational character. It is mostly this rotational motion which enhances mixing through flow stretch and convection leading to mixing at the molecular level. In this paper, molecular mixing and finite rate chemical reactions in a two dimensional viscous vortex are examined analytically. Two species initially separated across a plane are allowed to diffuse and react in the presence of a line vortex centered at this separation plane. Keywords: Turbulent reacting flows, Molecular mixing, Reaction, Turbulent structures.

DESCRIPTORS: (U) *VORTICES, *FLUID DYNAMICS, CHEMICAL REACTIONS, DIFFUSION, REACTIVITIES, CONVECTION, FLOW FIELDS, DIFFUSION, BOUNDARY LAYER, STRATIFICATION, MOLECULAR STATES, TURBULENCE, TURBULENT FLOW, TWO DIMENSIONAL, VISCOSITY, DENSITY, EQUATIONS.

ABSTRACT: (U) Alloys and coatings for alloys for improved high temperature service life under aggressive atmosphere are of great contemporary interest. There is a general consensus that addition of reactive elements such as Hf will provide many beneficial effects for such alloys. The laser cladding technique was used to produce Ni-Fe-Cr-Al-Hf alloys with extended solid solution of Hf. A 10kW CO2 laser with mixed powder feed was used for laser cladding. Optical, scanning electron (SEM) and scanning transmission electron (STEM) microscopy were employed for microstructural evolution of alloys produced during laser cladding processes. The electron probe microanalysis and the auger electron spectroscopy were also used for micro-chemical analysis of different phases. Microstructural studies revealed a high degree of grain refinement, considerable increase in solubility of Hf in matrix and Hf rich precipitates and new metastable phases. This paper will report the microstructural development in this laser clad Ni-Fe-Cr-Al-Hf alloy.

ABSTRACT: (U) Complementary experimental-theoretical studies were conducted on the following subjects related to the dynamics and control of flexible large spacecraft structures: 1) Transient wave propagation - Extensive results are presented for traveling waves in a laboratory structure excited by suddenly applied oscillatory point forces; 2) The dynamics of a thin-walled grid with a rigid body slewing degree of freedom - The design, theoretical analysis, experimental testing, and experimental, and experimental-theoretical correlation are reported. Even after much refinement, the finite element model of the relatively simple structure did not satisfactorily predict the measured dynamic behavior; and 3) Active damping and control the slewing grid with the use of structure-borne accelerometers and reaction wheel actuators - The results of an active vibration damping experiment are presented. Also discussed are the serious practical problems encountered in this research and the potential for future experiments with simultaneous control of maneuvering and vibration. Keywords: Structural dynamics; Structural wave propagation; Large spacecraft structures.

ABSTRACT: (U) The purpose of this effort was to study the construction of novel energy absorbing boundary conditions for use at the artificial far field boundaries of exterior wave problems. One approach was pursued which involves the superposition of the solutions for a fixed boundary and for a free boundary. An analytic model was used to identify the cause of the small errors that result in the cancellation process of this approach. This model showed that the appropriate velocity at the free boundary has to be modified when the computational time step is less than the maximum stable time step. First and second order corrections have been developed.

ABSTRACT: (U) The Third International Conference on Superlattices, Microstructures, and Microdevices was successfully held at the Westin Hotel, Chicago, on August 17-20, 1987. There were 286 attendees from around world who contributed 68 oral and 160 poster presentations on their research on ultra-small structures with application in optics and electronics. Unsolicited comments from attendees indicated that the quality of the technical presentations was very high. The conference was also a financial success based on costs relative to our 1985 estimates and value relative to price paid by attendees.

UNCLASSIFIED REPORT

ABSTRACT: (U) Numerical simulation was used to explore the process of transition that a flow undergoes in changing from a laminar state to a turbulent state. The effort concentrated on three relatively simple flows for which extensive databases exist; these are the plane channel, curved channel, and flat boundary layer flows. Significant results were produced for all three cases.

ABSTRACT: (U) Increasing numbers of III-V compound semiconductor devices and circuits operate in a regime where internal noise testing with traditional electronic means proves impossible due to circuit loading and limited time resolution. Electrooptic sampling employs picosecond infrared laser pulses to non-invasively examine internal mode voltages with 100 GHz bandwidth. Under this grant, a very low phase noise synthesizer was purchased to provide stable drive to the laser mode-locker, and a microwave synthesizer was purchased to drive the device under test up to 40 GHz. In addition, a computer aided design graphics workstation was purchased to permit the design of novel ultrafast devices. In-house design, fabrication, and detailed diagnostic testing of ultrafast III-V integrated circuits are now all possible at this unique facility.

ABSTRACT: (U) This is a study of vibration control for large space structures. Advantage is taken of the limiting performance characteristics of dynamic systems. This approach permits large problems with constraints to be analyzed. A modal formulation for the limiting performance was developed in order to enhance the applicability of limiting performance to large structural systems. One effort to develop an optimal control system is based on the limiting performance approach in combination with classical/optimal control theory. A limiting-performance/minimum-time solution was formulated to achieve the goal of rapid suppression of disturbances. Classical/optimal control studies show that a position loop might be useful in taking care of constraint controllers, such as proof-mass dampers. Finally, to derive feedback control law based on the limiting performance characteristics, parameter identification technique has been under investigation.

ABSTRACT: (U) This report discusses on A Sensor with Biological Preprocessing Features during the period February 1, 1986 to October 31, 1987. The first part of the report reviews the basic geometric sensor configuration and its mapping to computation plane. Three basic configurations are discussed and their application to edge and short range motion detection follows. The next section covers a qualitative long range motion detection algorithm. The algorithm was tested first with synthetic images and next real images, and in both cases the results were very satisfactory. The algorithm is now being tested with multiple images. A one line correlation tracker is discussed in the next section. The correlation tracker can be implemented with parallel architecture and is very fast. Tests have been performed with satisfactory results using real images. Pattern recognition using BVS together with a class transforms which are invariant to translations is discussed. It should be possible to implement this pattern recognition system using neural networks. A preliminary neural network implementation is given. The use of learning neural nets will allow recognition of sensor follows. A hardware configuration is proposed to map a rectangular

UNCLASSIFIED REPORT

ABSTRACT: (U) We have established that solutions of linear programs are globally Lipschitz continuous with respect to right-hand side perturbation of the constraints, but are not even locally Lipschitz continuous with respect to perturbation of the cost function. The latter implies that solutions of monotone linear complementarity problems are not Lipschitz continuous with respect to right-hand side perturbation of the constraints. On the other hand, we established that solutions of linear complementary problems with matrices with positive principal minors do have this Lipschitz continuity property. This includes strictly monotone linear complementary problems. We established that the distance between an arbitrary point and the solution set of a monotone linear complementarity problem is bounded by the product of a condition of the complementarity problem conditions by the point considered. When the point violates only the complementarity condition, but satisfies the linear equalities, the residual consists of x to the T power times $(Mx+q)$ plus its square root. The square root term is essential and without which the bound cannot hold. The result has important applications in the design and analysis of iterative methods for solving monotone linear complementarity problems.

ABSTRACT: (U) In this paper, a general class of nonquadratic convex Nash games is studied, from the points of view of existence, stability and iterative computation of noncooperative equilibria. Conditions for contraction of general nonlinear operators are obtained, which are then used in the stability study of such games. These lead to existence and uniqueness conditions for analysis. Also, convergence of an algorithm which employs inaccurate search techniques is verified. It is shown in the context of a fish war example that the algorithm given is in some aspects superior to various algorithms found in the literature, and is furthermore more meaningful for real world implementation. ABSTRACT: (U) Stress-strain curves are presented for tensile impact tests on plain-weave glass/epoxy and plain-weave carbon/epoxy laminates loaded in a direction at 45 deg to both the warp and weft directions. From the initial linear-elastic response the in-plane shear moduli for the two types of reinforcement at impact rates of strain are derived. In conjunction with results previously obtained from tensile impact tests on the same laminates loaded in the warp and the weft directions, two-dimensional stiffness matrices for both the glass-fabric and the carbon-fabric reinforced plies are determined. When compared with similar stiffness matrices previously obtained under quasi-static loading a marked effect of strain rate is apparent, particularly for the glass-reinforced ply. Keywords: Fibre reinforced composites, Tensile impact testing, Hopkinson-bar.

ABSTRACT: (U) Studies were conducted on semiconductor doped filter glasses which have been observed to exhibit third order optical non-linearity. This NLO behavior switches on and off in sub-picosecond times. However, the switching time, the NLO coefficient and the operating temperature are affected by the microstructure of the precipitated CdS and CdSe semiconductors. Studies were conducted to examine the crystal microstructures developed in these filter glasses and to correlate them with the optical properties of the semiconductors. There appears to be a potential for an increase in NLO coefficient by a factor of 10 to 1000 with the development of a suitable microstructure. Results and implications of the studies are presented. Studies on thin films of semiconducting CdS showed that microstructure can be controlled by suitable sputtering conditions. Strong exciton transitions were observed and have a high potential for NLO behavior. Composite thin films of CdS semiconducting crystals confined in a glass matrix were formed by co-evaporation. Studies of the phase separation behavior of fluoride glasses were continued in the system: CdF₂, LiF, AlF₃, PbF₂. Two levels of phase separation were observed, consisting of a large microstructure of isolated spheres 3-10 micron in diameter, and a very small interconnected microstructure

resulting from secondary phase separation.

ABSTRACT: (U) The U.S. AF Summer Faculty Research Program (USAF-SFRP) is a program designed to introduce university, college, and technical institute faculty members to Air Force research. This is accomplished by the faculty members being selected on a nationally advertised competitive basis for a ten-week assignment during the summer intersession period to perform research at Air Force laboratories/centers. Each assignment is in a subject area and at an Air Force facility mutually agreed upon by the faculty members and the Air Force. In addition to compensation, travel and cost of living allowances are also paid. The specific objectives of the 1987 USAF-SFRP are: (1) To provide a productive means for Scientists and Engineers holding Ph.D degrees to participate in research at the Air Force Weapons Laboratory; (2) To stimulate continuing professional association among the scholars and their professional peers in the Air Force; (3) To further the research objectives of the United States Air Force; and (4) To Enhance the research productivity and capabilities of Scientists and Engineers especially as these relate to Air Force technical interests.

UNCLASSIFIED REPORT

ABSTRACT: (U) The Graduate Student Summer Support Program (GSSSP) is conducted as part of the Summer Faculty Research Program. The program provides opportunities for research in the physical sciences, engineering, life sciences, business, and administrative sciences. The program has been effective in providing basic research opportunities to the Graduate Students of universities, colleges, and technical institutions throughout the United States. The program is available to Graduate Students enrolled in either Masters Degree or Doctorate Programs. It has proven especially beneficial to the students who are starting their academic research programs. Beginning with the 1982 program, research opportunities were provided for 17 graduate students. The 1982 pilot student program was highly successful and was expanded in 1983 to 53 students; there were 84 graduate students in the 1984 program. In the previous programs, the graduate students were selected along with their professors to work on the program. For the 1985 program, the graduate students were selected on their own merits. They were assigned to be supervised by either a professor on the program or by an engineer at the Air Force Laboratories participating in the program. There were 101 graduate students selected for the 1987 program. Its purpose is to provide funds for selected graduate

ABSTRACT: (U) This report summarizes experimental and theoretical studies carried out during the period of Nov 1986 to Oct 1987 on laser cladding of Ni and Nb alloys for improved environmental resistance at high temperature. Major emphasis has been on Ni-Cr-Al-Hf system. Microstructural evolution and oxidation properties of these alloys were examined. For Nb alloys microstructural characterization and differential thermal analysis were carried out. One-dimensional diffusion model for finite domain to examine the extended solid solubility in laser cladding was also developed.

ABSTRACT: (U) Downstream marching iterative schemes for the solution of the Parabolized or Thin Layer(PNS or TL) Navier-Stokes equations are described. Modifications of the primitive equation global relaxation sweep procedure result in efficient second-order marching schemes. These schemes take full account of the reduced order of the approximate equations as they behave like the SLOR for a single elliptic equation. The improved smoothing properties permit the introduction of Multi-Grid Acceleration. The proposed algorithm is essentially Reynolds number independent and therefore can be applied to the solution of the subsonic Euler equations. The convergence rates are similar to those obtained by the Multi-Grid solution of a single elliptic equation; the storage on is also comparable as only the pressure has to be stored all levels. Extensions to three-dimensional and compressional subsonic flows are discussed. Numerical results are presented. Keywords: Steady incompressible two dimensional equations.

DESCRIPTORS: (U) *ITERATIONS, *NAVIER STOKES EQUATIONS, ADAPTERS, ALGORITHMS, CONVERGENCE, DIFFERENTIAL EQUATIONS, ELLIPSES, NUMERICAL ANALYSIS, RATES, SOLUTIONS(GENERAL).

ABSTRACT: (U) This report describes research conducted in Cognitive Psychophysiology. Our primary mission has been to develop an understanding of the Event-Related Brain Potential (ERP) so that it can be used in the study of human cognitive function and in the assessment of man-machine interactions. To this end, we have conducted research in the following areas: The use of ERPs in the study of attention and skill acquisition. The use of ERPs in the study of mental chronometry. The use of ERPs in the study of mental resources and workload. The use of ERPs in the study of memory. The development of animal model of the P300 component. The use of ERPs as a communication channel. Listed are all chapters, papers, abstracts and presentations that were published, submitted, or in preparation in 1987. Keywords: Memory; Information processing; Brain function.

DESCRIPTORS: (U) *COGNITION, *INFORMATION PROCESSING, *PSYCHOPHYSIOLOGY, ACQUISITION, ANIMALS, ATTENTION, BRAIN, FUNCTIONS, HUMANS, INDEXES, INTERACTIONS, MAN MACHINE SYSTEMS, MEMORY DEVICES, MENTAL ABILITY, MISSIONS, MODELS, RESOURCES, SKILLS, WORKLOAD.

UNCLASSIFIED REPORT

ABSTRACT: (U) The author pursued research to provide improved subroutines for common arithmetic functions for scientific computations. He produced an algorithm for the accurate implementation of rational arithmetic operations without resorting to multi-precision arithmetic. This was described in a paper entitled Rational arithmetic in floating point. He has also made a careful study of how to make branch cuts in the complex plane so as to allow evaluation of the elementary functions without any anomalies. This was presented in a talk at the conference on State-of-the-Art in Numerical Analysis held in Birmingham, England, April 14-18, 1988.

DESCRIPTORS: (U) *SPACECRAFT, *STRUCTURAL ENGINEERING.

ABSTRACT: (U) This report summaries 20 months of research into Travelling Wave Concepts for the Modelling and Control of Space Structures. A good portion of the research has focused upon the development of techniques for the modelling of structural response in terms of disturbance propagation. Such models are of interest for several reasons: 1. Understanding the mechanisms that govern the propagation of disturbances through an elastic structure is useful for building intuition, for structural design and for design of active control, and 2. Disturbance propagation models have the potential for providing high-fidelity analysis capabilities in response regimes where other techniques are inapplicable. Of considerable interest to the researchers at MIT is the response of elastic spacecraft to disturbances with significant spectral content at frequencies including many (even hundreds) of the spacecraft natural modes of structural vibration; and 3. Elastic disturbance propagation is a classic area of research in applied mechanics, having application in acoustics, seismology, microwave electronics, transducer design, biological fluid mechanics, design of mechanisms and machines, and many other areas.

ABSTRACT: (U) Six papers have been published in the literature during the past two years, related to the development and performance of the Doppler Lidar Detector System, and its associated wavelength meters. The instrumentation and all of the necessary software is now available at University College London. Three complete Doppler Detector/Wavelength meter units have been fabricated. One of these has been delivered to AFGL, awaiting the completion of the Laser system. Another one of these combined units was integrated temporarily with the complete Lidar system of the Bonn University group at Andoya in August 1987, for proof of concept, and to demonstrate that all of the optical and electronic interfaces and software functioned correctly. Due to limited time in the field, and very poor weather, it was not possible to obtain direct data on the lower thermosphere, but the tests did prove that the entire system functioned as designed. Further tests with Bonn University are planned in 1988.

SUPPLEMENTARY NOTE: Prepared in cooperation with Georgia Institute of Technology, contract AFOSR-84-0387.

ABSTRACT: (U) We present conditions under which a point process of certain jump times of a Markov process is a Poisson process. One result is that if the Markov process is stationary and the compensator of the point process in reverse time has a constant intensity λ , then the point process is Poisson with rate λ . A classical example is that the output flow from a M/M/1 queueing system is Poisson. We also present similar Poisson characterizations of more general marked point processes of a Markov process. These results yield easy-to-use criteria for a collection of such processes to be multi-variate Poisson or marked Poisson with a specified dependence or independence. We give several applications of queueing systems, and indicate how our results extend to functionals of non-Markovian processes.

ABSTRACT: (U) A statistical study is presented of signatures of the high-latitude ionospheric convection pattern and the simultaneously observed energetic electron precipitation. Most often convection cells are found in which the sunward flowing region contains auroral particle precipitation but the antisunward flowing region does not. However, observations also show the frequent occurrence of convection cells in which neither the antisunward nor the sunward flowing plasma region contains auroral particle precipitation. These findings may appear within the dawnside or duskside convection pattern and strongly suggest that such convection cells may be associated with open magnetic field lines that thread the magnetotail lobes. Examination of the interplanetary magnetic field (IMF) data shows that this lobe cell convection signature is most likely to be accompanied by the signature of dayside merging when the IMF has a significant y component but is directed southward. A lobe convection cell has a location and sense of circulation that are dependent on the sign of By. For the northern hemisphere, clockwise circulation displaced to the duskside appears roughly 35% of the time

when By is positive, and anticlockwise circulation displaced to the dawnside appears when By is negative. The same circulation sense and location exist in the southern hemisphere for the opposite polarity of By. At times of northward IMF, the circulation within the polar cap can be at least partially on closed field lines and cannot be easily reconciled with merely a distortion of the standard two-cell convection pattern. The significance of these results to several models of the solar wind/magnetosphere interaction is discussed.

SUPPLEMENTARY NOTE: Pub. in *Angewandte Chemie*, v28 n12
p1201-1211 Dec 87.

ABSTRACT: (U) Disilenes, compounds containing silicon-silicon double bonds, can be isolated as thermally stable, yellow- or orange-colored crystalline compounds; the substituent groups at silicon must be large (mesityl, tert-butyl, etc.) to prevent polymerization. Structural and spectroscopic studies indicate many similarities between the 3p-3p pi bonding in disilenes and the 2p-2p pi bonding in olefins, but disilenes are much more reactive than alkenes. The reactions of disilenes lead to many new classes of silicon compounds, including three- and four-membered rings which present novel problems in chemical bonding.

DESCRIPTORS: (U) *CHEMICAL BONDS, *SILICON, *SILICON COMPOUNDS, ALKENES, BONDED JOINTS, BONDING, CHEMISTRY, POLYMERIZATION, SILICON DIOXIDE, SPECTROSCOPY, STRUCTURAL PROPERTIES, SYNTHESIS(CHEMISTRY), CYCLIC COMPOUNDS, THERMAL STABILITY, REPRINTS, NUCLEAR RESONANCE.

ABSTRACT: (U) The Summer Faculty Research Program (SFRP) provides opportunities for research in the physical sciences, engineering, life sciences, business, and administrative sciences. The program has been effective in providing basic research opportunities to the faculty of universities, colleges, and technical institutions throughout the United States. The program is available to faculty members in all academic grades: instructor, assistant professor, professor, department chairman, and research faculty members who are starting their academic research programs and to senior faculty members who have spent time in university administrative and are desirous of returning to scholarly research programs. Beginning with the 1982 program, research opportunities were provided for 17 graduate students. The 1982 pilot student program was highly successful and was expanded in 1983 to 53 students; there were 84 graduate students in the 1984 program. In the previous programs, the graduate students were selected along with their professors to work on the program. For the 1985 program, the graduate students were selected on their own merits. There were 101 graduate students selected for the 1987 program. Follow-on research opportunities have been developed for a large percentage of the participants in the Summer Faculty Research Program in 1979-1983 period through an AFDOR

ABSTRACT: (U) The report describes measurements of ion-pair production cross sections for He*(2(1,3)S)-Li, Li-Cs, Li-Na, and Li-Na*(3p) collisions at energies of several keV. Measurements of chemi-ionization cross sections for He*(2(1,3)S)-Li collisions are also mentioned. A method is described for exciting a fraction of the atoms in a Li vapor to the 2p resonance state using a dye laser. The fraction is determined by observing with the laser on and off the ion-pair production of C₁⁻ when a fast Cl beam collides with the vapor. Keywords: Ion pair production, Ionization, Cross sections, Molecular beams, Reaction rates.

ABSTRACT: (U) Our research has involved studies on neuronal communication in the mammalian brain, and has focused on rapid conducting mechanisms in local neuronal circuits. Most of our work has centered on electrical interactions between cells in the hippocampus, but other research has involved excitatory chemical synaptic transmission in the hypothalamus. We have found that intracellular injection of antibodies directed at the liver gap junction polypeptide reduces dye coupling between cultured glial cells. Although antibody injections did not completely block junctional transmission, a similar approach could be useful with hippocampal pyramidal cells for understanding the role that electronic coupling may play in synchronization of neuronal activity. Another major area of research has involved low calcium solutions where chloride was replaced with propionate. These two treatments have been shown to block chemical synaptic transmission and electronic junctions, respectively. We have obtained preliminary evidence that synchronous activity can still be obtained in this solution, thus arguing that electrical field effects alone can synchronize the action potentials of hippocampal neurons. In collaboration with Roger Traub at IBM, theoretical studies with a computer model have provided a quantitative conceptual framework for understanding how electrical interactions operate in

ABSTRACT: (U) The construction and performance of a photoelectron spectrometer designed for the vapor phase study of high-temperature species is described. An inductively heated furnace is used to produce atoms and molecules in the vapor phase at furnace temperature >2000 K. Electrical interference is eliminated using pulsed heating and gated electronics. A microchannel plate phosphor silicon intensified target camera detector is used for rapid data acquisition to minimize problems caused by time-dependent contamination in the ionization region. A dedicated, menu-driven, firmware-based data interface, with key pad control is utilized. The TV monitoring of the photoelectron line images and use of a video window to select data allow optimum spectral conditions to be preserved during an experiment. Results show reductions in data acquisition times of up to 90 compared to equivalent single-channel detector experiments. Keywords: Great Britain.

UNCLASSIFIED REPORT

ABSTRACT: (U) Concerning adaptive array and null steering applications of polynomials with restricted coefficients, the basic mathematical question to consider in electronic beam steering, with a discrete array consisting of omnidirectional elements spaced at equal increments along a straight line, is how coefficients of a polynomial may be chosen in a robust yet computationally efficient manner so as to arrive at a desired beam pattern. In numerous applications, these coefficients are required to satisfy certain restrictions, such as a bound on their dynamic range. Thus, particularly in null steering, it is often advantageous, or even necessary, for the shading coefficients to all have the same magnitude. Basic properties of such polynomials and their applications to beamforming are described. Keywords: Notched filters, Applied mathematics.

UNCLASSIFIED REPORT

ABSTRACT: (U) We prove a necessary condition and a sufficient condition for the existence of steady plane wave solutions to the Navier Stokes equations for a reacting gas. These solutions represent plane detonation waves, and converge to ZND detonation waves as the viscosity, heat conductivity, and species diffusion rates tend to zero. We assume that the Prandtl number is $3/4$, but we permit arbitrary Lewis numbers. We make no assumption concerning the activation energy. We show that the stagnation enthalpy and the entropy flux are always monotone for such solutions, and that the mass density and pressure are nearly always not monotone, as predicted by the ZND theory. In certain parameter ranges, typically that of large diffusion, many of these waves have the appearance of a weak detonation followed by an inert shock wave. This confirms a phenomenon observed in numerical calculations and in a model system by Colella, Majda, and Roytburd.

ABSTRACT: (U) The photodissociation dynamics of (S02) 2(-) to form S02/S0 2(-) products is investigated over the wavelength range 656 (1.89 eV) to 458 nm (2.71 eV). Product angular distributions are obtained. An asymmetry parameter analysis indicates the lifetime of the (S02) 2(-) photoexcited state is much less than a rotational period. Product kinetic energy distributions are obtained at all wavelengths. Both the overall shape of these distributions and comparison with statistical phase space theory calculations indicate the excited state assessed by the photon is repulsive consistent with the asymmetry parameter analysis. An impulsive model analysis suggests the bond between the two S02 moieties in (S02) 2(-) is probably between one oxygen atom on each moiety and the structure is quasilinear. Structure is also observed in the kinetic energy distributions. It is suggested this is due to selective photoexcitation of vibrational states of either the S02 or SO 2(-) moiety in (S02) 2(-). Hodges and Vanderhoff have reported a bimodal photodestruction cross section for (S02) 2(-) with major peaks near 600 and 400 nm. We argue these peaks are due to photodissociation of (S02) 2(-) not photodetachment, with the first excited doublet state (repulsive) leading to the 600 nm peak and the second excited doublet state (bound) leading to the second maxima. The repulsive state

ABSTRACT: (U) A photodissociation study of S02 02+ is presented. The experiments were carried out on mass selected ion beams that were crossed with a polarized laser beam and then photoproducts were mass and energy analyzed. The S02 02+ ions were formed by three body association reactions in a pressure and temperature dependent ion source. Studies were carried out at wavelengths of 582, 514, 488, 458, and 357 + or - 7 nm using an argon ion laser/dye laser system. Both 02+/S02 and S02+/02 photoproducts were observed and the branching ratio measured as a function of lambda. In addition, product kinetic energy distributions and angular distributions (asymmetry parameters) were measured and statistical phase space theory calculations were carried out. The results indicate the 02+/S02 products are formed from photon absorption to a bound excite state at all wavelengths followed by internal conversion to the ground state and statistical vibrational predissociation. Keywords: Photodissociation, Weakly bound ion neutral, Clusters, Sulfides, Oxygen.

ABSTRACT: (U) A summary of the technical work performed during the past twelve months under AFOSR Grant 85-0195 is presented in this report. Significant progress on a number of adaptive concepts has been made. Problems associated with earlier adaptive mesh schemes controlling cell area/volume have been resolved. Resolution of this difficulty led to the evolution of an adaptive orthogonal scheme for two-dimensional grids. This technique is even structurally simpler than the original Poisson equation based adaptive methods. Other research emphasis has been placed on developing an unstructured solution scheme as a fast solver to generate these grids.

DESCRIPTORS: (U) *GRIDS, *VOLUME, ADAPTIVE SYSTEMS, GENERATORS, MESH, ORTHOGONALITY, POISSON DENSITY FUNCTIONS, SOLUTIONS(GENERAL), TWO DIMENSIONAL.

IDENTIFIERS: (U) Adaptive grids, PE81102F, WUAFOSR2307A1.

ABSTRACT: (U) The contributions of autoionizing resonances to the electron-impact excitation-rate coefficients for the $n = 2$ to $n = 2$ transitions in Be-like ions have been evaluated for six ions with atomic numbers $Z = 30, 34, 38, 42, 47,$ and 54 . The calculations were carried out in the isolated-resonance approximation. Interference between direct and resonance channels was neglected. The detailed Auger and radiative rates were computed using the multiconfiguration Dirac-Fock model. Results for 45 transitions among 10 states from $1s^2 2l^2 2l'$ configurations are listed. For electric dipole allowed transitions, the contributions from the autoionizing resonances are quite small. However, the autoionizing resonances can enhance the excitation rates by a factor of 2-4 dipole forbidden transitions.

DESCRIPTORS: (U) *ELECTRON IMPACT SPECTRA, *AUGER ELECTRON SPECTROSCOPY, ATOMIC PROPERTIES, CHANNELS, COLLISIONS, ELECTRONS, EXCITATION, IONIZATION, IONS, MASS NUMBER, RADIATION, RATES, RESONANCE, BERYLLIUM, ELECTRON TRANSITIONS.

SUPPLEMENTARY NOTE: Pub. in Jnl. of American Chemical Society, v109 p8865-8868 1987.

ABSTRACT: (U) First results are presented on velocity distribution measurements of Ba+ ions drifted in helium using a well-characterized drift tube and single-frequency laser-induced fluorescence detection. Reduced mobilities of Ba+ in helium are obtained for E/N values between 7.74 and 23.2 Td. The velocity distributions that are observed parallel to the electric field fit a displaced Maxwell-Boltzmann distribution, in agreement with theoretical predictions. However, the temperatures parallel and perpendicular to the field are not in good agreement with theoretical treatments. Keywords: Ion; Laser; Mobility; Velocity; Barium.

ABSTRACT: (U) Reaction of tetraaryldisilenes with N20 produces tetraaryldisilaoxiranes, R4Si2O where R = mesityl, 2,6-xylyl and 2,6-dimethyl-4-tert-butylphenyl. The crystal structure of tetraesityldisilaoxirane (2a) has been determined by x-ray crystallography. The sum of bond angles C-Si-Si', C-Si-C' and C'-Si-Si' at each silicon is 360, and the Si-Si distance is very short, 222.7 pm. These results suggest that bonding in the disilaoxirane structure may be regarded as intermediate between a disilene-oxygen pi-complex and a three-membered ring.

DESCRIPTORS: (U) *LASER INDUCED FLUORESCENCE, *PARTICLE ACCELERATOR COMPONENTS, *VELOCITY, BARIUM, DETECTION, DISTRIBUTION, ELECTRODES, HELIUM, IONS, LASERS, MEASUREMENT, MOBILITY, OBSERVATION, PREDICTIONS, REDUCTION, THEORY, STATISTICAL DISTRIBUTIONS.

UNCLASSIFIED REPORT

ABSTRACT: (U) An explicit flow solver, applicable to the hierarchy of model equations ranging from Euler to full Navier-Stokes, was combined with several techniques designed to reduce computational expense. The computational domain consisted of local grid refinements embedded in a global coarse mesh, where the locations of these refinements are defined by the physics of the flow. Flow characteristics were also used to determine which set of model equations is appropriate for solution in each region, thereby reducing not only the number of grid points at which the solution must be obtained, but also the computational effort required to get that solution. Acceleration to steady-state was achieved by applying multigrid on each of the subgrids, regardless of the particular model equations being solved. Since each of these components is explicit, advantage could readily be taken of the vector-and parallel-processing capabilities of machines such as the Cray X-MP and Cray 2.

ABSTRACT: (U) While the Reformatsky reaction is celebrating the centennial of its discovery this year, the mechanism is still a matter of controversy. Early mechanistic suggestions have centered around the rearrangement of adducts 1 and 2 of the two possible monomeric forms of the Reformatsky reagent (RR) with the majority of the chemical evidence favoring the enolate form 2. However, recent X-ray evidence has shown that the RR is dimeric in THF, throwing doubt on the suggestion that the monomeric forms participate at all. Here we report a detailed theoretical study of the reaction, with use of the MODO has been recently parametrized to handle organozinc compounds. The aldehyde and ether component of the RR was modelled by formaldehyde and dimethyl ether, respectively.

ABSTRACT: (U) The magnitudes of secondary deuterium isotope effects (SDIE) are generally in the range of $0.9 < kH/kD < 1.25$, and are often satisfactorily rationalized by the zero-point energy (ZPE) change on going from reactant to transition state due to C-H rehybridization. We now report a far larger SDIE for the title reaction. Its rationalization on the basis of transition state theory suggests that it more closely resembles a primary isotope effect. Laser flash photolysis of cis-1-phenylcyclohexene (direct, 268 nm, or sensitized by thioxanthone, 355 nm) affords its trans isomer which in heptane exclusively reverts to 1, $k = 2.1 \times 10$ to the 5th power s at 300 K. Isotopically substituted 2-2-d1 or 2-2, 6-6-d3 (generated similarly from the corresponding cis isomers) both have rates of reversion longer than 2 itself by a factor of 2.0 at room temperature. No previously reported SDIE approaches this magnitude.

UNCLASSIFIED REPORT

ABSTRACT: (U) The Cope rearrangement of hexa-1,5-diene derivatives was long regarded as a classic example of an 'allowed' pericyclic reaction, taking place via an aromatic transition state (TS) isoconjugate with benzene and with a chair geometry. This view was challenged some years ago by Doering et al., who suggested that the reaction might be nonsynchronous, the TS being a biradical by a through-bond interaction between the radical centres, i.e. a biradicaloid. Keywords: Reprints.

SUPPLEMENTARY NOTE: Pub. in Jnl. of Organic Chemistry, v52 n21 p4784-4788 1987.

ABSTRACT: (U) The title compounds (1, 2a and 2b, respectively) have been synthesized from 4,4-dimethoxypentacyclo(5.4.0.02,6.03,10.05,8)undecane-exo, exo-8,11-diol (4). Thus, hydrolysis of the ketal functionality in 4 followed by oxidation of the resulting ketodiol afforded 1 in essentially quantitative yield. When 4 was heated with acetic acid in the presence of concentrated sulfuric acid, a mixture of cage ketodiacetates 6 and 7 was produced. Compound 2a was synthesized in several steps from this mixture by using the route shown in Scheme I. This synthesis could be shortened considerably when propionic acid was substituted for acetic acid in the acid-promoted rearrangement of 4. An improved synthesis of 2a based on this latter approach is shown in Scheme II. Compound 2a was then converted into the corresponding tris(oxime) from which the corresponding D3-hexanitrotrishomocubane (2b) could be synthesized by using an established literature procedure.

ABSTRACT: (U) Ab initio calculations up to the MP54SDQ/6-31G level are reported for the chair Cope rearrangement of 1,5-hexadiene. These are consistent with a recent AM1 study, which showed the reaction to take place via a biradicaloid intermediate. Recent AM1 calculations seem to have established that the chair Cope rearrangements of 1,5-hexadiene and its derivatives take place by the non-synchronous mechanism suggested by Doering et al. involving a biradicaloid derived from the 1,4-cyclohexylene biradical as a symmetrical intermediate. These reactions had earlier been assumed to be typical synchronous allowed pericyclic processes taking place via aromatic transition states a mechanism supported by a recent ab initio MC SCF study.

ABSTRACT: (U) The quest to apply an ever-increasing
amount of computing power to numerical applications has
resulted in the evolution of a broad spectrum of ideas
and implementations for high performance computing
systems. The architectural complexity of these high
performance systems typically requires special tools and
techniques to achieve efficient utilization of available
computational resources. These tools range from automatic
restructuring and optimizing compilers to interactive
debugging and performance analysis systems. The
programming environment for these systems must
be general and adaptive, providing the appropriate level
of assistance for users of varying levels of
sophistication. This paper presents recent developments
in supercomputer environments, and focuses in more detail
on the Cedar Project which is currently under way at the
University of Illinois Center for Supercomputing Research
and Development. The Cedar Project consists of the
construction of a prototype multiprocessor, restructuring
compilers for the Fortran and C programming languages.

ABSTRACT: (U) A high-resolution process timing facility, called HRTIME, has been implemented for the Cedar system. HRTIME is an extension of the Concentrix USER and SYSTEM process states with 10 usec accuracy. In addition, HRTIME provides individual processor timing measurements to give a detailed account of the time spent in various states of sequential and concurrent execution. The main purpose of this manual is to explain how to use the HRTIME facility. In particular, the manual discusses how to access the timing data, to correct time a program section, and to interpret the resulting time measurements. Although a brief overview is given describing what the time measurements are and how they are produced, the user should refer to BELM87 for a complete discussion of the HRTIME design and implementation. ABSTRACT: (U) This paper proposes a definition for VPC, an extended C programming language for vector-parallel applications. VPC is a superset of the conventional C language that contains extensions for vector and parallel machines. New constructs and their semantics are presented, along with some discussion about potential problems that arise when extending C into the parallel domain. The reader is assumed to be familiar with the C programming language--this paper only describes those aspects of VPC that differ from the standard definition. Keywords: Parallel processing; Synchronization.

UNCLASSIFIED REPORT

ABSTRACT: (U) This document explains how to use a facility for measuring concurrency efficiency on the Alliant FX/8 implemented as part of CSRD's modifications to the Concentrix operating system. A brief overview of the concurrency efficiency analysis is presented first. The CSRD implementation is then described to point out the measurements' limitations. Concurrency efficiency measurements are directly controlled by the user program. Instructions for determining CEFF values from within a program are given. Concurrency efficiency statistics for the entire program are often desired. A tool for generating this data without requiring user program modification is described. Finally, we give some suggestions on the use of CEFF results in association with other program performance information. Keywords: Variables, FORTRAN computations.

DESCRIPTORS: (U) *PROGRAMMING MANUALS, COMPUTATIONS, EFFICIENCY, MEASUREMENT, MODIFICATION, STATISTICS, USER MANUALS, USER NEEDS, VARIABLES, FORTRAN.

IDENTIFIERS: (U) PE61102F, WUAFOSR2304A3.

ABSTRACT: (U) The goal of program profiling is to provide an accurate characterization of a program's behavior and performance. Program profiling can have several different meanings depending on the measurements of interest and the programming environment. Generally, profiling measurements are concerned with collecting information regarding the dynamic execution behavior of the program. The purpose is to help the user evaluate alternative implementations and to guide program optimizations. This paper presents an analysis of parallel program profiling for the Cedar multiprocessor and a preliminary functional specification of a parallel program profiling tool, cprof. The standard UNIX profiling tools serve as a beginning design basis for cprof and their basic functionality is discussed in Section 2. Section 3 describes the problems with parallel program profiling. In particular, profiling in the Cedar program execution environment is analyzed. The initial version of cprof supports routine counting and timing functionality. The proposed cprof implementation is presented in detail in Section 4. Profiling operations other than routine counting and timing are interesting for parallel programs. Section 5 briefly describes

UNCLASSIFIED REPORT

ABSTRACT: (U) Orthogonal functions, and in particular, Walsh functions, have been advocated in the literature as a method of approximating the solutions of singular systems $Ex' = Fx + Bu$ of index k . This paper gives the first analysis of the accuracy of these approximations. For Walsh functions, divergence is shown for $k > 0$ or -3 and convergence for $k = 0, 1$. The index two case is also analyzed. Keywords: Singular control systems; Constant matrices; Coefficients.

DESCRIPTORS: (U) *ORTHOGONALITY; *WALSH FUNCTIONS, ACCURACY, COEFFICIENTS, CONTROL SYSTEMS, INDEXES, SOLUTIONS(GENERAL), CONVERGENCE, APPROXIMATION(MATHEMATICS).

IDENTIFIERS: (U) PEG1102F, WUAFOSR2304A1.

ABSTRACT: (U) This report presents the research that was conducted in the year 1987 and some of the results were achieved. Low frequency fluctuations were studied at metastable states of long Josephson junctions biased at Fiske steps in a magnetic field. The fluctuations exhibit telegraph type of noise whose origin in the thermal noise of the internal resistance of the junction. Temperature dependence of these fluctuations shows that a thermal activation process is responsible for the behavior. At lower temperatures, quantum mechanical tunneling is expected to contribute to the fluctuations and experiments are presently being prepared for such studies down to 10 mK in a 3He-4He dilution refrigerator. The I-V curves for our junctions show a regular step structure due to cavity resonances and they also show subharmonic generation of period three due to the strong non-linearities of the dissipative system. Such subharmonic voltage steps are important because they normally precede chaotic behavior. A study was also made of the effects of geometry on fluxon motion and the results show that the device characteristics depend strongly on the bias current distribution in the junction. Studies for the next period are presented; they consist of experiments on fluxon quantum tunneling down to temperatures of 10 mK and effects of dissipation on such tunneling; conductance fluctuations in the junction will also be investigated.

ABSTRACT: (U) High heating rate thermolysis studies of energetic materials using rapid-scan Fourier transform infrared spectroscopy as the diagnostic technique have yielded considerable information on the origins of the pressure dependence of the process and structure/property/ reactivity relationships. The pressure dependence of the observed gas products up to 1000 psi was shown for the first time to originate from heterogeneous gas/condensed phase reactions. The formation of NH_3 from alkylammonium nitrate salts occurs only if the O/H ratio is less than one. The thermochemistry of cyclic and acyclic nitramines is shown to be different in the condensed phase as a result of the different global molecular shapes. Hydrogen bonding as a stabilizing feature in the impact sensitivity of an energetic material was shown to be overriden by the presence of energetic functional groups. Keywords: Thermal decomposition, Infrared spectroscopy, Pressure effects, Gas analysis, Impact sensitivity, Energetic materials.

ABSTRACT: (U) This research project was designed to assess the role of tRNA anticodon modifications in regulating gene expression and to determine the potential for manipulating these modifications to modulate biologic responses in human cells. The modification reactions of primary interest were those involved in generating the nucleosides queuosine and inosine exclusively in the first position of the anticodon of specific tRNAs. These are the only two tRNA modifications known to occur by base exchange mechanisms, whereby queuine and hypoxanthine are inserted directly into tRNA macromolecules. Various human cell culture systems were used to determine whether and/or how the dietary factor queuine and the normal purine catabolite hypoxanthine: Inhibit the effects of tumor promoters, block the neoplastic process subsequent to the initiation event, reverse the expression of transformed phenotypes by malignant cells, and induce the maturation of undifferentiated cells. The relationship to specific tRNA structural changes in the anticodon was evaluated.

ABSTRACT: (U) It has been frequently observed that the
backward differentiation approximation of the solutions
of $Ex' + Fx = f$ can fail to converge even pointwise in an
initial boundary layer. This note shows that the
approximations converge in a distributional sense even if
the exact solution is also distributional. Keywords:
Matrices; Convergence; Approximation.

ABSTRACT: (U) Fracture by the progressive growth of
incipient flaws under cyclically varying loads, i.e., by
fatigue, must now be considered as the principal cause of
in-service failures of engineering structures and
components, whether associated with mechanical sliding
and friction (fretting fatigue), rolling contact,
aggressive environments (corrosion fatigue), or elevated
temperatures (creep-fatigue). Of particular importance
are the early stages of fatigue damage, involving the
initial extension of microcracks and their subsequent
growth at very low velocities, as these processes tend to
dominate overall lifetime. This has been reflected by
trends in fatigue research over the past five years,
which have focused largely on so-called 'small cracks,'
of dimensions comparable with the scale of microstructure
or local plasticity, and on crack growth in the near-
threshold regime, i.e., at stress intensities approaching
the fatigue threshold below which cracks are presumed
dormant. In addition, associated mechanistic studies have
highlighted the critical role of crack tip shielding in
fatigue, which arises predominantly from crack closure

ABSTRACT: (U) The initial-boundary value problem for a reaction diffusion equation $u_t = u_{xx} + f(u)$ $u(0,t) = u(1,t) = 0$ has been analyzed using the Conley index. This paper the asymptotic behavior of the semidiscrete finite element approximations, with interpolation of the coefficients in the nonlinear terms. We show that for small h the spectrum of the linearized discrete steady-state problem is a good approximation for the spectrum of the linearized continuous steady state problem. Using the interpretation of the Conley index as the dimension of an unstable manifold of a steady state solution, we establish that the properties of the semidiscrete approximations are completely analogous to those of the solution (*). The asymptotic, as t approaches infinity, optimal order convergence of the approximate solution is proved.

ABSTRACT: (U) Current ability to improve the combustion efficiency of B and Al solid propellants and slurries is hampered by a lack of understanding and knowledge of the kinetics of the individual reactions involved and the ways and manner by which temperature affects the rate coefficients and product channels. While the simple Arrhenius-type equation $k(T) = AT(\text{to the } 1/2 \text{ power}) \exp(-E(A)/RT)$ has over limited temperature ranges been of great value, when applied to wide temperature ranges it is often not obeyed. Particularly for exothermic and slightly endothermic reactions, order of magnitude errors can be made by extrapolations based on the Arrhenius equation. It is the goal of this program to provide an insight in the kinetic behavior of B and Al radical oxidation reactions as influenced by temperature. To this end measurements are made in high-temperature fast-flow reactors (HTFFR). These unique tools provide measurements on isolated elementary reactions in a heat bath.

ABSTRACT: (U) We report the first study of both time-resolved and frequency domain coherent Raman scattering in a conjugated polymer, specifically a soluble polydiacetylene called poly-4-BCMU. Both CARS and CSRS spectra were recorded at room temperature and at 4 K in the region of -C=C- stretch on a approx. 12 micro m thick film of poly-4-BCMU in the red amorphous form. The relevant CSRS spectra of the blue crystalline form are also reported. Frequency domain study reveals the vibrational resonance frequency to be independent of the polymer molecular weight in the red form, but different for the blue and red form. The line shapes are asymmetric, but do not seem to fit the predictions of a simple model involving dominant two-photon resonance contributions. The observed vibrational dephasing in the time-resolved study is very fast at both room temperature and 4 K, being within the time-resolution available. From the combined analysis of the frequency domain and time-resolved studies at both room temperature and 4 K, an inhomogeneous mechanism of dephasing is inferred. The inhomogeneous dephasing arises from simultaneous coherent

SUPPLEMENTARY NOTE: Pub. in Jnl. of Chemical Physics, v87 n3 p1697-1698, 1 Aug 87.

ABSTRACT: (U) We report here the first observation of third harmonic generation (THG) from a monolayer film of a processable polydiacetylene, poly-4-BCMU, spread on a water subphase. Surface second harmonic generation (SHG) has been used successfully in the past to probe monolayer molecular arrangement and orientations at an interface; however, due to symmetry requirements this technique cannot be applied to centrosymmetric molecules. Our present work shows that for centrosymmetric conjugated polymers, THG instead of SHG can serve as a powerful tool to obtain information on the molecular orientation and to probe any conformational transition in the polymer monolayer films. Poly-4-BCMU was selected as a suitable choice for two reasons: (1) it has large third-order nonlinear susceptibility $\chi^{(3)}$, and (2) when compressed into the monolayer film form, it undergoes a conformational transition from a less pi-electron conjugated yellow form to a more conjugated red form. Keywords: Third harmonic generation, Monolayer film, Polydiacetylene.

DESCRIPTORS: (U) *HARMONIC GENERATORS, *POLYMERIC FILMS, *THIRD HARMONIC GENERATION, *ACETYLENES, FILMS, LAYERS,

ABSTRACT: (U) . A dynamical approach to the classical decay rates for molecules near a dielectric sphere is presented through the application of the diffraction theory for a dipole antenna established by Van der Pol and Bemer. This theory is somewhat simpler than but formally equivalent to that established by Ruppung and preserves a feature which is closer to the method of the theory established by Chance, Prock and Silbey for a flat surface. The results, when compared to those obtained from the static image theory, show that this latter theory can be very inaccurate for large molecule-sphere distances of highly-conducting spheres, consistent with previous findings for surfaces with perfect flatness or small roughness. Keywords: Molecule decay; Dynamical analysis; Spherical surfaces; Dielectric sphere; Diffraction; Dipole antenna.

UNCLASSIFIED REPORT

ABSTRACT: (U) Although theories of nonlocal mechanics were developed to address the role of hardening and damage microstructures in heterogeneous engineering materials, these theories frequently require additional, but unavailable, information concerning the concentrations or size distributions of the microstructures to compute the internal stresses. An objective of this work was to develop generalized equations for the size distributions of hardening and damage microstructures as functions of the stress, strain rate, and the scale of observation, and thus to reduce the above information requirements. The two approaches employed addressed incompressible and compressible materials. Limitations identified from the incompressible formulation were employed to construct a variational integral for compressible materials. Definition of the variables in this integral was completed except for a strain rate scale factor. The associated Euler Lagrange equations are expected to provide the desired microstructure evolution equations. Keywords: Hardening, Damage, Viscoplasticity, Nonlocal stress polarization, Variational methods, Scale factors, Fractals.

UNCLASSIFIED REPORT

ABSTRACT: (U) Our goal in this program continues to be the understanding of the role of microstructure in the strength properties of ceramics. It is becoming increasingly apparent to the brittle fracture community that the toughness characteristics and flaw distributions of structural ceramics can be very much influenced, sometimes with great sensitivity, by small details in the microstructural makeup. For instance, the addition of less than 1% glassy phase to the grain boundaries of alumina polycrystals can alter the fracture properties dramatically, giving rise to significant improvements in strength.

ABSTRACT: (U) A variety of theoretical methods were used to elucidate the structure and properties of rigid rodlike polymer chains which are of interest as high-performance polymeric materials. Semi-empirical molecular mechanics methods were used to calculate the intramolecular and intermolecular energies pertinent to conformational flexibility and chain packing effects. Also, geometry optimized CNDO/2 molecular orbital calculations were carried out to investigate the structure and conformational characteristics of the rodlike polymers, in both the unprotonated and protonated states. Electronic band gap calculations within the extended Huckle approximation were carried out to elucidate the packing and electronic properties of these chains in the crystalline state. ABSTRACT: (U) The report describes the performance criteria sought and the system selected for data acquisition on two quite different civil engineering research facilities: one for testing composite structural section with application to bridge rehabilitation, and one for geotechnical centrifugal modelling. It also outlines the initial applications of the systems.

ABSTRACT: (U) This research developed analysis and optimal designed procedures for planar as well as spatial mechanisms that are frequently used in space structures. A nonlinear finite element procedure developed originally for planar mechanisms during the initial stages of this research, has been modified considerably to handle complex mechanisms with sliding masses and mechanisms operating at relatively high speeds. The analysis takes into account the effects of geometric and material nonlinearities, vibrational effects and coupling of deformations. Numerical results have been reported for certain mechanism examples. The effects of nonlinearities of mechanisms. Considerable progress has been made in developing a nonlinear finite element procedure for three-dimensional mechanisms. Numerical results obtained for some example problems indicate the validity of the current three-dimensional formulation. A new optimization algorithm has also been developed based on the Gauss method to handle various types of nonlinear constraints with the goal of reducing the number of analyses required to obtain an optimal design. Complete details of the nonlinear finite element procedures as well as the optimization technique are available in published papers, copies of which are included here in the Appendix.

UNCLASSIFIED REPORT

ABSTRACT: (U) One of the most attractive structural configurations for large space structures (LSS) for outer space applications is the repetitive lattice concept. Achieving the operational requirements of such structures will necessitate considerable knowledge of the dynamics, control, materials and nondestructive evaluation (NDE) of these structural systems. Wave propagation analyses provide potentially valuable perspectives from which to consider this broad range of analysis, design and synthesis issues. The theoretical and experimental results of a two-year research program on the wave propagation and dynamics of LSS are briefly reviewed. Potential benefits to wave propagation analyses in the vibration, parameter identification, dynamic failure, control and NDE of lattice structures have been identified and are summarized in this report. Keywords: Wave propagation, Dynamic failure, Lattice structures, Large space structures.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report describes one aspect of an investigation of dense-spray processes: namely turbulence/dispersed-phase interactions. The work was divided into two phases: (1) measurements of particle-laden jets injected into a still liquid; and homogeneous particle flows, consisting of particles falling in a still (in the mean) liquid bath. The structure of turbulent, dilute, particle-laden water jets, submerged in still water, was studied both experimentally and theoretically. Nonintrusive measurements were made of mean and fluctuating phase velocities and particle number fluxes. Analysis was used to help interpret the measurements, considering three limiting cases, as follows: (1) locally-homogeneous flow, where relative velocities between the phases are ignored; (2) deterministic separated flow, where relative velocities are considered, but particle/turbulence interactions are ignored; and (3) stochastic separated flow, where both phenomena are considered using random-walk methods. The locally-homogeneous flow approximation was more effective than for past work involving larger density ratios between the phases; nevertheless, stochastic analysis yielded best agreement with measurements. Effects of enhanced drag (due to high relative turbulent intensities of particle motion) and effects of particles on liquid turbulence properties (turbulence modulation), were observed. Several recent proposals for treating these phenomena were examined; however, none appears to be adequate for reliable general

ABSTRACT: (U) A real-time visual processing theory is developed to explain how three-dimensional form, color, and brightness precepts are coherently synthesized. The theory describes how several fundamental uncertainty principles which limit the computation of visual information at individual processing stages are resolved through parallel and hierarchical interactions among several processing stages. The theory hereby provides a unified analysis and many predictions of data about stereopsis, binocular rivalry, hyperacuity, McCollough effect, textural grouping, border distinctness surface perception, monocular and binocular brightness precepts, filling-in, metacontrast, transparency, figural aftereffects, lateral inhibition within spatial frequency channels, proximity-luminance covariance, tissue contrast, motion segmentation, and illusory figures, as well as about reciprocal interactions among the hyper-columns, blobs, and stripes of cortical areas V1, V2, and V4. Monocular and binocular interactions between a Boundary Contour (BC) system and a Feature Contour (FC) System are developed. The BC System, defined by a hierarchy of oriented interactions, synthesizes an emergent and coherent binocular boundary segmentation from combinations of unoriented and oriented scenic elements.

ABSTRACT: (U) A real-time visual processing theory is developed to explain how three-dimensional form, color, and brightness percepts are coherently synthesized. The theory describes how several fundamental uncertainty principles which limit the computation of visual information at individual processing stages are resolved through parallel and hierarchical interactions among several processing stages. The theory hereby provides unified analysis and many predictions of data about stereopsis, binocular rivalry, hyperacuity, McCollough effect, textural grouping, border distinctness, surface perception, monocular and binocular brightness, surface filling-in, metacontrast, transparency, figural aftereffects, lateral inhibition within spatial frequency channels, proximity luminance covariance, tissue contrast, motion segmentation, and illusory figures, as well as about reciprocal interactions among the hypercolumns, blobs, and stripes of cortical areas V1, V2, and V4. Monocular and binocular interactions between a Boundary Contour (BC) System and a Feature Contour (FC) System are developed. The BC System, defined by a hierarchy of oriented interactions, synthesizes an emergent and coherent binocular boundary segmentation from combinations of unoriented and oriented scenic elements.

DESCRIPTORS: (U) *CYBERNETICS, *VISUAL CORTEX, *VISUAL PERCEPTION, BOUNDARIES, BRIGHTNESS, CHANNELS, COHERENCE, EYE, FREQUENCY, HIERARCHIES, INTERACTIONS, PREDICTIONS, SEGMENTED, SPATIAL DISTRIBUTION, STEREOSCOPES, STRIPES,

ABSTRACT: (U) The workshop was attended by about 110 researchers who are actively involved, in one phase or another, with GaAs on Si and related problems. The format of the workshop was such that there was ample opportunity for spontaneous discussions in subjects ranging from materials growth to potential systems that may be possible. The enclosed program details and the list of attendees should provide a sufficient account of what went on at the workshop. Keywords: Meeting agenda, Attendees, Discussion topics, Gallium arsenides, Silicon.

DESCRIPTORS: (U) *GALLIUM ARSENIDES, CALIFORNIA, GROWTH(GENERAL), MATERIALS, SILICON.

IDENTIFIERS: (U) PEB1102F, WUAFOSR2305C1.

ABSTRACT: (U) Research is progressing on two fronts: our learning robotics system and natural language processing. The robotics system is nearly implemented. It will run in INTERLISP on a XEROX 1108 Lisp Processor. Most of the major component sub-systems have been finished. A solid modeling system has been implemented to support the reasoning necessary for manipulation of pieces within a workspace. It can model cylindrical and rectangular solid primitives which can be added and subtracted to form complex pieces. A graphics package has been developed which is capable of presenting any of the complex pieces on a bitmapped video screen as correct perspective wire-frame drawings. A schema organization sub-component has also been developed. There are three projects proceeding in the area of natural language processing.

DESCRIPTORS: (U) *LEARNING, *NATURAL LANGUAGE, *ROBOTICS, COMPREHENSION, GRAPHICS, MODELS, ORGANIZATIONS, PARTS, PROCESSING, REASONING, RECTANGULAR BODIES, SKILLS, SOLIDS.

ABSTRACT: (U) Directional solidification in the presence of an impurity may be described by a set of impurity concentration and thermal diffusion equations coupled at a free boundary. In the limit of a small distribution coefficient, a long wavelength expansion can be used to obtain a single fourth order parabolic equation describing the deviations of the interface from planarity in the limit in which the deviations are small. Here we present an alternate version of this asymptotic scheme which isolates and preserves the nonlinearities in their original form. While the new asymptotic expansion is of an equivalent level of asymptotic validity, the extrapolated predictions of cusping, blow up and front formation appear to be more accurate.

DESCRIPTORS: (U) *IMPURITIES, *SOLIDIFICATION, *THERMAL DIFFUSION, ASYMPTOTIC SERIES, BOUNDARIES, COEFFICIENTS, CONCENTRATION(COMPOSITION), DIRECTIONAL, DISTRIBUTION, EQUATIONS, EXPANSION, INTERFACES, BINARY ALLOYS, PHASE TRANSFORMATIONS.

ABSTRACT: (U) The focus of this research was primarily feedback stabilization of distributed parameter systems. The principal investigator derived feedback operators for a general class of distributed systems, which include flexible beams, under the constraint of bounded control. Six papers were published, including Feedback Stabilization in Hilbert Space. Feedback laws are found for control systems governed by partial differential equations. In particular those control systems which give the dynamics of aeroelastic systems have been of particular interest.

ABSTRACT: (U) Large space structures exhibit distributed parameter behavior in their dynamics and thus must be described on infinite-dimensional state-spaces. However, the controller algorithm must be finite-dimensional to be implemented. The focus of this research has been to make finite-dimensional approximations of infinite-dimensional controllers which stabilize the distributed parameter system. The investigator has shown conditions under which Galerkin approximation schemes can yield finite-dimensional stabilizing controllers for linear distributed parameter systems.

ABSTRACT: (U) The important result reported is that under a distinguished limit procedure an alternative to the K-S Equation is obtained when modeling the evolution of solidification fronts. Three papers are being prepared for publication. Solidification Fronts: Asymptotic equations are derived to model the evolution of the solid liquid interface which occurs in the directional solidification of binary alloys. In the limit where $GD/VCo(g + fc)$ is small, the Kuramoto-Sivashinsky equation is obtained. Viscous Phase Transition: Two equations are derived and analyzed which model the dynamics of viscous first order phase transitions.

ABSTRACT: (U) A program involving the investigation and characterization of reactions of coordinatively unsaturated organometallic species is described. The program emphasizes the measurement of rates of reaction of photolytically produced coordinatively unsaturated species with the parent and rates for cluster formation. Experimental measurements are performed using a time resolved transient absorption apparatus which uses a line turnable carbon monoxide (CO) laser and a diode laser to record spectra and kinetic information by means of probing absorptions in the CO stretch region of the infrared. Systems that have been investigated include coordinatively unsaturated species generated from the Fe(CO)5, Cr(CO)6 and Mn2(CO)10 parents. The results of experiments with these systems are discussed.

ABSTRACT: (U) Alpha-2U globulin is a low molecular weight urinary protein which may be associated with a hydrocarbon-induced proximal tubular cell degeneration in the male rat kidney. A new method was developed to obtain monospecific immunologic reagents for alpha-2U globulin using diafiltration, anion-exchange and hydroxylapatite chromatography. Isoelectric focusing techniques were developed to isolate the major isoelectric variants of alpha-2U globulin after experimental exposure to hydrocarbon compounds. Alpha-2U globulin was isolated from the urine of albino and pigmented male rats to study strain susceptibility to the nephrotoxic process. An alpha-2U globulin isoelectric variant profile distinguishing albino from non-albino male rats was not apparent, however, strain differences were revealed. Fischer 344 male rats appear to have higher levels of isoelectric variants than the other strains studied. These findings suggest that if a strain susceptibility to the hydrocarbon-induced nephrotoxic lesion exists, it may be associated with the alpha-2U globulin isoelectric variant profile.

ABSTRACT: (U) The purpose of this research program was the investigation of mechanisms of attention in auditory and bimodal information processing. The manner in which division of attention influences three stages of information processing-- stimulus coding, decision making, and response selection -- was described previously by the principle investigator in a general, quantitative theory of attention. Previous work had shown that, framework of this theory, the effects of division of attention on the first two stages could be separately identified.. As in the earlier research, the work reported here has focused on two key issues: (What are the decision processes involved in combining information from two or more sources, and Does division of attention degrade the information obtained from each source (i.e., does it result in losses of information at the coding stage)? Keywords: Attention, Information processing, Auditory psychophysiology decision making.

ABSTRACT: (U) The studies summarized in this report concern auditory perceptual processes that underlie several aspects of complex pattern recognition -- whether of speech, of music, or of environmental sounds. These patterns differ from each other according to the characteristics of individual sound events and also characteristics of the pattern sequences themselves. Among the sound characteristics, we have focussed on pitch, quality and duration. We find that spectral properties of complex tones can be changed to yield changes in both apparent pitch and quality, that individuals differ with respect to relative performance on these dimensions, and that both pitch and quality or timbre can play similar grouping roles in auditory systems. Most of the experimental work has concerned timing of successive sounds in sequences. We find that at slow rates, listeners detect equally well small temporal offsets or jitters at different positions in the sequence. Increasing the frequency of one of the tones, or increasing the duration of one or two of the successive intervals produces changes in performance at or near the changes. Some of these timing effects are also manifest in the rhythmic aspects of spoken sentences.

UNCLASSIFIED REPORT

ABSTRACT: (U) Among the most interesting examples of the perception of complex sounds is that of the perception of constants. Here, sequences of changing spectra induce the perception of phonetic entities in a manner that requires an understanding of the role of spectral trajectories, brief silences, the growth and decay of loudness, as well as language learning. An extensive study of the entire set of the consonant sounds of English is designed to elucidate, the sensory and perceptual processes whereby the acoustic waveform of speech is transformed by a series of processes leading to the perception of consonants as phonetic elements. Included is a significant effort in preparing slides, video tapes, and/or films that will illustrate the theoretical structures, both static and dynamic, in three-dimensional displays in both black and white and color. The overall goal of this research program is to extend work now underway on vowels and diphthongs to include all of the phonetic elements of English. This is to provide a detailed account of the auditory-perceptual processes of phonetic perception by the human listener and, at the same time, provides a foundation for phonetically based automatic speech recognition which should be essentially independent of speaker and rate, with unlimited vocabulary in fluent speech. Keywords: Speech recognition, Waveforms.

UNCLASSIFIED REPORT

ABSTRACT: (U) Perfluorinated polyethers constitute an important class of materials that demonstrate exceptional chemical and thermal stability, amongst organic liquids, and some of these materials show good lubricant properties. Consequently, such materials are of special interest to the U.S.A.F. as lubricants in aggressive environments and, particularly, as potential liquid lubricants for high temperature/high efficiency aero engines. The aim of this project is to explore new approaches to the synthesis of perfluorinated ethers because the main problem that limits the wider application of industrially available materials is their high cost, which is an inevitable consequence of the limited methodology available. Keywords: Fluorinated polyethers, Direct fluorination, Polymer modification, Cobalt trifluoride.

ABSTRACT: (U) This report summarizes the research findings of a project which has been jointly funded by the Air Force Office of Scientific Research and the National Bureau of Standards. The goal of the research was to improve the fundamental understanding of chemically reacting turbulent flow. The approach which was taken was to investigate mixing in variable density flows in order to better understand the role of local density fluctuations (which result from chemical heat release) on the turbulent mixing behavior. The development of new experimental diagnostics having excellent spatial and temporal resolution is described. These techniques have been utilized to investigate a wide range of mixing properties in variable density flows. These results are summarized along with a discussion of their importance to an improved understanding of chemically reacting flow. Keywords: Concentration fluctuations; Concentration measurement; Density effects; Digital line camera; Flow visualization; Hot wire anemometry; Jet flames; Rayleigh light scattering; Reynolds.

Keywords: Solid mechanics; Bifurcation; Symmetry; Groups; Structures; Nonlinear analysis.

UNCLASSIFIED REPORT

ABSTRACT: (U) Oxide-dispersion-strengthened and whisker/particulate reinforced titanium and niobium alloys produced by rapid solidification processing are being investigated with the objectives of understanding the mechanisms of formation and growth of the secondary phases and how these factors determine strengthening mechanisms and thermal stability of Ti and Nb alloys. During the first year of the three-year program, Titanium alloys containing Aluminum, Erbium, Boron, and Carbon, and Nb alloys containing Tungsten, Hafnium, Lanthanum, B, and C were prepared by nonconsumable electrode arc melting and microstructures were characterized. The alloys were rapidly solidified by electron beam melting and splat quenching and the rapidly solidified flakes were characterized by x-ray diffraction, optical metallography, and electron microscopy. The mechanical properties of rapidly solidified Ti alloys containing Er, B, and C were determined by tensile testing of specimens prepared from electron-beam-melted and splat-quenched flakes. Keywords: Hybrid materials, Refractory materials, Oxide dispersions, In-situ composites, Deformation mechanisms, Work hardening.

UNCLASSIFIED REPORT

ABSTRACT: (U) Recent developments and applications of an interactive boundary layer procedure for unsteady flows are reviewed. The emphasis is on a model problem corresponding to an oscillating thin airfoil in laminar flows and results are reported for different amplitudes and frequencies of oscillation. The use of the characteristic box scheme, with its stability criterion, are shown to allow the accurate calculation of reverse flows and the interaction procedure removes the singularity to allow calculation through regions of separated flow. Although the current focus of the interactive boundary layer procedure has been on the leading edge region, it has general applicability and, together with models for transition and turbulent flows, it can provide the basis for a method to deal with oscillation airfoils and wings and the rapid movement of fixed wing arrangements at angles of attack up to and beyond those of dynamic stall. Calculations at high angles of attack indicate that the behavior of the unsteady separated leading edge flow has similarities to steady flows down-stream of surface corrugations. The use of linear stability theory in the latter case shows that the locations of the onset of transition moves upstream with severity of corrugation and can move inside the separation bubble. In practice this means that the

AD-A190 490

bubbles will be shortened and analogy with unsteady flows suggests that transition may play an important role and preclude the existence of the long separation bubbles determined by the laminar-flow calculations.

ABSTRACT: (U) Progress is reported for the past year of an interdisciplinary program to establish advanced optical diagnostic techniques applicable to combustion and plasma flows. The primary effort is on digital flowfield imaging techniques, which offer significant potential for a wide range of spatially resolved 2-d and 3-d measurements. The imaging is accomplished by recording light scattered from a planar laser-illuminated region using a modern solid-state camera. The scattering process is generally laser-induced fluorescence, though Mie scattering is also used in connection with sizing particles. Activities reported herein include: (1) single-photon fluorescence imaging of molecular oxygen; (2) two-photon fluorescence imaging of CO and H₂O; (3) photofragmentation-based fluorescence imaging; (4) multiple particle sizing by imaging of Mie-scattered light; (5) fluorescence-based velocity and pressure imaging; (6) 3-d imaging; (7) laser and solid-state camera development; and (8) processing/display of image data using a specialized image computer. Other diagnostics topics discussed in this report include research on laser wavelength modulation spectroscopy and development of plasma diagnostics based on laser-induced fluorescence and Stark broadening. Finally, initial work to develop a

UNCLASSIFIED REPORT

ABSTRACT: (U) We show experimentally that thermooptically induced beam guides and phase grating structures can be used to efficiently switch an optical beam by redirecting its energy in times of 20 and 2 nsec, respectively. Beam guiding was achieved by passing a focused, TEM at infinity laser pulse through an absorbing liquid to which an absorbing dye had been added. Heating of the liquid in the focal region by the Gaussian profile beam changed the refractive index to produce a long cylindrical volume analogous to a graded-index (GRIN) optical fiber. Radiation from a second laser beam not absorbed by the liquid could be coupled into the graded index real-time fiber and redirected by it with an efficiency as high as 90%. The switch-on time was measured to be 20 nsec and persisted without intervention for about 1 millisecond (i.e. optical memory). The rise and decay times are in good agreement with calculations using a simple thermal model which describes the process. The thermo-optically induced phase grating was generated by interfering two beams of laser radiation in an absorbing liquid. Heating of the liquid along the interference pattern produced a sinusoidally varying refractive index pattern or phase grating. This real-time optically generated grating was used to switch (redirect by diffraction) a probing laser beam. For a small crossing angle of 7 deg, a switching time of 2 nsec was measured and was in good agreement with the thermal model.

UNCLASSIFIED REPORT

ABSTRACT: (U) Homing missile guidance is formulated as an optimal stochastic control problem where the special nonlinear structure of the missile-target engagement is exploited. Since this stochastic control problem assumes a nested information pattern, the filter structure can be developed independently of the guidance scheme. However, the guidance scheme is dependent on and affects filter performance. Significant progress is being made on both the estimation problem and the guidance problem. Investigation of the nonlinear estimators especially tailored to the homing missile problem has produced not only a good deal of insight but responsive and mechanizable schemes. Although these schemes are applicable to active sensors, our emphasis has been on the more difficult passive sensor case where only angles are available. Recently-developed schemes based on coordinate transformations and on a assumed probability density function perform well, but the modified-gain extended Kalman filter has been used as the basis of a stochastic adaptive flight control scheme. Two important current efforts in missile guidance with bearings-only information are in development of the guidance schemes that enhance an information measure by trajectory modulation and in target acceleration detection.

ABSTRACT: (U) A dilution refrigerator was installed tested and modified. Several cryogenic probes were fabricated to measure resistivity, ac susceptibility and ultrasonic attenuation in high T superconductors. Ultrasonic attenuation measurements were performed on single crystals of Upt3 and URu2S12. A maximum in attenuation was found below the superconducting transition temperature Tc of URu2S12. A magnetic field decreased this maximum. The temperature of the attenuation in the normal and superconducting states below Tc was measured in Upt3. The ratio of the attenuation follows a power law dependence indicative of an anisotropic superconducting energy gap. A peak in attenuation was found in the mixed state of Upt3, which may be associated with a phase transition of the flux line lattice.

SUPPLEMENTARY NOTE: Pub. in Mathematical Theory of Networks and Systems, n58 p521-540 1984.

ABSTRACT: (U) Stability and feedback control of linear neutral (and retarded) time-delay systems with one or more noncommensurate time delays is studied. The Theory is based on a pointwise or local approach involving polynomial and rational functions in the complex variables s, z_1, z_2, \dots, z_q , with s evaluated at points in the right-half plane and the z_i evaluated at points in the unit disc. In terms of this framework, an algebraic notion of stability, called pointwise stability, is defined and studied. Necessary and sufficient conditions are then given for the existence of a stabilizing dynamic output feedback compensator. The problem of stabilization using nondynamic state feedback is also briefly considered in the case when the system's input matrix has constant rank.

UNCLASSIFIED REPORT

ABSTRACT: (U) A supersonic inlet diffuser with flow at
supercritical conditions has been analyzed using a
combination of analytical and numerical methods of
solution. Analytical solutions for the flow variables are
presented for the inviscid part of the unsteady flow
field. Instantaneous displacement thickness distributions
found numerically for both separated and unseparated
flows allow definition of the effective wall shape for
the analytical solutions. An equation describing the
unsteady motion of the passages shock caused by
variations in back pressure and/or wall shape has been
derived. Results have been compared with those found
numerically, both for inviscid and viscous flow fields;
agreement is excellent in phase and good in amplitude. In
example calculations, parameters are varied separately to
show how they may cause shock disorgement (engine
unstart) when back pressure oscillations are impressed
upon the flow. A mechanism by which shock wave
oscillations may be selfsustaining has been proposed and
illustrated by example. Parametric effects upon the
magnitude and frequency of the self sustained
oscillations and upon shock disorgement are illustrated
by numerical examples with given inlet. The work on inlet
buzz, although not completed, has led to studies of high
resolution schemes for capturing both shock and slip
surface discontinuities in numerical algorithms, reported

UNCLASSIFIED REPORT

ABSTRACT: (U) This program dealt with the development
and application of new approaches for producing and
evaluating lumped parameter models of physical processes.
Local and global sensitivity analysis procedures were
studied for achieving this goal. Specifically, Lie group
formalism was developed to address global parameter space
mapping issues of temporal kinetics problems and extended
to more complex reactive-diffusive problems. Furthermore,
Lie group theoretical techniques were also used to gain
analytic insight into the solution of nonlinear kinetic
systems. Using local gradient methods, the lumpability
(or model reduction) of hydrogen/oxygen and carbon
monoxide/hydrogen/oxygen kinetic mechanisms were studied
in various physical environments. It was found that the
presence of strong scaling and self similarity in the
sensitivities allowed for kinetic model simplification.
Such scaling and similarity was found associated with
strong thermal coupling in the systems. Lastly, a general
analysis method for the exact lumping of chemical kinetic
mechanisms was developed and illustrated by simple.

ABSTRACT: (U) The mechanical properties of high toughness magnesia partially stabilized zirconia were found to be severely degraded by a single cooling cycle between room temperature and 100 C. In-situ Raman spectroscopy and optical interference measurements, and room temperature x-ray diffraction were used to correlate the changes in mechanical properties with structural changes; cooling to temperatures below approximately 100C caused transformation of most of the tetragonal precipitates that are responsible for toughening to a new phase was stable with heating to 300 C, but at 400 C it transformed back to the tetragonal structure. After heating to 400 C the original high toughness mechanical properties were also restored. A new approach for measuring the nature and distribution of strains within transformation zones surrounding cracks in transformation toughened materials was demonstrated, using Mg-PSZ. The method involves measuring out-of-plane distortions adjacent to a surface-breaking crack and comparing the measurements with computed displacements. The fraction of transformation was found to be strongly varying function of distance from the crack plane.

ABSTRACT: (U) The goal of knowledge delivery research is to create a technology of authorship by computer. Existing technology is all in the laboratory stage, and is limited to very small, rigidly constrained texts. This research project has focused on two kinds of developments intended to overcome these limits: 1) expanding the notation and practices of knowledge representation so that a wider range of knowledge can be rendered in natural language, and 2) creating a theory of text structure that is suitable as a basis for writing programs that design texts. These goals are being pursued using the methods of Artificial Intelligence, with heavy input from Linguistics. Keywords: Computational linguistics.

UNCLASSIFIED REPORT

ABSTRACT: (U) Research during the second year of this grant extended the studies begun during the first year on fabrication and modeling of long Josephson junction structures. The Nb-Pb technology, although reliable, is not versatile enough for proposed multilayer structures and considerable effort was expended in the development of an all Nb and a parallel all NbN technology. This effort is not over but recently we were able to demonstrate an all NbN vortex flow transistor possessing superior properties to the Nb-Pb version. New progress was made toward solution of the problems of high frequency testing of the very low impedance vortex flow transistor and towards determination of its potential for high frequency applications. It was demonstrated that the device exhibits active behavior in the form of a measurable transresistance out of frequencies of about 10% of the theoretical transit time cutoff frequency. Capability of higher frequency testing was developed with the design of novel new impedance matching structures. A new type of distributed amplifier was also proposed and modeled. Modeling of spatially nonuniform long junction structures resistance was necessary in order to obtain realistic simulations. The unusual magnetic field dependence we had seen in certain Nb-Pb VFT configurations is undergoing study with the design of new double junction NbN devices.

UNCLASSIFIED REPORT

ABSTRACT: (U) A two-process model of pattern discrimination was developed to describe how tonal sequences are processed, stored, and discriminated by the human auditory system. The model was tested in tasks in which subjects were required to discriminate between the frequency patterns encoded in two sequences of tones. The experimental results strongly supported the assumptions of a trace and context coding mechanism and indicated that the trace mechanism is relatively insensitive to temporal transformations made to the stimulus. An attempt to model the pattern discrimination mechanism with specific computational algorithms was less successful. A technique was developed to assess the manner in which information is accumulated from elements of an auditory or visual stimulus. Results indicate that the technique may be useful in the design of display systems. **Keywords:** Hearing, Sense organs, Algorithms, Auditory patterns, Auditory memory, Temporal uncertainty, Models of auditory signal processing.

SUPPLEMENTARY NOTE: Pub. in IEEE Transactions on Information Theory, VIT-33 n3 p391-398 May 87. Supersedes Rept. dated Jun 83, AD-A136 518. Presented at International Symposium on Information Theory, Brighton (England), 24-28 Jun 85.

ABSTRACT: (U) An adaptive matched differential pulse-code modulator (AMDPCM) is analyzed. The adaptation of the symmetric uniform quantizer parameter Delta sub n is performed by fixed multipliers assigned to the quantizer output levels. The input is stationary first-order Gauss-Markov. The correlation of the samples is used as the leakage parameter in the matched integrator, with the predictive reconstruction similarly matched for a 4-level quantizer and multipliers 1/gamma; gamma the limiting joint distribution of the prediction error and Delta sub n is derived and the asymptotic sample-point and time-averaged mean-square error (mse) and mean and variance of Delta sub n as functions of gamma is an element of (1,2) are computed and plotted. It is found that asymptotic performance of AMDPCM does not depend on the choice of Delta sub 0 that the increase in mse incurred by using A(M)DPCM instead of (M)DPCM with Delta sub opt is small, with mse (A(M)DPCM) approaching min sub Delta mse (M)DPCM)

UNCLASSIFIED REPORT

ABSTRACT: (U) Suppose in a laboratory, say Laboratory I, a certain instrument is designed to measure several characteristics, and a number of vector-valued measurements is recorded. The objective is to estimate the unknown population mean. It is known, however, that a similar instrument is used in another laboratory, say Laboratory II for the same purpose, and a number of observations is recorded from the second instrument. It is also suspected that the two population means are equal, in which case, observations recorded in Laboratory II can possibly be used effectively together with those in Laboratory I for estimating the population mean of the first instrument. Thus, the question that naturally arises is whether one should use the sample mean from Laboratory I or the pooled mean from the two laboratories. In problems of this type what is normally sought is a compromise estimator which leans more towards the pooled sample mean when the null hypothesis of the equality of the two population means is accepted, and towards the sample mean from Laboratory I when such a hypothesis is rejected. A very popular way to achieve this compromise is to use a preliminary test estimator (PTE) which uses the pooled mean when the null hypothesis is accepted at a desired level of significance, and uses the sample mean

from Laboratory I when opposite is the case. This paper proposes instead an empirical Bayes estimator which achieves the intended compromise.

ABSTRACT: (U) In 1970 Stein introduced a new method for bounding the approximation error in central limit theory for dependent variables. This was subsequently developed by Chen for Poisson approximation and has proved very successful in the areas to which it has been applied. Here this document shows how the method can be applied to extreme value theory for dependent sequences, focussing particularly on the nonstationary case. The method gives new and shorter proofs of some known results, with explicit bounds for the approximation error. Keywords: Stochastic process; Random variables.

ABSTRACT: (U) Several classes of distribution functions (d.f.) are originated by considering distributions whose tailfunctions satisfy special asymptotic relations. A large class sharing this property is provided by a certain subexponential class, in which case the asymptotic relation involves tails of convolution powers. This paper introduces a statistic which estimates the asymptotic behaviour of convolution tails of a given d.f. and it is shown that this statistic is strongly consistent and asymptotically normal under appropriate conditions. Furthermore, the statistic can be used to test the hypothesis that a d.f. is in the exponential class being described.

UNCLASSIFIED REPORT

ABSTRACT: (U) Methods are described which permit one to work with continuous-time optimal stopping problems, using the heat equation, even when the prior placed on the drift parameter of a Wiener process is not normal. The details of the method are worked out for Chernoff's problem of testing the sign of the drift parameter when the prior is smooth. Keywords: Sequential Bayes; Heat equation; Brownian motion; Asymptotic; Free boundary problems.

ABSTRACT: (U) It is well known how to combine the significance levels observed in a number of independent experiments. When this number is a random variable determined by a stopping rule, the observed significance level can still be calculated if there is an acceptable ordering of the points in the extended sample space. But what can be said if the stopping time is ill-defined? This paper obtains explicit lower bounds on the level of significance by considering orderings based on a family of alternative hypotheses. These bounds give some measure of the effect of failing to specify the stopping rule in advance. Keywords: Stochastic processes.

ABSTRACT: (U) A theoretical and experimental study of the dense-spray region of pressure-atomized nonevaporating sprays is described, emphasizing operation in the wind-induced and atomization breakup regimes. Experiments involved large-scale (9.5 and 19.1 mm injector diameters) water jets in still air. The flows were visualized using flash photography. In addition, the following measurements were made: mean and fluctuating streamwise velocities at the injector exit, mean liquid volume fraction distributions, and mean entrainment rates. The new measurements were used to assess predictions of flow structure based on the locally-homogeneous-flow approximation, i.e., assuming that interphase transport rates are infinitely fast so that relative velocities between the phases are negligible. UNCLASSIFIED REPORT

ABSTRACT: (U) The research efforts supported by AFOSR Grant AFOSR-84-Q381 were directed towards development and analysis of robust estimation techniques for autoregressive (AR) and autoregressive-moving average (ARMA) models. Work on related system theoretic problems associated with parameter estimation problems for times series models and on square-root filtering for least squares state estimation applications was also carried out. Finally, an adaptive estimation technique for a class of piecewise (in time) stationary signals was developed. The motivation for our research arises from applications in signal processing including linear predictive signal modeling, signal detection, dynamic state estimation (Kalman filtering), and spectral analysis. The general goal of this research has been to put together ideas and techniques from statistics, signal processing, and system theory to bring new perspectives to such problems. Our research on various autoregressive modeling problems resulted from a desire to relax some of the assumptions made by previous researchers in order to broaden the domain of application of the basic technique which has proved to be useful in a range of signal processing tasks. In particular, our efforts have been directed at the goal of obtaining allowing robust estimates in the presence of outliers in the observed

ABSTRACT: (U) This report discusses the progress in the fluid modeling of a hybrid plume plasma rocket and the heating of plasma in a tandem mirror device. In the theoretical area three tasks have been accomplished: 1) A major advance has been made in the development of a numerical method for solving the time dependent fluid equations for both ions and electrons in the plasma. 2) A mathematical model has been formulated for studying the radio frequency heating of the hot plasma in cylindrical geometry. 3) An analysis on the performance characteristics of the hybrid plume rocket has been carried out. Under the funding of the instrumentation program the component fabrication is on progress. The coils have been delivered. Keywords: Plasma propulsion.

UNCLASSIFIED REPORT

ABSTRACT: (U) This final report covers the action taken regarding equipment purchases. The funds were for the purpose of purchasing and establishing a network of Microvax computers for research in the area of chemical physics particularly involving dynamics and kinetics phenomena. We have purchased all the original stated items except the line printer and the IBM-PC terminals. These latter items were replaced with the purchase of the extra disk storage deemed important to attain maximal usage from the hardware. Attached is a list of all the items purchased from DEC, their model number and cost. The overall system network is fully on-line and we are finding that the machines make a significant impact on our research. The design of the networked set of computers linked to the Departmental mainframe Vax is proving to be very effective. Additional experience will be needed to finally establish the optimal mode of system operation but we are already finding considerable speed-up in the rate that computations can be performed. The computers are being especially put to use for studying problems in gas-surface dynamics, molecular collisions and related problems in chemical kinetics.

DESCRIPTORS: (U) *DATA PROCESSING EQUIPMENT, *AIR FORCE PROCUREMENT, CHEMICALS, COLLISIONS, COMPUTATIONS, COMPUTERS, COSTS, DYNAMICS, GAS DYNAMICS, GAS SURFACE INTERACTIONS, KINETICS, MAGNETIC DISKS, MEMORY DEVICES.

ABSTRACT: (U) A theory has been developed which predicts onset and erosion in MPD thrusters. The theory predicts onset currents which are in quantitative agreement with experiment. Erosion rates are predicted for a steady-state hot cathode thruster. This theory is the first to model the viscous and thermal electrode boundary layers in MPD thrusters. Stability criteria for diffuse-mode electrode current conduction have been found. Keywords: Two temperature flow; Electrode plasma interactions, Magnetoplasma dynamic thrusters.

ABSTRACT: (U) A new pruned-trellis search algorithm for high-rate convolutional code is developed. The search time and memory size is significantly reduced from standard search techniques. Some new high-rate systematic optimum convolutional codes of rate up to 7/8 have been found by this new search technique, and with constraint length up to 15. These newly found high-rate convolutional codes can be efficiently decoded using pruned, error-trellis, syndrome decoding. The real advantage of the pruned error-trellis decoding over the conventional Viterbi decoding algorithm is the reduction of the memory size required. Simulation shows that the error trellis performance of pruned error-trellis decoding suffers only a 0.2 dB loss for some systematic high-rate convolutional codes compared with conventional, full trellis decoding. Keywords: Integrated circuits; Architectures; Bibliographies; Abstracts.

ABSTRACT: (U) We complete the discussion of the periodic fixed points of Backlund transformations for the Korteweg-de Vries equation. It will be shown that the systems of equations defined by the KdV periodic fixed points are equivalent to the periodic Kac-Van Moerbeke systems. As a consequence, for even order fixed points, the KdV systems are equivalent to the periodic Toda lattice. The periodic fixed points of the Backlund transformation for the Boussinesq equation are found to have a Hamiltonian structure. The integrals of these systems are found.

ABSTRACT: (U) Laser excitation of matrix isolated IF has been used to characterize three previously unobserved electronic states. Excitation at wavelengths longer than 535 nm resulted in emission from the metastable A cubed pi(2) state. Vibrational analysis of the A-X system gave an approximate value of $T_e(A) = 13\ 250$ cm to the minus 1 power. The radiative lifetime of IF (A) was found to be about 11 ns. Excitation of IF at wavelengths shorter than 475 nm produced a long-lived ($\tau = 5$ ns) fluorescence in the 720-1500 nm region. This emission originated from a low-lying electronic state (T00 19 040 cm to the minus 1 power) and terminated on the $v' = 9$ to 22 levels of the ground state. Laser excitation spectra, recorded by scanning the laser wavelength and monitoring this emission system, showed a progression of bands from 474 to 415 nm. Franck-Condon arguments show that the absorbing state is not the emitting state. The excitation spectra provided a T00 value of 21 100 cm to the minus 1 power and a vibrational constant of 500 cm to the minus 1 power for the absorbing state.

DESCRIPTORS: (U) *ELECTRONIC STATES, *EXCITATION, *LASERS, *SPECTRA, EMISSION, FLUORESCENCE, FREQUENCY, GROUND STATE, LOW LEVEL, RADIATION, TIME, VIBRATION.

UNCLASSIFIED REPORT

ABSTRACT: (U) Analysis of systems with many time scales is important in many engineering applications. This thesis addresses the approximation and decomposition of Markov processes which exhibit such multiple time scales. An algorithm is presented for the decomposition of explicitly perturbed, finite state, continuous time Markov processes. An approximation of the probability transition function which converges uniformly to zero over T greater than or equal to 0 is obtained. The algorithm extends previous work by providing a straightforward algorithm which has a direct probabilistic interpretation, particularly with respect to the role played by transient states. This result is then extended to consider semi Markov and discrete time Markov processes as well. Decomposition of perturbed positive systems is also addressed. Finally, the Markov process decomposition algorithm is expressed in graphical terms and applied to a problem of determining the multiple time scale structure of a fault-tolerant system model.

UNCLASSIFIED REPORT

ABSTRACT: (U) An investigation of the power of the Euler equations in the prediction of conical separated flows is presented. These equations are solved numerically for the highly vortical supersonic flow about simple bodies. Two sources of vorticity are studied: the first is the flow field shock system and the second is the vorticity shed into the flow field from a separating boundary layer. Both sources of vorticity are found to produce separation and vortices. In the case of shed vorticity, the surface point from which the vorticity is shed (i.e., separation point) is determined empirically. At very high angles of attack the only stable separated solution is found to be asymmetric. Solutions obtained with both sources of vorticity are studied in detail, compared with each other and with potential calculations and experimental data. Keywords: Fluid mechanics, Vortex flows, Supersonic flows.

UNCLASSIFIED REPORT

ABSTRACT: (U) Progress is described on study of a new class of potential excimer lasers based on diffuse bands of the alkali metal vapors. In particular, the violet diffuse bands of sodium vapor and the yellow diffuse bands of potassium vapor have been shown by detailed modeling of single vibrational-rotational level emission to be each composed of overlapping singlet and triplet 'excimer' emission continua of the diatomic molecule. The gain and low absorption loss previously found in the violet and yellow with laser optical pumping of sodium vapor and potassium vapor, respectively, have been quantitatively examined. Prospects for laser oscillation appear to be good at low pressures where quenching is not dominant. Free-bound-free spectra (which include only the triplet portion of the diffuse bands) have been produced and analyzed in sodium, potassium, rubidium and cesium. Keywords: Excimer, Lasers, Singlet.

ABSTRACT: (U) Sounds produced by acoustic sources are localized and detected on the basis of differences in the time of arrival between the two ears and differences in the levels at the two ears. Most real world sounds are spectrally complex, consisting of energy distributed across many frequencies. In general, the auditory system must make judgments regarding the location of acoustic sources on the basis of these interaural differences, even though their distribution across frequency may be quite complex. This proposal has sought to understand the processes by which the binaural auditory system combines interaural information across the spectrum. The auditory system is spectrally synthetic, averaging information across the frequency domain, when the signal consists of relatively few components. Under these circumstances, the system behaves as though all components arise from the same spatial location.

UNCLASSIFIED REPORT

ABSTRACT: (U) It has become a certainty that Multiple Instruction Stream, Multiple Data Stream (MIMD) parallel architectures are going to play a major role in all aspects of high speed computer design for the foreseeable future. What is not clear is whether we will be able to devise a means to design algorithms and software for these machines that transcends our current ad-hoc, nonportable techniques. In this research project the author has focused on the portability issue from the perspective of parallel algorithm design and how it affects the internal organization of advanced compilers. The eventual goal of the project is to produce an expert system that can help users transform large, complex applications from one highly parallel machine to another. The basic strategy has been to follow the following plan:

- 1) Build an experimental research laboratory for parallel computation; 2) Design and experimental program of research that would shed light on the problems involved with restructuring parallel programs for different machines; 3) Attempt to provide a mathematical characterization of the properties of the machines and how algorithms must be restructured to run on them; and 4) Attempt to design a model of machine architecture that can be embedded into the inference engine or knowledge base of an expert system for program restructuring.

ABSTRACT: (U) The fundamental scientific deficiencies impeding the integration of laser diffraction particle sizing techniques into intelligent sensors for next generation propulsion systems have been identified. The research addressed three relevant areas: inverse scattering algorithms; multiple scattering; and the problems of laser beam deflections due to refractive index gradients in hostile propulsion environments. A generalized eigenfunction approach to the inverse Fraunhofer diffraction particle sizing problem has been developed. Based on an analysis of the eigenvalue spectrum, scaling laws for optimal configuration of the system are proposed. The results are in agreement with an independent analysis of the system based on condition number analysis of the linear system produced by numerical quadrature as reported in a previous annual report. The formulation and scaling laws provide a scheme for determining the optimal number and location of the scattering sensors and the maximum number of pieces of independent information on the particle size distribution which can be reliably extracted from the inversion. Finally, a new concept involving programmable (real time) detector configuration at the transform plane has been

ABSTRACT: (U) This project continued and extended a series of experiments on the discrimination and identification of complex auditory patterns. The general purpose of this work is to determine the limits of human listeners' abilities to extract information from complex sounds including, but not limited to, those with temporal and spectral properties approximating speech. Experiments used criterion-controlled psychophysical methods in which listeners were trained until approaching asymptotic performance in various discrimination and identification tasks. Advances were made in the following areas: (A) the spectral and temporal range of selective auditory attention; (b) the time course of auditory perceptual learning; (c) informational limits on pattern discrimination; (d) listeners' abilities to learn to attend to multi-tone targets within longer patterns; (e) individual differences in auditory sensitivity, and (f) the perception of spectrally complex sound, including speech and non-speech sounds.

SUPPLEMENTARY NOTE: Pub. in Iapqr Transactions, v8 n1 p1-7 1984.

ABSTRACT: (U) A direct finite-element method for computing solutions of compressible potential flow problems is presented. An analysis of least-squares approximation is given, including optimal order estimates for piecewise polynomial approximation spaces. The model problem considered is that of potential flow past a cylinder. Numerical results for the model problem are given for a shock free subsonic case.

ABSTRACT: (U) A common assumption made in analyzing competing risk experiments is that the risks are stochastically independent. Under that assumption the product limit estimator is a consistent estimator of the marginal survival function. We show that when the risks are not independent the product limit estimator converges, with probability one, to a survival function which may not be the same as the marginal survival function of interest. Keywords: Reprints.

UNCLASSIFIED REPORT

ABSTRACT: (U) Modeling and preliminary testing of a monolithic coplanar waveguide (CPW) phase shifter using both optical and Schottky-contact control techniques has been performed. Simulation work on a periodically illuminated structure has been completed, showing that some improvement in performance may be possible, although with a reduction in frequency bandwidth. CPW transmission lines have been fabricated on semi-insulating GaAs, on heavily doped epi GaAs, and on an AlGaAs/GaAs heterostructure, and initial electrical characterization has been performed. Optically controlled phase shift has been obtained with the heterostructure device, and Schottky-bias controlled behavior has been seen with the epi sample.

UNCLASSIFIED REPORT

ABSTRACT: (U) The objective of this research program was to develop the theoretical models, design methodology, and technology needed for optimally applying near field electromagnetic sensor arrays to nondestructive evaluation (NDE) and robot control. This program was a collaborative effort by SRI International and Stanford University. This report summarizes SRI's contribution to the program's third-year research activities. SRI's work on this study has shown that small printed circuit single turn loops exhibit good sensitivity when used as sensors. This technology allows ready fabrication of high resolution arrays. By addressing different elements in the array and suitably processing the resulting signals, different sensing functions can be realized with the same array. In particular, SRI has demonstrated the use of such arrays for edge tracking and ranging (proximity sensing). Keywords: Sensor, Arrays, Nondestructive evaluation, Robotics, Electromagnetic, Imaging, Edge tracking.

UNCLASSIFIED REPORT

ABSTRACT: (U) This is the final report of activities on a study of metallic aerosol growth under reduced pressure conditions. The aerosol produced is very complex in shape, and the use of fractal descriptors was investigated. The report details the kind of fractal analysis used. It shows that the particles have fractal characteristics that describes stages of growth and that the pressure under which the particles are grown does influence the growth structure. At very low pressures, the particles fall to form because of chamber size limitations. The conclusions reached in the report show some of the utility of fractal analysis for investigating irregular particle shapes, some of the pressure effects on formation of metallic aerosols of different compositions, and extrapolations of the growth conditions to lower pressures.

ABSTRACT: (U) There are 3 major areas of accomplishments in recent AFOSR sponsored AI research at Yale. While case-based reasoning is simple in concept, there are of course many subtle and difficult design issues that have to be resolved to make it work. One major achievement in the past two years at Yale has been the development of an explicit structure for the case-based reasoning process, as shown in the slide containing the flowchart entitled 'Case-Based Reasoning'. This process description summarizes results from the JUDGE (Bain 1986) AFOSR project as well as from other projects such as CHEF (Hammond 1986) and COACH (Collins forthcoming). The flow of control in the process (represented by the arrows and boxes) is task-independent, while the particular knowledge bases (represented by the ovals) are task specific. The JUDGE program models the subjective assessment task of judicial sentencing. That is, given a description of an event, such as a fight between two people that ended in a death or serious injury, where someone has been convicted of a criminal act.

ABSTRACT: (U) Efforts to develop computational methods for the identification and optimal control of linear and nonlinear systems governed by distributed parameter systems are reported on. Specifically, approximation methods for determining Optimal LOG compensators (feedback control and estimator gains) and functional parameters in linear and nonlinear partial differential equations and hereditary systems were developed, analyzed and tested. The study included theoretical, experimental based and modal finite element schemes were established and extensive numerical studies on both conventional (serial) and vector supercomputers were carried out. A parameter estimation scheme was tested using experimental data taken from the RPL structure, a laboratory experiment designed to test control algorithms for the large angle slewing of spacecraft with flexible appendages, and other projects involving the identification of flexible structures based upon experimental data were initiated.

ABSTRACT: (U) The most significant research progress and accomplishment in our project is on the modelling, analysis and designs of stabilizing joints for coupled structures. In a series of papers, we have studied second order dynamic structures modelling vibrating strings and cables, and fourth order dynamic structures modelling vibrating beams. We are able to classify all linear dissipative joints into types. Dr. H.H. West of the Civil Engineering Department of the Pennsylvania State University has collaborated with us and completed mechanical designs for all of them. Numerical and experimental verification have also been carried out. Dr. Chen's Ph.D. student M.P. Coleman is now using the Cyber 205 supercomputer to compute eigenfrequencies of a damped plate. Experiments were conducted at the MIPAC Facility of the University of Wisconsin in collaboration with Dr. D.L. Russell.

UNCLASSIFIED REPORT

ABSTRACT: (U) This is the final technical report for a
research program to study repetitive opening switches
using optically activated semiconductors. This program
was funded by the Air Force Office of Scientific Research
for the period September 1, 1984 to August 31, 1987 under
Grant No. AFOSR-84-0359. The goal of this research was to
study opening switch characteristics of various
semiconductors in conjunction with inductive energy
storage systems.

DESCRIPTORS: (U) *ENERGY STORAGE, *OPENING(PROCESS),
*SEMICONDUCTORS, *SWITCHES, INDUCED ENVIRONMENTS.

IDENTIFIERS: (U) PE61102F, WUAFOSR2301A7.

ABSTRACT: (U) We consider the problem of service
deterioration and maintenance when there are only small
statistical differences in the quality (or time required)
of each produced item when the system is in the different
states of deterioration, but where those marginal
differences are economically important. This is somewhat
analogous to the situation in the modelling of queues in
heavy traffic, where the main effects which are dealt
with might also be considered to be 'marginal' ones. In
our cases, the production of each item takes a random
length of time and the deterioration during any
production or sampling period can have a fairly general
(and state dependent) statistical relation with this time
and with the quality of the production. Due to this
generality, there are several continuous parameter
interpolations (of the sequence of conditional
probabilities of the system states, given the observed
data) which are appropriate for purposes of the weak
convergence, each with its own advantages. (One can work
with the 'natural time scales' of the deterioration
process, or with that of the sampling process, or with
something in between). The diffusion process limit is
obtained when the random sequences (time, quality) are
appropriately correlated. The limit process is of the

ABSTRACT: (U) Ion beam enhanced grain growth has been investigated in thin films of germanium. Grain boundary mobilities are greatly enhanced over their thermal equilibrium values and exhibit a very weak temperature dependence. We propose that defects which are generated by the ion beam at or near the grain boundary are responsible for the boundary mobility enhancement. Films of Ge deposited under different conditions, either unsupported or on thermally oxidized silicon exhibit similar normal grain growth enhancement when implanted with 50 keV Ge+. Beam-enhanced grain growth in Ge was also demonstrated using Xe+, Kr+, and Ar+ ions. The variation in growth enhancement with projectile ion mass is in good agreement with the enhanced Frankel defect population calculated using a modified Kinchin-Pease formula and Monte Carlo simulation of ion transport in thin films. Calculations based on experiments suggest that there is approximately one atomic jump across the grain boundary per defect generated. Also, the grain growth rate for a given beam-generated defect concentration near the boundary is approximately equal to the expected growth rate for the same defect concentration if thermally generated.

ABSTRACT: (U) During the past year we have advanced the state-of-the-art in several areas of magnetic bubble technology. The main thrust of our research has been to advance ion implanted contiguous disk devices because these devices offer order of magnitude higher bit density than presently manufactured bubble devices. We succeeded in several regards. Noteworthy accomplishments include demonstration of bubble propagation in devices having 4 sq micron bit cells and exhibiting operating margins equal to those of today's manufactured devices. These devices were demonstrated to operate from 0 C to 120 C, the limits of our present testing capabilities. A major factor in this success was our development of new epitaxial garnet materials which exhibited isotropic magnetostrictive properties -- a feature previously not obtained. In addition to the work on bubble propagation we made significant progress on demonstrating a fully operational contiguous disk chip, complete with bubble generators, transfer gates and stretcher/detectors. All components have now been demonstrated to operate with good overlapping margins and a complete chip has been designed and fabricated. We are in the process of testing it.

UNCLASSIFIED REPORT

ABSTRACT: (U) The occurrence of three-dimensional motion within a plane mixing layer results in a significant increase of the internal mixedness (mixing transition). The three-dimensional motion necessary for mixing is induced by streamwise, counter-rotating vortex pairs superimposed on the primary spanwise vortices. While their appearance in the plane mixing layer has been established, their origin and their evolution with increasing streamwise distance remains an enigma. Stability considerations indicate that an instability in the spanwise direction may lead to the generation of streamwise vorticity. This suggests that the flow may be susceptible to low level spanwise periodic forcing. Previous experiments have demonstrated that forcing allows the enhancement of individual instability modes and is an essential step towards understanding the evolution of the natural flow. Furthermore, application of forcing to the flow provides a powerful tool of considerable practical significance for the control of the downstream evolution. We have begun an experimental investigation of a plane mixing layer which is forced independently in the spanwise and streamwise directions. Our objective is to study the evolution of spanwise instability. Its role in the development of the plane mixing layer and possible interaction between the

AD-A190 136 CONTINUED

streamwise and spanwise instabilities. Forcing is applied by a spanwise line of discrete surface film heaters flush mounted on the flow partition. This technique enables us to study nonlinear interactions between various modes of spanwise and streamwise instabilities. Keywords: Mixing layer, Spanwise forcing, Coherent structures, Hotwires, Schlieren.

ABSTRACT: (U) Abstract-This paper considers, from a
complex function theoretic point of view, certain kinds
of robust synthesis problems. In particular, we use a
certain kind of metric on the disk (the hyperbolic metric)
which allows us to reduce the problem of robust
stabilization of systems with many types of real and
complex parameter variations to an easily solvable
problem in non-Euclidian geometry. It is shown that
several apparently different problems can be treated in a
unified general framework. A new result on the gain
margin problem for multivariable plants is also given.
Finally, we apply our methods to systems with real zero
or pole variations.

ABSTRACT: (U) The photodissociation process is
interesting, from a fundamental point of view, because it
brings together the distinct but related phenomena of
spectroscopy (photon absorption) and dynamics (subsequent
dissociation). From a molecular dynamics point of view
the dissociation process can be viewed as a half-
collision, where the optical absorption process is used
to prepare the complex for dissociation. The advantages
of this method are first, control of the angular momentum
and thus the impact parameter and, second, the collision
geometry is defined by the structure of the complex that
absorbs the photon. This process is intellectually
related to both laser-induced charge exchange and
attempts to directly observe properties of transition
states of reactions. Both of these areas of research are
currently of great interest. In this manuscript we are
concerned with charge transfer half-collisions. The
process is schematically represented in Fig. 1. A loosely
bound (A₂BC⁺) complex absorbs a photon and undergoes
intramolecular charge transfer to form (A₂BC). Carbon
dioxide, Oxygen.

UNCLASSIFIED REPORT

ABSTRACT: (U) A final scientific report is given for research in the areas of chromatographic separations and mass spectrometry. A new porous polymer containing cobalt has been synthesized and characterized. It has been found to bind molecular oxygen reversibly. Additional characterization has been made of a symmetrical multidentate ligand, when chelated with a suitable metal ion, potentially may be a new shift reagent for nuclear magnetic resonance spectrometry. Tandem mass spectrometry has been investigated as a new means of characterize various metal chelates. Significant differences have been observed for fragment ions produced by collisionally activated dissociation compared to electron impact ionization. Chromium chelates of a beta-diketone have shown exceptional stability in chromatographic systems, yielding new procedures for separating various chromium species. Experiments with a supercritical fluid chromatograph have indicated the potential to use the device with selective chromatographic detectors and for separations that are difficult to effect by gas chromatography. Keywords: Selective sorbents, chromatographic phases, metal chelates NMR shift reagents, mass spectrometry, tandem mass spectrometry, supercritical fluid chromatography.

UNCLASSIFIED REPORT

ABSTRACT: (U) Three studies dealing with perception of acoustic repetition for long-duration complex sounds have been completed. 1) Repetition of 'frozen' Gaussian noise can be detected for infratoneal repetition frequencies from 1 Hz through 20 Hz (repetition frequencies above 20 Hz are tonal). Infratoneal repetition might be perceived either through the detection of the reoccurrence of singularities within the acoustic pattern, or through a holistic recognition of the entire pattern. This investigation indicated that a holistic recognition of the complex sound is normally responsible for detection of periodicity. 2) Illusory continuity of interrupted tones (pulsation thresholds) have been used to study peripheral auditory mechanisms. The investigators found that illusory continuity also occurs in the infratoneal range, requiring revision of the theories of basilar membrane mechanics based on the pulsation threshold paradigm. 3) The investigators demonstrated that 'frozen' noises repeated at infratoneal frequencies at one ear (silence at the other ear) are detected by some listeners with much greater clarity than when the other ear receives the signal. Ear advantages of this nature have not been observed with other types of complex sounds, and this finding has some interesting implications for auditory theory. Keywords: Auditory perception;

ABSTRACT: (U) The most important results of the animal studies on the mode of action of the antitransformer DADH on short and long term experiments are the following: Combined treatment of DADH and gamma-irradiation generated a decreased incidence of malignant lymphomas compared to gamma-irradiation alone. DADH itself shows some carcinogenic properties. In short term experiments DADH has an immunoprotective effect with respect to gamma-irradiation: a. earlier reconstitution of lymphocyte subsets, b. increase in natural killer cell activity. Higher poly(ADP-ribose)-polymerase activity to a certain extent seems to control replicative DNA synthesis and specific DNA amplification determined by double minutes. Spleen cells with loss of DNA repair increased remarkably with age. At the same time lymphoma incidence is increasing. Nucleotide sedimentation studies showed an over-sedimentation phenomena rather than DNA breaks during short and long term experiments. A certain correlation between basic UDS in spleen cells and the occurrence of lymphomas exists. Basic UDS was highest in the combined (gamma + DADH) group. But also after a single irradiation dose of 1 Gy basic UDS was elevated during the whole life time. Poly(ADP-ribose)-polymerase activity parallels the poly(ADP-ribose) content in spleen and liver cells at the end of the life span of C57 bl mice.

ABSTRACT: (U) This paper provides an algebraic approach to the celebrated quantum-mechanical problem of a particle in a box. There are two primary reasons for such a formulation. The first is that the potential and therefore the spectrum are quite anharmonic. Hence simpler algebraic techniques were the Hamiltonian is one of the group generators, which lead to, at best, a quasi-harmonic spectrum, will just not work for this potential. Systematic methods are, in principle, available for handling anharmonic systems. Also, model algebraic Hamiltonians which are bilinear in the generators have recently been extensively employed in both nuclear and molecular physics. It is therefore of interest to see whether these techniques will work for this benchmark problem.

SUPPLEMENTARY NOTE: Pub. in Physica, v141A p489-508 1987.

ABSTRACT: (U) The temporal evolution of stochastic processes is described using a one-parameter group with time as the parameter. The generator of the group is a first order differential operator. This generator determines the time rate of change of physical variables. If these variables are the probabilities of the different possible states of the system then their equation of motion is exactly equivalent to the master equation. However, the very same equation of motion is equally valid for other variables such as expectation values or, in general, functions of the probabilities. The introduction of an equation of motion which is linear in the generators of the group provides a very convenient algebraic tool. For example, constants of the motion and symmetries of dissipative processes can readily be discussed. For many physical situations, a smaller subgroup suffices to describe the time evolution. The formalism is illustrated for two models of energy relaxation by binary collisions in the gas phase. While the models are valid for complementary physical situations, they have a common (two generators) group structure.

ABSTRACT: (U) The nature of turbulence-combustion
interactions was examined by the use of simultaneous dual-
thermocouple velocity and LDV-thermocouple measurements,
which showed that the presence of the high-frequency
velocity (in a direction normal to the flame brush) and
temperature fluctuations within slowly drifting turbulent
premixed V-flames was associated with changes in the
flame shapes, thicknesses, and propagation speeds. Unlike
the RMS normal-velocity fluctuations which assumed
maximum values within the reaction zone, the RMS
tangential-velocity fluctuations remained almost constant,
implying that the flame-generated turbulence was in the
normal direction. Furthermore, cross-correlation
coefficients of simultaneous velocity and temperature
fluctuations remained positive within the flame, with
values involving normal velocities higher than those
involving tangential components. Keywords: Turbulence,
Combustion interactions, Instability mechanisms, Dist
turbulent flames.

SUPPLEMENTARY NOTE: Pub. in Biometrics, V41 p253-259 Mar 85.

ABSTRACT: (U) When there is extreme censoring on the right, the Kaplan-Meier product-limit estimator is known to be a biased estimator of the survival function. Several modifications of the Kaplan-Meier estimator are examined and compared with respect to bias and mean squared error. In human and animal survival studies, as well as in life-testing experiments in the physical sciences, one method of estimating the underlying survival distribution (or the reliability of a piece of equipment) which has received widespread attention is the Kaplan-Meier product-limit estimator (Kaplan and Meier, 1958). For the situation in which the longest time an individual is in a study (or on test) is not a failure time, but rather a censored observation, it is well known that there are many complex problems associated with any statistical analysis (Lagakos, 1979). In particular, the Kaplan-Meier product-limit estimator is biased on the low side (Gros and Clark, 1975). In the case of many censored observations larger than the largest observed failure time, the bias tends to be worse. Estimated mean survival time and selected percentiles, as well as other quantities dependent on knowledge of the tail of the

ABSTRACT: (U) We have, in this period, developed a microcomputer-based optical linear transformation processing technique. The technique utilizes a systolic array processing method to perform various types of linear transformations, such as discrete Fourier transformation, discrete Hilbert transformation, discrete chirp-Z transformation and many others. By partially parallel addressing two magneto-optic spatial light modulators (MOSLM), this proposed system would offer high speed and parallel processing capability of optics and programmability of microcomputer. In this research, we have shown that a color liquid crystal television (LCTV) can be used for color pattern recognition. The grid structure of the display panel together with a specially designed color filter provides spatially isolated polychromatic spectra to enable polychromatic signal detection. We have found a serious drawback of the color LCTV which is the lack of space invariance, even after it has been immersed in a liquid gate. This drawback is primarily due to the inherent color filter in the liquid crystal display and the phase modulation by liquid crystal molecules. A quantitative investigation of space variance of the LCTV, especially the color LCTV, is currently being studied.

SUPPLEMENTARY NOTE: Pub. in Technometrics, v28 n3 p277-
284 Aug 84.

ABSTRACT: (U) This article investigates the consequences
of departures from independence when the component
lifetimes in a series system are exponentially
distributed. Such departures are studied when the joint
distribution is assumed to follow a Gumbel bivariate
exponential model. Two distinct situations are considered.
First, in theoretical modeling of series systems, when
the distribution of the component lifetimes is assumed,
one wishes to compute system reliability and mean system
life. Second, errors in parametric and nonparametric
estimation of component reliability and component mean
life are studied based on life-test data collected on
series systems when the assumption of independence is
made erroneously. Systems with two components are studied.

ABSTRACT: (U) In this paper the authors use results on the aggregation of singularly perturbed Markov chains to analyze manufacturing systems. The basis for this analysis is the presence in the system of events and processes that occur at markedly different rates -- operations of machines, set-ups, failures, and repairs, etc. The result of the analysis is a set of models, each far simpler than the full model, describing system behavior over different time horizons. In addition, this document presents a new theoretical result on the computation of asymptotic rates of particular events in perturbed Markov processes, where an event may correspond to the occurrence of the one several transitions in the process. We may apply this result to compute effective production rates at different time scales, taking into account the occurrence of setups and failures.

ABSTRACT: (U) Advanced fiber composites are often used in laminate form in strength critical applications. However the ultimate strength of laminates is very poorly understood, primarily because of a lack of valid experimental data. A biaxial test specimen for laminates based on a tubular geometry was developed and used to determine the failure mechanics of two laminates. The results showed a failure process that includes matrix cracking, but this matrix cracking does not appear to directly affect fiber failure. Fiber failure in the laminate studied determines ultimate strength, and can be predicted based on either a maximum fiber stress of fiber strain criterion applied on a ply level. Keywords: Composite materials, Laminate failure, Biaxial stress.

UNCLASSIFIED REPORT

ABSTRACT: (U) A fundamental program of research on the mechanical properties of microelectronic thin film materials is underway at Stanford University. The work is being supported under AFOSR Grant No. 86-0051. In this Interim Scientific Report, some of the progress made during the second year of the program is reviewed. We have made rapid progress since starting this development of new experimental techniques for measuring mechanical properties of thin films. That work led to several publications and to an equal number of invited oral presentations, both of which are listed at the end of this report. Now much of our work involves the use of these techniques to study mechanical properties of thin film materials of interest in microelectronics.

DESCRIPTORS: (U) *MATERIALS, *MICROELECTRONICS, *THIN FILMS, EXPERIMENTAL DESIGN, MEASUREMENT, MECHANICAL PROPERTIES, METHODOLOGY.

ABSTRACT: (U) One of the most attractive structural configurations for large space structures (LSS) for outer space applications is the repetitive lattice concept. Achieving the operational requirements of such structures will necessitate considerable knowledge of the dynamics, control, materials and nondestructive evaluation (NDE) of these structural systems. Wave propagation analyses provide potentially valuable perspectives from which to consider this broad range of analysis, design and synthesis issues. The theoretical and experimental results of a two-year research program on the wave propagation and dynamics of LSS are briefly reviewed. Potential benefits of wave propagation analyses in the vibration, parameter identification, dynamic failure, control and NDE of lattice structures have been identified and are summarized in this report. Keywords include: Wave propagation, Dynamic failure, Lattice structures, and Large space structures.

UNCLASSIFIED REPORT

ABSTRACT: (U) The p-version of the finite element method is a new, important, computationally efficient, approach to finite element analysis. It is more robust than the conventional h-version and its rate of convergence, for domains with corners and for other singularity problems, is twice that of the h-version. Hierarchic elements which implement the p-version efficiently have been formulated so as to enforce C superscript 0 or C superscript 1 continuity in the planar case, and so as to enforce C superscript 0 continuity in three dimensions. Recent research accomplishments include: 1. Development of an algorithm that finds all roots of an analytic function in a finite domain. 2. Preprocessing procedures to restrict the search in unbounded domains which contain roots to bounded domains. 3. A reliable numerical argument principle algorithm to compute number of zeros within a closed contour. 4. Formulation of equations which determine the nature of stress singularity at a corner of a plate composed of n isotropic materials. All of the above are used in the extraction method for p-version finite element analysis of composite materials with corners.

ABSTRACT: (U) Collisional energy transfer rates from highly excited 1p states to nearby 3p, 1D, 3D, and F states of Ca and Sr and fine-structure mixing within the metastable 3p state of Sr have been studied. Several collisional and stimulated population-transfers between the lowest 1p, 3p, 1D, and 3D, states Sr have been isolated, and energy-pooling in collisions between pairs of these energy storage states has been studied. These processes interconnect the excited-state populations and produce energy leakage during high energy density storage in these metastable states. During the course of these studies, several multiphoton excitation and stimulated Raman population processes have been discovered. Cross sections for electronic state-changing collision. Large and remarkably selective alignment effects have been observed for energy transfer processes in both calcium and strontium upon collisions with rare gases and with some molecules revealing a new level of detail about the precise curve crossings and electronic potentials. UNCLASSIFIED REPORT

ABSTRACT: (U) The focus of this research was to develop theoretical and computational tools for optimal control and adaptive parameter identification and control and adaptive parameter systems, primarily large flexible space structures. Approximations results for optimal control of infinite-dimensional systems were derived along with numerical results. Also developed was an approximation theory for discrete-time optimal regulator problems, which included problems with flexible structures as a particular example.

ABSTRACT: (U) The investigators explored the area of neural-net associative memories and their optical implementations. The problem of organizing an associative memory to reflect known structure in the pattern is addressed; because the structure is encoded as a model in the memory, the memory differs considerably from simple pattern matchers where an iconic version of the pattern is stored. Early work concentrated on the idea of encoding a compositional hierarchy within the memory. Though this worked well, the theory was inadequate to explain the behavior of the memory. An optimization approach was adopted in which the goal of the computation could be stated in a mathematical objective function. The ideas of compositional and inheritance hierarchies were encoded directly into the objective function. A simulator was completed that demonstrated these ideas. Optical implementation was concerned with the problem of implementing ever more general interconnect patterns. The investigators began with the construction of a system that computed Radon Transforms of the input object. This demonstrated the necessary first step of an optical connection scheme to transform objects to parameter spaces. A more complex system was built that demonstrated discrete space-invariant connection patterns. This worked satisfactorily. The current work involves designs for holographic space-variant connection patterns.

UNCLASSIFIED REPORT

ABSTRACT: (U) A large structure is formed by the coupling of simple structural elements. This paper considers the simplest type of such structures which is made up of two coupled strings modelled by quasilinear or linear wave equations. Two stabilizers are installed: one at the left boundary and one at an in-span point. The exponential stability property of this coupled dynamic structure is studied. The method of characteristics, and a frequency domain theorem due to F.L. Huang are used. For the quasilinear case, one can determine various parameters so that the system is exponentially stable for sufficiently small data. For the linear case, installing a stabilizer at a boundary point is robust for the exponential stability of the system.

UNCLASSIFIED REPORT

ABSTRACT: (U) The Optical Conceptual Computing and Associative Memory (OCCAM) Program applied the techniques of neural-network dynamical systems analysis and fuzzy theory to problems in conceptual computing. Key contributions are detailed in the ten technical papers included in the Appendix. Three fundamental results were: the development of bidirectional associative memories (BAMs), a fuzzy knowledge combination scheme that allows arbitrarily many neural (casual) network 'expert systems' from experts with arbitrary credibility to be naturally synthesized into a single, representative associative knowledge network, and the development of pure fuzzy associative memories (FAMs). UCSD focused on the theory and application of optical neurocomputing. Four fundamental research thrusts were: the design and implementation of optical neural networks, especially optical BAMs, the investigation of physical properties important to neural network implementations, the application of optics to fuzzy knowledge processing and to fuzzy computing (approximate reasoning) in general, and the application of neural network principles to optical pattern recognition. Several holographic and nonholographic BAM systems were devised, with emphasis on volume holography. A backpropagation (hierarchical supervised learning) network was taught to perform rotation-invariant pattern recognition.

UNCLASSIFIED REPORT

ABSTRACT: (U) Three major objectives were completed during the year. The first demonstrates how to directly use rank-one updates to a Cholesky factorization of the required inverse for Karmarkar projections while fully exploiting sparsity. This can significantly improve computational speed when only a few variables are changing significantly at each step. The second demonstrates a new method for adding new variables to a quasi-Newton Hessian approximation which preserves problem scale and positive definiteness of the Hessian. Numerical results show the method to be preferable to known methods. The third examines a variety of ways of implementing a sequential quadratic programming code, and uses numerical testing to indicate a suitable merit function and good algorithms for updating Lagrange multiplier and Hessian approximations. Recent new results for updating Hessians for unconstrained problems are currently being studied to determine if better Hessian approximations can be obtained.

ABSTRACT: (U) Chlorine atom complexes with pyridine, with methyl nicotinate, and with methyl isonicotinate have been studied by three techniques. The effect of the pyridine derivatives on the selectivity of free radical chlorination of 2,3-dimethylbutane was examined at various concentrations. The kinetics of reaction of chlorine complexes of these pyridine derivatives with 2,3-dimethylbutane and with cyclohexane was examined by nanosecond time-resolved laser spectroscopy; the same technique was used to determine the spectra of the complexes. Finally, high level molecular orbital calculations were performed on the pyridine/chlorine atom complex to determine the optimum geometry and the predicted spectrum. All of these measurements indicate that the pyridine/Cl₂ complex has a long three-electron sigma bond between N and Cl. This contrasts with the structure of related radicals in which a hydrogen or an alkyl group is fully bonded to the nitrogen of pyridine, producing a pi-type aromatic radical. Keywords: Chlorine, Pyridine, Laser spectroscopy, Molecular orbital calculations.

UNCLASSIFIED REPORT

ABSTRACT: (U) An experimental investigation of the relationship between flow structure and chemical reaction in turbulent reacting flows is in progress. The principal objective of the research is to examine the spatial structure of the unsteady reaction process as it relates to the unsteady velocity field. The configuration chosen for study is a co-flowing, non-premixed jet flame. A small perturbation in the fuel jet velocity, produced acoustically, is used to create a very periodic and controllable flame, suitable for conditional sampling. Initial measurements of the unsteady velocity field in the flame have been obtained using laser anemometry. In addition, flow visualization experiments have been conducted using direct and schlieren photography and Mie scattering from the seed particles introduced into the flow. Planar laser-induced fluorescence images of the OH radical, which provide spatially and temporally resolved information on the instantaneous location of the reaction zone, have been obtained. A particle tracking technique to facilitate acquisition of velocity field data has been developed, and is being used to provide velocity field data to be overlaid on the reaction field data to reveal the flame-flow interaction. Keywords: Combustion, Diagnostics, Turbulent flow.

ABSTRACT: (U) The vapor phase HeI photoelectron spectra (Aluminum 2 oxide) and (Aluminum) have been recorded using a new multidetector, high temperature photoelectron spectrometer. Ab initio molecular orbital calculations which include the effects of electron correlation show that the ground electronic state of Al2O has a (D alpha H equilibrium geometry and, as a result, the four observed photoelectron bands are assigned to ionization from the outermost 5 sigma sub u, 6 sigma sub g, 2 pi sub u and 4 sigma sub u molecular orbitals. For atomic aluminum, three bands have been recorded and measurement of their relative intensities allows the Al 3s:3p photoionization cross-section ratio to be measured as (0.36 + or - 0.04) at the HeI photon energy. This result has proved useful in interpreting the relative band intensities in the Al2O spectrum.

SUPPLEMENTARY NOTE: Pub. in Transactions of The Army Conference on Applied Mathematics and Computing (4th), p1157-1172.

ABSTRACT: (U) The initial boundary value problems for a reaction diffusion equation (*) $u_{sub t} = u_{sub xx} - G(L, u)$, $0 < x < 1$, $u(u, t) = u(1, t) = 0$, $t > 0$; $G(L, u) = 4(L - sq)u(u - b)(u - 1)$, $0 < b < 1/2$ was recently analyzed. The large time behavior is studied for the semidiscrete finite element approximations, with interpolation of the coefficients in the nonlinear terms. This paper approximates the spontaneous bifurcation (with L as a parameter) for the steady state problem. For the semidiscrete approximations of (*) Error estimates are established that hold uniformly on the infinite time interval (t sub 0 infinity) t sub 0 > 0 , for nonsmooth or incompatible initial data.

ABSTRACT: (U) Let X_1, \dots, X_n be i.i.d. samples drawn from a d-dimensional distribution with density f . Partition the space R subscript d into a union of disjoint intervals I sub $1 = I(1, X_1, \dots, X_n)$ with the form I sub $1 = (x = (x(1), \dots, x(d)); -\infty < x$ sub $1 < \infty$ or x sub $1 < \infty$ or x sub $1 < \infty$, $1 = 1, \dots, d$). Define the database histogram estimate of $f(x)$ based on this partition as $fn(x) =$ The number of X_1, \dots, X_n falling into I sub $1 + n$ times the volume of I sub 1 , for x is an element of I sub 1 , $1 = 1, 2, \dots$. For given constant $r > 0$ we obtain the sufficient condition for limit as n approached infinity of the integral over the R subscript d of the absolute value of $(f$ sub $n)(x) - f(x)$ to the r th power $dx = 0$. The results give substantial improvements upon existing results. Keywords: Data based; Density estimator; Empirical distribution; Histogram.

ABSTRACT: (U) Performance characteristics of Magnetoplasma dynamic(MPD) arcjets depend on proper matching of electromagnetic and fluid mechanical constraints within the thrust chamber. Experimental measurements of internal flow conditions during MPD arcjet operation are needed to guide development of flow models and to assess the validity of theoretical predictions. Efforts are continuing in a cooperative effort to apply an array of diagnostic techniques including time-, space-, and spectrally-resolved photography to examine MPD arcjet internal flows. Experimental elucidation of the internal flow structure is used to develop predictive models for optimal geometries and operating parameters. Probes have been used to map the current and voltage distributions within uniform height and flared annular channels. This work is concerned with the effect of thruster channel variations on the current conduction regions of the MPD internal flow. Other aspects of the internal flow structure that have been modeled involve the transition of the input mass flow from neutral gas to electrically-conducting plasma. Scale sizes for the transition region were estimated in terms of the electrical and thermodynamic properties of the propellant gas (e.g., argon). These estimates indicate that the electrical conductivity of the flow can be established in distances that are small

ABSTRACT: (U) The HE I photoelectron spectra of NbO and TaO have been recorded. In both cases four main bands were observed which can be attributed to ionization of the isolated metal monoxide molecule. Bands associated with other oxides or the metal were not observed. Assignment of the photoelectron spectra of NbO and TaO was made with the aid of Hartree-Fock-Slater (HFS) calculations and by comparison with the known photoelectron spectrum of VO. The first adiabatic ionization energies of NbO and TaO have been measured as 7.81 + or - 0.2 eV and 8.61 + or - 0.02 eV, respectively. Suggestions are made to explain the poor agreement between previous mass-spectrometric values for the first ionization energy of each oxide. Niobium, Tantalum.

ABSTRACT: (U) During the spring of 1988 a group of students at the University of Maryland under the leadership of Dr. P. S. Krishnaprasad designed a Mobile Remote Manipulator System for the Space Station in order to test the MRMS design, a simulator was constructed on a Iris 2400 series graphics workstation. The MRMS Simulator allowed the Iris to play the role of the MRMS, and at the same time allow the user to view the MRMS from the perspective which was best suited to the task being viewed. The MRMS Simulator also made extensive use of distributed processing to simulate the actual distributed, wide-spread environment in which the actual MRMS control would occur. The simulation was divided into the following tasks: Command Systems - the user interface to the simulation tasks, as well as the individual MRMS controls; Control System - controlling the kinematics of the MRMS; Dealing also with collision avoidance, safety, etc.; and Display System - a graphical representation of the MRMS with a moveable view-point, allowing for the MRMS to be viewed from any position in its universe.

ABSTRACT: (U) Quantum electrodynamics of an atom near a surface is a timely problem in current theoretical research. It appears, however, that a full dynamical theory, which includes both the time evolution of the atomic density operator and the details of the fluorescence radiation (temporal photon distribution) has never been formulated. In this paper the quantum theory of an atom near a perfect conductor is presented, and it is indicated how the formalism can be modified to account for more realistic optically-active substrates. An expression is derived for the atomic spontaneous-decay Liouville operator from the Hamiltonian, which recovers the familiar results for the lifetimes and energy shifts. Furthermore, the emitted power is calculated as a function of time from the explicit expression for the radiation field. Comparison of the atomic-decay rates with the power of the emitted radiation shows the consistency of the theory, as far as the properties of the fluorescence are concerned. An unusual energy interference in the fluorescence, which is emitted by a multilevel atom, is predicted. Similarities and discrepancies with other theories are pointed out, and it is shown that especially the mirror theory has a very restricted applicability. Keywords: Reprints; Atomic fluorescence; Quantum electrodynamics; Perfect

SUPPLEMENTARY NOTE: Pub. in Jnl. of Chemical Physics, v87 n7 p3833-3842, 1 Oct 87.

ABSTRACT: (U) Effects of orbital alignment on the relative cross sections for electronic energy transfer are determined for the near resonant transfer between Ca(4s5p 1p1) and Ca(4s5p 3p sub j) states with rare gas collision partners. The experiments are carried out by pulsed laser excitation in a crossed beam. The results for the forward direction, 1p to 3p, formulated in terms of the ratio of the maximum to minimum transfer probability are: Helium 3 1.61 + or - 0.05; Helium 1.60 + or - 0.03; Neon 1.55 + or - 0.10; Argon 1.52 + or - 0.21; for Krypton, transfer occurs, but no preference is distinguishable within 1 + or - 0.2; Xenon 1.44 + or - 0.06. The results for He, Ne, and Ar indicate a clear preference in the transfer for the initially prepared molecular pi state. For Xe the molecular sigma state is dominant. The energy transfer is also carried out in the reverse direction, 3p1, to 1p, for He and Xe. Analysis of the state preparation suggests that the reverse direction favors the asymptotic molecular sigma state for He and the molecular pi state for Xe. These alignment results provide a first experimental determination of the dominant electronic states involved in a collisional energy transfer process.

ABSTRACT: (U) Recently there has been considerable experimental and theoretical interest in, and controversy concerning, the spin-forbidden transitions $b\ 1\ \Sigma_g(+)$ yields $X\ 3\ \Sigma_g(-)$ and $a\ 1\ \Delta_g$ yields $X\ 3\ \Sigma_g(-)$ in the nitrogen halides. Much of this interest may be attributed to the work of Coombe and Van Benthem (CVB) the $b\ 1\ \Sigma_g(+)$ yields $X\ 3\ \Sigma_g(-)$ transition in Nitrogen Chloride and Nitrogen Bromide. It is the goal of this work to resolve these discrepancies in the $b\ 1\ \Sigma_g(+)$ and $a\ 1\ \Delta_g$ radiative rates in Nitrogen chloride.

ABSTRACT: (U) A photodissociation study of Krypton Sulfur dioxide (+) is presented. $\text{Kr}\cdot\text{S}02(+)$ was formed by three-body recombination of $\text{S}02(+)$ with Kr in a high pressure ion source. Two ionic products, $\text{Kr}(+)$ and $\text{S}02(+)$ were observed when the ion beam was crossed with a focused laser beam. Wavelengths of 458, 488, 514, and 585 nm were used. Product relative kinetic energy distributions, product angular distributions (asymmetry parameters), and product branching ratios were obtained. A statistical phase space calculation was carried out for the $\text{S}02(+)$ Kr product channel. These results suggest either the $\text{S}02(+)$ product is both vibrationally and electronically excited or a new electronic state of $\text{S}02(+)$ at approx 1.5 eV is formed. Product relative kinetic energy distributions and angular distributions suggest the $\text{Kr}(+)$ ionic product is produced nonstatistically, probably via direct transition to a repulsive state(s) that correlate to $\text{Kr}(+)(2p\ 3/2)/\text{S}02(+)$ products. The $\text{Kr}(+)$ / $\text{S}02$ and $\text{S}02(+)$ /Kr products come from two noninterconverting sets of photoexcited states.

ABSTRACT: (U) The physics of vaporization of matter under pulsed CO₂ laser evaporation was studied. Analysis of the nature of the vapor plume in several materials indicated the presence of numerous excited species, neutral as well as ionized species, and ions with high kinetic energies. High quality films of refractory metal oxides and epitaxial films of Ge were deposited. The oxide materials were dense and crystalline and had high refractive index values, even when deposited on room temperature substrates. Ge films were epitaxial and single crystalline when deposited on Si substrates at 300 C. Study of the relationship of deposition conditions and film properties clearly indicated the beneficial role of the energetic ions in the film deposition. Special emphasis was given to the solution of the problem of particulates in the films. Keyword: Germanium, Silicon, Laser deposition.

ABSTRACT: (U) The vortex element method and the transport
element method are developed for the numerical simulation
of the Navier Stokes equations and the energy and species
conservation equations, accurate simulation of the
governing equations at high Reynolds and Peclet numbers,
without resorting to turbulence modelling. Finite rate
chemical reactions, finite compressibility and finite
heat release ratios are also considered in the
formulations of the numerical schemes. To validate these
methods, we are obtaining solutions for reacting shear
layers, both homogenous and heterogeneous, under various
idealizations, and comparing the numerical results with
experimental data. The solutions are also analyzed to
investigate the mechanisms of turbulence combustion
interactions. Keywords: Turbulent combustion.

ABSTRACT: (U) Seemingly tunneling is intimately related to a geometrical approach. That however is not always the case as shown by our first example where tunneling connects regions of phase space which are not separated by a potential yet are disjoint in classical mechanics. This example shows that an algebraic approach can handle dynamic tunneling in a bound state system. Recent work has also considerably affirmed the geometric interpretation of the algebraic approach. Hence even such traditional problems as barrier penetration can be discussed. To obtain the tunneling rates we discuss the use of non-unitary representations. Towards the extension of the algebraic approach to unbound states in multidimensional systems, the simpler case of an unbound one dimensional motion is discussed and possible generalizations are indicated.

UNCLASSIFIED REPORT

ABSTRACT: (U) The experimental and theoretical progress that has been made in the coupled high power waveguide laser research program is reported. A problem has been encountered with the hollow-bore ridge waveguide laser array approach in which multimode operation occurs when the array is increased to above three elements. Alternative waveguide geometries were explored with the objective of achieving both phase locked operation and mode discrimination for an array size of 5 elements. Three new waveguide geometries were investigated. Of these new geometries, a modified hollow-bore ridge waveguide, utilizing a staggered ridge, has been used successfully to obtain single mode operation. This array, with a gain volume equivalent to six waveguide lasers, produced an output of 88 watts. The theoretical effort has resulted in the development of a theoretical method for calculating the modes and frequencies of two coupled rectangular waveguides separated by an infinitely thin partition with a gap in it.

ABSTRACT: (U) A one-dimensional, dynamic, thermomechanical model, which includes nonlinear inelastic deformation, internal heat generation (strain-heating), temperature dependent material properties, thermal expansion and thermoelastic coupling, is considered for a uniform thin bar subjected to mechanical or thermal disturbances. A nonlinear Maxwell material is examined in this model and special attention is focused on the temperature change. By solving a nonlinear problem, it is found that a thermal instability, called thermal runaway, may result due to the mutual feedback between strain-heating and the temperature dependent inelastic material properties. Neglecting this important phenomenon may lead to unexpected material failure.

ABSTRACT: (U) This report summarizes results of a combined theoretical and experimental investigation of wave propagation and liquefaction from high intensity dynamic loading of saturated porous media. This work presents results obtained during the second year of a three year research effort. Theoretical derivations describing undrained hydrostatic and uniaxial strain loadings were obtained and incorporated into a numerical code (NKOCF) which models the two-phase undrained response of saturated soils and rocks. Numerical calculations of the response of saturated rock and soil compare very well with laboratory data in which both the soil and rock are liquefied during the unload portion of the cycle. Theoretical and numerical solutions for the speed and damping of waves of the first and second kind in fully coupled two phase media are also presented. Parameter studies of the influence of frequency and variations in material properties on wavespeed and damping are performed.

ABSTRACT: (U) The focus of this research is the filtering jump processes. To investigate the filtering of manifold valued processes, their approximation by random walks and Markov chains was studied. The object was to approximate a signal process by a finite-state jump process for which a finite dimensional filter is available. The Partially Observed Stochastic Minimum Principle: A minimum principle for a partially observed diffusion can be obtained by differentiating the statement that a control u^* is optimal. The results on stochastic flows enable us to compute in an easy and explicit way the change in the cost due to a strong variation of an optical control. The only technical difficulty is the justification of the differentiation.

ABSTRACT: (U) Judgments of sounds depend on context. How a sound is labeled depends on the sounds that just occurred (sequence effects) and the sounds that might occur (set effects or range effects). These dependencies are sufficiently large that they sometimes predict performance better than the stimulus itself. This report summarizes studies of context conducted during two years of AFOSR support. These studies of sound classification evaluated features of a memory model constructed to account for univariate judgments. The data show how response variability depends on stimulus variability, and demonstrate the importance of experimental details such as whether feedback is given and whether an identification function is present. It is concluded that three variables are needed to describe the collection of results. These are the stimulus itself, the stimulus or response (depending on feedback) on the just prior trial, the stimulus or response (depending on feedback) on the just prior trial, and an average (called a memory pool) of the stimuli on each of several earlier trials.

DESCRIPTORS: (U) *CLASSIFICATION, *PSYCHOACOUSTICS, *JUDGEMENT(PSYCHOLOGY), COLLECTION, IDENTIFICATION, MODELS, RESPONSE, SEQUENCES, SOUND, STIMULI, VARIABLES, VARIATIONS, MEMORY(PSYCHOLOGY), SEQUENTIAL ANALYSIS.

UNCLASSIFIED REPORT

ABSTRACT: (U) Complex sounds describe most of the sounds that are perceived in our everyday life. However, most of our present knowledge is required about the neural process studying simple sounds. More knowledge is required about the neural processing of complex signals and about how animals process similar complex sounds. This proposal was to purchase two real-time, high-speed data acquisition computers similar to the one used for the human perception research at the Parmly Hearing Institute. These computers, MASSCOMPs, will be used to generate stimuli and to analyze behavioral and neurophysiological response. The research in these projects involves the human perception of complex stimuli, and combined animal behavior and neurophysiological measures of some of these stimuli, and combined animal behavior and neurophysiological measures of some of these stimuli. The physiological studies include measurements within the eighth nerve and at the level of the cochlear nucleus of the auditory system. In order to relate these measures to the animal's ability to process these stimuli a series of animal behavioral studies are described. The addition of these computer was essential for the full benefit of a multidisciplinary study of the processing of complex sounds. Keywords: Complex sound processing, Hearing, Psychophysics, Physiology.

UNCLASSIFIED REPORT

ABSTRACT: (U) We have digitized the cone centers of a primate and a human photoreceptor lattice and have determined that the Nyquist limit predicts visual resolution out to nearly two degrees of retinal eccentricity. Beyond 2 degrees lattice disorder appears to have a deleterious effect on cone density and aperture size. A developing model of lattice structure and design strategies reflects complex principles involved in the evolution of human spatial vision. We are currently exploring a bottom up model of human vision where sampling limitations are propagated along the spatial vision processing hierarchy. The observations that this model addresses include a new class of two dimensional spatial discriminated more accurately than the bisection of two points of comparable separation. This discovery has led to the development of two additional lines of research, area discrimination and density discrimination. We have identified a fundamental similarity between spatial frequency discrimination and vernier acuity that demonstrates that Weber's Law applied similarity to both tasks. Further, we have shown that two-dot vernier discrimination falls off within two degrees of retinal eccentricity similarly to changes in retinal sampling. These findings contribute to a model of spatial discriminations that includes limits imposed at the sampling level of the visual process.

ABSTRACT: (U) This report, experimentally demonstrates
digital all-optical Compare and Energy circuits based on
our original designs. The circuits uses ZnS bistable
optical devices in novel operational modes such as
bidirectional and latching logic. These modes are central
to the low complexity of the implementation. In addition,
the experimental demonstration utilizes polarization
multiplexing and filtering to reduce crosstalk, losses
and feedback in the optical system. The capabilities of
optical interconnection networks are generally useful in
parallel processing and specifically useful in sorting.

ABSTRACT: (U) This report describes the equipment acquired and the research performed under the DoD University Research Instrumentation Program grant for 'Gas Source MBE' at Colorado State University. The objective of the research supported by the grant is to grow epitaxial III-V semiconductor films using gaseous materials for molecular beam epitaxy (MBE). The grant provided the critical equipment items needed to customize the existing commercial MBE system and allow growth of heteroepitaxial structures that can not be fabricated by other techniques. The resulting gas source MBE materials could provide the optoelectronic device technology required for the high data rate signal processing of the vast quantities of input data expected in future DoD space and ground-based sensing systems. Keywords: Molecular beam epitaxy.

ABSTRACT: (U) A procedure for constructing $H(ss)C(1)$ using the symbolic matrix method introduced by Liu and Yoshimine has been developed. Here $H(ss)$ is the dipolar spin-portion of the Breit-Pauli interaction and $C(1)$ satisfies $H(0)-E(1)(0)C(1)$ where H is the non-relativistic electronic Born-Oppenheimer Hamiltonian. This approach permits, for the first time, treatment of $H(ss)$ in the large configuration state function (CSF) spaces (100,000-1,000,000 terms) presently used in the context of direct CI methods for the characterization of a non-relativistic wavefunction. For systems containing only light atoms, relativistic effects are well characterized by the Breit-Pauli interaction ($H(BP)$). Recently there has been considerable interest in the characterization of phenomena originating as a result of this interaction using post Hartree-Fock, ab initio electronic structure techniques. These investigations have concentrated principally on the spin-orbit part ($H(so)$ of $H(BP)$) with the aim of characterizing non-adiabatic spin forbidden chemical reactions (involving singlet and triplet potential energy surfaces), spin forbidden radiative transitions and fine structure splittings.

ABSTRACT: (U) The epitaxial growth of an adsorbed layer of NH₃ on top of chemisorbed CO on Ni(111) and Ni(110) surfaces was studied using ESDIAD. A strong interaction yielding an activation energy for NH₃ desorption of 12 kcal/mol was observed. This interaction, possibly involving hydrogen bonding, between the adsorbed NH₃ and adsorbed CO causes a tilting of the NH₃ molecules on the CO-covered Ni surfaces. For the NH₃/CO/Ni(110) system, the two-fold symmetry of the underlying Ni substrate is transmitted through the CO spacer layer to the NH₃ overlayer. This symmetry transfer was not observed for the NH₃/CO/Ni(111) system at the current resolution of our ESDIAD detection system. Keywords: Chemisorption, Multilayers, Epitaxy, Ammonia, Nickel, Carbon, Monoxides.

SUPPLEMENTARY NOTE: Pub. In Surface Science, v191 p1-14 1987.

ABSTRACT: (U) The interaction between adsorbed NH₃ and adsorbed CO molecules on two Ni single crystal planes has been investigated using ESDIAD and temperature programmed desorption (TPD). Interactions have been observed on both surfaces which influence the ESDIAD patterns of both adsorbed species. Evidence for long distance azimuthal orientation interactions of NH₃ with CO on Ni(110) is observed, whereas shorter distance interactions are observed on Ni(111). In the case of the short distance CO..NH₃ interactions on Ni(111), a tipping of the C3v axis of NH₃ away from the normal is seen. The role of the substrate crystal structure is shown to be important in determining the character of the intermolecular interactions on the two surfaces. Keywords: Chemisorption, Adsorbate interactions, Adsorbate structure, Hydrogen bonding, Ammonia, Nickel, Carbon monoxide.

ABSTRACT: (U) The regulator problem with internal stability is one of the central problems in linear control theory. This problem is motivated by the fact that a typical control system is usually required to track a prescribed signal. Assuming that the disturbances can be modeled as output of a linear, finite-dimensional, time-invariant system (and quite often this is a fair assumption), output stabilization using dynamic compensation is known as the regulator problem. It is well known that the problem of tracking can also be regarded as a regulator problem by viewing tracking error as the output. A fundamental additional requirement in a regulator problem is the internal stability of the overall feedback system consisting of the plant and the dynamic compensator. This is known as the regulator problem with internal stability (RPIS). In this conference paper, we present certain results obtained in 1982. Here we define RPIS in transfer matrix terms and present a necessary and sufficient solvability condition in terms of skew-primeness of polynomial matrices.

UNCLASSIFIED REPORT

ABSTRACT: (U) A straightforward algorithm for the multiple time scale decomposition of singularly perturbed Markov processes has been presented. That algorithm provides a uniform approximation of the probability transition function over the interval $t > 0$ through the construction of a sequence of aggregate models valid at successively slower time scales. When only the structure of these models is desired, the algorithm can be expressed simply in terms of graphs associated with each of the aggregated models. The major computation then becomes computing shortest paths in these graphs. This representation of the algorithm furthermore allows analysis of more complex systems where there are multiple perturbation parameters with unknown relative orders of magnitude. Keywords: Markov processes; Singular perturbation; Multiple time scales; Graph theory.

ABSTRACT: (U) The phonon relaxation of the vibrational adbond of an adsorbed molecule and a phonon damped adbond irradiated by a laser are studied. Approximations are made within the Zwanzig projection operator formalism to arrive at a master equation for the reduced density operator of a small subsystem (the adbond) in contact with a reservoir (the phonons). The conditions of validity for the Born and Markov approximations are derived. It is shown that the master equation is only valid for times τ sub c, where τ sub c is the characteristic time of the reservoir. These results are applied to the phonon relaxation of the vibrational adbond of physisorbed molecules. It is shown that for carbon monoxide adsorbed on nickel or copper (a strongly-bound physisorbed system) argon on tungsten, numerical results show that these approximations can be made. Finally, an adbond interacting with both laser radiation and lattice vibrations is considered. This system can be regarded as a subsystem (the adbond) in contact with two reservoirs, where the conditions for validity of the Markov approximation are then seen to be more severe than when each reservoir is considered independently. For the phonons, these conditions can never be matched. For an initial state given by an adbond in equilibrium with the

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub in Proceedings of the Annual Meeting of the Electron Microscopy Society of America (45th), p752-753 1987.

ABSTRACT: (U) A typical high resolution structure image contains a large amount of intensity information which is masked by both statistical and amorphous noise. One useful method of quantifying such images is to employ correlation techniques. When one seeks to quantify the atom column positions, correlation techniques can be used to decompose the image into separate motifs (of specific peak amplitudes and positions - each motif corresponding to a single column of atoms), thereby reducing the data to a more manageable form. We have tested the use of cross-correlation to determine atom column positions in high resolution structure images using SEMPER routines implemented on an Apollo 880 work station. A number of image conditions were tested using simple Gaussians as test objects. Our results show that: 1) Provided the motifs are well separated, simple cross-correlation of the motif and the picture gives the peak positions and the peak heights to a very high accuracy even at high noise levels.

DESCRIPTORS: (U) *CORRELATION TECHNIQUES, *HIGH RESOLUTION, *IMAGE PROCESSING, *ATOMIC STRUCTURE, *ACCURACY, *AMORPHOUS MATERIALS, *AMPLITUDE, *ATOMS, *CORRELATION, *CROSS CORRELATION, *HIGH RATE, *IMAGES.

UNCLASSIFIED REPORT

ABSTRACT: (U) In this report, models for saturated and unsaturated soils are reviewed. In addition, the applicability of micromechanics modeling for unsaturated, saturated, and dry sands are explored. The expressions for effective moduli and poisson's ratio are developed for all levels of saturation for sands. The potential of these models for providing a better understanding of partly saturated soil behavior is also discussed in this report.

ABSTRACT: (U) This program reports research done under DARPA contract number F49620-86-C-0012. The goals of this program include the establishment of autonomous LEC crystal growth and its commercialization. This report provides a short description of the autonomous control system, a detailed description of the digital hardware developed for the control system and the multibus computer system and the computer-puller hardware of the growth system. Technical drawings for the signal processing box and the motor controller board are also given. During the first period (1 year) this system has grown 30 single GaAs crystals with a yield of better than 70% of single crystals. Keywords: Autonomous crystal growth, Expert control system, Gallium arsenides.

DESCRIPTORS: (U) *CONTROL SYSTEMS, *CRYSTAL GROWTH, *CZOCHRALSKI CRYSTALS, *GALLIUM ARSENIDES, *ARTIFICIAL INTELLIGENCE, *DIGITAL COMPUTERS, BOXES, ENGINEERING DRAWINGS, MOTORS, SIGNAL PROCESSING, LIQUIDS, ENCAPSULATION, MICROCOMPUTERS, SINGLE CRYSTALS.

UNCLASSIFIED REPORT

ABSTRACT: (U) Two-phase materials are technologically important because optimum properties can be obtained by a proper combination of the two phases. Among these materials, two phase Titanium alloys are of particular interest for high temperature aerospace applications. However, there is a lack of understanding in the areas of high temperature deformation, recrystallization and grain-growth behavior of two-phase alloys in terms of the properties of the component phases. Such an understanding is essential to develop new titanium alloys with greater high temperature strength and stability for high temperature applications. The lack of understanding is due to the complex deformation behavior of these two-phase materials. Whenever a material comprising two or more phases is subjected to stress, the component phases deform differently and this results in inhomogeneous strain and stress distributions. In addition, interaction stresses develop as a result of interactions between the deforming phases. For these reasons, the deformation behavior of two-phase materials cannot be explained by the simple law of mixture rule.

ABSTRACT: (U) This report describes the design and development of a W-band (75-110 GHz) vector automatic network analyzer. The system was funded under the DoD sponsored University Research Instrumentation Program. The W-band system will be located in the Microwave Laboratory located in the Electrical and Computer Engineering Department of North Carolina State University. The equipment funded under this program will interface with an existing Hewlett-Packard 8510A automatic network analyzer and will extend the operating frequency range of this instrument to the millimeter-wave bands. Currently, the system is limited to an upper frequency of 28.5 GHz. The enhanced system will permit research to be performed in the area of millimeter-wave characterization of solid-state devices. In particular, we are interested in performing S-parameter measurements on experimental mm-wave devices in order to determine ultimate frequency and performance limitations. It is anticipated that information of this type will contribute to research directed towards developing optimized solid-state devices for mm-wave applications.

UNCLASSIFIED REPORT

ABSTRACT: (U) Using the theory of stochastic flows the integrand in a stochastic integral is identified. After some rearrangement this integrand is itself written in terms of a martingale which can be expressed as a stochastic integral, and by recursively repeating the representation a homogeneous chaos expansion is obtained. Using the stochastic integral representation an integration by parts formula is then derived. If the inverse of the Malliavin matrix M belongs to all the spaces L superscript p (Ω) we show a random variable has a smooth density. The difficult questions concerning the relationship between Hoermander's conditions on the coefficient vector fields and the integrability of $1/M$ are not discussed, but, at least for Markov flows, the discussion below appears to be an elementary treatment of some ideas of the Malliavin calculus.

ABSTRACT: (U) The focus of this research is the filtering jump processes. To investigate the filtering of manifold valued processes, their approximation by random walks and Markov chains was studied. The object was to approximate a signal process by a finite state jump process for which a finite dimensional filter is available. Four papers were published during the past year, including the existence of smooth densities for the prediction, filtering and smoothing problems and the partially observed stochastic minimum principle. Using stochastic flows a minimum principle is obtained when a diffusion is controlled using stochastic open loop controls. An equation for the adjoint process is then derived using an explicit formula for the integrand in a certain stochastic integral.

ABSTRACT: (U) Polydimethylsiloxane (PDMS)-modified
Silicon dioxide-Titanium dioxide glasses have been
prepared via the sol-gel route. Polymer compositions
varied between 17 and 67 wt% PDMS, using PDMS of
molecular weights 1,700 and 38,000. Also varied was the
Silicon/titanium ratio for a given polymer content and
the nature of the Ti alkoxide. A general synthetic
procedure was found which made optically clear samples.
Dense monolithic structures were obtained at room
temperature for all compositions. The room temperature
densification is attributed to relaxation and flow in the
sample due to the presence of the polymer. The effects on
properties of the overall composition and molecular
weight of the polymer are reported, and implications in
terms of structural models are considered.

ABSTRACT: (U) Research into the submicroscopic behavior of the cement paste and mortar constituents of concrete is enhanced through the acquisition of an integrated scanning electron microscope, energy dispersive spectrometer, image analysis system. The combined system is used to obtain crack surveys of cement paste and mortar loaded in uniaxial compression at strain rates ranging from 0.3 to 300,000 microstrain per second. Research background, equipment selection procedures, equipment capabilities, installation, and on-site evaluation are described. Crack dimensions, orientations, and locations are determined using the combined instrumentation. The surface crack distributions are converted to three-dimensional crack distributions, which are in turn used to estimate the portion of the total deformation due to cracking. The new instrumentation provides a major improvement in both the quality and the quantity of crack data available for analysis. Keywords: Cement, Concrete, Electron microscopes, Image analysis, Microcracks, Microscopic, Mortar, Strain rate, Submicrocracks, X ray analysis.

ABSTRACT: (U) An experimental and computational investigation of supersonic combustion flows is in progress. The principal objective of the research is to gain a more fundamental understanding of mixing and chemical reaction in supersonic flows. The research effort comprises three inter-related elements: 1) an experimental study of mixing and combustion in a supersonic plane mixing layer; 2) development of laser-induced fluorescence techniques for time-resolved two-dimensional imaging of species concentration, temperature, velocity and pressure; and, 3) numerical simulations of compressible reacting flows. The design of the supersonic plane mixing layer was completed and the high-pressure gas storage system was installed. The pulsed lasers and camera systems, to be used for two-dimension flow field imaging, were installed and initial performance evaluations are in progress. This work has focussed on development of appropriate numerical methods for performing full-turbulence simulations of high-speed compressible flows and on the application of these methods to temporally and spatially developing compressible mixing layers. The effort to date has identified several promising numerical methods for

AD-A189 690

ABSTRACT: (U) The maximum-entropy formalism is used to characterize the fluctuations in transition strengths for a bound quantum-mechanical system. In the chaotic limit only one, ever present, sum rule is required as a constraint. The resulting distribution is that of Porter and Thomas, which can also be derived from random-matrix theory. For nonchaotic systems the distribution of transition strengths has a lower entropy. A possible additional constraint, operative during the onset of chaos, is proposed. The distribution of maximal entropy subject to both constraints accords with computed intensities in a system of two degrees of freedom.

SUPPLEMENTARY NOTE: Pub. in Annual Meeting of the Electron Microscopy Society of America (45th) p78-79 1987.

ABSTRACT: (U) The study of localized phenomena, defect structures, relaxations, surface impurities, etc., all require the ability to resolve small deviations from equilibrium (average) positions of the atoms. Thus, a useful HREM image must have the property of being a one-to-one mapping of the atomic columns in the image to those in the specimen. This localization of the image depends on the imaging parameters of the microscope and on the spatial frequency of the information (1). Therefore, each microscope should be calibrated for the imaging conditions under which the maximum localization of the information of any given spatial frequency is obtained. We have done this for the Hitachi H-9000 HREM which is operated typically at 300 kV, with a Cs of 0.9 and a focal spread of approximately 80 A (fwhm).

UNCLASSIFIED REPORT

ABSTRACT: (U) Theoretical and experimental work on the deformation and fracture of fibrous composites with distributed damage is described. Emphasis is on establishing the existence of potentials analogous to strain energy and on using these so called work potentials in deformation and fracture studies. The difference between changing damage and constant damage processes is accounted for by using multivalued work potentials. Discussed first are investigations of flat rectangular bar specimens and thin walled tubes under axial and torsional loading. The limited amount of experimental data presently available on angle ply laminates confirms the existence of a potential even when there are large increases in microcracking. Next, path independence of the J integral is discussed. A study is then described in which the J integral is used to determine fracture energy for delamination in double-cantilevered beam specimens, some of which have a large percentage of off-axis fibers; the results are compared with fracture energies found by standard methods (which do not account for effects of distributed damage).

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Pub. in Geophysical Journal of The Royal Astronomical Society, v88 p593-620 1987.

ABSTRACT: (U) This article studies the problem of recovering the elastic parameters of a layered half-space from single component measurements of reflected waves. We analyze the perturbational relationship between the elastic moduli (ρ , λ , and μ) and the vertical component of surface particle displacement due to a point impulsive traction. This linearized has a unique solution and derive some stability estimates.
