Statistics of a chi-square random variable obtained from independent Gaussian samples with a non-zero mean and arbitrary variance

Richard K. Brienzo

Marine Physical Laboratory Scripps Institution of Oceanography University of California, San Diego San Diego, CA. 92152

ABSTRACT

The mean and variance of a chi-square random variable are generally given for the case in which the chi-square random variable is derived from a process having a zero mean and unit variance. In this report, the mean and variance of the random variable found by squaring and summing N samples of an independent Gaussian process with a non-zero mean and arbitrary variance is derived.

Statistics of a chi-square random variable obtained from independent Gaussian samples with a non-zero mean and arbitrary variance

1. Introduction

In this report, general expressions are derived for the mean and variance of a random variable that is found by squaring and summing N independent samples of a Gaussian process x_i , which has a non-zero mean and an arbitrary variance (i.e. $\sum_{i=1}^{N} x_i^2$).

A common structure which generates such a random variable is an energy detector (Figure 1). Each output sample is obtained by squaring and summing N input samples. This is the optimal detector for an unknown signal buried in white Gaussian noise, and is often used as a post-processor for other routines (for example, the output of a beamformer may be run through an energy detector to determine if a signal is present).

Figure 1. Energy detector. Finds the energy in N samples of x(n). Eac. Suppose sample is produced by squaring and summing N input samples.

Chi-square random variables

Let z_1, z_2, z_3, \dots be normally distributed, independent random variables with zero mean and a variance of one, and define a new random variable

$$\chi_N^2 = z_1^2 + z_2^2 + z_3^2 + \dots + z_N^2$$
(1)

The variable in (1) is called a chi-square random variable with N degrees of freedom. The density function of χ_N^2 approaches that of a normally distributed random variable for large N (N > 30), and is non-symmetric for smaller N. The mean and variance of the chi-square random variable in (1) is given by [1, page 105].

$$\mu_{\chi_N^2} = E\left\{\chi_N^2\right\} = N \tag{2}$$

$$\sigma_{\chi\bar{\chi}}^2 = v \, a \, r \left[\chi_N^2\right] = 2 \, N \tag{3}$$

Details about the density and distribution functions may be found in [1, Section 4.2.2]. Random variables with a non-zero mean that are squared and summed have a non-central chi-square distribution [3,4].

A time series x can always be transformed to have a mean of zero and variance equal to one by defining the standardized variable z_i to be

$$z_i = \frac{x_i - \mu}{\sigma} \tag{4}$$

In some cases, it is desirable to find the statistics of the random variable formed by squaring and summing N values of x, which does not necessarily have a zero mean or variance equal to one. In the next section, general expressions for the mean and variance of a random variable that is obtained from squaring and summing independent Gaussian samples with a non-zero mean μ and arbitrary variance σ^2 are derived.

2. Derivation

Given the standardized random variable in (4), a chi-square random variable with N degrees of freedom is obtained by squaring the z_i and summing over N samples.

$$\chi_{N}^{2} = \sum_{i=1}^{N} z_{i}^{2}$$

$$= \frac{1}{\sigma^{2}} \left[\sum_{i=1}^{N} (x_{i} - \mu)^{2} \right]$$

$$= \frac{1}{\sigma^{2}} \left[\sum_{i=1}^{N} (x_{i}^{2} - 2\mu x_{i} + \mu^{2}) \right]$$
(5)

$$= \frac{1}{\sigma^{2}} \left[\sum_{i=1}^{N} x_{i}^{2} - 2\mu \sum_{i=1}^{N} x_{i} + N\mu^{2} \right]$$
(6)

$$E\left\{\chi_{N}^{2}\right\} = \frac{1}{\sigma^{2}} E\left\{\sum_{i=1}^{N} x_{i}^{2}\right\} - \frac{2\mu}{\sigma^{2}} E\left\{\sum_{i=1}^{N} x_{i}\right\} + \frac{N\mu^{2}}{\sigma^{2}}$$
$$= \frac{1}{\sigma^{2}} E\left\{\sum_{i=1}^{N} x_{i}^{2}\right\} - \frac{N\mu^{2}}{\sigma^{2}}$$

Solving for the N squared and summed samples of \mathbf{r}_i , and using Equation (2) gives

$$E\left\{\sum_{i=1}^{N} x_{i}^{2}\right\} = N\sigma^{2} + N\mu^{2}$$
$$= N(\sigma^{2} + \mu^{2})$$
(7)

By definition, the variance of the chi-square random variable is given by

$$v \, a \, r \left[\chi_{N}^{2} \right] = E \left\{ \left[\chi_{N}^{2} - \mu_{\chi_{N}^{2}} \right] \left[\chi_{N}^{2} - \mu_{\chi_{N}^{2}} \right] \right\}$$
(8)

Using (2) and (6), and multiplying both sides by σ^4 gives

$$\sigma^{4} v a r \left[\chi_{N}^{2} \right] = E \left\{ \left[\sum_{i=1}^{N} x_{i}^{2} - 2 \mu \sum_{i=1}^{N} x_{i} + N \mu^{2} - N \sigma^{2} \right] \left[\sum_{j=1}^{N} x_{j}^{2} - 2 \mu \sum_{j=1}^{N} x_{j} + N \mu^{2} - N \sigma^{2} \right] \right\}$$

Replacing the expression on the left side with (3) and expanding yields

$$2N\sigma^{4} = E\left\{ \left(\sum_{i=1}^{N} x_{i}^{2}\right)^{2} + 2\mu \sum_{i=1}^{N} x_{i}^{2} \sum_{j=1}^{N} x_{j} + N\mu^{2} \sum_{i=1}^{N} x_{i}^{2} - N\sigma^{2} \sum_{i=1}^{N} x_{i}^{2} - 2\mu \sum_{i=1}^{N} x_{i}^{2} \sum_{j=1}^{N} x_{j}$$
$$+ 4\mu^{2} \left(\sum_{i=1}^{N} x_{i}\right)^{2} - 2N\mu^{3} \sum_{i=1}^{N} x_{i} + 2N\mu\sigma^{2} \sum_{i=1}^{N} x_{i} + N\mu^{2} \sum_{i=1}^{N} x_{i}^{2} - 2N\mu^{3} \sum_{i=1}^{N} x_{i}$$
$$+ N^{2}\mu^{4} - N^{2}\mu^{2}\sigma^{2} - N\sigma^{2} \sum_{i=1}^{N} x_{i}^{2} + 2N\mu\sigma^{2} \sum_{i=1}^{N} x_{i} - N^{2}\mu^{2}\sigma^{2} + N^{2}\sigma^{4} \right\}$$

$$= E\left\{\left(\sum_{i=1}^{N} x_{i}^{2}\right)^{2} - 4\mu \sum_{i=1}^{N} x_{i}^{2} \sum_{j=1}^{N} x_{j} + 2N\mu^{2} \sum_{i=1}^{N} x_{i}^{2} - 2N\sigma^{2} \sum_{i=1}^{N} x_{i}^{2} - 4N\mu^{3} \sum_{i=1}^{N} x_{i} \right. \\ \left. + 4N\mu\sigma^{2} \sum_{i=1}^{N} x_{i} - 2N^{2}\mu^{2}\sigma^{2} + N^{2}\mu^{4} + N^{2}\sigma^{4} + 4\mu^{2} \left(\sum_{i=1}^{N} x_{i}\right)^{2}\right\}$$

3

Using Equations (A1) - (A4) from the Appendix in the above equation results in

$$2N\sigma^{4} = E\left\{\left(\sum_{i=1}^{N} x_{i}^{2}\right)^{2}\right\} - 4\mu\left(2N\mu\sigma^{2} + N^{2}\mu\sigma^{2} + N^{2}\mu^{3}\right) + 2N^{2}\mu^{2}\left(\sigma^{2} + \mu^{2}\right) \\ - 2N^{2}\sigma^{2}\left(\sigma^{2} + \mu^{2}\right) - 4N^{2}\mu^{4} + 4N^{2}\mu^{2}\sigma^{2} - 2N^{2}\mu^{2}\sigma^{2} + N^{2}\mu^{4} \\ + N^{2}\sigma^{4} + 4\mu^{2}\left(N\sigma^{2} + N^{2}\mu^{2}\right)$$

$$= E\left\{\left(\sum_{i=1}^{N} x_{i}^{2}\right)^{2}\right\} - 8N\mu^{2}\sigma^{2} - 4N^{2}\mu^{2}\sigma^{2} - 4N^{2}\mu^{4} + 2N^{2}\mu^{2}\sigma^{2} + 2N^{2}\mu^{4} \\ - 2N^{2}\sigma^{4} - 2N^{2}\mu^{2}\sigma^{2} - 4N^{2}\mu^{4} + 4N^{2}\mu^{2}\sigma^{2} + N^{2}\mu^{4} - 2N^{2}\mu^{2}\sigma^{2} + N^{2}\sigma^{4} \\ + 4N\mu^{2}\sigma^{2} + 4N^{2}\mu^{4}$$

$$= E\left\{\left(\sum_{i=1}^{N} x_{i}^{2}\right)^{2}\right\} - 4N\mu^{2}\sigma^{2} - 2N^{2}\mu^{2}\sigma^{2} - N^{2}\mu^{4} - N^{2}\sigma^{4}$$

Therefore.

$$E\left\{\left(\sum_{i=1}^{N} x_{i}^{2}\right)^{2}\right\} = 2N\sigma^{4} + 4N\mu^{2}\sigma^{2} + 2N^{2}\mu^{2}\sigma^{2} + N^{2}\mu^{4} + N^{2}\sigma^{4}$$
(9)

For a random variable y.

$$v a r [y] = E \{y^2\} - (E \{y\})^2$$

therefore the variance of $\sum_{i=1}^N x_i^2$ is given by

$$v \, a \, r \left[\sum_{i=1}^{N} x_i^2 \right] = E \left\{ \left(\sum_{i=1}^{N} x_i^2 \right)^2 \right\} = \left(E \left\{ \sum_{i=1}^{N} x_i^2 \right\} \right)^2$$

Using Equations (9) and (7) results in

$$var\left[\sum_{i=1}^{N} x_{i}^{2}\right] = E\left\{\left(\sum_{i=1}^{N} x_{i}^{2}\right)^{2}\right\} - N^{2}\left(\sigma^{2} + \mu^{2}\right)^{2}$$
$$= 2N\sigma^{4} + 4N\mu^{2}\sigma^{2} + 2N^{2}\mu^{2}\sigma^{2} + N^{2}\mu^{4} + N^{2}\sigma^{4} - N^{2}\sigma^{4} - 2N^{2}\mu^{2}\sigma^{2} - N^{2}\mu^{2}$$

$$= 2N\sigma^4 + 4N\mu^2\sigma^2 \tag{10}$$

3. Summary

If x is a Gaussian random process and has mean μ and variance σ^2 , then

$$E\left\{\sum_{i=1}^{N} x_{i}^{2}\right\} = N(\sigma^{2} + \mu^{2})$$

$$var\left[\sum_{i=1}^{N} x_{i}^{2}\right] = 2N\sigma^{4} + 4N\mu^{2}\sigma^{2}$$

Note that when $\mu=0$ and $\sigma^2=1$ these equations reduce to (2) and (3).

Appendix: Expected values of various summations

1.
$$E\left\{\sum_{i=1}^{N} x_i\right\} = N\mu$$
(A1)

2.
$$E\left\{\sum_{i=1}^{N} x_{i}^{2}\right\} = N(\sigma^{2} + \mu^{2})$$
 (A2)

This is Equation (7) and was derived in the main text.

3.
$$E\left\{\left(\sum_{i=1}^{N} x_{i}\right)^{2}\right\} = N\sigma^{2} + N^{2}\mu^{2}$$
 (A3)

Derivation

Let x_i be normally distributed random variables and define $\tilde{x} = \sum_{i=1}^{N} x_i$, then \tilde{x} is a normal random variable with mean $N\mu$ and variance $N\sigma^2$. The variance of \tilde{x} may be written as

$$var\left[\tilde{x}\right] = E\left\{\tilde{x}^{2}\right\} - \left(E\left\{\tilde{x}\right\}\right)^{2}$$

so that

$$E\left\{\tilde{x}^{2}\right\} = E\left\{\left(\sum_{i=1}^{N} x_{i}\right)^{2}\right\}$$
$$= v a r \left(\tilde{x}\right) + \left(E\left\{\tilde{x}\right\}\right)^{2}$$
$$= N \sigma^{2} + N^{2} \mu^{2}$$

4.
$$E\left\{\sum_{i=1}^{N} x_{i}^{2} \sum_{j=1}^{N} x_{j}\right\} = 2N\mu\sigma^{2} + N^{2}\mu\sigma^{2} + N^{2}\mu^{3}$$
 (A4)

Derivation

$$E\left\{\sum_{i=1}^{N} x_{i}^{2} \sum_{j=1}^{N} x_{j}\right\} = E\left\{\sum_{i=1}^{N} \sum_{j=1}^{N} x_{i}^{2} x_{j}\right\} = \sum_{i=1}^{N} \sum_{j=1}^{N} E\left\{x_{i}^{2} x_{j}\right\}$$

6

When i = j this becomes the single sum $\sum_{i=1}^{N} E\{x_i^3\}$. From [2, page 162],

$$E\left\{x_i^3\right\} = 3\mu\sigma^2 + \mu^3$$

 $\mathbf{s}\mathbf{o}$

$$\sum_{i=1}^{N} E\{x_{i}^{3}\} = N(3\mu\sigma^{2} + \mu^{3}) \qquad i = j$$

When $i \neq j$

$$\sum_{i=1}^{N} \sum_{j=1}^{N} E\{x_{i}^{2} x_{j}\} = \sum_{i=1}^{N} \sum_{j=1}^{N} E\{x_{i}^{2}\} E\{x_{i}\}$$

since the processes are independent. Using $E\{x_i\} = \mu$, and

$$E\{x_i^2\} = var[x] + \mu^2 = \sigma^2 + \mu^2$$

results in

$$\sum_{i=1}^{N} \sum_{j=1}^{N} E\{x_i^2\} E\{x_i\} = \sum_{i=1}^{N} \sum_{j=1}^{N} \mu(\sigma^2 + \mu^2)$$

These are summed over all i and j except for the case i = j, so there are N(N-1) of them, giving

$$\sum_{i=1}^{N} \sum_{j=1}^{N} E\{x_i^2\} E\{x_i\} = N(N-1) \mu (\sigma^2 + \mu^2) \qquad i \neq j$$

Adding the cases for i = j and $i \neq j$ together gives

$$E\left\{\sum_{i=1}^{N} x_{i}^{2} \sum_{j=1}^{N} x_{j}\right\} = N(3\mu\sigma^{2} + \mu^{3}) + N(N - 1)\mu(\sigma^{2} + \mu^{2})$$
$$= 2N\mu\sigma^{2} + N^{2}\mu\sigma^{2} + N^{2}\mu^{3}$$
