OFFICE OF NAVAL RESEARCH FINAL REPORT PUBLICATION/PATENTS/PRESENTATIONS/HONORS/STUDENTS REPORT for Contract N00014-86-K-0282

R&T Code 4135004

"Monomers, Polymers and Transition Metal Complexes Based Upon Carboranes"

Accession For

Period Covered:	March 3, 1986 - February 28, 1989	DTIC TAB
Principal Investigator:	Professor M. Frederick Hawthorne	Unannounced
Organization:	University of California, Los Angeles	Justification
Organization Address:	Department of Chemistry University of California, Los Angeles 405 Hilgard Avenue Los Angeles, CA 90024	By Distribution/ Availability Codes Avail and/or Dist Special A-/

Reproduction in whole, or in part, is permitted for any purpose of the United States Government.

This document has been approved for public release and sale: its distribution is unlimited.

Part I

a. Papers Submitted to Refereed Journals: none

b. Papers Published in Refereed Journals:

3. "Activation of C-H Bonds with Intermediates Produced by Mild Thermal and Photochemical Decomposition of Metallacycle (η^5 -C₆H₅)Ir[C(p-ClC₆H₄)=NOC(=O)]CO in Hydrocarbon Solvent" Peter A Chetcuti and M.F. Hawthorne J. Am. Chem. Soc. **1987**, <u>109</u>, 942.

4. "Intramolecular Conversion of a 5-Membered Iridacycle to a 3-Membered Counterpart by CO₂ Extrusion" Peter A. Chetcuti, Carolyn B. Knobler and M.F. Hawthorne Organometallics **1986**, <u>5</u>, 1913.

c. Books Submitted for Publication: none

d. Books Published: none

e Technical Reports and Papers Published in Non-refereed Journals: four

f. Patents Filed: none

g. Patents Granted: none

h. Invited Presentations at Scientific/Technical Society Conferences: none

i. Contributed Presentations at Scientific/Technical Society Conferences: none

j. Honors/Awards/Prizes: none

k. Number of Graduate Students Receiving Full or Partial Support on ONR Contract: three

I. Number of Postdoctoral Fellows Receiving Full or Partial Support on ONR Contract: two

Part II

a. Principal Investigator: Professor M. Frederick Hawthorne

b. Cognizant ONR Scientific Officer: Dr. Harold E. Guard

c. Curent telephone number: 213/825-7378

d. Brief Description of Completed Project:

Our research for the Chemistry Division of ONR has involved studies of the reactions of low valent metal carbonyl complexes with arylnitrile oxides resulting in the [3 + 2] cycloaddition of the arylnitrile oxide to the M-CO bond of the metal carbonyl complex. A number of metallacycles have been synthesized in good yield by this route, establishing the generality of this reaction.

Recent studies have been concerned with the nature and synthetic utility of the products resulting from the thermolysis of rhodium- and iridium-containing metallacycles. We have recently reported the accomplishment of an important goal of this project, the metallacycle-promoted thermal activation of C-H bonds of saturated hydrocarbons. This accomplishment has attracted considerable interest from other workers in this field. In short, the thermolysis of selected metallacycles results in the loss of arylnitrile and CO₂ to genrate a coordinatively and electronically unsaturated metal fragment which is highly reactive. Hermolysis of Selected metallacycles on pounds? Rhodium Compounds?

$$L_n M = U_n M + CO_2 + ArCN \quad (2)$$

Thermolysis of the appropriate metallacycle provides a low energy pathway to the generation of a metal fragment which is sufficiently reactive to add into the C-H bonds of hydrocarbons. The extension of the [3 + 2] cycloaddition reaction of arylnitrile-N-oxide to other metal complexes was attempted. The reactions of $[W(CO)_3(C_2B_9H_{11})][PPN]_2$, Rh(PPh₃)₂(Cl)(CS) or RhCp(PPh₃)(NO) with p-fluorobenzonitrile-N-oxide and attempts using nitrones, instead of arylnitrile-N-oxides, as the 1,3-dipolar reagent in the reaction with metal carbonyls generated unpromising results.

In another area, recent research efforts have been directed towards an examination of the chemistry of ruthenium-containing metallacarboranes with regard to their potential for catalytic behavior. This chemistry has precedence in the synthesis of the active and highly stable rhodacarborane catalyst [*closo*-3,3-(PPh₃)₂-3-H-3,1,2-RhC₂B₉H₁₁] and its derivatives. Previous work by us involving ruthenacarboranes has led to the discovery of two hydride complexes that show catalytic activity for the hydrogenation of activated olefins such as ethyl acetate, as well as, the isomerization of terminal olefins. In addition, the eleven vertex complex [*hyper-closo*-6,6-(PPh₃)₂-6,2,3-RuC₂B₇H₉] has previously been shown to be an active catalyst precursor for the hydrogenation of alkenes, and the icosahedral cluster [*closo*-3,3,3-(PPh₃)₃-3-H-3,1,2-RuC₂B₉H₁₁] facilitates the activation of carbon monoxide, promoting reactions with various nucleophiles. Our recent studies in this area have involved the synthesis and structural characterization of various metal- and carborane cage-substituted ruthenacarborane complexes in an attempt to obtain new ctalytic species having high selectivity.

The unusual rhodacarborane complex $[Rh(\eta^{5}-C_2B_9H_{11})(CO)(PPh_3)(Tl)]$ (1), was prepared as a result of attempts to develop an alternative one-step route to the important rhodacarborane anion complex $[Rh(\eta^{5}-C_2B_9H_{11})(CO)(PPh_3)]^-$, the precursor to the rhodacarborane metallacycle $[(PPh_3)(\eta^{5}-C_2B_9H_{11})Rh\{\eta^2-C(Ar)=NOC(=O)-\}]$. Complex (1) is very interesting since it possesses a very short rhodium-thallium interatomic distance of 2.954 Å. In order to gain a greater understanding of the metal-metal interaction, thallium-205 NMR spectroscopy was attempted. Unfortunately, no signal was observed in the NMR spectrum. The reason for this is unclear, since resonances of similarly bond thallium in other complexes have been observed. The variation of the carbonyl stretching frequency, v(CO), in the infrared spectrum of (1) was studied as a function of solvent. In non-coordinating solvents the carbonyl stretching frequency varied only slightly from that of the solid. This indicates that there is still a strong interaction between rhodium and thallium in non-coordinating solvents. However, in coordinating solvents there was significant variation in the carbonyl stretching frequency. This indicates the formation of a solvent-seperated ion pair or free ion in coordinating solvents. Several attempts to form heterobimetallic compounds by reaction with metal halides yielded purple or red, amorphous, decomposition products and reaction with (CH₃)₄NCl resutled in the formation of {Rh(PPh₃)₂(CO)-3,1,2-C₂B₉H₁₁}-[(CH₃)₄N]⁺, with TlCl precipitation. The iridium complex, Ir(PPh₃)(CO)(Tl)[3,1,2-C₂B₉H₁₁], was synthesized from Vaska's complex, Ir(PPh₃)₂(CO)Cl, via its reaction with Tl[*closo*-3,1,2-TlC₂B₉H₁₁]. The analytically pure, yellow microcrystalline product was fully characterized and shown to possess a strong iridium-thallium interaction, similar to that found in (1).

The reaction of (PPh₃)₃RuHCl with [(CH₃)₃NH][7,8-C₂B₉H₁₂] and with Tl₂[7,8-C₂B₉H₁₁] in the presence of (C₂H₅)₄NCl yields [(C₂H₅)₄N][*closo*-3,3-(PPh₃)₂-3-Cl-3,1,2-RuC₂B₉H₁₁] (**2**) and [(C₂H₅)₄N][*closo*-3,3-(PPh₃)₂-3-H-3,1,2-RuC₂B₉H₁₁] (**3**), respectively. Complex (**3**) has been shown to catalyze the isomerization of 1-hexene to cis and trans 2-hexene, however, the rate of this catalytic reaction is slow. The molecular structures of both (**2**) and (**3**) have been determined by X-ray diffraction studies. The reaction of (PPh₃)₃RuHCl with Na[9-NC₅H₅-7,8-C₂B₉H₁₀] yields the previously known complex [*closo*-3,3-(PPh₃)₂-3-H-7-NC₅H₅-3,1,2-RuC₂B₉H₁₁], which has also been shown to slowly catalyze olefin hydrogenation and isomerization. Acidification of solutions of (**3**) in ethanol and in acetonitrile yields [*closo*-3,3-(PPh₃)2-3,3-(H)₂-3,1,2-RuC₂B₉H₁₁] (**4**) and [closo-3,3-(CH₃CN)₂-3-(PPh₃)-3,1,2-RuC₂B₉H₁₁] (**5**), respectively. The molecular structures of (**4**) and (**5**) have been determined by single crystal X-ray diffraction studies.

The rhodacarborane catalyzed cleavage of alkenyl carboxylates concommitant with the activation of C-H and Si-H has been previously demonstrated. As an extension of our C-H activation project, we undertook a study aimed at determining the potential for activation of arene C-H bonds by a rhodium catalyst. The rhodium complex [Rh(P(CH₃)₃)₂Cl]₂ was chosen as a candidate for initial catalytic screening. Attempts with vinyl acetate and isopropenyl acetate did not result in the hoped for alkene formation; and the use of aldehydes as hydrogen sources also gave negative results.
