SECTION I. INTRODUCTION

The US Army CECOM Center for Night Vision and Electro-Optics (C²NVEO) is responsible for developing cryogenic coolers for all infrared imaging systems for the Army. C²NVEO also maintains configuration management control of the forward-looking infrared (FLIR) Common Module coolers used in thermal imagers in fielded Army weapon systems such as: M60A3 and M1 Tanks, Bradley Fighting Vehicle System, tube-launched, optically tracked, wire-guided (TOW) Missile System, and Army Attack Helicopters. Currently, there are over 30,000 coolers in fielded systems and several thousand more are added each year. C²NVEO conducts development programs and monitors contractor internal research and development efforts to improve cooler performance such as reliability, audio noise, power consumption, and output vibration. One of these efforts has been the development of a clearance seal HD-1045 cooler for the potential use in the tank and helicopter FLIRs.

The HD-1045 1/4-Watt Split Stirling Cooler was originally designed and developed by the CECOM Center for Night Vision and Electro-Optics (C²NVEO) in the early 1970s as a replacement for the gas bottle/cryostat used on the Manportable Common Thermal Night Sights. To date, however, the HD-1045 cooler has been used in the field in the Integrated Sight Unit (ISU) of the Bradley Fighting Vehicle (BFV) System.

Performance requirements for the HD-1045 are governed by the cooler specification, B2-28A050122A, dated 18 June 1982. The primary specification requirements for this cooler include the ability to maintain a 0.35-watt heat load at 85K at room temperature, cooldown a 1.8 gram copper mass to 85K within 10 minutes over the temperature range of -40°C to +71°C, and operate under steady state conditions with a 0.35 watt heat load applied at room temperature with a power consumption of 30 watts or less.

This report describes the performance and environmental testing that C²NVEO conducted on the RICOR/CRYO-TEK Coolers. The test procedure used throughout the evaluation, "Qualification Test Procedure 1/4-Watt Split Stirling Cooler," has been included in Appendix A for reference. The RICOR/CRYO-TEK coolers have not been subjected to life testing, therefore no mean time to failure (MTTF) is available. The MTTF testing and determination are required prior to the decision being made on whether the coolers are acceptable for use or not.

SECTION II. DESCRIPTION

The environmental evaluation was conducted on two RICOR/CRYO-TEK coolers, S/N 8011 and S/N 013 in accordance with the Qualification Test Procedure in Appendix A. Baseline acceptance tests and leak rates were conducted before and after each environmental test to determine whether or not the units had survived the test. In addition to the environmental tests, C²NVEO conducted audible noise and vibration output testing on the coolers.

A brief description of each test performed is provided in Table 1.

Table 1. Test Description

TEST	REQUIREMENT
Leak Rate	Less than 1.0×10^{-6} std cc/sec helium
Acceptance Test	
— Cooldown	Less than 7.5 min to 100K Less than 10 min to 85K
— Cooling Capacity	0.35 Watt at 85K
— Input Power	Less than 30 watts
Acoustic Noise	Sound pressure levels must be less than specified limits between 125 to 8,000 Hz
Vibration Output	No requirement
Temperature Shock	Rapid temperature changes from -54°C to +71°C every 4 hours for 24 hours total
High Temperature	48 hour soak at +71°C, +71°C operation
Low Temperature	24 hour soak at -57°C, -40°C operation
Mechanical Shock	100 g's peak amplitude for 11 msec
Imposed Vibration	4-5 g's acceleration over 5 to 500 Hz

SECTION III. TEST RESULTS

Both coolers failed audible noise testing at Noise Unlimited and C²NVEO. The coolers exceeded the specification maximum sound pressure levels at 2,000, 4,000, and 8,000 Hz. The vibration output testing was conducted for information purposes; there is no specification requirement. All the environmental tests were successfully completed by S/N 8011 and S/N 013. There were no failures, relevant or otherwise, and all environmental tests were completed without incident. A brief summary of all acceptance testing is shown in Tables 2 and 3.

APPENDIX A TEST DATA

All environmental test data shown in this appendix appears in chronological order, as the tests were conducted. The acoustic noise test data (pages A-46 through A-57) and vibration output data (pages A-58 through A-74) are provided. All cooier testing was conducted using a 1.8 gram copper mass coldstation and an input voltage of 17.5 VDC.

TEST DESCRIPTION

Both coolers were fastened to a rigid fixture and vibrated on three mutually perpendicular axes. The vibration was sinusoidal and its amplitude and frequency were controlled per para 4.3.2.3 and figure 3 of the above cited specification.

Both coolers continued to operate during all tests and maintained a frosted cold finger.

LEAK RATE TEST DATA SHEET

Test Tech. G. DOGGETT Project Eng. _____

Date Time

TEST REQUIREMENT

Conduct Leak Rate Test per paragraph 6.1.1
of this plan.

9 Jun 88

Cooler S/N 013

Charged to operating pressure _____ (initial)
Measured leak rate (1.0×10^{-6} scc/sec air
equivalent at 23C ambient) 2.3×10^{-9

Cooler S/N 8011

Charged to operating pressure _____ (initial)
Measured leak rate (1.0×10^{-6} scc/sec air
equivalent at 23C ambient) 2.5×10^{-9

Cooler S/N _____

Charged to operating pressure _____ (initial)
Measured leak rate (1.0×10^{-6} scc/sec air
equivalent at 23C ambient) _____

MEASUREMENTS TAKEN FOLLOWING THE
MECHANICAL VIBRATION TEST.

Test Sheet 2

TEMPERATURE SHOCK—S/N 8011

TEMPERATURE SHOCK TEST SUMMARY SHEET

Cooler S/N 8011Date: 9 JUNE 88Test Tech. HLD Project Eng. _____

Step	Date	Elapsed Time	Test requirement	Initial
1.0	<u>9 JUN</u>	<u>10:50</u>	Install coolers into test chamber	<u>HLD</u>
2.0		<u>10:50</u>	Adjust chamber ambient to +71C	<u>HLD</u>
3.0		<u>15:15</u>	Verify cooler has soaked for four hours	<u>JKS</u>
4.0		<u>15:15</u>	Place cooler into test chamber that has been pre-cooled to -54C within 5 minutes from 71C	<u>JKS</u>
5.0		<u>19:15</u>	Verify cooler has soaked for four (4) hours at -54C	<u>HLD</u>
6.0		<u>19:15</u>	Place cooler into test chamber that has been pre-heated to 71C within 5 mins. of removing from -54C ambient.	<u>HLD</u>
7.0		<u>23:15</u>	Verify cooler has soaked for four hours at +71C	<u>HLD</u>
8.0		<u>23:15</u>	Place cooler into test chamber that has been pre-cooled to -54C within 5 mins. of removing from +71C ambient.	<u>HLD</u>
9.0	10 JUNE	<u>3:15</u>	Verify cooler has soaked for four hours at -54C	<u>HLD</u>
10.0		<u>3:15</u>	Place cooler into test chamber that has been pre-heated to +71C within 5 mins. of removing from -54C ambient.	<u>HLD</u>
11.0		<u>7:15</u>	Verify cooler has soaked for four hours at +71C	<u>JKS</u>
12.0		<u>7:15</u>	Place cooler into test chamber that has been pre-cooled to -54C within 5 mins. of removing from +71C ambient.	<u>JKS</u>

Temperature Shock Test Summary Sheet (Continued)

Step	Date	Elapsed Time	Test Requirement	Initial
13.	<u>10 JUNE</u>	<u>11:15</u>	Verify cooler has soaked for four hours.	<u>JKS</u>
14.		<u>11:15</u>	Adjust test chamber ambient to +23C	<u>JKS</u>
15.		<u>13:00</u>	Verify test chamber Ambient is 23C	<u>JKS</u>
16.		<u>13:20</u>	Visually inspect cooler for physical damage and record.	<u>JKS</u>
17.	<u>13 JUNE</u>	<u>08:30</u>	Conduct performance test per Para. 6.0 of this test plan	<u>JHD</u>
		<u>2.6×10^{-10}</u>	Std. CC Helium/sec (record)

ACOUSTIC NOISE

C²NVEO DATA

Two RICOR 1/4-Watt Split Rotary Coolers, S/N 8011 and S/N 013, were tested to determine their audible noise levels. The coolers were suspended with rubber bands in the C²NVEO firing range (semi-anechoic room). The ambient octave band sound pressure levels were then recorded with the required DC power supply operating. The cooler was then allowed to cool down. The overall sound pressure level data was then recorded. All measurements were taken at a distance of 1 meter from the cooler. The specification maximum sound pressure levels were then converted to 1-meter levels. As can be seen from the data, both coolers exceeded the maximum levels in +Y and +Z axes at the 2,000, 4,000, and 8,000 center frequencies.

VIBRATION OUTPUT

Self-Induced Vibration Test of RICOR/CRYO-TEK 1/4-Watt Split Cooler

Three RICOR 1/4-Watt Split Rotary CRYO-Coolers were tested to determine the vibration characteristics. The coolers were freely suspended so that the linear and angular restraints would not affect the measurements. The accelerometers were mounted in pairs to facilitate the angular vibration components. From the acceleration measurements, the forces and torques generated by the cooler were determined.

Measurements of the three RICOR coolers show that the primary disturbances generated by the cooler are 1) Forces at the compressor in the direction of the Y and Z axis at the fundamental frequency, 2) A torque about the compressor axis (X AXIS) at the first harmonic, and 3) A force along the coldfinger AXIS at the first, second or third harmonic.

A schematic of the test set up is shown. An aluminum block/collar was clamped around the compressor to facilitate accelerometer mounting. The coldfinger was suspended below the compressor and covered with foam insulation. The cooler was suspended by a bungy cord arrangement that allowed free rotation about the C.G. and free translation. The natural frequency of the suspension system was determined to be less than 5 Hz.

An accelerometer was mounted to the cooler system in one of the positions (X, Y, Z). The linear accelerations along the X, Y, Z axis were determined by measuring the spectrum of the resulting signals with an HP-3561A, dynamic signal analyzer. The force generated by the compressor or coldfinger about the C.G. was determined by multiplying the weight of the cooler system by the measured acceleration. The weight of the cooler and accelerometer mounting block is 2.14 pounds. Thus, if "a" is acceleration, the force is:

$$F_x = 2.14 \times a$$

$$F_y = 2.14 \times a$$

$$F_z = 2.14 \times a$$

The torque generated by the compressor was obtained by coherently summing the accelerometer outputs of two accelerometers. The torque required to generate the measured acceleration was determined by multiplying this measurement by the inertia of the cooler system about the appropriate axis and by dividing by the distance between the accelerometers. The moments of inertia were determined by the bifilar torsional pendulum method.

$$I_{xx} = 0.856 \text{ in-Oz-sec}^2$$

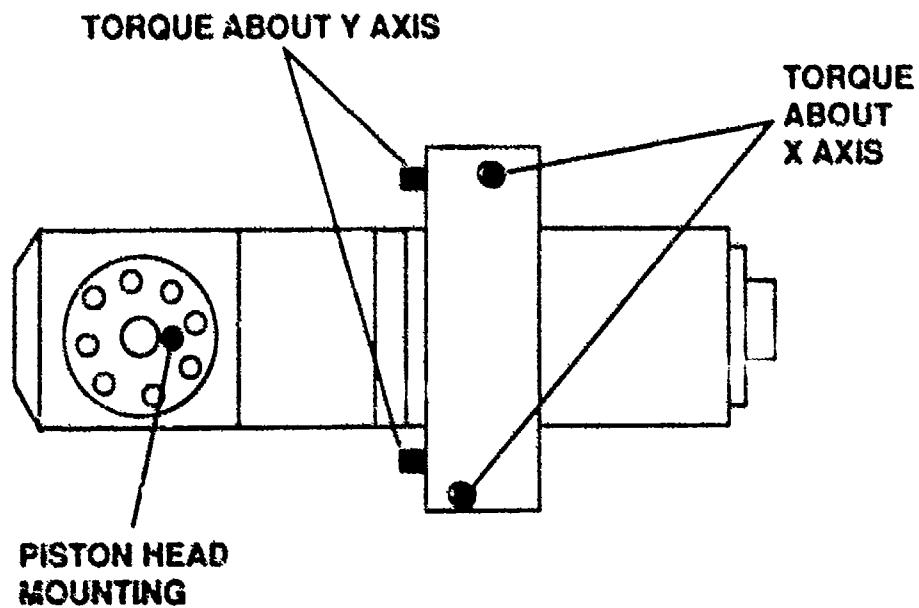

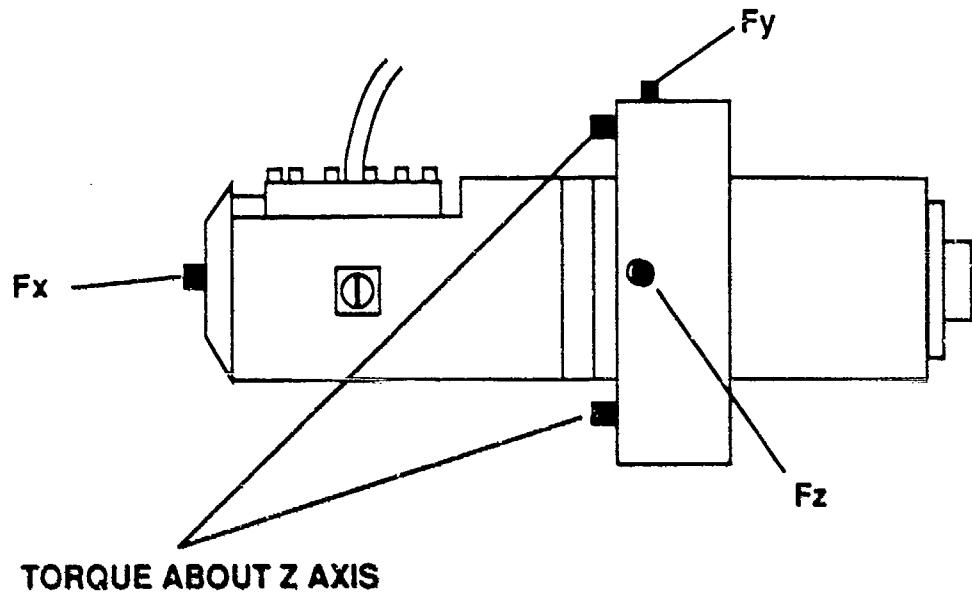

$$I_{yy} = 0.1663$$

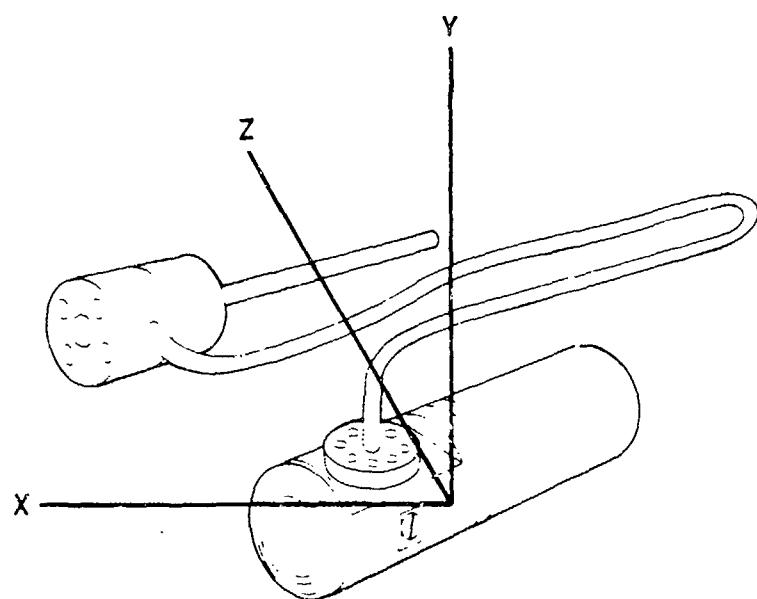

$$I_{zz} = 0.1936$$

Power spectral data for the force and torque measurements are shown in the following graphs.

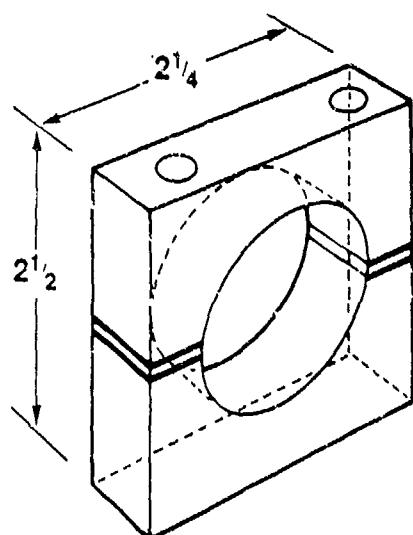

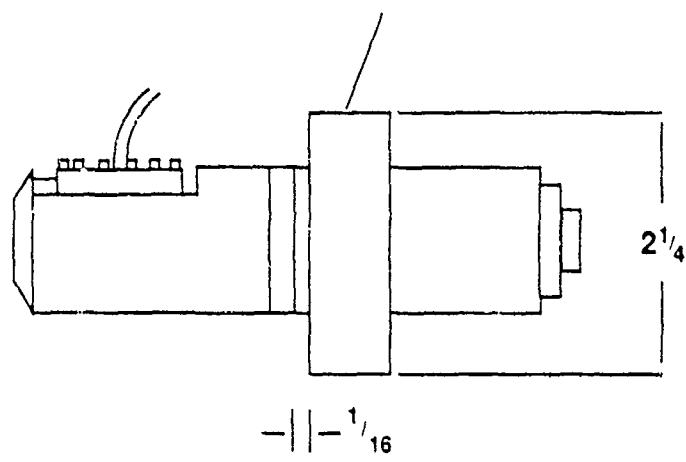

This vibration test was performed to determine the vibration output of the coolers. There is no accept or reject requirement for this test.

DEVELOPMENT SPECIFICATION
FOR
COOLER, CRYOGENIC, SPLIT STIRLING HD-1045 (V) /UA

1. SCOPE

1.1 General. This specification establishes the general performance design, development, and test requirements for the several models of the Coolers, Cryogenic, Split Stirling, HD-1045(V)/UA, hereafter referred to as the cooler.

1.2 Models. Specific coverage of each model of the HD-1045 (V) /UA are contained in specification sheets which are used to supplement this general specification.

2. APPLICABLE DOCUMENTS

2.1 Government documents. The following documents, of the issue in effect on date of invitation for bids or request for proposal, form a part of the specification to the extent specified herein. In the event of conflict between the documents referenced herein and the contents of this specification, the contents of this specification shall be considered a superseding requirement.

ANSI S1.11	Specification for Octave, Half Octave, and Third Octave Band Filter Sets
(American National Standards Institute, Inc., 1430 Broadway, New York, New York 10018)	

Technical society and technical association specifications and standards are generally available for reference from libraries. They are also distributed among technical groups and using Federal agencies.

3. REQUIREMENTS

3.1 Item definition. The cooler shall consist of a compressor assembly, an expander assembly, and a connecting transfer line for cooling an infrared detector and shall interface with the Dewar of the infrared Detector/Dewar package DT-591/UA. Model variations are for length and bend configuration of the transfer line.

3.2 Characteristics.

3.2.1 Performance. Unless otherwise specified herein, the cooler shall meet the specified performance requirements at an ambient temperature of +23°C, $\pm 5^\circ\text{C}$ and a 12-inch line separation. Heat sinking shall be sufficient to limit the crankcase temperature to 20°C above ambient.

3.2.1.1 Cooling capacity. The cooler shall provide the minimum refrigeration capacity at 85 K as shown in figure 1 over the temperature range of -40°C to +71°C.

3.2.1.1.1 Specific Model Cooling Capacity. The specific model cooling capacity at the ambient temperature shall be as specified in the applicable specification sheets.

3.2.1.2 Cooldown time. The cooldown time to reach a cold spot temperature of 100 K with a 1.8 grams minimum copper mass load shall be 7.5 minutes or less. Cooldown to 85 K shall be 10 minutes or less for any temperature over the range of -40°C to +71°C.

3.2.1.3 Input power. The total input power to the cooler shall be as shown in Figure 2. The input voltage shall be 17.5 Vdc ± 0.5 Vdc with a maximum voltage ripple of 10 percent at frequencies of 10 Hz or greater. Starting current shall not exceed 7 amperes for 50 milliseconds (ms) duration.

3.2.1.4 Operating mode. The cooler shall perform as specified in any geometrical orientation.

3.2.1.5 Audible noise. The cooler shall not exceed the noise values tabulated below, when measured at a distance of 5 meters:

Center Frequency (Hz)	Octave Band (Hz)	Maximum Sound Pressure Level (dB) (Reference 0.0002 microbar)
125	87 to 175	49.5
250	175 to 350	48.5
500	350 to 700	43.5
1,000	700 to 1400	35.5
2,000	1400 to 2800	29.5
4,000	2800 to 5600	29.5
8,000	5600 to 11200	26.5

3.2.1.6 Leak rate. The leak rate of helium from the cooler shall not be greater than 1.0×10^{-6} standard (std. cc/sec) cubic centimeters per second (cc/sec) air equivalent at an ambient temperature of +23°C, $\pm 5^\circ\text{C}$.

3.2.2 Physical characteristics.

3.2.2.1 Size. The size and configuration of the cooler shall be in accordance with that specified on drawing SM-0-808551 as modified by the applicable specification sheet for the individual item.

3.2.2.2 Weight. The weight of the cooler shall be less than 2.5 pounds.

3.2.3 Reliability. The cooler shall have a specified mean time between failure (MTBF) of 1,000 hours, θ_0 .

3.2.4 Maintainability. The cooler shall be designed to be maintainable by the Direct/General Support (DS/GS) maintenance level when disassociated from its next higher assembly. The maintenance tasks shall consist of purging and recharging the cooler with helium and repairing/replacing the input power cable and connector. The mean time to repair (MTTR) for the DS/GS tasks shall not exceed 0.5 hour. Potting cure time is not considered within the MTTR definition.

3.2.5 Environmental conditions. The cooler performance shall not be degraded when subjected to the environments specified in table 1.

3.2.6 Transportability. When properly packaged, the cooler can be shipped by common carrier.

3.3 Design and construction.

3.3.1 Materials, processes, and parts. Unless otherwise specified, all parts, materials, and processes used in construction shall be in accordance with MIL-P-11268.

3.3.1.2 Protective coatings and surface treatments. Unless otherwise specified, finishes of machines, case-forged, and welded surfaces shall be the minimum required for proper operation, good appearance, and economy of manufacture. The method of protection shall in no way prevent compliance with other requirements of this specification. Protective coatings shall not be applied to areas which will lose that coating during normal operation, testing, or maintenance. The cooler shall be finished in accordance with the applicable specification sheet.

CODE IDENT: 54490

18 June 1982

3.3.2 Electromagnetic radiation. The cooler, when properly connected for operation shall comply with the following requirements of MIL-STD-461.

		Deviation
RE 01	Radiated emission/magnetic field, 30 Hz to 30 kHz	30 dB
RE 02 BB	Radiated emissions/electric field, 14 kHz to 1 GHz	30 dB
RE 02.1 NB	Radiated emissions/electric field, 14 kHz to 10 GHz	30 dB
*RS 03	Radiated susceptibility/electric field, 14 kHz to 10 GHz	
CE 01	Conducted emissions/dc power leads, 30 Hz to 50 kHz	30 dB
CE 04	Conducted emissions/ac power leads, 50 kHz to 50 MHz	30 dB

The field strengths specified in MIL-STD-461 shall be modified as follows:

0.014 MHz to 2 MHz	10 volts per meter
2 MHz to 75 MHz	50 volts per meter
76 MHz to 10,000 MHz	10 volts per meter

3.3.3 Nameplates and product marking. The cooler parts, components, sub-assemblies, and assemblies thereof, shall be marked for identification per MIL-STD-130, and in accordance with MIL-M-13231, and as specified in the applicable specification sheets. Reference designation markings shall be permanent and in accordance with ANSI Y32.16. To prevent working fluid contamination, internal parts need not be marked.

3.3.4 Workmanship. Workmanship shall be in accordance with MIL-STD-454, Requirement 9.

3.3.5 Interchangeability. Parts shall be functionally and dimensionally interchangeable without selective assembly. The control of interchangeability shall be in accordance with MIL-I-8500. Within the limits imposed by performance, maximum use of parts, tools, and test equipment common to other US Army systems is essential. Compressors and expanders shall be interchangeable from one cooler to another.

3.3.6 Safety. The cooler shall be designed and fabricated to prevent injury to the operator or maintenance personnel. Safety features shall be incorporated so that any component failure will not result in conditions hazardous to personnel, in accordance with MIL-STD-454, Requirement 1. Potentially hazardous areas shall be identified in accordance with MIL-STD-882.

3.4 Documentation. The cooler shall be documented by development and product specifications prepared in accordance with MIL-S-83490 and MIL-STD-490, and by drawings prepared in accordance with DOD-D-1000 and DOD-STD-100. Variations of

cooler models shall be documented with supplemental specification sheets using this specification number with an assigned slash number (i.e. 82-28A050122A/1).

3.5 Logistics.

3.5.1 Maintenance. The maintenance concept allows for a combined DS/GS maintenance level for helium purging/recharging and repair/replacement of the input power cable and connector. No other tasks are to be performed below depot level. Depot level maintenance shall be either Government or contractor performed.

3.5.1.1 Tool and test equipment requirements. The cooler design shall be such that the need for special tools and test equipment for alignment, adjustment and maintenance is kept to a minimum. No special tools or test equipment shall be required for operator/organizational maintenance. Direct/general support maintenance shall be accomplished using standard tools and test equipment and a helium purging/recharging device.

3.5.2 Supply. The cooler shall impose no unique requirements on the supply system. The cooler is intended to be replaced as a unit at DS/GS maintenance level with a minimum of maintenance parts (purge port cover and input power cable) introduced into the supply support system.

3.6 Precedence. The characteristics of the cooler shall have priority as follows:

- a. Performance.
- b. Reliability, maintainability.
- c. Size, weight, configuration.
- d. Transportability.
- e. Safety (should be given consideration equal to each of the characteristics above).

4. QUALITY ASSURANCE PROVISIONS

4.1 General. The inspections in this section shall be conducted by the contractor to verify the performance and design characteristics specified in section 3 and the preparation for delivery requirements in section 5 are met. Quality assurance requirements are divided into four groups; initial source qualification, second source qualification, acceptance inspection, and periodic production inspections. There are five categories of quality assurance inspections; examinations, analyses, demonstrations, environmental tests, and performance tests. Supplemental specification sheets augment the quality assurance requirements herein for specific cooler models.

4.1.1 Responsibility for tests. Unless otherwise specified in the contract, the contractor shall be responsible for the performance of all tests specified herein. Except as otherwise specified, the contractor may use his own facilities. The contractor shall maintain a quality assurance program in accordance

with the requirements of MIL-Q-9858. Inspection records of the examinations and tests shall be kept complete and available to the Government as specified in the contract, and shall include a complete description of each test method and identification of the instrumentation used. The contractor is responsible for ensuring that components and materials used, are tested in accordance with the requirements of this specification and the referenced documents. The Government reserves the right to perform any of the tests set forth in this specification where such tests are deemed necessary to ensure that supplies and services conform to the prescribed requirements.

4.1.2 Special tests and examination.

4.1.2.1 Qualification, initial source. The initial qualification tests of table II shall be performed to prove the item design and the initial source supplier. Failure to meet any of the inspections of table II shall constitute failure of qualification.

4.1.2.2 Qualification, second source. The second source qualification tests of table II shall be performed to prove the capability of a second source supplier to manufacture a specific cooler without requalification of the item design. Failure to meet any of the second source inspections of table II shall constitute failure of qualification.

4.1.2.3 Acceptance inspections. Each cooler submitted for acceptance shall be subjected to the acceptance inspections of table II following the run-in of 4.1.2.5. Failure to meet any of the acceptance inspections of table II shall be cause for rejection of that cooler.

4.1.2.4 Periodic inspections. Coolers shall be sampled on a monthly basis for the periodic inspections of table II as follows:

<u>Monthly lot size</u>	<u>Number of sample units</u>
1-9	0
10-99	1
100-299	3
300-499	5
500-999	7
1000 or more	10

Failure to meet any of the periodic inspections of table II shall constitute failure of that monthly lot.

4.1.2.5 Run-in. An 8 hour continuous run-in shall be performed prior to acceptance test.

TABLE II. Quality Conformance Inspection.

4.1.3 Test conditions. Unless otherwise specified, the cooler shall be operated at an ambient temperature of +23°C, $\pm 5^\circ\text{C}$ using a 12-inch line separation. Adequate heat sinking or convective cooling shall be provided to ensure that the crankcase temperature does not exceed 20°C above ambient temperature.

4.2 Quality conformance inspection.

4.2.1 Performance tests.

4.2.1.1 Cooling capacity. The cooling capacity shall be measured by attaching to the cooler a test Dewar which is evacuable and contains temperature sensors and heating elements required to apply heat load. The cooler shall also have a copper mass of 1.3 grams minimum attached directly to the expander. Heat load shall be applied after achieving cooldown and capacity shall be measured not less than thirty minutes later. Failure to meet the requirements of 3.2.1.1 shall constitute failure of this test.

4.2.1.2 Cooldown time. Cooldown time shall be measured using the test Dewar and thermal mass described in 4.2.1.1. Failure to meet the requirements of 3.2.1.2 shall constitute failure of this test.

4.2.1.3 Input power. Input power shall be measured during the cooling capacity test of 4.2.1.1. Failure to meet the requirements of 3.2.1.3 shall constitute failure of this test.

4.2.1.4 Operating mode. The cooler shall be operated in the horizontal and vertical axes for a minimum of five minutes per axis with the test Dewar and thermal mass described in 4.2.1.1. Failure of the cooler to maintain the expander temperature at or below 85 K shall constitute failure of this test.

4.2.1.5 Audible noise. The cooler shall be set up in an area where the background noise level is not greater than 10 dB below the sound level to be measured. The cooler shall be operated and sound pressure measurements recorded with the cooler oriented for maximum sound level output. Measurements shall be made using an octave band analyzer with characteristics which comply with ANSI S1.11. Failure to meet the requirements of 3.2.1.5 shall constitute failure of this test.

4.2.1.6 Leak rate. The cooler shall be charged with helium to its normal operating pressure, allowed to set for at least one hour, and placed into a test chamber. Using a mass spectrometer, the leak rate shall be measured. Failure to meet the requirement of 3.2.1.6 shall constitute failure of this test.

4.2.2 Physical examinations.

4.2.2.1 Size. The cooler shall be examined for conformance to the dimensional controls of cited drawings. Failure to meet the requirements of 3.2.2.1 shall constitute failure of this examination.

4.2.2.2 Weight. The cooler shall be weighed on a scale having an accuracy of ± 0.05 pound. Failure to meet the requirement of 3.2.2.2 shall constitute failure of that examination.

4.2.3 Reliability. Cooler reliability shall be demonstrated in accordance with MIL-STD-781B, Test Plan IV A, test cycle paragraph 5.2.3.1 and figure 4. Failure to meet the requirement of 3.2.3 shall constitute failure of that demonstration.

4.2.4 Maintainability. Maintainability shall be verified by analysis in accordance with Military Handbook 472, method 2, procedure II.

4.2.5 Environmental tests. The cooler shall be subjected to the environments specified in table I at the levels specified in accordance with the specified procedure of MIL-STD-810. Failure to meet the acceptance inspections (performance) of table II following the individual test shall constitute failure of that test.

4.2.6 Transportability. When packaged as specified in section 5, the cooler shall be analyzed to determine if the requirement of 3.2.6 is satisfied. Failure to meet the requirement of 3.2.6 shall constitute failure of that analysis.

4.3 Design and construction inspections.

4.3.1 Materials, processes and parts. The cooler shall be examined for compliance with 3.3.1. Failure to meet the requirement of 3.3.1 shall constitute failure of that examination.

4.3.2 Electromagnetic radiation. The cooler shall be subjected to the tests of 3.3.2. Failure to meet the requirements of 3.3.2 shall constitute failure of that environmental test.

4.3.3 Nameplates and product markings. The cooler shall be examined to verify nameplates and product marking. Failure to meet the requirements of 3.3.3 shall constitute failure of that examination.

4.3.4 Workmanship. The cooler shall be examined for workmanship. Failure to meet the requirements of 3.3.4 shall constitute failure of that examination.

4.3.5 Interchangeability. The cooler shall be examined for interchangeability. Failure to meet the requirements of 3.3.5 shall constitute failure of that examination.

4.3.6 Safety. The cooler shall be analyzed for safety. Failure to meet the requirements of 3.3.6 shall constitute failure of that analysis.

32-28A050122A
CODE IDENT: 54490
18 June 1982

4.4 Documentation. The cooler technical data package shall be examined. Failure to meet the requirements of 3.4 shall constitute failure of that examination.

4.5 Logistics. The cooler shall be analyzed for logistics. Failure of the cooler to meet the requirements of 3.5 shall constitute failure of that analysis.

4.6 Inspection of packaging. Packaging shall be inspected in accordance with MIL-P-116 to determine compliance with the requirements of section 5.

5. Preparation for delivery.

5.1 Preservation. Preservation shall be as specified in MIL-STD-726, coded as follows:

5.1.1 Level A. 10-1-1-00-00-NS-X-ED-9-00-A.

5.1.2 Level B. 10-1-1-00-00-NS-X-ED-9-00-B.

5.2 Packing and marking. Packing and marking shall be in accordance with MIL-E-55585.

6. NOTES

6.1 Intended use. The cooler is intended for use in infrared systems. Installation may require additional heat sinking or forced-air cooling for the compressor depending upon the system/cooler interface.

6.2 Ordering data. Procurement documents should specify the following:

- a. Title, number and date of this specification.
- b. Title, number and date of an applicable specification sheet.
- c. Qualification of either initial or second source are required (4.1.2).
 - (1) Time frame for submission of qualification test reports.
 - (2) Time frame for approval of qualification test reports.
- d. Production delivery schedule.
 - (1) Defined in terms of monthly lots.
 - (2) Actions relative to periodic inspection failures (see 4.1.2.4).
- e. Level A or level B preservation and packaging.
- f. MIL-STD-810B may be used in lieu of the current revision of MIL-STD-810 for the shock and vibration environmental tests of 3.2.5.
- g. Requirement for contractor-generated, Government-approved acceptance test procedure.

1.0 SCOPE:

This document establishes the procedure to be followed for Qualification Testing of the item described in Paragraph 4.0 below.

2.0 APPLICABLE DOCUMENTS:

The following documents of revision shown form a part of this Test Procedure to the extent specified herein. In the event of any conflict between this document and the documents specified herein, this document shall take precedence.

B2-28A050122A, Development Specification for Cooler, Cryogenic, Split Stirling, HD-1045 (V)/UA dated 18 June 1982.

MIL-STD-810B, Environmental Test Methods.

MIL-STD-461, Electromagnetic Emission and Susceptibility Requirements.

MIL-STD-45662, Calibration Methods.

ANSI S1.11-1971, Specification for Octave, Half Octave, and Third Octave Band Filter Sets.

3.0 QUALITY ASSURANCE PROVISIONS:

3.1 Test Facilities

Facilities providing testing shall be certified capable to meet the test requirements of MIL-STD-810B. In addition to CRYO-TEC's internal testing, RICOR Ltd. Israel and Night Vision and Electro-Optics Center, Atlantic Research will be used for the EMI testing and Noise Unlimited will be used to provide the Acoustic noise testing as necessary.

3.2 Test Surveillance

CNVEO will provide test surveillance/auditing to certify accuracy of data collected including verification of test equipment, instrumentation, tooling and test fixturing shall be verified capable of meeting MIL-STD-45662, Calibration standards where applicable. Night Vision and Electro-optics Center will be the qualifying agency. CRYO-TEC will witness all testing and coordinate the effort.

4.0 TEST ITEMS:

The test items shall be (5) five coolers, Cryogenic, 1/4 watt Miniature Split Stirling Model No. CT 45 (RICOR 516) herein known as the coolers or Units Under Test (UUT). Each cooler consists of a compressor, expander, and a 12 inch connecting tube which will interface with a DT-S91/UA Detector/Dewar.

Three coolers will be subjected to the Reliability tests to determine the reliability of the product, and two will be subjected to the environmental conditions as prescribed in MIL-STD-810B. One of the environmental samples will be tested for EMI and audio security.

5.0 PHYSICAL CHARACTERISTICS:

5.1 Size

The cooler shall conform to the dimensions and configuration of drawing SM-D-808551

5.2 Weight

The weight of the cooler will be 2.5 lbs. or less when weighed on a scale having an accuracy of ± 0.05 lbs.

6.0 PERFORMANCE TESTS:

6.1 Tests and Performance Criteria

6.1.1 Leak Rate

The cooler leak rate shall not exceed 1.0×10^{-6} standard cubic centimeters per second air equivalent at an ambient temperature of +27 degrees centigrade ± 5 degrees C.

Leak tests will be performed on all coolers submitted for testing using a helium leak detector.

6.1.2 Cool Down Time

The cool down time to reach a temperature of 100 with a 1.8 grams minimum copper mass load shall be 7.5 minutes or less. Cooldown to 85 shall be 10 minutes or less for any temperature over the temperature range of -40 degrees C to +71 degrees C.

6.3.6 Heat sinking of the coolers shall be sufficient to limit the housing temperature to 20 degrees C above ambient.

6.3.7 Temperatures to be monitored shall be measured using T type thermocouples or by electronic thermometers mounted at the following locations:

1. Cooler housing (cooler temp)
2. Centrally located within the test chamber (chamber ambient)

6.4 Test requirement

The test shall consist of instrumenting the coolers as in paragraph 6.3 above to measure the cooldown time, refrigeration capacity, and input power of the coolers. The following performance data shall be measured and recorded on the Performance Test Data sheet at start-up and at each required time interval during test.

1. Elapsed time from start-up, Min-Sec.
2. Test chamber ambient temp, degrees C
3. Cooler Housing Temperature degrees C
4. Applied Heat Load, Watts
5. Coldfinger temp, degrees F
6. Applied Voltage, VDC
7. Input Current, Amps.
8. Test Dewar Vacuum (Torr)
9. Coldfinger Attitude, horizontal/vertical

Performance testing shall begin subsequent to the coolers having reached stabilization temperature. The coolers shall be considered to have reached stabilization when the coldfinger temperature is within ± 3 degrees of the test chamber ambient or has soaked at the required ambient temperature for four hours in a non-operating mode.

6.5 Performance Test Procedure

Insure that the coolers are instrumented in accordance with para. 6.3 of this test plan.

Step 1: Establish test set-up as outlined

Step 2: After the coolers have stabilized at the required ambient temperature, energize the coolers by applying 17.5 $\pm .5$ VDC to the input terminals of the coolers. The starting current shall be monitored with an oscilloscope. Verify that the input current does not exceed 7.0 amps for a period of 50 milliseconds (ms). With no heat load applied to the coldfinger, allow the cooler to cool down.

NOTE

The input voltage shall be monitored for ripple by applying a simulated nominal resistive load across the power supply output terminals and measuring the voltage ripple with an oscilloscope. AC component of voltage shall be less than 1.7 volts peak to peak at frequencies greater than 10 Hz. Record findings on the Input Power Test Data Sheet.

Step 1. Allow cooldown with no applied heat load to the coldfinger. Record data on the Performance Test Data Sheet immediately after start-up and when the coldfinger temperature reaches BSI. This procedure will be repeated for each ambient temperature specified. This shall conclude the cooldown test.

Step 4. Allow the cooler to operate for 20 minutes with no applied heat load. After 20 minutes has elapsed, record all applicable data on the Performance Test Data Sheet.

Step 5. After 20 minutes of operation, apply the required heat load which correlates to the ambient temperature of the test being performed. Allow the cooler to operate for another 20 minutes.

Step 6. Record data on the Performance Test Data Sheet at the time the heat load is applied and at 10 minutes intervals end at the end of the required time period. This shall conclude the Cooling Capacity Test.

Step 7. De-energize the coolers.

7.0 DEMONSTRATION TESTS

7.1 Operating Mode

7.1.1 Test purpose

The operating test shall be performed to verify the ability of the coolers to perform as specified in the B2 Specs. when operated in the horizontal and vertical axis as defined in this test procedure.

7.1.2 Acceptance criteria

The coldfinger temperature shall not rise above BSI when the coldfinger is in the horizontal or vertical attitudes respectively.

6.1.3 Cooling capacity

The coolers shall provide the minimum net refrigeration capacity at 85K as shown in figure 1 over the temperature range from -40 C to +71 C.

6.1.4 Input Power

The Power consumed by each cooler shall be in accordance to the chart shown in figure 2

6.2 Test Purpose

Performance testing shall be performed to verify cooler performance before, during, and after exposure to the various environmental conditions as required by this test plan. The performance test data taken after exposure to an environmental test may be used as the performance test data to be taken before the next environmental test provided that the environmental test is run within 48 hours.

6.3 Test Instrumentation

6.3.1 Those parts of the test fixtures and test equipment that are in contact with the coolers shall be visually inspected prior to and during use to insure that they are free of oil, grease, soil, or other contamination. All test instrumentation used shall be calibrated within the requirements of MIL-STD-45652.

6.3.2 The thermal mass applied shall be as defined in the Developement Specification E2-28A150122A. The mass shall include a silicon diode (temperature sensor) and an integral heater shall have a total mass of 1.8 grams of copper over the temperature range of 70K to 80K.

6.3.3 Each coldstation will be immersed in an ice bath and a liquid nitrogen bath to establish the calibration curve.

6.3.4 The electric voltage for operating the coolers will be set at 17.5VDC $\pm .5$ VDC with a maximum voltage ripple of 10 % at frequencies of 10 Hz or greater. Starting current shall not exceed 7 amperes for 50 milliseconds (ms) duration.

6.3.5 Prior to the start of performance testing the dewar assembly shall be evacuated to a vacuum level of 1.0×10^{-4} Torr or better.

7.1.3 Test Procedure:

Step 1. Instrument coolers in accordance with paragraph 6.3 of this test plan.

Step 2. Establish the test set-up as previously outlined.

Step 3. Mount the coolers in the test chamber with the cold finger and the compressor in the X axis. See figure 5.

Step 4. Energize the coolers by applying 17.5 ± 5 Volts D.C. to the input terminals of the coolers.

Step 5. Repeat the test as outlined in paragraph 6.5 step 5.

Step 6. De-energize the coolers.

Step 7. Rotate the coolers and place the coldfinger and the compressor in the Y axis. See figure 5.

Step 8. Repeat the previous test for ambient temperature and heat load.

This concludes the Operating Mode Test.

7.2

AUDIO SECURITY

7.2.1 Test purpose

The Audio Security test shall be performed on the cooler to determine the sound pressure levels emitted from the cooler over various frequency bandwidths. The qualifying agency has the option to choose the cooler to undergo Audio Security Testing; should the option not be exercised CFVC-TER will make the choice.

7.2.2 Acceptance Criteria:

The cooler shall not exceed the noise levels tabulated below, when measured at a distance of 5 meters:

Center Frequency	Octave Band (Hz)	Pressure Level (SPL) .0001 dB
125	87 to 175	49.5
250	175 to 350	49.5
500	350 to 700	47.5
1,000	700 to 1,400	45.5
2,000	1,400 to 2,800	49.5
4,000	2,800 to 5,600	49.5
8,000	5,600 to 11,200	45.5

7.2.3 Test Requirement:

The Audio Security test will be performed in an anechoic chamber where the background noise level will be limited to at least 10 db below the sound pressure levels to be measured.

7.2.4.1 Test Data:

Test data shall be obtained using an octave band analyzer which complies with ANSI S1.11. The cooler shall be energized by applying 17.5 ± 5 Volts D.C. to the input terminals of the cooler. Using a hand held Octave Band Analyzer, the cooler shall be surveyed to determine the location of the area of maximum noise generation. The maximum sound pressure values measured at 5 meters shall not exceed the values of the above table.

7.3 MECHANICAL VIBRATION OUTPUT:

7.3.1 Test Procedure:

The Mechanical vibration Output Test shall be performed to determine the vibration output of the cooler when monitored at various frequencies.

7.3.2 Acceptance Criterion:

There is no accept or reject requirement for this test.

7.3.3 Test Requirements:

The cooler shall be vertically suspended such that the fundamental frequency of the cooler is 7.5% higher than the natural frequency of the suspension system.

7.3.4 Test Procedure:

Step 1. Establish Test set-up.

Step 2. Turn on fan.

Step 3. Energize the cooler by applying 17.5 ± 5 Volts D.C. to the power input terminals of the cooler. Record start time on the Mechanical vibration vibration Test Sheet.

Step 4. Allow both cooler and fan to operate for 10 minutes.

Step 5. De-energize fan. Record time on Data Sheet.

Step 6. Measure G2/Hz at frequency per figure

Step 7. De-energize cooler and permit cooler to assume ambient temperature.

Step 8. Repeat steps 1, 4, and 5.

Step 9. Measure G2/Hz at frequency per figure 5 (Z axis) and record data.

Step 10 repeat steps 7, 8, 4, and 5.

Step 11. Measure G2/Hz at frequency per figure 5 (X axis) and record data.

Step 12 De-energize cooler.

This concludes the Mechanical Vibration Test.

8. ENVIRONMENTAL TESTS

8.1 Electromagnetic Radiation:

8.1.1 Test Purpose:

The Electromagnetic Radiation Test shall be performed on one (1) cooler to determine the deviation levels of radiated emission susceptibility at specified frequencies and field strengths.

8.1.2 Acceptance Criteria:

The cooler when properly connected for operation, shall comply with the following radiated emission and susceptibility requirements of MIL-STD-461:

FE11	Radiated Emission/Magnetic Field 10 Hz to 10 KHz	dBc
FE12-5B	Radiated Emission/Electric Field 10 Hz to 1 GHz	dBc
FE12-1-1B	Radiated Emission/Electric Field 10 Hz to 10 GHz	dBc
SE50T	Radiated Emission Susceptibility/ Electric Field (4 KHz to 10 GHz)	dBc
CE01	Conducted Emissions/DC Power Leads 10 Hz to 50 KHz	dBc
CE04	Conducted Emissions/AC Power Leads 50 KHz to 50 MHz	dBc

* The field strengths specified in MIL-STD-461 shall be specified as follows:

0.014 MHz to 2 MHz	10 Volts per meter
2 MHz to 70 MHz	50 Volts per meter
70 MHz to 10,000 MHz	100 Volts per meter

Conduct a performance test per paragraph 5.4. of this plan.

8.2 Temperature Shock

8.2.1 Test Purpose

The Temperature Shock Test shall be conducted to determine the effect of sudden changes in temperature of the surrounding atmosphere on the coolers.

8.2.2 Acceptance Criteria

The coolers shall satisfy the requirements of paragraph 6.1 of this test plan.

8.2.3 Test Requirement-

The Temperature Shock Test shall be performed in accordance with MIL-STD-810B, Method 503.1, Procedure 1, with the exception of temperature extremes will be limited to +71 degrees C \pm 5 degrees C and -54 degrees C \pm 5 degrees C.

8.2.4 Test Procedure

Step 1. Install the coolers into the temperature chamber and raise the test chamber temperature to 71 degrees C \pm 5 degrees C. Allow the coolers to soak at this temperature for four (4) hours minimum or until the coolers stabilize.

Step 2. After four (4) hours minimum exposure to the high ambient soak, move the system into a test chamber with an ambient temperature of -54 degrees C \pm 5 degrees C within 5 minutes.

Step 3. Allow the coolers to soak at this temperature for four (4) hours minimum or until the coolers stabilize.

Step 4. After four (4) hours minimum exposure to the low ambient soak, return the coolers to the test chamber set at 71 degrees C \pm 5 degrees C within 5 minutes.

Step 5. Allow the units to soak at this temperature for four (4) hours minimum or until the unit stabilizes.

Step 6. Repeat steps 2 thru 5

Step 7. Repeat steps 2 and 3.

Step 8. Raise the test chamber temperature to 27 degrees C \pm 5 degrees C and allow the coolers to stabilize at standard room ambient conditions.

Step 9. Visually inspect for any evidence of mechanical damage or deterioration. Record any abnormal findings on the Temperature Shock Test Summary Sheet

Step 10. Conduct a performance test per paragraph 6.0 & break test

This concludes the Temperature Shock Test.

8.3 THERMAL EXPOSURE

8.3.1 High Temperature

8.3.1.1 Test purpose

The High Temperature Test shall be performed to determine the resistance of the coolers to elevated temperatures that may be encountered during service life.

8.3.1.2 Acceptance Criteria

The coolers shall satisfy the requirements of paragraph 6.1 (at +23 degrees C \pm 5 degrees C and + 71 degrees C \pm 5 degrees C) of this test plan.

8.3.1.3 Test Requirement

The high Temperature test shall be performed in accordance with MIL-STD-810B, method 501.1, procedure 1.

8.3.1.4 Test Procedure

Step 1. Install the cooler, instrumented for operation, per paragraph 6.1, into a temperature chamber capable of achieving + 71 degrees C minimum (temperature rate shall not exceed 10 degrees C/min.)

Step 2. Raise the chamber ambient temperature to + 71 degrees C \pm 1.4 degrees C.

Step 3. Allow the coolers to soak at +71 degrees C \pm 1.4 degrees C for a period of forty eight (48) hours.

Step 4. Ensure that the cooler has stabilized at + 71 degrees C. Operate the cooler in accordance with paragraph 6.0 of this test plan and record the results.

Step 5. Lower the test chamber ambient to allow the coolers (non-operating) to return to standard room temperature.

Step 6. Visually inspect the coolers for any evidence of mechanical damage or deterioration. Record any abnormal findings on the High Temperature Test Summary Sheet.

Step 7. Conduct the performance test at 23 degrees C \pm 5 degrees C per paragraph 6.0 of this test plan. Record the results of paragraph 6.1.1 on the High Temperature Test Summary Sheet.

This concludes the High Temperature Test.

8.3.2 Low Temperature

8.3.2.1 Test Purpose

The low temperature test shall be performed to determine the resistance of the coolers to low temperatures that may be encountered during service life.

8.3.2.2 Acceptance Criteria

The coolers shall satisfy the requirements of paragraph 6.1 (at -40 degrees C and 27 degrees C \pm 1.4 degrees C) of this test plan.

8.3.2.3 Test Requirement

The Low Temperature Test shall be performed in accordance with MIL-STD-810B, Method 502.1, Procedure 1.

8.3.2.4 Test Procedure

Step 1. Install the coolers instrumented for operation per Paragraph 6.3, into a Temperature Chamber capable of achieving -57 degrees C minimum.

Step 2. Lower the temperature in the test chamber to -57 degrees C \pm 1.4 degrees C (temperature rate shall not exceed 10 degrees C/10 min). Soak for twenty four hours.

Step 3. After the completion of the twenty four hours soak at -57C \pm 1.4 degrees C, visually inspect the coolers for any evidence of mechanical damage or deterioration. Record any abnormal findings on the Low Temperature Test Summary Sheet.

Step 4. Raise temperature to -40 and allow coolers to stabilize.

Step 5. Conduct performance test at -40C \pm 1.4 degrees C per paragraph 6.0 of this test plan. Record the results of paragraph 6.1.1 on the Low Temperature Test Summary Sheet.

Step 6. Raise the temperature in the test chamber to allow the cooler to return to room ambient conditions and stabilize.

Step 7. Conduct performance test at +27 degrees C \pm 3 degrees C per paragraph 6.0 of this plan. Record the results of paragraph 6.1.1 on the Low Temperature Summary Sheet.

Step 8. Visually inspect the cooler for any visible mechanical damage or deterioration. Record any abnormal findings on the Low Temperature Summary Sheet.

This completes the Low Temperature Test.

8.4

MECHANICAL SHOCK8.4.1 Test Purpose:

The Mechanical Shock Test shall be performed to determine if the coolers are constructed to withstand the expected dynamic shock stresses and that performance degradations will not be produced by the service shock environment expected in handling, transportation, and service use. The coolers shall be operated during shock test.

8.4.2 Acceptance Criteria:

The Cooler shall satisfy the requirements of paragraph 6.1 (at 27 C \pm 5 degrees C) of this test plan.

8.4.3 Test Requirement:

The Mechanical Shock Test shall be performed at 27 degrees C \pm 5 degrees C in accordance with MIL-STD-816B Method 516.2 Procedure IV, High Intensity Test. The coolers shall operate continuously during the shock portion of the test.

8.4.4 Test Procedure:

Step 1. Install a dummy load onto the shock test fixture to simulate the expected mass that will be encountered when the actual unit is installed onto the test fixture.

Step 2. Attach the test fixture and the dummy load to the moving element of the Shock Test Machine.

Step 3. Calibrate the Shock Test Machine to assure conformance to the specified waveform. Two consecutive shock applications to the dummy load shall fall within the specified tolerance envelope prior to installation of the coolers. The calibration shall conform to figure 516-1 100g for 10 ms duration.

Step 4. After the Shock Test Machine has been calibrated for conformance to the waveform, the coolers shall be installed onto the test fixture in the place of the dummy load.

Step 5. Energize the coolers and allow cooldown without the thermal mass or thermal load for ten (10) minutes.

Step 6. Apply Two (2) shocks in direction of three mutually perpendicular axles for a total of twelve (12) shock pulses. Axis identification is shown in figure 5.

Step 7. De-energize coolers.

Step 8. The coolers shall be visually inspected for any evidence of mechanical damage or deterioration. Any abnormal findings shall be recorded on the Mechanical Shock Test Summary Sheet.

Step 9. Upon completion of the Mechanical Shock Test the performance test described in paragraph 6.0 of this test plan shall be conducted at 27 degrees C \pm 5 degrees C. Record the results of 6.1.1 on the Mechanical Shock Test Summary Sheet.

This concludes the Mechanical Shock Test.

8.5 Mechanical Vibration:

8.5.1 Test Purpose:

The Mechanical Vibration Test shall be performed to determine if the coolers are constructed to withstand the expected dynamic vibrational stresses that may be encountered during service life. These coolers will be operated during this test.

8.5.2 Acceptance Criteria:

The coolers shall satisfy the requirements of paragraph 6.1 (at 27 C \pm 5 degrees C) of this test plan.

8.5.3 Test requirement:

The Mechanical Vibration Test shall be performed at 27 degrees C \pm 5 degrees C in accordance with MIL-STD 810B, Method 5124.2 procedures I & VIII, and conform to the vibration profile in figure 7. Cycle time of 120 minutes per axis with a dwell time of 1/6 cycling at each resonance. The accelerometer shall be affixed to the cooler mounting fixture.

8.5.4 Test Procedure:

Step 1. Mount the coolers onto the vibration machine with the cold finger and the compressor in the X axis. See figure 5.

Step 2. Energize the cooler and allow cooldown for 10 minutes with no thermal mass or thermal load. Record all applicable data on the Mechanical Vibration Test Summary Sheet.

Step 3. Energize the Vibration Machine and conduct a resonance search at an input level of 1g from 5-500 Hz. Record all resonant frequencies encountered.

Step 4. Select the four (4) most severe resonants recorded in step 3 and perform a resonant dwell for 20 minutes at the frequency levels specified.

Step 5. Energize the Vibration Machine in accordance with the appropriate vibration profile.

Step 6. Allow the coolers to vibrate in this axis for 120 minutes.

Step 7. De-energize the Vibration machine and the coolers.

Step 8. Remove the coolers from the vibration machine and visually inspect them for any evidence of mechanical damage or deterioration. Record any abnormal findings on the Mechanical Vibration Test Summary Sheet.

Step 9. Instrument the coolers per paragraph 6.3 of this test plan and mount the coolers in the Y axis. See figure 5. Repeat steps 2,3 and 4 in the Y axis.

Step 10. Energize the coolers and allow cooldown for 10 minutes with no thermal mass or thermal load.

Step 11. Energize the vibration machine in accordance with the appropriate vibration profile.

Step 12. Allow the coolers to vibrate in this axis for 120 minutes.

Step 13. De-energize the vibration machine and remove the coolers. Inspect the coolers for any physical damage and record the results on the Mechanical Vibration Test Summary Sheet.

Step 14. Instrument the coolers per paragraph 6.7 of this test plan and mount the coolers in the Z axis. See figure 5. Repeat steps 2,7 and 4 in the Z axis.

Step 15. Energize the coolers and allow cooldown for 10 minutes with no thermal mass or thermal load.

Step 16. Energize the vibration machine with the appropriate vibration profile.

Step 17. Allow the coolers to vibrate in this axis for 120 minutes.

Step 18. De-energize the vibration machine and remove the coolers. Inspect the coolers for any physical damage and record the results on the Mechanical Vibration Test Summary Sheet.

Step 19. Conduct a performance test per paragraph 5.0 of this test plan.

10. The following tests were omitted for reasons assigned. If these tests were stringently required by the Army, CRYO-TEK would gladly submit to your request.

SOLAR RADIATION: The component parts are buried in the system and are not subjected to direct solar radiation.

FUNGI: Materials used in the fabrication are not affected by nor do they promote fungus growth.

SALT FOG: The materials are selected so as not to be susceptible to the effects of Salt Fog.

DUST: The unit is sealed so as not to allow infusion of dust and sand into the working area.

LEAKAGE: (IMMERSION) The units are sealed and do have a positive internal pressure therefore preventing any contamination by water leakage.

Temperature- Humidity- Altitude: The unit is a positive pressured vessel and is not affected by the Altitude. The materials used in the construction of the coolers do not lend them to be affected by Temperature and Humidity.

11.0 A Reliability Test Plan will be submitted along with this procedure.

TEST REQUIREMENT

INITIAL

- 1.0 Instrument cooler per paragraph 6.3 of this plan. _____
- 2.0 Establish test set-up _____
- 3.0 Verify power supply meets the voltage ripple requirements of paragraph 6.1.4 of this plan. _____
- 4.0 Energize cooler and record the following data:
- o Input voltage _____ VDC
 - o Starting current _____ Amps
 - o Duration of starting current _____ Ms
- 5.0 Record data when the cold tip reaches 80K
- o Input voltage _____ VDC
 - o Current _____ Amps
 - o power _____ Watts
- 6.0 Apply sufficient heat load to maintain a cold tip temperture of 80K. Allow cooler to operate for an additional 30 min. _____
- 7.0 At the end of 30 mins. record the follwing data:
- o Input voltage _____ VDC
 - o Current _____ Amps
 - o Power _____ Watts
 - o Cold tip temp. _____ Degrees K
 - o Applied heat load _____ Watts

8.0 De-energize cooler
