APPENDIX A: GLOSSARY OF TERMS AND ABBREVIATIONS

TABLE A-1

GLOSSARY*

Ablation Till	Loosely consolidated rock debris, formerly in or on a glacier.
Alluvium	A general term for all detrital material deposited permanently or in transit by streams. It includes gravel, sand, silt, and clay, and all variations and mixtures of these.
Aqueoglacial	Resulting from or pertaining to the combined action of ice and water; as, many glacial deposits.
Aquiclude	A formation that, although porous and capable of absorbing water slowly, will not transmit water fast enough to furnish an appreciable supply for a well or spring.
Aquifer	A geologic formation or structure that transmits water in sufficient quantity to supply pumping wells or springs.
Artesian	Pertaining to underground water that is confined by impervious material under pressure sufficient to raise it above the upper level of the saturated material in which it lies if this is penetrated by wells or natural fissures.
Basal Till	A firm clay-rich till containing many abraded stones dragged along beneath a moving glacier and deposited upon bedrock or other glacial deposits.
Bed	Any tabular body of rock lying in a position essentially parallel to the surface or surfaces on or against which it was formed, whether these be a surface of weathering and erosion, plans of stratification, or inclined fractures.
Bedding	The arrangement of rock in layers, strata, or beds.
Bedrock	The more or less solid, undisturbed rock in place either at the surface or beneath superficial deposits of gravel, sand, or soil.
Bentonite	A rock composed of any of the montmorillonite-beidellite group of clay minerals.
Boulder	A large detached rock fragment, somewhat rounded or otherwise modified in shape by transport. A boulder is larger than a cobble, 10 inches (256 mm) having been suggested as a convenient lower limit for the diameter.

Calcareous	Consisting of or containing calcium carbonate.
Clastic**	Rock or sediment comprised of fragments broken from their place of origin.
Clay	A fine-grained aggregate consisting wholly or dominantly of microscopic and submicroscopic mineral particles, derived from the chemical decomposition of rocks, which is plastic when wet and hard when dry. The distinctive physical properties are due to the presence of clay minerals, which are hydrous aluminum silicates that break down into colloidal, exceedingly minute shreds or flaky particles.
Cobble	A rock fragment between 64 and 256 mm diameter, thus larger than a pebble and smaller than a boulder, rounded or otherwise abraided in the course of transport by water, wind, or ice.
Cross-Section	A geologic diagram or actual field exposure showing the geologic formations and structures transected by a given plane.
Dip	The angle at which a stratum or any planar feature is inclined from the horizontal.
Dolomite	A common rock-forming rhombohedral mineral, $CaMg(CO_3)_2$.
Effective Porosity	The portion of pore space in saturated permeable material in which movement of water takes place.
End Moraine	A ridgelike accumulation of drift built chiefly along the terminal margin of a valley glacier or the margin of an ice sheet. It has a surface form of its own and is the result chiefly of deposition by ice, deformation by ice thrust, or both.
Facies***	Lithologic and biologic characteristics of a sedimentary deposit imparted by the depositional environment.
Glaciation	The geologic work accomplished by ice, including erosion and deposition and the resulting effects of these processes on the surface.
Glacier	A body of ice consisting of recrystallized snow, lying wholly or largely on land, and showing evidence of present or former flow.
Glaciofluvial	Pertaining to the meltwater streams flowing from wasting glacier ice and especially to the deposits and land forms produced by such streams.

Transmissivity	Rate at which water is transmitted through a unit thickness of an aquifer under a unit hydraulic gradient.
Water Table	A water table is the upper surface of a zone of saturation except where that surface is formed by an impermeable body.
Well Log	A systematic and sequential record of geologic data obtained from a well.

TABLE A-2

LIST OF ABBREVIATIONS AND ACRONYMS

AF	Air Force
AFB	Air Force Base
AFFF	Aqueous Film Forming Foam
ALS	Above Land Surface
ATV	All Terrain Vehicle
BLS	Below Land Surface
Br	Bromine
CB	Chlorobromoethane
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
Cl	Chlorine
cm/sec	centimeter per second
DOD	Department of Defense
EDM	Electronic Distance Meter
ft/day	feet per day
ft/sec	feet per second
gal/min	gallons per minute
HARM	Hazard Assessment Rating Methodology
I	Iodine
ID	Inside Diameter
IRP	Installation Restoration Program
NORAD	North American Aerospace Defense Command
NYANG	New York Air National Guard
OD	Outside Diameter
pH	The negative logarithm of the effective hydrogen-ion concentration

Gravel	Loose or unconsolidated coarse granular material, larger than sand grains, resulting from erosion of rock by natural agencies.
Ground Water	Subsurface water in a zone of saturation; phreatic water.
Gypsum	A hydrous calcium sulfate mineral, $CaSO_4 \cdot 2H_2O$.
Hazardous Waste	A solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics may cause or significantly contribute to an increase in mortality or an increase in serious, irreversible, or incapacitating reversible illness; or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed.
Hydraulic Conductivity	The capacity of a rock or soil for transmitting water under pressure.
Lacustrine	Pertaining to, produced by, or formed in a lake or lakes.
Lithology	The study of stones or rocks.
Lodgement Till	A basal till commonly characterized by compact fissile structure and containing stones oriented with their long axes parallel to the direction of ice movement.
Moraine	An accumulation of drift with an initial topographic expression of its own, built within a glaciated region chiefly by the direct action of glacier ice.
Outwash	Detrital material removed from a glacier by meltwater and laid down by streams beyond the glacier itself.
Paleofluvial	Pertaining to an ancient river or rivers.
Periglacial	Processes, conditions, areas, climates and topographic features at the immediate margins of former and existing glaciers and ice sheets.
Permeability	The property or state of being permeable, of allowing fluids and gases to pass through.
Piezometric Surface	An imaginary surface that everywhere coincides with the static level of the water in the aquifer.
Porosity	The property of a rock of containing interstices without regard to size, shape, interconnection, or arrangement of openings.

Shale	A general term for lithified muds, clays, and silts that are fissile and break along planes parallel to the original bedding.
Silt	Unconsolidated material finer than sand and coarser than clay.
Silt Loam	A type of soil having over half of the particles of the size called silt. The amount of material of sand or clay size is relatively small.
Solid Waste	Any garbage, refuse, or sludge from a waste treatment plant, water supply treatment, or air pollution control facility and other discarded material, including solid, liquid, semi-solid, or contained gaseous material resulting from industrial, commercial, mining, or agricultural operations and from community activities, but does not include solid or dissolved materials in domestic sewage; solid or dissolved materials in irrigation return flows; industrial discharges which are point source subject to permits under Section 402 of the Federal Water Pollution Control Act, as amended (86 USC 880); or source, special nuclear, or by-product material as defined by the Atomic Energy Act of 1954 (68 USC 923).
Stratigraphy	The branch of geology that deals with the definition and interpretation of the stratified rocks, the conditions of sequence, age, distribution, and especially their correlation by the use of fossils and other means.
Strike	The direction or bearing of the outcrop of an inclined bed or structure on a level surface. It is perpendicular to the direction of the dip.
Swell-and-Swale	The type of topography characteristic of the ground moraine of a continental glacier.
Till	That part of a glacial drift deposited directly by ice, without transportation or sorting by water, consisting generally of an unstratified, unsorted, unconsolidated to moderately consolidated, heterogeneous mixture of clay, sand, gravel, and boulders.
Topographic Map	A topographic map is a representation on paper that is designed to portray certain selected features of a section of the earth's surface plotted on some form of projection and to a certain scale; that primarily depicts the relief of the country mapped by shows also its drainage and cultural features; and that delineates all features in true latitude and longitude and therefore all parts in a rigidly correct relative position.

APPENDIX B: STATEMENT OF WORK

MOD 3

INSTALLATION RESTORATION PROGRAM
CONFIRMATION/QUANTIFICATION (STAGE 2)
HANCOCK FLD NY

I. DESCRIPTION OF WORK

MOD 3 The overall objective of the Installation Restoration Program (IRP) is to assess potential contamination at past hazardous waste disposal and spill sites on Air Force installations. from hazardous materials at their disposal and spill sites...

The initial Phase II (Stage 1) survey performed at Hancock FLD grouped four potential sites into two zones. Individual sites were not evaluated.

The Stage 2 survey will investigate five individual sites - the Fire Training Area (FT-1), Disposal Site D-5, the Entomology Underground Storage Tank (S-3), Transformer Storage Area (S-1)), and the Old Spill Area (SP-1). Three of these sites (S-3, S-1, and SP-1) are new. A zone approach will still be taken for Disposal Sites D-1 and D-3 (adjacent landfills); however, additional monitoring wells will be installed to characterize the groundwater hydrology and identify any contaminants migrating from the zone. The program schedule for this investigative survey is shown in Appendix 5.

The purposes of this Stage 2 follow-on field and laboratory study at Hancock FLD are to (1) confirm the presence or absence of contamination within the specified areas of investigation, (2) if possible, determine the extent, degree of contamination, and the potential for migration of those contaminants in the environment, (3) identify public health and environmental hazards of stationary or migration of ~~migrating~~ pollutants based on state or federal standards for those contaminants, and (4) delineate additional investigations required beyond this stage to reach the
MOD 3 objectives of the IRP. Volume 2 contains Appendices A through M. Data tables, field notes, correspondence etc. are included.

The IRP Phase I Report incorporates the background and description of the sites/zones at Hancock FLD. The Phase II Stage 1 Report describes the field work and summarizes the analytical results of sampling activities during the initial investigative study. Both of these reports (to be mailed under separate cover) should be thoroughly reviewed by the contractor prior to the start of work to obtain an understanding of all previous findings and recommendations which impact the current task. To accomplish this survey effort, the contractor shall take the following actions:

A. General Requirements

1. Conduct a literature search of local hydrogeological conditions to complement the Phase I and Phase II Reports. Use these data along with field investigation data, to determine optimum well depth and locations. Include the pertinent literature search information in an appendix to the Final Report. Develop the literature search data using the following guidelines:

a. Topographic data

b. Geologic data

(1) Structure

(2) Stratigraphy

(3) Lithology

c. Hydrogeologic data

(1) Location of all existing and abandoned wells, observation wells, springs, ponds (natural and artificial) and seepages that occur on or off the installation within a one-mile radius of the sites to be investigated.

(2) Groundwater table and piezometric contours

(3) Depth to groundwater

(4) Surface and groundwater quality

(5) Delineated areas of recharge, discharge and contributing areas

(6) Geologic setting, yield data, and hydrographs of springs and natural seepages

d. Data on all existing and abandoned wells, including uncased boreholes, on or off the installation within a one-mile radius of the sites to be investigated.

(1) Location, depth, diameter, well type, and lithologic logs associated with the well

(2) Static and pumping water levels, well hydrographs, yield, specific capacity, and related data

(3) Existing and projected groundwater development and use.

(4) Well and screen corrosion, encrustation, and similar operation and maintenance problems

(5) Observation and monitoring well networks, pumping influences, barrier and recharge boundaries, and related hydraulic interferences influencing aquifer behavior.

(6) Existing water sampling sites

e. Aquifer data

(1) Type, i.e. unconfined, artesian, or perched

(2) Thickness, depth to aquifer, and formational designation

(3) Barrier and recharge boundaries

(4) Transmissivity, storativity, and permeability (gpd/ft^2)

(5) Specific retention

(6) Delineation of discharge and recharge areas

(7) Ground and surface water relationships

(8) Aquifer models

f. Climatic data

(1) Precipitation (total and net)

(2) Evapotranspiration

2. Determine the areal extent of the sites by reviewing historical and current panchromatic and infrared aerial photography.

B. Technical Operations Plan

Immediately after the Notice To Proceed (NTP) for the delivery order, develop a Technical Operations Plan (TOP) based on the technical requirements specified in this task description (see Sequence No. 19, Item VI below). Follow the TOP format (mailed under separate cover). This plan shall be explicit with regard to field and laboratory procedures. Include, but do not limit the plan to well purging procedures, field decontamination operations, sampling protocol, QA/QC for field and laboratory procedures, field schedule, etc. Provide the TOP to the USAFOEHL within two weeks of the NTP.

C. Health and Safety

Comply with USAF, OSHA, EPA, state and local health and safety regulations regarding the proposed work effort. Use EPA guidelines for designating the appropriate levels of protection needed at the study sites. Prepare a written Health and Safety Plan for the proposed work effort and coordinate it directly with applicable regulatory agencies prior to commencing field operations. Provide an information copy of the Health and Safety Plan to the USAFOEHL after coordination with regulatory agencies. The Health and Safety Plan is specified in Sequence No. 7, Item VI below.

D. Drilling and Soils Work

1. Determine the exact location of all monitoring wells, soil borings, and test pits during the planning/mobilization phase of the field investigation. Consult with base personnel to minimize disruption of base activities, to properly position wells with respect to exact site

locations, and to avoid underground utilities. Direct the drilling and sampling and maintain a detailed log of the conditions and materials penetrated during the course of the work. Do not drill boreholes into or position wells in actual landfill areas; rather install wells at the landfill perimeter.

2. Monitor the ambient air during all well drilling, soil boring and test pit work with a photoionization meter or equivalent organic vapor detector to identify the generation of potentially hazardous and/or toxic vapors or gases. Include air monitoring results in the boring logs. If soil encountered during borehole drilling or test pit work is suspected to be hazardous because of abnormal discoloration, odor or air monitoring levels, containerize the soil cuttings in new, unused drums. Enter into the boring logs the depths(s) from which suspected contaminated soil cuttings were collected for containerization. Collect a maximum of 20 composite samples, one from the contents of each drum. Test each composite sample for EP Toxicity (metals). Use Resource Conservation and Recovery Act (RCRA) criteria to determine if soil cuttings must be classified as hazardous waste (40 CFR 261.24).

3. Groundwater Monitoring Wells

a. Installation of Groundwater Monitoring Wells

(1) Comply with U.S. EPA Publication 330/9-S1-002, NEIC Manual for Groundwater/Subsurface Investigations at Hazardous Waste Sites for monitoring well installation.

(2) All well drilling, development, purging, sampling methods, and other activities pertaining to this effort must conform to state and other applicable regulatory agency requirements. Cite references in an appendix to the Final Report (Sequence No. 4, Item VI).

(3) Install wells at a sufficient depth to collect samples representative of aquifer quality and to intercept contaminants if they are present.

(4) Avoid, when possible, installing wells in depressions or areas subject to frequent flooding and standing water. If wells must be installed in such areas, design the wells such that standing water does not leak into the top of the casing or cascade down the annular space.

(5) Drill all monitoring wells using the following specifications:

(a) Drill wells that are less than 150 feet deep using hollow-stem auger techniques. A center stem, plug, and bit attached to the stem may be inserted into the auger for use while drilling. This will prevent material from entering into the hollow stem of the auger. Drill
MOD 2 all wells that are equal to or more than 150 feet deep using <u>an air hammer - drive casing</u> technique. If drilling fluid additives such as bentonite or polymers are used, insure that the components from each batch/lot used will not interfere with the laboratory analyses to be performed on samples. Analyze the additive from each batch/lot used for the parameters listed in

Appendix 2. Biodegradable organic drilling fluid additives are not permitted.

(b) Take lithologic samples at five-foot intervals and prepare borehole log descriptions. Include pilot boring logs and well completion summaries in the Final Report (Sequence No. 4, Item VI, below).

MOD 4 MOD 2 MOD 2 MOD 2 MOD 4 (c) Drill a maximum of 19 wells - 9 deep wells and 10 shallow wells. The maximum depth of each deep well shall not exceed 194 linear feet. The maximum depth of each shallow well shall not exceed 50 linear feet. Total footage for all wells in this task shall not exceed 2246 linear feet. Refer to the site specific details in Section I.H.

(d) Construct each shallow well with two-inch inside

MOD 2 diameter (i.d.) Schedule 80 PVC casing. Construct each deep well, except the deep well between landfills D-1 and D-3, with four-inch i.d. Schedule 80 PVC casing. Construct the deep well between landfills D-1 and D-3 with two-inch i.d. Schedule 80 PVC casing. Use threaded screw-type joints only. Glued fittings are not permitted. Flush-thread all connections.

(e) Screen each shallow well using two-inch i.d. 304 stainless steel casing having up to 0.020 inch slots. Screen each deep well using four-inch i.d. 304 stainless steel casing having up to 0.020

MOD 2 inch slots. The deep well between landfills D-1 and D-3 shall be screened in the same manner as the shallow wells. Slot size may be smaller based upon borehole geology. Each well screen shall be a maximum of twenty feet

MOD 3 in length. Total screening for all wells in this task shall not exceed 500 linear feet. Cap the bottom of the screen.

(f) Prevent cross-contamination between aquifers by using a dual casing system. Where wells extend through the most shallow aquifer and into a deeper aquifer, install an outer conductor casing into the confining layer below the shallow aquifer. Grout the annular space to the surface with bentonite.

(6) Complete all monitoring wells using the following specifications:

MOD 2 [DELETE PARA AND RENUMBER]

MOD 2 (a) Once the casing is installed, allow the soil formation to collapse around the well screen. Supplement the natural gravel pack with washed and bagged rounded silica sand or gravel with a grain size distribution compatible with the screen and soil formation. Place the pack from the bottom of the borehole to two feet above the top of the screen. Tremie a five foot bentonite seal (granulated or pellets) above the sand/gravel pack. Ensure that the bentonite forms a complete seal. Grout the remainder of the annulus to the land surface with a Type I Portland cement/bentonite slurry.

MOD 2 (b) Check with the Base point of contact (POC) to determine whether wells shall be completed flush or projected above the ground surface.

1 If well stick-up is of concern in an area, complete the well flush with the land surface. Cut the casing two to three inches below land surface, and install a protective locking lid consisting of a cast-iron valve box assembly. Center the lid assembly in a three foot diameter concrete pad sloped away from the valve box. Ensure that free drainage is maintained within the valve box. Also, provide a screw-type casing cap to prevent infiltration of surface water. Maintain a minimum of one foot clearance between the casing top and the bottom of the valve box. Clearly mark the well number on the valve box lid.

2 If an above ground surface completion is used, extend the well casing two or three feet above land surface. Provide an end plug or casing cap for each well. Shield the extended casing with a steel guard pipe (sleeve) which is placed over the casing and cap, and seated in a two-foot by two-foot concrete surface pad. The concrete surface pad shall have a minimum thickness of four inches above ground level and be sloped away from the well sleeve. It shall extend to a sufficient depth below ground level (to the frostline) to resist cracking and breakage during the winter months. Install a lockable cap or lid on the guard pipe. Install three, four-inch diameter cement-filled metal barrier posts in the ground around each concrete surface pad. The barrier posts shall be five feet in total length, with two feet recessed into the ground and set in concrete. Do not install the barrier posts in the concrete pad placed at the well base. Paint the protective steel sleeve and clearly number the well on the sleeve exterior.

3 Provide locks for both flush and above-ground well assemblies. Turn over the lock keys to the Base POC following completion of the field effort.

MOD 2 (c) Develop each well as soon as practical after completion with a submersible pump, bailer, and/or airlift method. Continue well development until the discharge water is clear and free of sediment to the fullest extent possible. Measure the rate of water production, the pH, specific conductance and water temperature during well development and include this information in the Final Report (Sequence No. 4, Item VI).

MOD 2 (d) Determine by survey the elevation of all newly installed monitoring wells to an accuracy of 0.01 foot. Notch the top of the riser casing where well elevations are established. Horizontally locate the new wells to an accuracy of 1.0 foot and record the position on both project and site specific maps. Bench marks used must have previously been established from and be traceable to a USCGS or USGS survey marker.

MOD 2 (e) Measure water levels at all monitoring wells as feet below the ground surface or below the top of casing elevation to the nearest 0.01 foot. Report as mean sea level (MSL). Measure static water levels in wells prior to well development and before all well purging which precedes sampling events.

b. Recommend well abandonment method(s) or technique(s) which are applicable to the type of monitoring wells installed and the geological conditions. Consider that these wells will be abandoned at some future

date after the study objectives have been met and there is no longer a need
MOD 2 for the wells. The actual process of well abandonment is only applicable if expressly called for in the site-specific work, Section I.H. Assure that the recommended method(s) meets state and/or local well abandonment guidelines or regulations.

c. Complete permits, applications, and other documents which may be required by local and/or state regulatory agencies for the installation of monitoring wells. File these documents with appropriate agencies and pay all permitting and filing fees.

4. Soil Borings

a. Perform a maximum of 6 shallow soil augerings using a hand or power auger. Each augering is to be one foot in depth. Total footage for all shallow soil augerings shall not exceed 6 feet. Collect one soil sample from each augering (maximum of 6 auger samples). Refer to Section I.H., for the site-specific details.

b. Conduct a maximum of 26 soil borings not to exceed a total of 390 linear feet. The maximum depth of each soil boring shall be 15
MOD 2 linear feet. Accomplish the borings using the hollow stem auger technique. Obtain split spoon samples at intervals of 0 to 5, 5 to 10, and 10 to 15
MOD 2 feet using ASTM Method D-1586, not to exceed 3 samples per boring. Borings may be accomplished using a hand or power auger when site conditions limit accessibility with the hollow stem auger drill rig. The appropriate boring method shall be determined in the field by the project manager in coordination with the USAFOEHL Technical Program Manager. The maximum number of boring samples to be collected is 78. Refer to Section I.H., for the site-specific details.

c. Scan all split-spoon soil cores with a photoionization meter or equivalent organic vapor detector. Include monitoring results in the boring logs.

d. During the boring operations, describe lithologies encountered and prepare stratigraphic logs. Place special emphasis on field identification of contaminated soils encountered.

e. Whenever possible, measure water levels in all boreholes after the water level has stabilized. Examine the water surface for the presence of hydrocarbons. Include this information in the boring logs.

f. Tremie-grout all boreholes to the surface with bentonite. It is especially important to insure that they be adequately resealed to preclude future migration of contaminants.

g. Permanently mark each location where soil borings are drilled. Record the location on a project map for each specific site or zone, whichever is applicable.

5. Well and Borehole Cleanup

Remove all well/borehole cuttings and clean the general area

following the completion of each well/borehole. Containerize and store cuttings suspected to be contaminated according to paragraph I.D.2. of this task order. Transport these drums to a location within the installation boundary designated by the Base POC. The base is responsible for ultimate disposal of contaminated soils using base resources.

E. Decontamination Procedures

1. Decontaminate all sampling equipment, including internal components, prior to use and between samples to avoid cross-contamination. Wash equipment with a laboratory-grade detergent followed by drinking quality water, solvent (methanol), and distilled water rinses. Allow sufficient time for the solvent to evaporate and the equipment to dry completely before reuse.

2. Dedicate for each well the monofilament line or steel wire used to lower sampling equipment into the well. Do not use a line or wire in more than one well. Decontaminate the calibrated water level probe for measuring well volume and water level elevation before use in each well.

3. Thoroughly clean and decontaminate the drilling rig and tools before initial use and after each borehole completion. As a minimum, steam clean drill bits after each borehole is installed. Drill from the "least" to the "most" contaminated sites, if possible.

F. Field Sampling

1. Strictly comply with the sampling techniques, maximum holding times, and sample preservation as specified in the following references: Standard Methods for the Examination of Water and Wastewater, 16th Edition (1985), pages 37-44; ASTM, Section 11, Water and Environmental Technology; Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846, 2nd Edition (USEPA, 1984); Methods for Chemical analysis of Waters and Wastes, EPA Manual 600/4-79-020, pages xiii to xix (1983); and the Handbook for Sampling and Sample Preservation of Water and Wastewater, EPA Document 600/4-82-029 (1982).

2. Groundwater Monitoring Wells

a. After development, allow wells to stabilize for a minimum of three days before sampling.

b. Prior to purging the wells, examine the surface of the water table for the presence of hydrocarbons and take water level measurements to the nearest 0.01 foot with respect to the established survey point on top of the well casing. If applicable, measure the thickness of the hydrocarbon layer.

c. Purge the well using a submersible pump, bailer, or other acceptable method. Purge until a minimum of three well volumes (based on borehole diameter) of water has been displaced and the pH, temperature, specific conductance, color, and odor of the discharge have stabilized using the following criteria: pH $\pm$ 0.1 unit, temperature $\pm$ 0.5C, and specific conductance $\pm$ 10 mhos. Include the final measurements in the

Results section of the Final Report.

d. Collect water samples with a Teflon bailer. To collect representative aquifer samples where floating hydrocarbons are present, use a "thief sampler" or similar point sampling device to minimize the influence of the free product.

e. If the well(s) cannot be sampled due to well development, well characteristics, or other reason(s), indicate the reason(s) in the Final Report (Sequence No. 4, Item VI below).

f. Remeasure water levels after sampling and after the water conditions in the wells have stabilized.

3. For surface water/sediment samples, collect one surface water and one sediment sample at each sample location specified. Collect samples so as not to cause cross-contamination; obtain downstream samples first, and obtain the water sample at each location before the sediment sample. Measure pH, temperature, and specific conductance at each surface water sampling point. Permanently mark the location where surface water or sediment samples are collected. Record the location on a project map for each specific site or zone, whichever applies.

4. Split all water and soil samples. Analyze one set and immediately deliver the other set (the same collection day) to the Base POC. The Base POC will select 10% of the split samples, package the selections with appropriate forms, and deliver them to the contractor within 24 hours of receipt. Supply all packing and shipping materials to the Base POC for packaging the split samples. Immediately ship (within 24 hours) the POC-selected samples through overnight delivery to:

USAFOEHL/SA
Bldg 140
Brooks AFB TX 78235-5501

For all split samples sent to the USAFOEHL, complete an AF Form 2752A "Environmental Sampling Data" and/or an AF Form 2752B "Environmental Sampling Data - Trace Organics", (working copies will be provided under separate cover) with the following information:

a. Date and time collected

b. Purpose of sample (analyte and sample group)

c. Installation name (base)

d. Sample number

e. Source/location and depth of sample

f. Contract Task Numbers and Title of Project

g. Method of collection (bailer, suction pump, air-lift pump, etc.)

h. Volumes removed before sample taken (well samples only)

i. Special conditions (use of surrogate standard, etc.)

j. Preservatives used

k. Collector's name or initials

In addition, label each sample container with a permanent ink pen (water-proof laundry marker) to reflect the data in a, b, c, d, j and k above.

MOD 2 5. For every 10 field samples collected, take at least one additional sample (a field duplicate) for quality control purposes.
MOD 2 Appendix 1 provides a 10% allowance for these additional analyses. Duplicates shall be indistinguishable from other analytical samples so that personnel performing the analyses are not able to determine which samples are duplicates.

MOD 2 6. For every 20 field water samples collected, prepare and submit for analysis one field blank for all parameters analyzed in water. A
MOD 2 minimum of one field blank for each parameter is required. In addition, for every 20 field water samples collected for the analysis of volatile organic compounds (VOCs), prepare one trip blank and collect one bailer
MOD 2 wash sample. Assure that the water used for the field blanks, trip blanks, and bailer wash samples has been previously tested and is free of contaminants which would interfere with the required analyses. Allowances for these additional analyses are included in Appendix 1.

MOD 2 7. Maintain chain-of-custody records for all samples, field blanks, and quality control samples.

G. Chemical Analyses

1. Analyze water and soil samples collected as specified in Section H below, Specific Site Work. The analytical parameters are summarized in Appendix 1 along with the required methods.

2. All analyses shall meet the required limits of detection for the applicable method identified in Appendix 1.

3. For those methods which employ gas chromatography (GC) as the analytical technique (E601, E608, SW8010, SW8020, SW8080, SW8140, and SW8150) positive confirmation of identity is required for all analytes having concentrations higher than the Method Detection Limit (MDL). Conduct positive confirmation by second-column GC; however, gas chromatography/mass spectroscopy (GC/MS) can be used for positive confirmation if the quantity of each analyte to be confirmed is above the detection level of the GC/MS instrument. Analytes which cannot be confirmed will be reported as "Not Detected" in the body of the report, but results of all second-column GC or GC/MS confirmational analyses are to be included in the report appendix along with other raw analytical data. Base
MOD 2 the quantification of confirmed analytes on the first-column analysis. The

maximum number of second-column confirmational analyses shall not exceed eighty-five percent (85%) of the actual number of field samples (to include duplicates, field blanks, trip blanks, and bailer wash samples). The total number of samples listed in Appendix 1 includes the allowance applicable to each GC method. If GC/MS, or a combination of second-column GC and GC/MS, is used, the total cost of all such analyses for a particular parameter shall not exceed the funding allowed for positive confirmation using only second-column GC.

4. All chemical/physical analyses shall conform to state and other applicable Federal and local regulatory agency legal requirements. If a regulatory agency specifies that a type of analysis be performed in a certified laboratory, assure compliance with the requirement and furnish documentation showing laboratory certification with the first analytical data supplied to the USAFOEHL/TS.

5. Archive all raw data, including QA/QC and standards data, for not less than five years after project completion. Supply these data to the USAFOEHL/TS upon request.

H. Specific Site Work

In addition to items delineated in I.A. through I.G. above, conduct the following specific actions at the sites listed below:

1. Zones 1 and 2, Existing Monitoring Wells GW-1 to GW-10

The contractor shall complete all the work required in this paragraph, including the chemical analyses on the water samples, prior to initiating the drilling of new monitoring wells at Hancock FLD. The chemical and hydrogeological data obtained are to be used to determine placement of new monitoring wells. The contractor shall provide the analytical data, along with recommendations for well placements, to the OEHL technical program manager as soon as it becomes available, but not later than five weeks after samples are taken. Data and recommendations shall be in the form of an Informal Technical Information Report (Sequence No. 3, Item VI, below). The USAFOEHL Technical Program Manager must approve locations for all new monitoring wells prior to their installation.

Locate and inspect the ten existing wells. Replace broken cement collars around well casings with 2 foot by 2 foot square cement collars and install protective barrier posts as specified in paragraph I.D.3.a(6)(c)2. Measure the water level in each well and from this data determine the potentiometric surface for each zone. Conduct pump and/or slug tests to determine horizontal groundwater velocities. Purge each well (see paragraph I.F.2.c. above). Collect one water sample from each existing well (a total of ten samples). Analyze each sample for the following parameters:

Parameter	Method	Max Number of Analyses
Alkalinity, Carbonate & Bicarbonate	A403	10
Common Anions	A429	10
Conductance	E120.1	10
pH	E150.1	10
Total Dissolved Solids	E160.1	10
Temperature	E170.1	10
Petroleum Hydrocarbons	E418.1	10
Purgeable Halocarbons	E601	10
Aromatic Volatile Organics	SW5030/SW8020	10
Metals Screens (Total of 26 Metals)	E200.7 (23 metals) plus E206.2 (As)	10
	E245.1 (Hg)	10
	E270.2 (Se)	10
Extractable Priority Pollutants (GC/MS)	E625	10

2. Fire Training Area (FT-1)

The purpose of the Stage 2 work at FT-1 is to determine the vertical and horizontal extent of contamination around the site through soil gas analyses and a soil sampling program. Using visual observations and a probe-type soil gas analysis technique, determine the approximate boundaries of the site and the extent and direction of any plume which might be emanating from the site. Include the plume as part of the overall site area. A maximum of thirty soil gas probes shall be installed at FT-1. Once the boundaries (including the plume) have been determined, develop a grid system for soil sampling radiating out from the center of the site. Establish soil sampling transect lines at 45 degree angles around the site. Each of the eight transect lines shall have three sampling stations. The total number of sampling stations for the site is 24. Locate the first sampling station on each transect line at a distance halfway between the center of the site and the site boundary. Place the second at the intersection of the transect line and the site boundary. Place the last sampling station on each transect line 100 feet past the boundary of the site. Using hollow stem auger equipment and stainless steel split spoon samplers, drill one borehole at each sampling station and take a maximum of three soil samples. Take samples at 5-foot intervals (see paragraph I.D.4.b.) until either a depth of 15 feet or the water table is reached. If the water table is encountered, collect the sample from the last interval at the water interface. A maximum of 72 soil samples shall be taken at the site. Identify all sampling stations with permanent markers. Analyze each soil sample for the following parameters:

Parameter	Method	Max Number of Analyses
Petroleum Hydrocarbons	SW3550/E418.1	72
Lead	SW3050/SW7420	72
Volatile Organics(GC/MS)	SW5030/SW8240	72

Select ten of the most highly contaminated samples (as determined by the soil gas analyses) from the total number of soil samples collected. Perform the following additional analyses on these ten samples:

Parameter	Method	Max Number of Analyses
Semivolatile Organics(GC/MS)	SW3550/SW8270	10

Install three well pairs to triangulate the site. A well pair is defined as two singly completed wells installed side-by-side and drilled to different depths. These six wells shall be the first ones installed at Hancock FLD. The wells shall be completed, purged, and sampled as rapidly as is feasible, without sacrificing sample integrity. Sufficient time must be allowed for completion of the initial chemical analyses on the water samples while the well drilling subcontractor is still at Hancock FLD, in the event that additional wells will be required at FT-1. Locate one well pair upgradient to site FT-1; place the other two downgradient in the direction of plume migration. One downgradient well pair shall be within 50 feet of the site boundary. The second downgradient well pair shall be
MOD 2 installed no more than 150 feet from the site boundary. Drill the deep well of each well pair into bedrock to a depth sufficient for setting a 20-foot screen and obtaining a representative sample from the aquifer. Drill the shallow well of the pair to 20 feet below the water table and screen the interval below the capillary fringe. The well screen must not extend into the capillary fringe of the unsaturated zone where free floating product may be encountered. Take one water sample from each well (a total of six water samples). Analyze each sample for the following parameters:

Parameter	Method	Max Number of Analyses
Conductance	E120.1	6
pH	E150.1	6
Temperature	E170.1	6
Petroleum Hydrocarbons	E418.1	6
Purgeable Halocarbons	E601	6
Aromatic Volatile Organics	SW5030/SW8020	6

Based upon the analytical data obtained during the first round of sampling of the initial six wells, evaluate the need for additional downgradient wells at FT-1. A maximum of two additional well pairs shall be installed if the analytical data obtained for the wells farthest downgradient from the site boundary indicate water contamination. The contractor must obtain approval from the USAFOEHL Technical Program Manager prior to the installation of additional wells. After installation of all wells at FT-1, conduct a second round of sampling. Take one water sample from each well (a maximum of 10 water samples). Analyze each water sample for the following parameters:

Parameter	Method	Max Number of Analyses
Conductance	E120.1	10
pH	E150.1	10
Temperature	E170.1	10
Petroleum Hydrocarbons	E418.1	10
Purgeable Halocarbons	E601	10
Aromatic Volatile Organics	SW5030/SW8020	10
Lead	E239.2	10

MOD 2 3. Disposal Site D-5

MOD 2 Install three shallow wells to triangulate the site. Locate one shallow well upgradient to site D-5; the other two downgradient. One downgradient shallow well shall be installed within 50 feet of the site boundary. The second downgradient shallow well shall be installed no more than 150 feet from the site boundary. Take one water sample from each well and one water sample from well MW-10, located north of D-5 (a total of four samples). Analyze each sample for the following parameters:

	Parameter	Method	Max Number of Analyses
MOD 2	Alkalinity, Carbonate & Bicarbonate	A403	4
MOD 2	Common Anions	A429	4
MOD 2	Conductance	E120.1	4
MOD 2	pH	E150.1	4
MOD 2	Total Dissolved Solids	E160.1	4
MOD 2	Temperature	E170.1	4
MOD 2	Petroleum Hydrocarbons	E418.1	4
MOD 2	Purgeable Halocarbons	E601	4
MOD 2	Aromatic Volatile Organics	SW5030/SW8020	4
MOD 2	Metals Screen (Total of 26 Metals)	E200.7 (23 metals) plus E206.2 (As)	4
MOD 2		E245.1 (Hg)	4
MOD 2		E270.2 (Se)	4
MOD 2	Extractable Priority Pollutants (GC/MS)	E625	4

MOD 2 The requirement to collect split samples (paragraph I.F.4) at Site D-5 is deleted.

V MOD 1 Conduct a second round of groundwater sampling. Take samples from each well at the site and from well MW-10 (a total of four samples). Analyze for total and dissolved thallium using the following method:

Parameter	Method	Max Number of Analyses
Thallium	SW3020/SW7841	
	Total	4
	Dissolved	4

V MOD 1 The portion of the sample to be analyzed for dissolved thallium must be field-filtered through a 0.45 micron filter immediately after collection and prior to preservation.

4. Zones 1 and 2, Surface and Sediment Monitoring Stations

Resample the nine existing surface water and sediment monitoring stations (or locations) in Zones 1 and 2. See the Stage 1 Report, provided under separate cover. Establish eight new surface water and sediment monitoring stations in Zone 1 at the locations indicated in Appendix 3 (Figure 2-11, extracted from the Phase II, Stage 1, report, page 2-22). Establish four new surface water and sediment monitoring stations in Zone 2 at locations indicated in Appendix 4 (Figure 2-8, extracted from the Phase II, Stage 1, report, page 2-16). Collect twenty-one surface water samples from Zones 1 and 2, one from each old and one from each new sampling station. Analyze each sample for the following parameters:

Parameter	Method	Max Number of Analyses
Conductance	E120.1	21
pH	E150.1	21
Temperature	E170.1	21
Petroleum Hydrocarbons	E418.1	21
Purgeable Halocarbons	E601	21
Aromatic Volatile Organics	SW5030/SW8020	21
Priority Pollutant Metals (Total of 13 Metals)	E200.7 (Sb,Be,Cd,Cr, Cu,Pb,Ni,Ag,Tl,Zn)	21
	E206.2 (As)	21
	E245.1 (Hg)	21
	E270.2 (Se)	21
Extractable Priority Pollutants (GC/MS)	E625	21

Collect twenty-one sediment samples from Zones 1 and 2, one from each old and one from each new sampling station. Analyze each sample for the following parameters:

Parameter	Method	Max Number of Analyses
Petroleum Hydrocarbons	SW3550/E418.1	21
Priority Pollutant Metals (Total of 13 Metals)	SW3050/SW6010 (Sb,Be, Cd,Cr,Cu,Pb,Ni,Ag, Tl,Zn)	21
	SW7060 (As)	21
	SW7471 (Hg)	21
	SW7740 (Se)	21
Volatile Organics(GC/MS)	SW5030/SW8240	21
Semivolatile Organics(GC/MS)	SW3550/SW8270	21

5. Zone 2, Disposal Sites D-1 and D-3

MOD 2 Install two new well pairs and two new deep wells within Zone 2. Locate

one well pair downgradient to Site D-3. Locate the other well pair between sites D-1 and D-3. The exact locations of the well pairs shall be determined in the field by the project manager in coordination with the USAFOEHL Technical Program Manager. Install one of the deep wells next to existing upgradient well GW-3. Install the second deep well next to downgradient well GW-6. Drill the deep wells into bedrock to a depth sufficient for setting a 20-foot screen and obtaining a representative sample from the aquifer. Drill the shallow wells to 20 feet below the water
MOD 2 table and screen the interval. Take one water sample from each new well (a total of six water samples). Analyze each sample for the following parameters:

	Parameter	Method	Max Number of Analyses
MOD 2	Alkalinity, Carbonate & Bicarbonate	A403	6
MOD 2	Common Anions	A429	6
MOD 2	Conductance	E120.1	6
MOD 2	pH	E150.1	6
MOD 2	Total Dissolved Solids	E160.1	6
MOD 2	Temperature	E170.1	6
MOD 2	Petroleum Hydrocarbons	E418.1	6
MOD 2	Purgeable Halocarbons	E601	6
MOD 2	Aromatic Volatile Organics	SW5030/SW8020	6
MOD 2	Metals Screens (Total of 26 Metals)	E200.7 (23 metals) plus E206.2 (As)	6
MOD 2		E245.1 (Hg)	6
MOD 2		E270.2 (Se)	6
MOD 2	Extractable Priority Pollutants (GC/MS)	E625	6

6. Zone 2, Disposal Sites D-1 and D-3

Conduct a magnetometer survey within sites D-1 and D-3 to detect the presence of buried drums. Horizontally locate all buried drums to an accuracy of 1 foot and record on site maps. Identify the locations of buried drums in the field with permanent markers. Uncovering and removal of the drums is not part of this Phase II project.

7. S-3 Entomology Underground Storage Tank (New Site)

This concrete underground storage tank is no longer in use. The contents were pumped out at the time of deactivation; however, groundwater seeps into the tank. Take one water sample from the tank contents through the access pipe on top of the tank. Analyze the sample for the following parameters:

Parameter	Method	Max Number of Analyses
Conductance	E120.1	1
pH	E150.1	1
Temperature	E170.1	1
Organochlorine Pesticides	E608	1
Organophosphorus Pesticides	SW3510/SW8140	1
Chlorinated Phenoxy Acid Herbicides	SW8150	1

Establish a soil sampling station 20 feet or less downgradient from the tank. The sampling station should be identified with a permanent marker. Using hollow stem auger equipment and stainless steel split spoon samplers, drill one borehole and take a maximum of three soil samples. Take the samples at 5-foot intervals (see paragraph I.D.4.b) until either a depth of 15 feet or the water table is reached. If the water table is encountered, collect the sample from the last interval at the water interface. Analyze each soil sample for the following parameters:

Parameter	Method	Max Number of Analyses
Organochlorine Pesticides	SW3550/SW8080	3
Organophosphorus Pesticides	SW3550/SW8140	3
Chlorinated Herbicides	SW8150	3

8. Site S-1 Transformer Storage Area (New Site)

Visually inspect the land surface area within a 50-foot radius of Building 530. Mark all areas where soil is found to be oily or abnormally colored, indicating a possible spill. If no oily or discolored areas are found during the visual inspection, select two sites at random no farther than 10 feet from Building 530. Take 1 surface soil sample using a hand auger from each marked area and 1 surface soil sample inside of building 530 (see paragraph I.D.4.a.). A maximum of six (6) soil samples shall be taken at this site. Analyze each sample for the following parameters:

Parameter	Method	Max Number of Analyses
Petroleum Hydrocarbons	SW3550/E418.1	6
PCBs	SW3550/SW8080	6

9. Site SP-1 Old Spill Area (New Site)

Locate the storm sewer outfall from the SAGE plant (Bldg 503) which is described in the Phase I Report, page 4-10. This outfall is site SP-1. Collect three surface water samples. Take one sample at the outfall. Take the second and third surface water samples at points 50 and 100 feet,

respectively, downstream of the outfall. Analyze each sample for the following parameters:

Parameter	Method	Max Number of Analyses
Conductance	E120.1	3
pH	E150.1	3
Temperature	E170.1	3
Petroleum Hydrocarbons	E418.1	3
Purgeable Halocarbons	E601	3
Aromatic Volatile Organics	SW5030/SW8020	3
Lead	E239.2	3

Collect sediment samples at the same locations where water samples were collected. Analyze each sediment sample for the following parameters:

Parameter	Method	Max Number of Analyses
Petroleum Hydrocarbons	SW3550/E418.1	3
Volatile Organics(GC/MS)	SW5030/SW8240	3
Lead	SW3050/SW7420	3

10. Background Soil Samples

Select a site in an undisturbed area on base where contaminants are not expected to be found and which has typical native soils. Drill one borehole. Take samples at 5-foot intervals (see paragraph I.D.4.b.) until either a depth of 15 feet or the water table is reached. If the water table is encountered, collect the sample from the last interval at the water interface. These soil samples are to be used to establish background levels of metals and petroleum hydrocarbons. Analyze each soil sample for the following parameters:

Parameter	Method	Max Number of Analyses
Petroleum Hydrocarbons	SW3550/E418.1	3
Lead	SW3050/SW7420	3
Priority Pollutant Metals (Total of 13 Metals)	SW3050/SW6010 (Sb,Be, Cd,Cr,Cu,Pb,Ni,Ag, Tl,Zn)	3
	SW7060 (As)	3
	SW7471 (Hg)	3
	SW7740 (Se)	3

MOD 2 11. Abandonment of Well GW-4

MOD 2 Abandon well GW-4 in accordance with state and/or local well abandonment guidelines and regulations (see paragraph I.D.3.b.).

NEW PARA ADDED PER MOD 3

12. Baseline Risk Assessment

a. Evaluate the threat of contaminants to public health and welfare or the environment through a literature search of documents identified in Section 2 of the USAFOEHL/TSS Handbook, Version 2.0, dated April 1988 (provided under separate cover). This effort shall satisfy the requirement in the Superfund Amendments and Reauthorization Act (SARA) of 1986 to identify all Applicable or Relevant and Appropriate Requirements (ARARs).

b. After a thorough review of all data gathered during the field investigation and the establishment of ARARs (paragraph I.H.12.a. above), determine the potential risk to human health and welfare or the environment from the contaminants identified at the various sites investigated. Do the following:

(1) Identify the physical and chemical characteristics of the site contaminants (e.g., toxicity, carcinogenicity, flammability, etc.)

(2) Identify release mechanisms (e.g., volatilization, leaching) and estimate the volume of contaminants released or being released at each IRP site.

(3) Identify potential human and environmental receptors and receptor characteristics which might increase vulnerability to the effects of contaminants.

(4) Determine potential contaminant exposure pathways (e.g., direct contact, inhalation of vapors/dust, ingestion of contaminated water or soil, ingestion of aquatic organisms, etc.).

(5) Determine representative rates of migration associated with individual sites. Rates of flow, groundwater velocities, and times necessary to reach receptors shall be calculated based on a range of conservative assumptions.

c. Include results of the baseline risk assessment in Section IV of the Final Report (paragraph I.J.).

NEW PARA ADDED PER MOD 3

13. Identify those IRP sites posing no threat to human health, welfare or the environment and which no further action is appropriate. Prepare a technical decision document to support this finding (Sequence No. 4, Item VI). One decision document is required for each such site. Use the format provided in Section 11 of the USAFOEHL/TSS Handbook, Version 2.0, dated 15 Apr 88 (mailed under separate cover).

NEW PARA ADDED PER MOD 3

14. Identify those IRP sites which will require further remedial investigation or a feasibility study. Prepare a Work Plan (Sequence No. 4, Item VI) for this next effort. Use the Work Plan format provided in Section 4 of the USAFOEHL/TSS Handbook, Version 2.0, dated April 1988 (mailed under separate cover). Forward all copies to USAFOEHL/TSS.

I. Data Review

1. Tabulate field and analytical laboratory results, including field and laboratory parameters and QA/QC data, as they become available and incorporate them into the next monthly R&D Status Report (Sequence No.1, Item VI below) forwarded to the USAFOEHL. In addition to the results, report the following:

a. the time and dates of sample collection, extraction (if applicable) and analysis;

b. the method used and Method Detection Limits achieved;

c. the chain-of-custody forms;

d. a cross-reference of laboratory sample numbers and field sample numbers;

e. a cross-reference of field sample numbers to wells, boreholes, sites, etc.

2. Upon completion of all analyses, tabulate and incorporate all results into an Informal Technical Information Report (Sequence No. 3, Item VI below) and forward the report to USAFOEHL for review a minimum of two weeks prior to submission of the draft report. Provide as a minimum the information specified in I.I.1 above.

3. Immediately report to the USAFOEHL Program Manager or his supervisor, via telephone, data/results generated during this investigation which indicate a potential health risk (for example, a contaminated drinking water aquifer). Follow the telephone notification with a written notice within three days and attach a copy of the laboratory raw data (e.g., chromatogram).

NEW PARA ADDED PER MOD 4

4. Prepare a letter report (Sequence No. 4, Item VI) delineating the findings from the field investigation at Site D-5 (Modification 2 to Delivery Order). Include alternative measures and formulate recommendations based upon findings. Include field and analytical laboratory results, and other information specified in paragraph I.I.1. above, as attachments to the letter report. A separate Informal Technical Information Report (paragraph I.I.2) is not required for Site D-5."

J. Reporting

1. Prepare a draft report delineating all findings of this field investigation and forward it to the USAFOEHL (as specified in Sequence No. 4, Item VI below) for Air Force review and comment. Strictly adhere to the USAFOEHL report format (mailed under separate cover). The format is an integral part of this delivery order. Draft reports are considered "drafts" only in the sense that they have not been reviewed and approved by Air Force officials. In all other respects, "drafts" must be complete, in the proper format, and free of grammatical and typographical errors. Include as a minimum, discussion of the regional/site-specific hydrogeology, well and boring logs, data from water level surveys, water

table configuration and/or piezometric contour maps, water quality and soil analysis results, hydrogeological cross sections, and laboratory and field QA/QC information. For states that require the field work or technical effort to be supervised by a state-registered geologist, engineering geologist or professional engineer; insert this information into the report and include registration numbers, certificates and seals (as appropriate).

2. Review the Results, Conclusions and Recommendations concerning the sites listed in this task which were investigated during a previous IRP Phase II stage work effort. Use this information and data from previous efforts to establish trends and develop conclusions and recommendations. Integrate all investigative work done at each site to date so the report reflects the total cumulative information for each site studied in this effort.

3. In the Results section, include water and soil analytical results and field quality control sample data. Report all internal laboratory quality control data (lab blanks, lab spikes and lab duplicates) and laboratory quality assurance information in an appendix of the report. Also provide second-column confirmation results and quantities, and include which columns were used, instrument operating conditions, and retention times. Summarize in the appendix the specific collection technique, analytical method (Standard Methods, EPA, etc.), holding time, and limit of detection for each analyte.

4. Make estimates of the magnitude, extent and direction which detected contaminants are moving. Identify potential environmental consequences of the discovered contaminants based upon state or Federal standards.

5. Plot and map all field data collected for each site according to surveyed positions.

6. In the Recommendations section, address each site and list them by category:

a. Category I consists of sites where no further action (including remedial action) is required. Data for these sites are considered sufficient to rule out unacceptable public health or environmental hazards.

MOD 3 b. Category II sites are those requiring an additional IRP effort to determine the direction, magnitude, rate of movement and extent of detected contaminants. Identify potential environmental consequences of discovered contamination.

MOD 3 c. Category III sites are those sites where contamination has been identified and quantified and which require a feasibility study to develop recommendations for remedial action. In the recommendations for Category III sites, include a discussion of any possible influence on sites in Categories I and/or II due to their connection with the same hydrological system. Clearly state any dependency between sites in different categories. Include a list of possible remedial action

alternatives, including long term montoring (LTM) as a remedial action, and the corresponding rationale that should be considered in selecting the remedial action for a given site. Included here should be recommendations on wells to be abandoned and/or sealed, if appropriate. List all alternatives that could potentially bring the site into compliance with environmental standards. For contaminants that do not have standards, use EPA-recommended safe levels for noncarcinogens (Health Advisory or Suggested-No-Adverse-Response Levels) and target levels for carcinogens 1 x 10^{-6} cancer risk level). Unless specifically requested, do not perform any cost analyses or cost/benefit reviews for remedial action alternatives. However, in those situations where field survey data indicate immediate corrective action is necessary, present specific, detailed recommendations.

7. For each category above, summarize the results of field data, environmental or regulatory criteria, or other pertinent information supporting conclusions and recommendations. Reduce this summary information into a table (or tables) which will be included in the text and the Executive Summary.

MOD 3 8. In a separate letter, submit a lump sum cost estimate (Sequence No. 2, Item VI) for the effort required to perform work detailed in the Work Plan for the next effort.

9. Provide an inventory of all on-base wells, to include production, irrigation, monitoring, etc. If the well has been abandoned, note the reason, and identify the wells which have been permanently plugged or sealed.

10. Reference in an appendix any local, state and/or Federal regulations which require specific well drilling techniques, materials, well development, purging, and sampling methods for work specified in this effort.

MOD 3 11. Provide three (3) microfiche copies of the approved Final Report (Sequence No. 17, Item VI).

K. Meetings

The contractor's project leader shall attend 1 meeting to take place at a time to be specified by the USAFOEHL. The meeting shall take place at Hancock FLD NY for a duration of one eight hour day.

MOD 3 L. The above technical efforts, including the maximum requirements for each category, are estimates only. Should the technical efforts, including field work, require variations from these estimates, the contractor shall obtain written concurrence from USAFOEHL/TS prior to proceeding with the variations. Under such circumstances, the ceiling of this order shall remain unchanged. Should an increase in the ceiling amount be necessary, contracting officer authorization will be required prior to proceeding with the variation.

II. SITE LOCATION AND DATES:

Hancock FLD NY
Date to be established

III. BASE SUPPORT:

A. Prior to any contractor digging or drilling, the Base Civil Engineer will locate underground utilities and issue digging or other appropriate permits.

B. The Base Civil Engineer will assign accumulation points within the installation for the contractor to use to deliver any drill cuttings or well installation/development fluids generated from the required work which are suspected to be hazardous. The contractor is responsible for providing all necessary containers (55 gallon drums) and for transporting the containerized material to the accumulation point.

C. The Base Civil Engineer will take custody of any drill cuttings or well installation/development fluids suspected to be hazardous and properly dispose of the material according to applicable state and/or federal regulations.

D. The Base will provide the contractor with existing engineering plans, drawings, diagrams, aerial photographs, etc., to evaluate sites under investigation.

E. The Base will obtain a letter from the responsible official at the commercial airport allowing the contractor access to airport property for the purpose of taking surface water and sediment samples from the runway taxi area adjacent to the Hancock FLD ANG Base boundary. These samples may be necessary for background data on the quality of surface water entering the base.

F. The Base Point of Contact (POC) shall select 10% of the samples provided by the contractor, package them, and ensure that they are picked up by the contractor within 24 hours of receipt (see paragraph I.F.4). The exact identities of samples selected shall not be provided to the contractor.

G. The Base will arrange for, and have available prior to the start up of field work, the following services, materials, work space, and items of equipment to support the contractor during the investigation:

1. Personnel identification badges, vehicle passes and/or entry permits.

2. A secure staging area for storing equipment and supplies.

3. A supply (i.e., fire hydrant) of large quantities (up to a maximum of 1,000 gallons) of potable water for borehole flushing, equipment cleaning, etc.

4. A paved area where drilling equipment can be cleaned and

decontaminated. A source of potable water (i.e., ordinary outdoor water faucet) and a 110/115 VAC electrical outlet must be available within 25 feet of the paved area for steam cleaner hookup. Drainage from this paved area should be through an oil/water separator to a sanitary sewer.

5. A temporary office area, not to exceed 100 square feet and equipped with a Class A telephone for local and long distance telephone calls. The contractor shall pay for any long distance telephone calls made by his personnel from this phone.

6. A household-type refrigerator having approximately two cubic feet of freezer space.

7. A set of keys to the locks on the ten existing monitoring wells (GW-1 through GW-10) at Hancock FLD and to the lock on the door of Bldg 530 at the old transformer storage area. The keys shall be returned to the Base POC by the contractor when the survey has been completed.

IV. GOVERNMENT FURNISHED PROPERTY: None

V. GOVERNMENT POINTS OF CONTACT:

*The Technical Operations Plan (TOP) required for this stage is due within two weeks of the Notice to Proceed.

**Upon completion of the total analytical effort and before submission of the first draft report.

***Two draft reports (25 copies of each) and one final report (50 copies plus the original camera-ready copy) are required. Incorporate Air Force comments into the second draft and final reports as specified by the USAFOEHL. Supply the USAFOEHL with an advance copy of the first draft, second draft, and final reports for acceptance prior to distribution. Distribute the remaining 24 copies of each draft report and 49 copies of the final report as specified by the USAFOEHL.

MOD 3 ****One draft (15 copies) and one final (10 copies) decision document are required for each site recommended for no further action. Incorporate comments into the draft decision document as specified by USAFOEHL/TS. Supply USAFOEHL/TS with one advance copy of each draft and final decision document for acceptance prior to distribution. Distribute the remaining 14 draft and 9 final copies of each decision document as specified by USAFOEHL/TSS.

MOD 3 *****One draft (5 copies) and one final (25 copies) Letter Report are required. Forward all five (5) copies of the draft Letter Report to USAFOEHL/TS. Incorporate comments into the draft Letter Report as specified by USAFOEHL/TS. Supply USAFOEHL/TS with one advance copy of the final Letter Report for acceptance prior to distribution. Distribute the remaining 24 copies of the Letter Report as specified by USAFOEHL/TSS.

****** Due within five weeks after samples are taken.

NEW SECTION ADDED PER MOD 4

VII. McENTIRE ANGB SC

A. Conduct analyses for semivolatile organic compounds, method SW3550/SW8270, on soil samples collected at McEntire ANGB SC:

Site	Number of Analyses
1	5 (see note below)
3	15
Cedar Crk	8
Soil Toxicity	5
S.P Above SW/SD2-1	8
Drilling Fluid	1
Dup/Rep	4
TOTAL ADDED ANALYSES	46

Note: At Site 1, select for analysis the five (5) most contaminated samples based upon OVA and HNu readings.

B. Conduct additional analyses for volatile organic compounds, method SW8240, on soil samples collected at McEntire ANGB SC:

Site	Number of Additional Analyses
1	25
3	13
7	11
Cedar Crk	7
Soil Toxicity	4
S.P. Above SW/SD2-1	7
Trip Blanks	8
Dup/Rep	7
TOTAL ADDED ANALYSES	82

C. Incorporate analytical results into the Technical Report (Item VI, Sequence No 4) for Delivery Order 003, Contract F33615-85-D-4543.

MOD 4 [Delete Appendix 6 and Notes.]

Appendix I

e For soil samples, report results as mg/kg of dry soil. Report moisture content for each soil sample.

Appendix 2

Analyze one drilling fluid additive sample for the following chemical parameters:

Parameter	Method	Max Number of Analyses
Petroleum Hydrocarbons	SW3550/E418.1	1
Metals Screen (23 metals)	SW3050/SW6010	1
Arsenic	SW7060	1
Lead	SW3050/SW7420	1
Mercury (Cold Vapor)	SW7471	1
Selenium	SW7740	1
Volatile Organics (GC/MS)	SW5030/SW8240	1
Semivolatile Organics (GC/MS)	SW3550/SW8270	1
Total Dissolved Solids	E160.1*	1
Common Anions	A429*	1
Alkalinity, Carbonate & Bicarbonate	A403*	1

* Perform an extraction of the drilling fluid additive using a modified SW1310 method:

(1) Use reagent water, no acid.
(2) Do not adjust the pH.
(3) Analyze the filtrate by the indicated method.

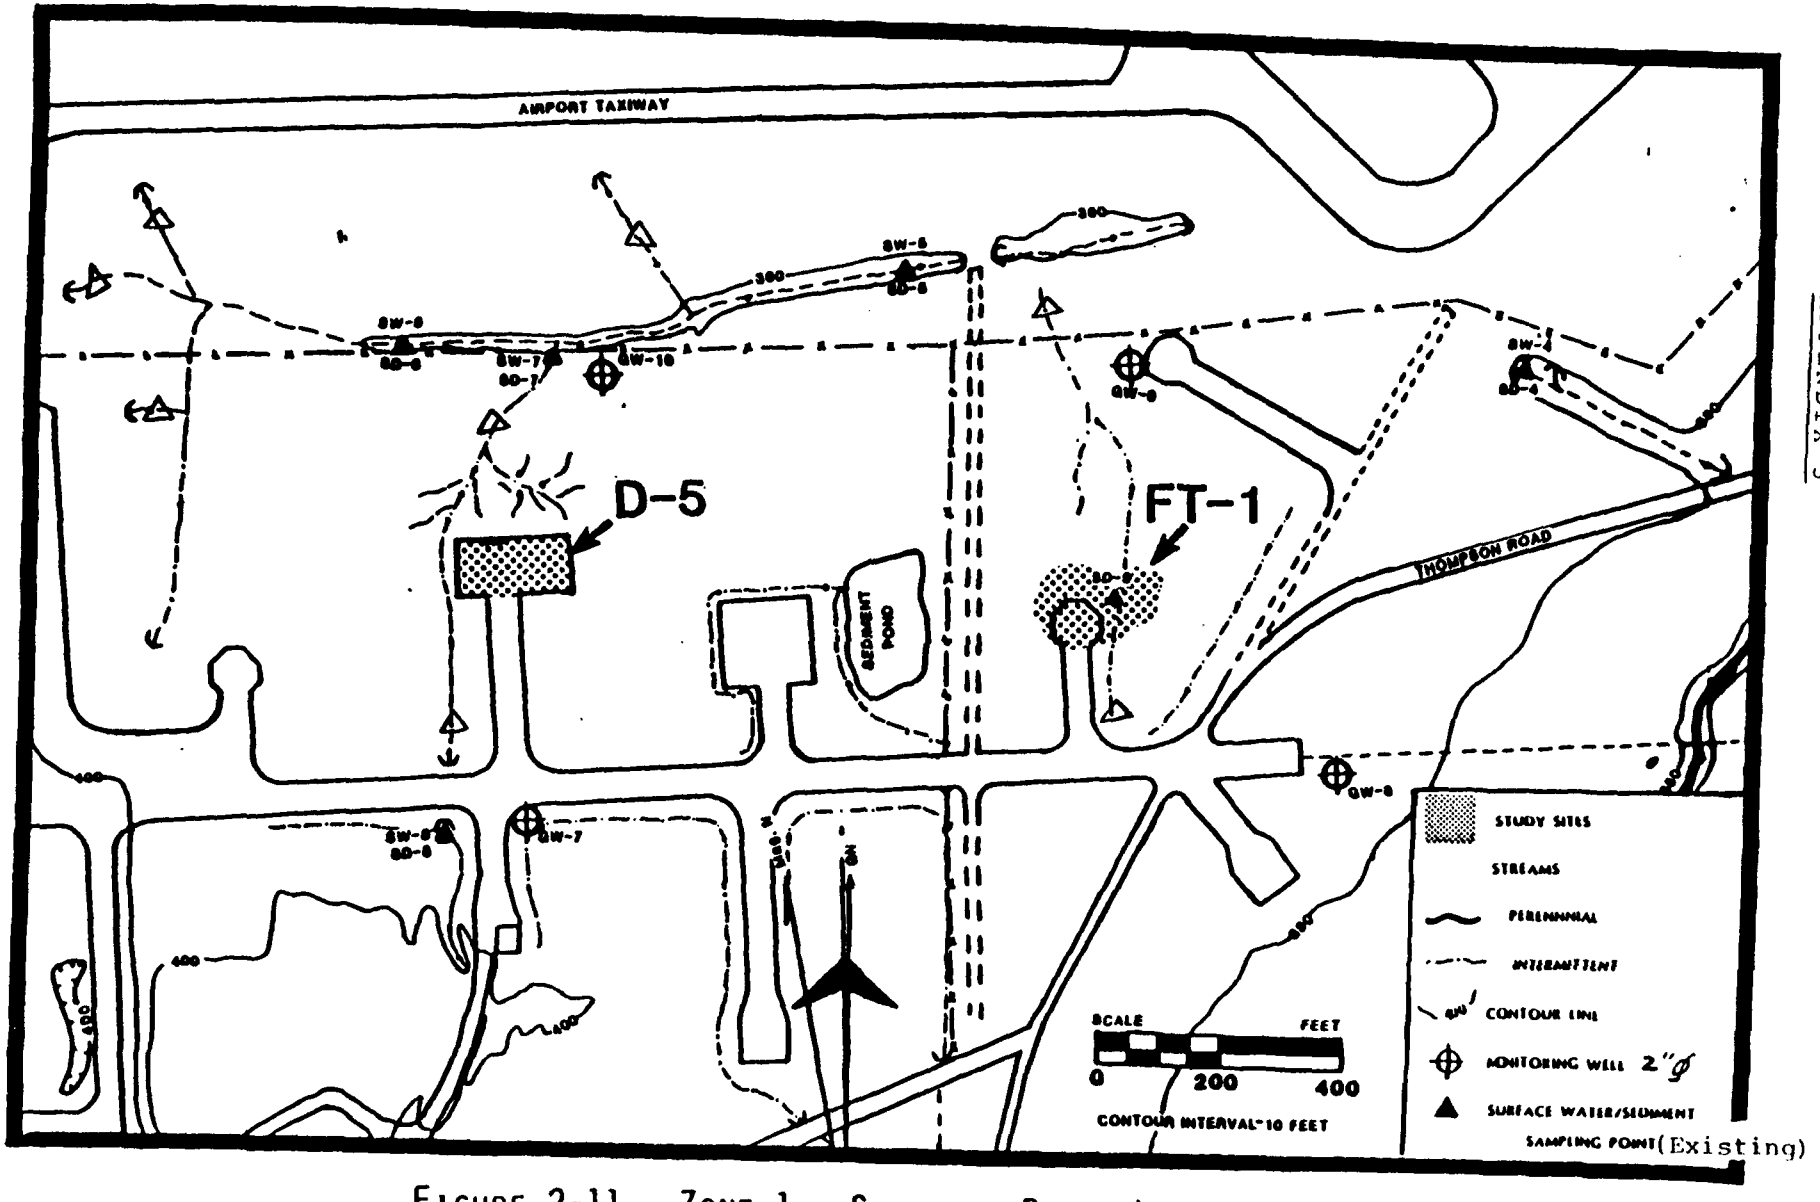

FIGURE 2-11. ZONE 1 - SAMPLING POINT LOCATIONS

Δ - Proposed surface water and sediment monitoring stations

(locations of monitoring wells at sites FT-1 and D-5 to be determined by contractor)

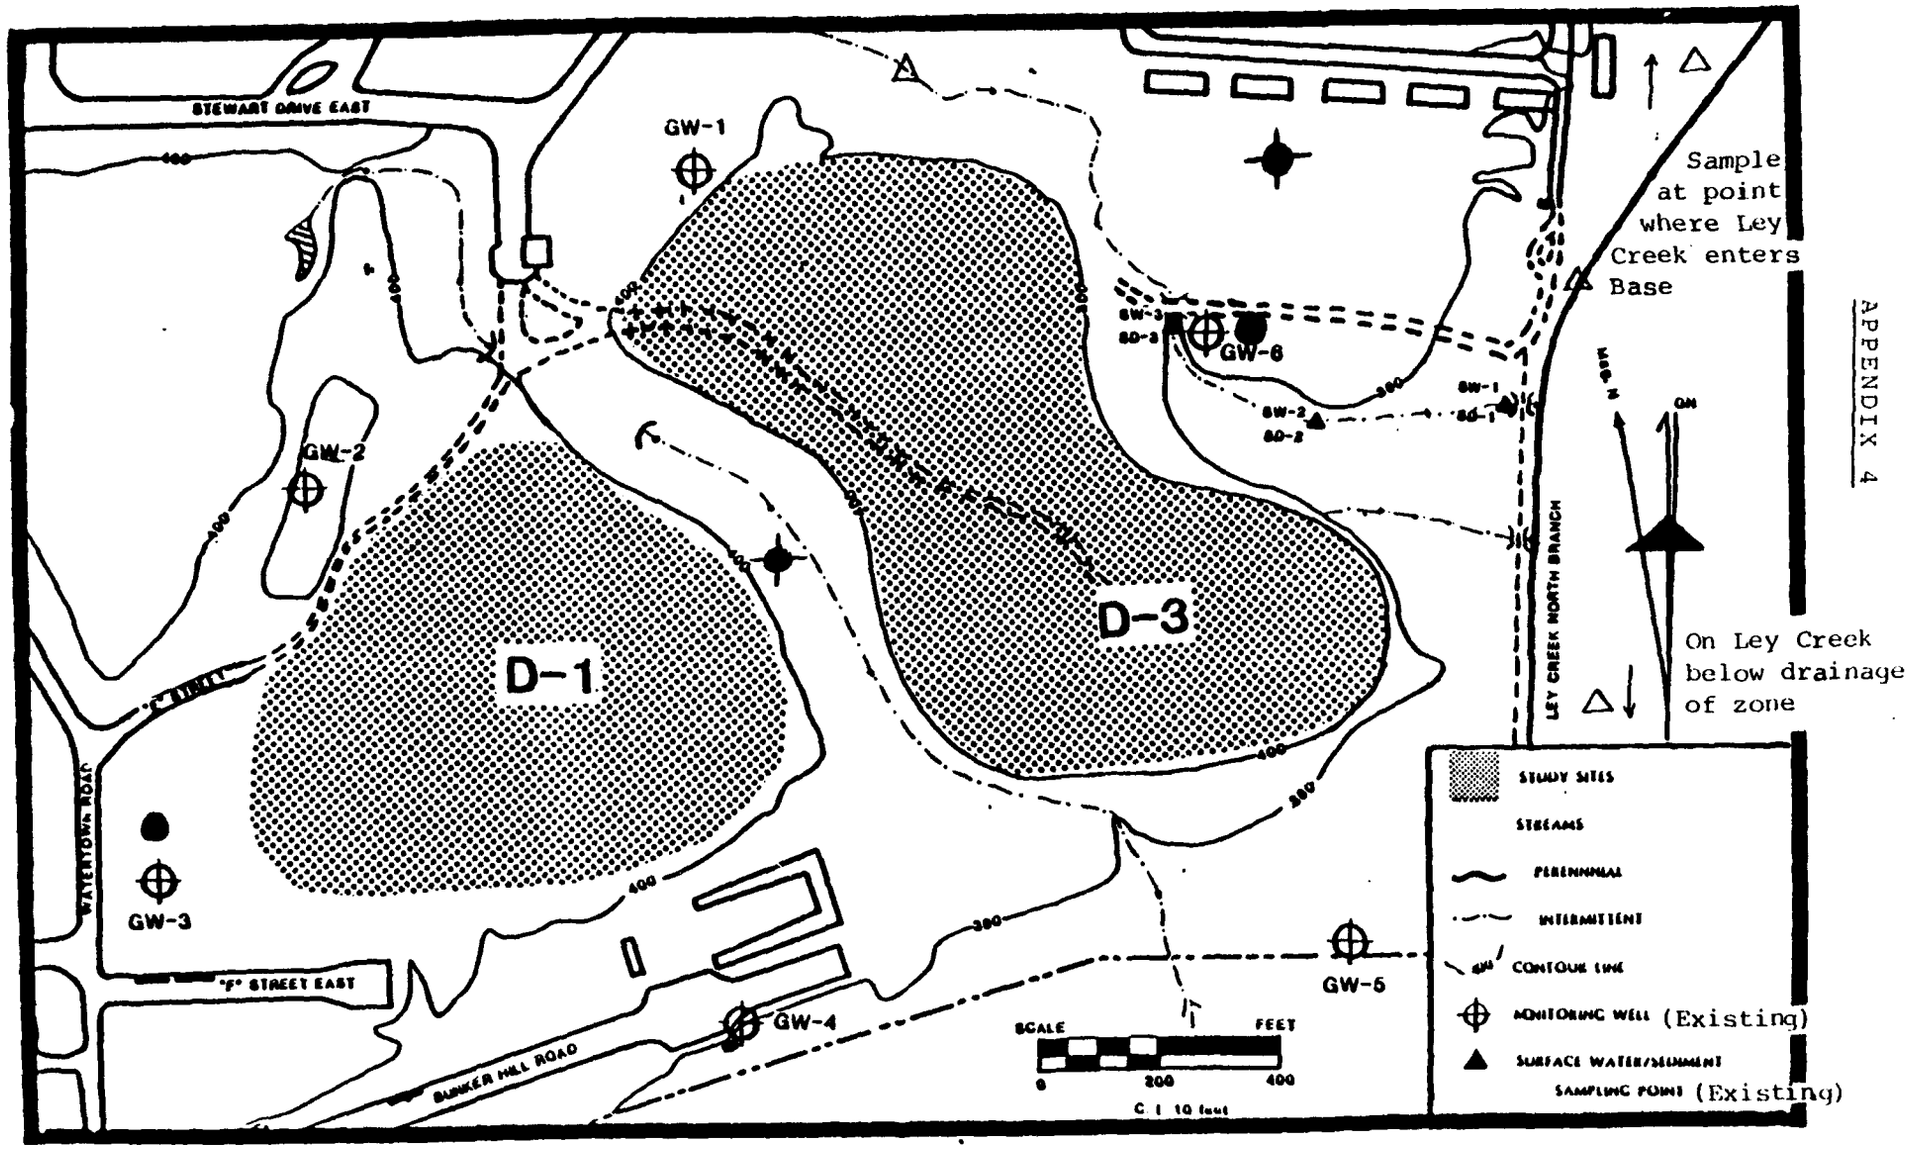

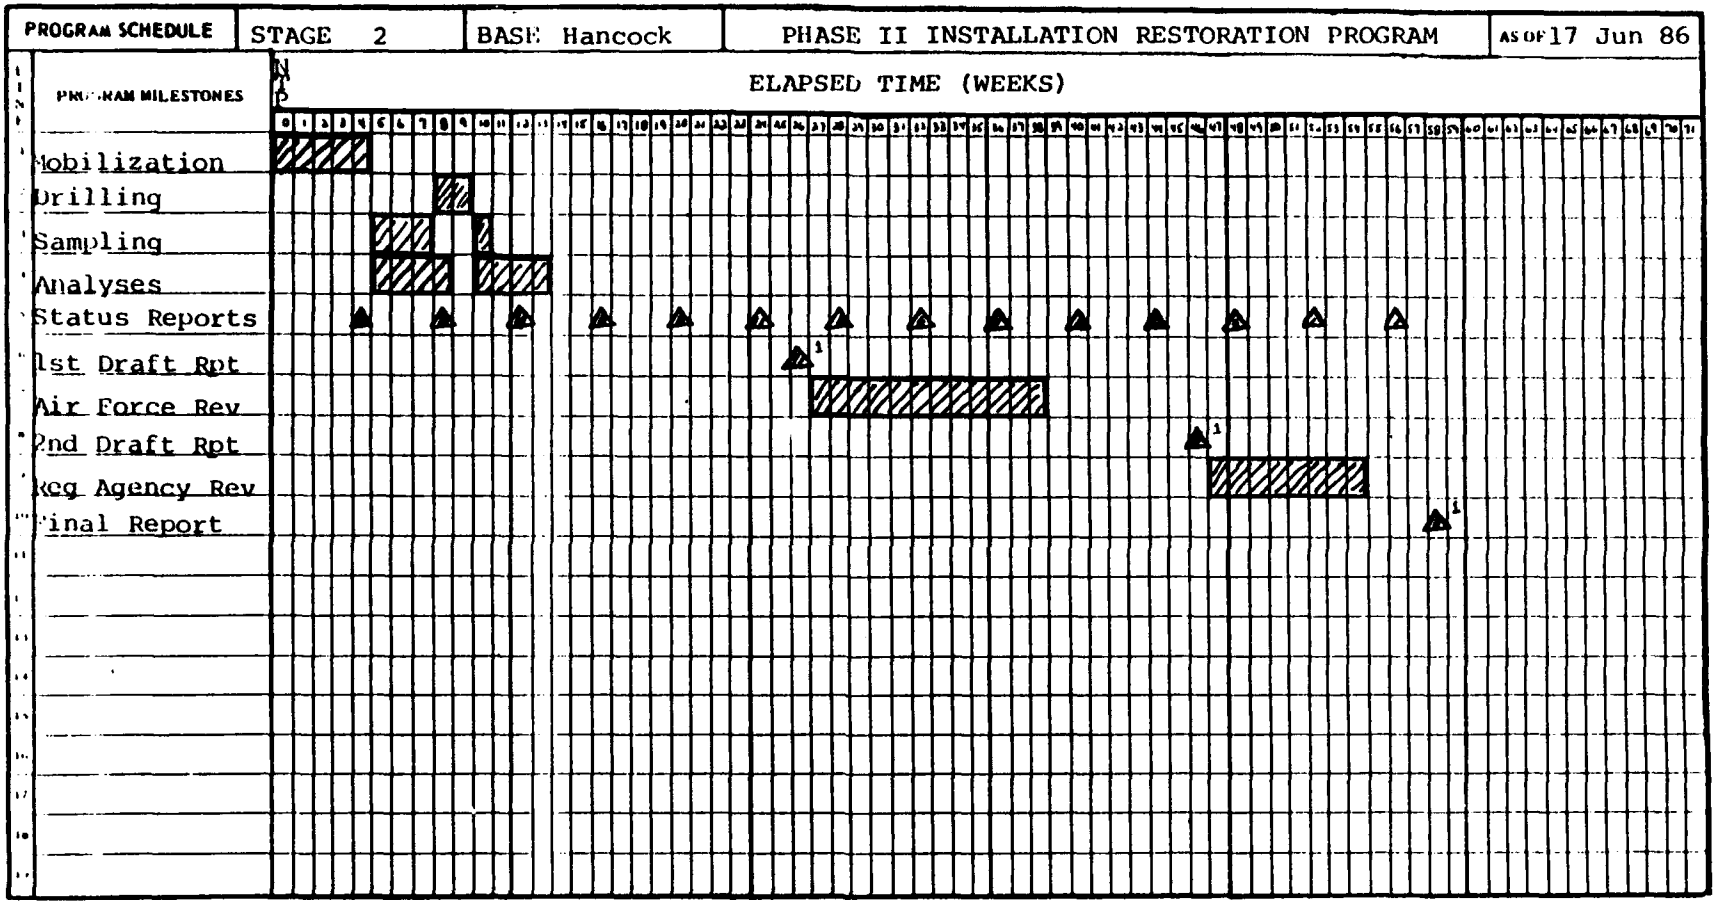

FIGURE 2-8. ZONE 2 SAMPLING POINT LOCATIONS

△ - Proposed surface water and sediment monitoring stations

✦ - Proposed well pair

● - Proposed deep well

Notes: 1. Advance copy due to technical program manager one week before scheduled delivery date.

SUMMARY OF MODIFICATIONS

Modification 1 -- The wrong statement of work was inadvertently published in the original contract. This modification substituted the correct version. (No change in contract ceiling)

Modification 2 -- Field conditions at Hancock ANGB necessitated a number of changes to the statement of work: (1) drilling method for deep wells, (2) well construction materials, (3) increase in number of field QC samples, (4) increase in the allowance for second column confirmation analyses, (5) deep well screening into the bedrock, (6) elimination of the magnetometry survey at site D-5, (7) installation of deep wells and well pairs in Zone 2, (8) abandonment of monitoring well MW-4, and (9) deletion of deep wells at D-5. (No change in the contract ceiling)

Modification 3 -- $109,855 added to the delivery order to perform additional work at site FT-1 and conduct baseline risk assessments for all sites. (New contract ceiling: $558,542)

Modification 4 -- Geological data and baseline risk assessment revealed that additional work was not necessary at site FT-1. This modification deleted sections of the SOW calling for further field work and analyses at site FT-1. A new Section VII was added to the delivery order specifying that analyses be performed on samples submitted from McEntire ANGB SC. (No change in the contract ceiling)

Variations Mod 1 -- Additional samples were collected from site D-5 and analyzed for thallium. Also, deliverable due-dates were changed to allow for this extended field effort. (No change in the contract ceiling)

APPENDIX C: WELL NUMBERING SYSTEM

APPENDIX C. WELL NUMBERING SYSTEM

Each well represents a groundwater monitoring station, which is reflected in the first two letters of the code (i.e., MW). The succeeding number in a well's code generally refers to the sequential order in which each well was installed. In the case of new deep wells, the number reflects the number of the shallow well it is paired with. The "D" designation that follows the well number refers to deep wells (i.e., wells screened in bedrock). All other wells are shallow. An example and explanation of a typical monitoring well designation is offered below:

MW-12D

MW = groundwater monitoring station
12 = well number; generally reflects the order in which a well was installed
D = deep well (i.e., well screened in bedrock).

START DATE 10/13/87 END DATE 10/13/87
BIT SCHEDULE Hollow stem auger 6" OD

DRILLING FLUIDS None

WATER ENCOUNTERED AT 8' BLS

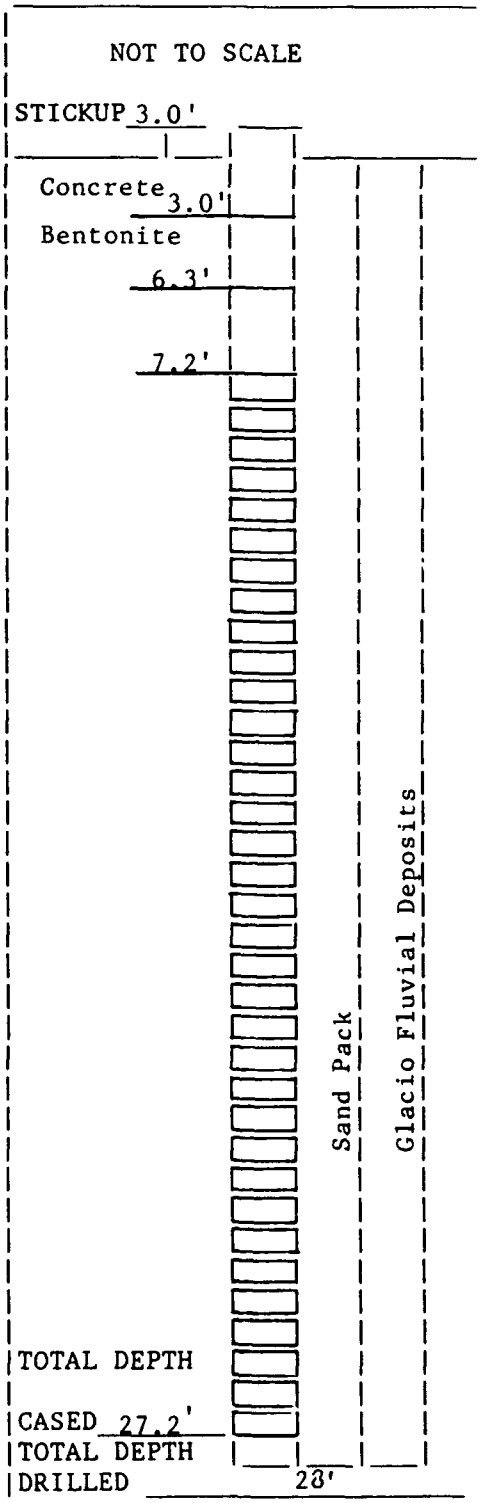

CONSTRUCTION
CASING SCHEDULE 0.02" slot, 2" ID 304 Stainless Steel Screen. (29.2'-8.9' BLS) 2" ID Sked. 80 PVC Riser (8.9' BLS - 3.0' ALS) 4" ID Protective Steel Casing

BACKFILL SCHEDULE 0 Grade Sand Pack: (29.2'-6.3' BLS) Bentonite Pellet Seal: (6.9'-1.9'BLS) Concrete Pad to 3.0' ALS

GEOPHYSICAL LOGS None

COMMENTS Some problems with heaving sand

STATIC WATER LEVEL 5.81' BLS
10/20/87 1123
DEVELOPMENT Pumped 150 Gal.

FIELD LOG

	DEPTH (FT bls)	DESCRIPTION	COMMENTS
		Dark Brown fine silty sand; wet, some gravel.	
SS #1	5'-7'	Yellow Brown (10yr5/6) and gray clayey sand, moist, firm (0.4'), gray brown (10yr5/3) silty sand, moist, firm (0.6')	N = 4,8,4,3 REC= 1.0'
		Few cuttings, water at 8' BLS	
SS #2	10'-12'	Gray (N5/0) silty clay, wet, plastic, sticky	N = 2,1,1,1 REC = 1.4'
SS #3	15'-17'	Gray (N5/0) silty clay, wet, plastic, sticky	N = 1,1,2,2 REC = 1.4'
SS #4	20'-22'	Gray (N5/0) silty clay, wet, plastic, sticky	N = 0,1,2,3 REC = 1.4'
SS #5	25'-27'	Brown(7.5yr5/2) very fine silty sand, wet	N = 0,0,1,2 REC = 0.85'

Shipment Method: Fed Ex

Instructions

1. Fill out form completely except for shaded areas (lab use only).
2. Complete in ballpoint pen. Draw one line through errors and initial.
3. Request analyses using EPA method method numbers only. Consult the project QAPP for instructions. Complete as shown.
4. Reference all field QC samples to the applicable site or Area.
5. Note all applicable preservatives.
6. [illegible] samples [illegible]

Note: See page H-347 for holding times summary.

*Resampled for purgeables in September 1988. See pages H-350, H-353, H-360 and H-361.

TABLE H-3-J. SAMPLE IDENTIFICATION CROSS REFERENCE
SITE D-5
THALLIUM RESAMPLING, JANUARY 1989

Laboratory ID No.	Field ID No.	Sampling Point Description	Page Number
33405	GW-1	Field Blank	H-347
33406	GW-2	Monitoring Well 16	H-347
33407	GW-3	Monitoring Well 17	H-347
33408	GW-4	Monitoring Well 18	H-347

Note: Samples were collected on 1/4/89 and analyzed on 1/9/89; well within the 6-month holding time.

CORRECTING WET WEIGHT TO DRY WEIGHT

To correct the wet weight sample result to dry weight, the result must be divided by the percent solids (expressed in decimal form).

FOR EXAMPLE:

A sample is 65% solids.

$$\frac{15 \text{ mg/kg as received}}{0.65 \text{ (Solids)}} = 23 \text{ mg/kg dry weight}$$

Project No. : 2-885-06-0624-00
Project Name: HANCOCK AFB
Shipment No.: 1

01-may-1987

Notes and Comments:

NR	Analysis Not Required
GF	GRAPHITE FURNACE
U	UNDETECTED AT DETECTION LIMIT SHOWN
*	Holding Times Exceeded for semivolatile organics only; see Page H-298 - H-303 for the new analytical results for the said parameters.

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

Project No. : 2-885-06-0624-00
Project Name: HANCOCK AFB
Shipment No.: 2

01-may-1987

Notes and Comments:

NR	Analysis Not Required
C	VALUE FOR SUBSTANCE IS A FRACTION OF TOTAL FOR A DEFINED COMBINATION OF UNRESOLVED SUBSTANCES
D	DETECTED, VALUE IS BELOW DETECTION LIMIT SHOWN
GF	GRAPHITE FURNACE
I	INTERFERENCE FROM COELUTING PEAKS; REPORTED VALUE IS AN APPROXIMATED VALUE
NC	NOT CONFIRMED ON SECOND COLUMN
U	UNDETECTED AT DETECTION LIMIT SHOWN
+	Holding Time Exceeded for organochlorine pesticides/PCBs, organophosphorus pesticides and chlorinated herbicides only; see Page H-304 for the new analytical results for the said parameters.
*	Holding Time was exceeded for purgeable halocarbons, aromatic volatile organics and mercury; was resampled for the parameters in Sept. 1987; see Page H-296, H-297 for new results.
**	Holding Time was exceeded for mercury only; was resampled for the parameter in Sept. 1987; see Page H-305 - H-307 for new results.

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

Project No. : 2-885-06-0624-00
Project Name: HANCOCK AFB
Shipment No.: 2

30-apr-1987

Notes and Comments:

NR	Analysis Not Required
C	VALUE FOR SUBSTANCE IS A FRACTION OF TOTAL FOR A DEFINED COMBINATION OF UNRESOLVED SUBSTANCES
I	INTERFERENCE FROM COELUTING PEAKS; REPORTED VALUE IS AN APPROXIMATED VALUE
NC	NOT CONFIRMED ON SECOND COLUMN
U	UNDETECTED AT DETECTION LIMIT SHOWN
+	Holding Time was exceeded for organochlorine pesticides/PCBs, organophosphorus pesticides only; See Page H-304 for the new analytical results for the said parameters.
*	Holding Time was exceeded for purgeable halocarbons, aromatic volatile organics and mercury; see pages H-296 - H-297 for new results.
**	Holding Time was exceeded for mercury only; was resampled for the parameter in Sept. 1987; see Pages H-305 - H307 for new results.

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

Shipment No.: 3

01-may-1987

Notes and Comments:

NR	Analysis Not Required
C	VALUE FOR SUBSTANCE IS A FRACTION OF TOTAL FOR A DEFINED COMBINATION OF UNRESOLVED SUBSTANCES
D	DETECTED, VALUE IS BELOW DETECTION LIMIT SHOWN
GF	GRAPHITE FURNACE
I	INTERFERENCE FROM COELUTING PEAKS; REPORTED VALUE IS AN APPROXIMATED VALUE
NC	NOT CONFIRMED ON SECOND COLUMN
U	UNDETECTED AT DETECTION LIMIT SHOWN
*	Holding times were exceeded for orthophosphate and incorrect method was used for lead detection; was resampled in Sept. 1987; see pages H-306 - H-307 for new results.

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

Environmental Chemistry Division

Project No. : 2-885-06-0624-00
Project Name: HANCOCK AFB
Shipment No.: 4

01-may-1987

Notes and Comments:

NO FIELD BLANK WAS SUPPLIED FOR VOA SAMPLES

NR	Analysis Not Required
C	VALUE FOR SUBSTANCE IS A FRACTION OF TOTAL FOR A DEFINED COMBINATION OF UNRESOLVED SUBSTANCES
I	INTERFERENCE FROM COELUTING PEAKS; REPORTED VALUE IS AN APPROXIMATED VALUE
NC	NOT CONFIRMED ON SECOND COLUMN
U	UNDETECTED AT DETECTION LIMIT SHOWN

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

LAST PAGE

Project No. : 2-885-06-0624-00
Project Name: HANCOCK AFB
Shipment No.: 5

30-apr-1987

Notes and Comments:

NR	Analysis Not Required
C	VALUE FOR SUBSTANCE IS A FRACTION OF TOTAL FOR A DEFINED COMBINATION OF UNRESOLVED SUBSTANCES
I	INTERFERENCE FROM COELUTING PEAKS; REPORTED VALUE IS AN APPROXIMATED VALUE
NC	NOT CONFIRMED ON SECOND COLUMN
U	UNDETECTED AT DETECTION LIMIT SHOWN

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

Shipment No.: 6

30-apr-1987

Notes and Comments:

NR	Analysis Not Required
C	VALUE FOR SUBSTANCE IS A FRACTION OF TOTAL FOR A DEFINED COMBINATION OF UNRESOLVED SUBSTANCES
D	DETECTED, VALUE IS BELOW DETECTION LIMIT SHOWN
GF	GRAPHITE FURNACE
I	INTERFERENCE FROM COELUTING PEAKS; REPORTED VALUE IS AN APPROXIMATED VALUE
NC	NOT CONFIRMED ON SECOND COLUMN
U	UNDETECTED AT DETECTION LIMIT SHOWN
*	Holding times exceeded for mercury and orthophosphate only; was resampled in Sept. 1987 for the two parameters; see page H-307 for new results.

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

Project No. : 2-885-06-0624-00
Project Name: HANCOCK AFB
Shipment No.: 6

30-apr-1987

Notes and Comments:

NR	Analysis Not Required
C	VALUE FOR SUBSTANCE IS A FRACTION OF TOTAL FOR A DEFINED COMBINATION OF UNRESOLVED SUBSTANCES
I	INTERFERENCE FROM COELUTING PEAKS; REPORTED VALUE IS AN APPROXIMATED VALUE
NC	NOT CONFIRMED ON SECOND COLUMN
U	UNDETECTED AT DETECTION LIMIT SHOWN

REPORTED DETECTION LIMITS ARE INSTRUMENT DETECTION LIMITS CORRECTED TO SAMPLE CONDITIONS
REPORTED VALUES ARE NOT CORRECTED FOR ANALYTICAL BLANK
VALUES REPORTED ON A DRY WEIGHT BASIS (EXCLUDING VOLATILE AND BASE/NEUTRAL/ACID ANALYSIS)

LAST PAGE

PROJECT NAME: HANCOCK AFB

OEHL VOLATILES PRECISION DATA

COMMENTS:

1. REPLICATE RESULTS FOR FS-G-1 FOR OEHL VOLATILE ANALYSIS ARE BELOW DETECTION AND ARE NOT APPLICABLE FOR RPD DETERMINATION.

2. RPD (RELATIVE PERCENT DIFFERENCE) = $\frac{\text{SAMPLE RESULT - SAMPLE DUPLICATE}}{\text{MEAN OF SAMPLE RESULT AND DUPLICATE}} \times 100$

OEHL VOLATILES ACCURACY DATA

SAIC I.D.	86-329025	86-329026
CLIENT I.D.	FS-G-1	FS-G-1SP
MATRIX TYPE	SOIL	SOIL

OEHL VOLATILES	SAMPLE RESULT (UG)	SPIKED SAMPLE (UG)	AMOUNT SPIKED (UG)	PERCENT RECOVERY (%)
1,1-DICHLOROETHENE	ND	81	50	160

COMMENTS:

1. THE FOLLOWING VOLATILE COMPOUNDS ARE NOT NORMALLY INCLUDED IN THE SPIKING SOLUTION UNLESS THESE ARE PRESENT AS POSITIVE HITS IN THE SAMPLE BEING ANALYZED. THE ABSENCE OF THESE COMPOUNDS IN SAMPLES SW-17MS AND SW-17MSD ARE NOT APPLICABLE FOR RPD DETERMINATION.

   2-CHLOROETHYL VINYL ETHER
   BROMOMETHANE
   CHLOROMETHANE
   DICHLORODIFLUOROMETHANE
   1,3- DICHLOROBENZENE

2. HIGH RPD VALUE IS DUE TO PRESENCE OF INTERFERING PEAK COELUTING WITH VINYL CHLORIDE IN SAMPLE SW-17MSD. REPORTED VALUE IS AN APPROXIMATION OF THE HIT ANALYTE.

3. ** = DOUBLET;THE PRESENCE OF TWO COELUTING HIT ANALYTES THAT CANNOT BE SEPARATED BY THE RECOMMENDED PRIMARY COLUMN OR SECONDARY COLUMN; REPORTED VALUE IS A FRACTION OF THE TOTAL VALUE OF THE UNRESOLVED SUBSTANCES.

4. *** = TRIPLET; THE PRESENCE OF THREE COELUTING HIT ANALYTES THAT CANNOT BE SEPARATED BY THE RECOMMENDED PRIMARY COLUMN OR SECONDARY COLUMN; REPORTED VALUE IS A FRACTION OF THE TOTAL VALUE OF THE UNRESOLVED SUBSTANCES.

5. I = PRESENCE OF AN INTERFERING PEAK WHICH IS NOT A HIT ANALYTE'S PEAK; VALUE REPORTED IS AN APPROXIMATED AMOUNT.

6. MS = MATRIX SPIKE; MSD = MATRIX SPIKE DUPLICATE

7. RPD (RELATIVE PERCENT DIFFERENCE) = $\frac{\text{SAMPLE RESULT - SAMPLE DUPLICATE}}{\text{MEAN OF SAMPLE RESULT AND DUPLICATE}} \times 100$

PROJECT NAME: HANCOCK FIELD

NOTES AND COMMENTS:

u = Not detected at the limits given.

d = 1,1,2,2-Tetrachloroethane and Tetrachloroethene coelute, the peak is quantitated as all Tetrachloroethene.

C = Compound found on both the primary and secondary column above the indicated detection limit.

CI = Compound found on both the primary and secondary column, however there is potential interference from another compound on the secondary column prevents accurate quantitation of the peak of interest.

NC = Compound found on the primary column but not on the secondary column at or above the detection limit indicated.

All volatile, halogenated compounds included in the 602 analysis and in the 601 analysis were quantitated based on their 601 response.

PROJECT NAME: HANCOCK FIELD

NOTES AND COMMENTS:

u = Not detected at the limits given.

d = Vinyl chloride and dichlorodifluoromethane coelute, the value is the total of both peaks.

C = Compound found on both the primary and secondary column above the indicated detection limit.

CI = Compound found on both the primary and secondary column, however there is potential interference from another compound which on the secondary column prevents accurate quantitation of the peak of interest.

NC = Compound found on the primary column but not on the secondary column at or above the detection limit indicated.

NA = Not applicable.

NR = Not required.

ND = Not detected.

All volatile, halogenated compounds included in the 8020 analysis and in the 601 analysis were quantitated using their response from the 601 analysis.

*RPD values for 1,1,1-trichloroethane and toluene are relative high due to their proximaty to the detection limits for these compounds. The values calculated are considered to be acceptable by the laboratory based on historical data.

**Outside laboratory established control limits for percent recovery. Corrective action required only when more than five compounds fall outside the established control limits for this analysis.

(1)Insufficient sample volumes to perform quality control check.
*Outside control limits established for RPD for this parameter.
**Outside control limits established for percent recovery for this parameter. Analysis of a check sample indicated possible matrix interference for this sample

***Potassium poses significant ionization problems when analyzed by ICAP,resulting in wide variance for percent recovery. Control limits for percent recovery have been established using a limited number of data points.

(all results in ug/L)

U-8892.9

Compound	E & E Lab. No. 88-	28171	28172	28173	28174	
	Sample Identity	GW-1	GW-2	GW-3	GW-4	
Benzene		2.1(0.29)†	0.70 U	0.70 U**	0.70 U**	
Chlorobenzene		1.0 U	1.0 U	1.0 U	1.0 U	
1,2-Dichlorobenzene		2.0 U	2.0 U	2.0 U	2.0 U	
1,3-Dichlorobenzene		2.0 U	2.0 U	2.0 U	2.0 U	
1,4-Dichlorobenzene		0.50 U	0.50 U	0.50 U	0.50 U	
Ethylbenzene		1.0 U	1.0 U	1.0 U	1.0 U	
Toluene		1.0 U	1.0 U	1.0 U	1.0 U	
Xylene (total)		2.0 U	2.0 U	2.0 U	2.0 U	

Explanation of data flags:
U - Analyte tested for and not found at this level
J - Estimated value; less than detection limit
B - Analyte also found in associated blank
E - Estimated value; above calibration range
* - Compound present below CRDL but reported at the CRDL
† - Value in parentheses is confirmation value.
** - The following results for benzene were obtained on the primary column:
sample #28173 - 0.93 ug/L
sample #28174 - 1.6 ug/L
We could not positively confirm these values on a second column due to suspected headspace problems or low instrument response. Therefore, the results are reported as non-detected.

APPENDIX I: CORRESPONDENCE

New York State Department of Environmental Conservation
50 Wolf Road, Albany, New York 12233-0001

Henry G. Williams
Commissioner

March 12, 1986

Mr. Edward Repa
SAIC
8400 Westpark Drive
McLean, VA 22102

Dear Mr. Repa:

Please find enclosed Generic Work Plan for Phase II investigations and a list of "technically acceptable" laboratories, which you requested in regard to your studies at Hancock Field, New York.

If you have any questions, please do not hesitate to call me at (518) 457-9538.

Sincerely,

Carl Hoffman

Carl Hoffman, P.E.
Senior Sanitary Engineer
Bureau of Hazardous Site Control

MEMORANDUM

TO: Jack Ryan
FROM: Larry Bailey
SUBJECT: Technically Acceptable Laboratories
DATE: August 13, 1985

The following is a list of the laboratories that have performed satisfactorily on P.E. samples and addressed any deviations found during on-site audits and have been determined to be "technically acceptable."

ETC-Edison, NJ, in conjunction with Wilson Laboratories, Salina, KS
ERCO-Cambridge, MA
General Testing-Rochester, NY, in conjunction with CompuChem Laboratories, Research Triangle Park, NC
H2M Corp.-Melville, NY
Galson Technical Services-E. Syracuse, NY, in conjunction with O'Brien & Gere Laboratories, Syracuse, NY
Aquatec, Inc.-S. Burlington, VT
NUS Corp.-Pittsburg, PA
Ecology & Environment-Buffalo, NY
IT Corp.-Pittsburg, PA
Recra Research-Buffalo, NY
GCA Corp.-Bedford, MA
IT Corp.-Knoxville, TN
O'Brien & Gere-Syracuse, NY
Versar, Inc.-Springfield, VA
CompuChem Laboratories-Research Triangle Park, NC
NYTest Environmental-Westbury, NY
EA Engineering, Science, & Technology-Sparks, MD
Roy F. Weston, Inc.-West Chester, PA
Environment One Corp.-Schenectady, NY
Hittman Ebasco Associates-Columbia, MD
Friend's Laboratories-Waverly, NY, in conjunction with NYTest Environmental, Westbury, NY
Princeton Aqua Science-Edison, NJ
Chemtech-NY, NY, in conjunction with Envirodyne Engineers, St. Louis, MO
C&S Environmental-Liverpool, NY, in conjunction with Camo Labs, Poughkeepsie, NY
Nanco Labs-Hopewell Junction, NY

STATE SUPERFUND PROGRAM

Phase II Investigations

The Division of Solid and Hazardous Waste, requires that certain aspects be addressed in any investigative work (Phase II) undertaken to determine the hazardous nature of a site. This document describes generally the minimum amount of work and reporting that must be accomplished by the consultant in performing a Phase II investigation; the requirements by the Division of the consultant in performing a satisfactory Phase II investigation is not limited to the items described herewith, but may include other needs to satisfy unanswered questions on a site-specific basis.

This generic work plan will be divided into five main areas:

1. Geophysical Survey
2. Well Drilling/Development
3. Recommended Well Sampling and Analyses
4. QA/QC Protocols
5. Phase II Report Format

1. Geophysical Survey

The broad considerations are:

a. Location of buried materials

b. Determination of the presence of contaminated plumes

c. Characterization of subsurface conditions

Because of complexities involved in detecting hazardous waste at a given site, with added complications of geologic anomalities, the Department requires that specific geophysical studies be conducted during each investigation. Generally, the goals of a geophysical survey are:

- to minimize the number of drilling sites
- to locate drilling and monitoring wells at representative sites

- to reduce risks associated with drilling into unknown terrain and waste
- to reduce overall project time and costs
- to provide improved accuracy and confidence levels to the project

Some of the specifics that are required to be determined by the geophysical survey are:

- layer thickness and depth of soil and rock formations
- mapping lateral anomaly locations
- determining vertical anomaly depths
- depth to water table
- existence of contamination and/or buried wastes
- mapping contamination and buried waste boundaries and contaminated plumes
- determining vertical extent of buried wastes and contamination
- quantify magnitude of buried wastes or contamination
- determine direction of groundwater flow
- detection of organics floating on the water table
- detection and mapping of contamination or wastes within the unsaturated zone

Table 1 specifies techniques, which have been proven at hazardous waste sites, and their application for various categories of a Phase II investigation. The preferred method must be employed to characterize to the maximum extent possible the subsurface stratigraphy of an inactive hazardous waste site.

The findings of the geophysical survey must be used to enhance the location of wells for obtaining samples, from leachate plumes or affected groundwater regimes. This means that geophysical data must be reduced and the findings used to determine the best locations for wells.

2. Well Drilling

These shall include, but are not limited to:

a. number of wells (nested or single) and located on a map of the site.

b. estimated depth of wells to the nearest foot based on available data.

c. materials needed to properly construct wells, seal annular space and secure wells with a steel protective casing and padlock.

d. split spoon sampling from grade elevation must be done at every 5 feet. A grain size analysis or Atterberg limits for non-cohesive materials or cohesive materials respectively must be done at every change in subsurface lithology, as well as one such analysis in the screened interval. If conditions are such that a mixture of cohesive and non-cohesive materials are encountered, perform only grain size analysis. Hydrometer analysis must also be done if 20 percent of the sample is less than a No. 200 sieve size.

e. Permeability testing of each well. Evacuation of the well for this determination will be accepted.

f. groundwater elevation readings in each well before and after development. These readings must be accomplished for normally recovering wells before the drill rig leaves the site, since if data is unable to show direction of groundwater flow, additional wells should be placed.

If low yielding wells, requiring greater than 8 hours for recovery, are encountered, then the consultant and sub-contractor must depart the site, after the last well development and return at a later date for its groundwater elevation measurement. It is required that a well must be developed as soon as its recovery is completed and as soon as practically possible before or during the drilling operations of the next well. This process of staggered well development will result in only the last well remaining underdeveloped at the end of the drilling operations. The consultant at this stage will have gathered enough information to aid in determining the next course of action.

g. development of each well.

h. classification of the split spoon samples by a geologist in the field using the N.Y.S.D.O.T. Soil Description Procedure. See Attachment 1.

i. shallow soil samples, if required, may be obtained with a hand auger.

j. The standard operating procedures anticipated to be used in drilling and installation of borings and wells.

It must be noted that in moving from one well to another on-site location for constructing a new well, all drilling equipment must be cleaned of all foreign matter, washed with a detergent, rinsed properly with water, given an acetone wash, then followed with a final hexane wash, in that order, or cleaned of foreign matter and sanitized with a steam cleaner. Any alteration to the method of cleaning is to be determined for each site by New York State Department of Environmental Conservation. Similarly, in conducting split spoon sampling, the split spoon must be cleaned as above after each sample and before introduction in a new bore hole.

It is also required that a HNu detector or OVA analyzer be used to monitor the gases emitted from each split spoon sample as soon as the sampler is opened.

When an OVA analyzer is used, special precautions must be taken in using a filter by which methane concentrations are recorded. Both filtered and unfiltered samples must be taken to show the difference for methane.

Prior to leaving a site, all equipment that was used in constructing the well, i.e., augers, split spoons, tools, accessories and other items such as vehicles and drill rigs must be cleaned as described above.

3. Recommended Well Sampling and Analyses

The Division expects that a minimum of 1 groundwater sample will be taken from each well. The consultant is therefore required to note in the work plan:

a. number of groundwater samples recommended.

b. recommended analysis for each sample, keeping in mind that:

i. if a determination on the type(s) of chemical(s) can be made from a foregoing Phase I study or other sources, then analysis shall be concentrated on those items.

ii. if there is a suspected multiplicity of chemicals, but no determination on their classification can be made, serious consideration will be given in analysing for:

A) total metals

B) identification and quantitation of compounds should be done in accordance with New York State Department of Environmental Conservation's Analytical, Quality Control and Reporting Requirements as adopted from the USEPA Caucus Protocol for the Contract Laboratory Program, with the requirement that all GC/MS peaks greater than 10 percent of the nearest calibrating standard be included in the identification and quantitation.

An analysis for total halogenated compounds (TOX) must also be performed. This is to ensure that no highly soluble halogenated compound was undetected by the GC/MS analysis. The results of the TOX analysis must be quantitively compared to the halide content (mg/l as chlorine) of individual chemicals identified by the comprehensive analysis. If less than 95 percent of the TOX is accounted for, consideration must be given for the presence of highly soluble halogenated chemicals.

In developing and extracting samples from wells, the Division will require that dedicated tubes, hoses, (rubber or tygon unacceptable), bailers including line and other sampling equipment must be provided for each well. Groundwater elevation equipment may be used between wells, provided that after use in each well, the detector is cleaned with a detergent wash, water rinse, acetone rinse and hexane rinse in that order.

4. Quality Assurance/Quality Control

QA/QC protocols for sample integrity from the field to the laboratory, as well as those employed in the laboratory must be submitted by the consultant. Generally, the sampling QA/QC protocols should describe sampling techniques and methods used in ensuring sample integrity, as cleaning of equipment, dedicated samplers, chain-of-custody procedures, sample preservation, experience and capabilities of personnel and other factors associated with obtaining and delivering hazardous waste samples to the laboratory.

A quality assurance document providing for the committment to the implementation of quality assurance and quality control practices applicable to field and laboratory activities of the hazardous waste program must be provided. This document must be in accordance with the NYSDEC, Division of Solid and Hazardous Waste Quality Assurance Program Plan which contain "Guidance for Preparation of Combined Work/Quality Assurance Project Plans for Water Monitoring (OWRS QA-1), U.S. EPA, Washington, D.C., May 1983.

5. Phase II Report Format

Cover:

The report cover shall be in accordance with the sample attached hereto as Attachment 3 and shall be printed on 65lb. Atlantic Pastel uncoated cover, Misty Blue color. The back cover shall be of the same material as that of the front cover.

Title Page:

Indicate: name of project (i.e., "Engineering Investigations at Inactive Hazardous Waste Sites in the State of New York, Phase II Investigations"); the site name, location (i.e., municipality and county) and NYSDEC site number; prepared for (i.e. Division of Solid and Hazardous Waste, New York State Department of Environmental Conservation, 50 Wolf Road, Albany, New York, 12233-0001); prepared by (i.e., contractor's name and address); and date submitted.

Table of Contents:

List all sections and subsections of the Phase II Report.

Section I:

Executive Summary -

Briefly describe the site, Phase II effort, site assessment and HRS score. (Include a portion of the USGS 7.5 minute Quadrangle Sheet 8 1/2" x 11") with site located, name of the quadrangle and the coordinates of the site, identified on it, as well as a sketch map of the site).

Section II:

Purpose -

Describe the goal of the Phase II effort at the specific site.

Section III:

Scope of Work -

Describe the scope of the Phase II effort including, but not necessarily limited to: geophysical studies, boring and monitoring well placement and installation, sampling and sampling station selection (soil, surface water, groundwater and air samples.)

Give reasons for the locations chosen for monitoring wells and sampling stations. Also include details of monitoring well installation and environmental sampling techniques used.

Section IV:

Site History-

A description of waste disposal, operation of the site, change in ownership and significant events such as, boil water notices issued by a health agency, reports of leachate outbreak, fish kills and remedial actions taken should be included.

Section V:

Site Assessment -

i) Description of site topography indicating such items as general slope of the site and proximity to surface waters, private and public wells, commercial buildings, dwellings and sensitive environments.

ii) Description of hydrology of the site, include data from geophysical studies (plots), boring logs, monitoring well data and soil test data. (Depth to groundwater, aquifers of concern, depth of bedrock, soil and bedrock permeabilities, and any unique geological characteristics such as, but not limited to, multiple aquifer systems and karst topography should be noted.)

iii) Describe the observations of the site inspection, e.g., was leachate flow noted, were drums observed and were they full or empty. Assess site contamination. Summarize the results of both past and Phase II sampling programs. Indicate the waste types and quantities on site if known, and the extent of contamination of soil, surface water, groundwater and air. Note when samples were taken and the location of samples on a map or sketch of the site. Include a description of how the QA/QC plan was applied to the site.

Section VI:

Final Application of the Hazard Ranking System - The final application of the HRS must incorporate all information collected in the Phase I and Phase II investigations of the site. This section of the report is to include:

i) Narrative Summary - Limit each narrative summary to one page (DOUBLE SPACED). Use active voice as much as possible and identify actors--that is, say "EPA erected a fence," not "a fence was erected," or "the State filed suit," not "a suit was filed." Be sure to tie the information to the response category/status codes you are assigning the site.

a. Site name (including origin of name).

b. Site location - city, county, and state

c. Size

d. Nature of operations (landfill, recycling, manufacturing, etc.)

e. History of ownership/operations - private, public, bankrupt, permitted (by whom? to do what?) currently operating (how long), closed (how long).

f. Wastes present (types, amounts, in what form, buried, on surface, etc.)

g. Media affected and with what (including source of analytical data)

h. Important demographic information.

i. Important geographic information (nearby surface water, aquifers, wetlands, etc.)

k. Enforcement actions

A typical summary is outlined below. While no single example can cover the variety of conditions at hazardous waste sites, this one illustrates the types of information and form we want.

Name
Location

The ABC/DEF (name) site covers (size) acres in (location, including county). ABC (describe operations) on the site (date), when it purchased the property from DEF (relationship of DEF to the site operation), until (date), when it (describe operations/ownership history).

The companies disposed of about (quantities of waste) of (types of waste) on the site by (describe disposal methods). According to tests conducted by (source of data), (media) are contaminated with (chemicals). The site is (important geographic information). About (population affected) are (affected how).

In (date), (who) filed (describe any legal action). In (date), (who) (describe any cleanup actions).

ii) Portion of USGS quadrangle with site located on it and the name of quadrangle identified as also required in Section I.

iii) Updated HRS Worksheets

All applicable data collected in the Phase I and Phase II investigations will be used to complete these worksheets.

iv) Updated HRS Documentation Records

All applicable data collected in the Phase I and Phase II investigations will be used to complete the HRS Documentation Records. All sources of information supplied in the documentation records must be clearly referenced on the same page where this information is presented. In addition, copies of all documents indicated as a source of information must be supplied. This includes correspondence, sampling and analytical data (even if previously presented in the Phase I report), professional papers and reports. Information based on conversations with knowledgeable individuals must be confirmed in a memorandum or a letter, and a copy included with the HRS Documentation Records. Also, a copy of the site sketch or map indicating the location of samples (as required in Section IV) must also be included in this section.

Updated EPA Form 2070-13 "Potential Hazardous Waste Site, Site Inspection Form," or any revision of such forms shall be used.

NOTE: Information presented on the HRS Documentation Records is to be typed and not handwritten or printed.

Appendix:

All raw data (i.e. geophysical, analytical, etc.) shall be presented in the appendix. This shall be in addition to any reduction of data presented elsewhere in the report.

6. Special Conditions

The consultant is required to observe certain conditions during the conduct of a Phase II investigation. These are:

a. Site visit must be made prior to completion of the work plan for reconnaisance and especially for determining access problems. Those of concern should include: is physical acccess possible, is auxiliary equipment required, can wells be located on or off the site, is off-site access permitted, are easements necessary, etc.

   If during the actual field activities of a Phase II investigation, the consultant should require a tractor to locate the drill rig, or determine that access through an adjacent property is needed and is not mentioned in the work plan, the Department will conclude that a reconnaissance was not done. This attitude will be maintained for any other condition occurring during the field activities, but which should have been addressed during the reconnaissance, nor will associated costs be considered.

b. Name and address of all sub-contractor must be submitted with an itemized list of jobs and charges.

c. The following requirements deal with the construction of overburden and rockwells. These are entitled:

   i. Guidelines for Exploratory Boring, Monitor Well Installation and Documentation of these activities.

   ii. Guidelines for rockwells

d. The attached Oversight Checklist (DSHW personnel) are items that DEC staff ensure will be met during their oversight of the Phase II investigation. The checklist is made a part hereof, and the consultant must at a minimum meet these requirements during his Phase II investigation field activities.

Atlanta, Georgia 30303

Attn of: ROV

Dear Mr. Sims:

Re: Installation Restoration Program, Hancock Field, New York

Thank you for the opportunity to review the Statement of Work (SOW) Phase II Stage 2 enclosed with your letter dated March 4, 1986 to Mr. Walter Demick, P.E., of my staff.

It has substantially addressed and incorporated the previous concerns outlined within our March 5, 1985 letter regarding the Phase II Stage 1 report.

The regional New York State Department of Environmental Conservation's office at Liverpool, has suggested that the considerable development within the area be put into perspective. Specifically, by documenting all investigative activities on a current map which includes recent residential development and proximity to the areas of concern.

Please apprise Mr. Walter Demick regarding field activity scheduling so he may coordinate field oversight.

If you have any questions, please feel free to contact Mr. Walter Demick at (518) 457-9538, or myself at (518) 457-0647.

Sincerely,

Charles N. Goddard, P.E.
Chief
Bureau of Hazardous Site Control
Division of Solid and Hazardous Waste

Reference: IRP Phase II, Stage 2, Hancock Field, New York

Dear Mr. Hoffman:

This letter is to confirm a conversation of last week between Ms. Jane Federico of your office and Ms. Judith Burris of USAFOEHL concerning the use of ERG Laboratories of Ann Arbor, Michigan for environmental analyses at Hancock Field. USAFOEHL understands that ERG is acceptable to NYDEC for this project. If this is not correct or you have any questions concerning this matter, please call me at (703) 827-8101.

Sincerely,

Philip A. Spooner
Project Manager

Dear Colonel Purple:

This letter is to confirm that you are authorized to provide access for commercial contractors for the purpose of sampling surface water and sediment sampling.

As we discussed on the telephone, it is important that any contractor be escorted in a way that controls their movement when they are within security fencing.

The person whom you should contact to arrange for such access is Robert Radway, and he may be reached at 455-1477. We would ask that a day's notice be given for any needed coordination.

Very truly yours,

Ralph E. Napolitano
Acting Commissioner
of Aviation

APPENDIX K: RESUMES OF KEY PERSONNEL

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation

EDUCATION

University of Delaware, Bachelor of Science, Geology, (1984)

EXPERIENCE

Mr. Gibson is a geologist with SAIC's Applied Technologies Division, Geotechnical Assessment Section. He has been involved in the implementation of Air Force IRP (Installation Restoration Program) studies at Air Force Bases throughout the country. These studies, which are currently in the confirmation/quantification phase, are intended to determine the degree and extent of environmental degradation resulting from past operations at the Air Force Base. Mr. Gibson's responsibilities include: supervision of the drilling and installation of soil gas and groundwater monitoring wells; sampling of groundwater, surface waters, soils, and stream sediments; analysis of data; assessment of hydrologic conditions; characterization of the local hydrogeology; and preparation of the final reports.

He has also participated in an in-situ bioreclamation research project at a contaminated site located on Kelly Air Force Base, Texas. This research project was intended to enhance the microbial degradation of organic contaminants through the controlled injection of microbe proliferating nutrients. His responsibilities in this remedial action research project consisted of: system operation (control and planning of the pumping and injection rates of both circulated groundwater and microbial nutrients); groundwater sampling; supervision of subcontractor personnel; sampling of contaminated soils obtained by drilling equipment while employing sterile sampling techniques; and field analysis of soil and groundwater chemical parameters.

In addition to these activities, Mr. Gibson has participated in EPA Resource Conservation and Recovery Act (RCRA) Part B Application Completeness Checks. These checks, which were performed on permit applications submitted by various private companies with hazardous waste management facilities, required the evaluation of each application to determine the adequacy of the data provided and, on a preliminary basis, the technical soundness of the document.

Prior to joining SAIC, Mr. Gibson was a geologist with ATEC Associates of Salisbury, Maryland. With this geotechnical engineering firm, Mr. Gibson's responsibilities included the evaluation of driven splitspoon samples to facilitate construction of well logs; the inspection of structural foundations, data interpretation, and report preparation. He assisted in a variety of projects consisting of structural foundation recommendations; determination of the areal extent and volume of proposed borrow pit materials; and potentiometric mapping.

Verified for accuracy by: J Eric Gibson Date: 8/25/86

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation

Also, Mr. Gibson was previously employed by Delmarva Drilling Company of Bridgeville, Delaware. As a member of the drilling group, he assisted with all facets of water well installation and evaluation. His responsibilities included: logging and installation of groundwater producing and monitoring wells; conducting water well pumping and slug tests used in the determination water well and aquifer parameters; recommendations concerning water well location and design and data interpretation.

Mr. Gibson was a research assistant for the Geology Department of the University of Delaware, during the summer of 1984. In this capacity, he assisted in the investigation of the geological and environmental characteristics of a coastal area experiencing rapid erosion in Central Delaware. He was responsible for flowmeter installation; collection of sediment samples; surveying of the coastal zone; determining the location of sediment sources; and preparation of reports.

SARA WILLIS HARTWELL

EDUCATION

B.S., Chemistry, Guilford College (1974)

SHORTCOURSES

1978. Column Selection in Gas Chromatography - Supelco, Inc., Bethesda, MD

1979. High Pressure Liquid Chromatography Apparatus Workshop - American Chemical Society Short Course, Philadelphia, PA

1980. Atomic Absorption Spectroscopy Course - Perkin Elmer, Gaithersburg, MD

1982. Polymer Chemistry, Principles and Practice - American Chemical Society Short Course, Blacksburg, VA

1982. Gel Permeation Chromatography - Waters, Inc., Milford, MA

EXPERIENCE

Ms. Hartwell is a Senior Chemist with SAIC's Environmental Technology Group in the Regulatory Compliance Division. She has 12 years of professional experience as an analytical chemist, including sampling techniques and analyses in environmental, biological and industrial systems.

As a Development Chemist with an industrial concern, Ms. Hartwell was involved in problem-solving research on polymers, coatings, adhesives, inks and aluminum. She has extensive experience with gas chromatography, high pressure liquid chromatography, gel permeation chromatography and fourier transform infrared spectroscopy. She served as technical advisor to a manufacturing operation, evaluating materials and process related issues with a wide spectrum of techniques including thermal analysis, rheology and optical microscopy. Ms. Hartwell designed and implemented a database management system for laboratory data, and trained the technical staff in its use. She was responsible for analytical method development, dissemination and implementation, including the selection and installation of appropriate instrumentation.

Ms. Hartwell was Chairman of the Building Safety Committee for 2 years, served on the Complex Safety Committee, and consulted with the company's safety department on chemical issues pertinent to the manufacturing operation.

As a Senior Research Technician in the Department of Environmental Toxicology at the Johns Hopkins University School of Public Health and Hygiene, Ms. Hartwell was the primary analyst on projects concerned with the analysis of phthalate esters, carbonyl sulfide and heavy metals in biological samples. She was responsible for analytical method development, as well as data management,

Verified for Accuracy by: Sara Willis Hartwell Date: Nov 18, 1986

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation

using gas chromatography and atomic absorption spectroscopy. She coordinated projects and instrument scheduling in a multi-user setting and taught a training course in the theory and practice of atomic absorption spectroscopy.

As a Laboratory Technician III with the Frederick Cancer Research Center, Ms. Hartwell performed both gas and liquid chromatographic analyses of anti-neoplastic agents in biological systems. She was responsible for the development of the analytical methods, sample handling and data management.

As a Chemist II at the Research Triangle Institute, Ms. Hartwell performed trace metal analyses on animal tissues, aqueous samples, tar residues and plant tissues. Using a wide range of chromatographic techniques, she worked on metabolic studies of testosterone propionate and trichlorocarbanalide in animal tissues and body fluids. Ms. Hartwell identified and quantified components of energy related wastes and effluents, including participation in pilot scale and in situ coal gasification studies. She was responsible for sample collection, preparation, preservation, storage, and analysis and the reduction and management of data. She had extensive experience with gas and high pressure liquid chromatography, mass spectra interpretation, column and thin layer chromatography and atomic absorption spectroscopy.

As a student, Ms. Hartwell was the Teaching Assistant for introductory chemistry labs.

ASSOCIATIONS

Ms. Hartwell is a member of the American Chemical Society.

JOHN J. KING

EDUCATION

Rutgers University, Newark College of Arts and Science, Newark New Jersey,
B.A. Geology, Cum Laude (1982)
M.S. Geology, Pending Thesis Defense

SUMMARY

Mr. King is a Geologist in SAIC's Environmental Technology Group. He is currently pursuing a Masters of Science Degree in Geology. Mr. King's thesis topic is concerned with the petrogenesis of simple pegmatites of the New Jersey Highlands.

EXPERIENCE

Mr. King is currently involved in a number of contractual work assignments with various government agencies. Under a contractual agreement to provide the USEPA's office of Water Enforcement and Permits support services on an as needed basis, Mr. King is taking an active role in the formulation of model minor permits for selected industrial categories. The model permits will become the basis for the development of individual permits for similar facilities or serve as a basis for general permits for specific industrial categories.

Under another contractual arrangement with USEPA, Mr. King is accessing State and Regional Files in an attempt to form a data base on industries which generate, treat, store and dispose of hazardous waste materials. The data base will serve as a basis for effluent guideline development for this industrial group.

Mr. King has played an active role in the performance of diagnostic inspections of Publicly Owned Treatment Works (POTWs) as a support service for USEPA's Enforcement Division. As part of an inspection, he is required to evaluate the operation of unit processes, access the adequacy of equipment, determine causes for chronic permit violations, and propose appropriate remedial measures.

Mr. King currently manages a number of environmental assessment and ECRA projects. Responsibilities include, ECRA applicability determination, completion of ECRA #1 and #2 Initial Notice Forms, Sampling and Cleanup Plan preparation, coordination of sampling and cleanup activities, and Cleanup Report preparation.

In response to a contractual assignment granted by NJDEP, Mr. King has prepared NPDES permits for Municipal Wastewater Treatment facilities throughout the state. Prerequisite activities conducted prior to permit development

JOHN J. KING

included an initial data gathering phase consisting of an on-site meeting with appropriate POTW administrative personnel.

Mr. King has been instrumental in the development of NPDES permits and accompanying engineering reports for an assortment of major industrial dischargers in the State of New Jersey.

Mr. King has participated in a number of groundwater monitoring inspections at land treatment, storage, and disposal (TSD) facilities in the State of Florida. As part of this work assignment, reports were prepared for the Florida DER and EPA Region IV describing the current level of compliance and adequacy of the groundwater monitoring programs.

In the past year, Mr. King provided technical support during the preliminary phases of a remedial investigation and feasibility study on a contaminated aquifer in Rockaway, New Jersey. Duties included the sampling and analysis of water from existing wells, and of water and sediments from local water bodies.

Mr. King worked as a research and teaching assistant at the Newark College of Arts and Science during his graduate studies. As a research assistant, he was required to sample, map, and analyze soils in the Talc districts of Southwestern Montana in an attempt to test the feasibility of a new prospecting method applicable for the exploration of mineable Talc bodies. As a teaching assistant, Mr. King maintained a supervisory position and was responsible for training the other teaching assistants in proper administration of introductory geology laboratory classes.

PHILIP A. SPOONER

EDUCATION

Virginia Polytechnic Institute and State University: BS, Agronomy, Soils Option (1977)

EXPERIENCE

Mr. Spooner is a Senior Soil Scientist with SAIC's Technical Services Division. He has over eight years experience in evaluating the environmental aspects of land and soil used for waste disposal, with particular emphasis on hazardous waste site investigation for remedial planning. Currently, Mr. Spooner is managing a Remedial Investigation/Feasibility Study for two adjacent hazardous waste disposal sites in northwestern Illinois. This project, for a private client, is one of the first in the nation to be performed under the 1984 amendments to RCRA rather than under CERCLA. He is also managing the IRP Phase II, Stage 2 investigation at Hancock Field, New York for the U.S. Air Force. Both of these projects involve detailed assessments of complicated contamination problems and recommendations for their remediation.

Earlier, Mr. Spooner managed the IRP Phase II investigation at Homestead Air Force Base, Florida and was in charge of a site characterization effort at Kelly, AFB, Texas, for a demonstration project involving biologic reclamation of contaminated groundwater.

Mr. Spooner has developed a technical handbook on Slurry Trench Construction for Pollutant Migration Control, recently published as the first of the EPA Superfund series documents (EPA-540/2-84-001). He has also completed a study on the compatibility of grouts with hazardous wastes, for EPA (EPA-600/2-84-015). In addition to project manager, Mr. Spooner was a principal investigator and author for these tasks.

Mr. Spooner has been involved in numerous waste site investigations, from preliminary assessments to detailed hydrogeologic studies. He participated in the planning and initial field work for the long-term monitoring at the Lipari Superfund site in Glochester Co., NJ. He participated in a field investigation of nine disposal sites at the Naval Air Development Center in Warminster, PA, which involved the installation of over twenty groundwater monitoring and observation wells. Mr. Spooner has also managed an EPA Region III groundwater enforcement case at a Superfund site in Nitro, West Virginia. This work involved the installation of nine new monitoring wells and sampling of contaminated groundwater. Mr. Spooner was responsible for planning all phases of this investigation from monitoring network design and sampling plan preparation, to the disposal of contaminated drilling wastes. He also oversaw preparation of the final report and provided expert witness testimony on behalf of EPA and

Verified for accuracy by: Philip A. Spooner Date: 8/25/86

SAIC

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation.

the U.S. Justice Department. This work resulted in a complex consent decree for site clean-up and remediation.

Mr. Spooner also participated in an extensive groundwater monitoring project at Love Canal in Niagara Falls, NY. During this project, he served as Chief Soil Scientist for SAIC and was one of several geologic supervisors overseeing the installation of groundwater monitoring wells.

Earlier, Mr. Spooner worked on a technical handbook entitled, "Remedial Actions for Waste Disposal Sites." This manual, (EPA-625/6-82-006), deals with the various measures that can be taken to slow or halt pollution from wastes in a disposal site, and involves studying the techniques and costs of these measures. Mr. Spooner also worked on the update of this manual (EPA/625/6-85/006), and a training manual and seminars on the hazardous waste site investigation process. This work involved all site investigation procedures from site discovery through investigation, sampling and remedial planning.

Mr. Spooner also helped to develop, field test, and refine a methodology for rating the hazard potential of waste disposal sites. This methodology was tested on over thirty sites in EPA Region II, and was distributed to all EPA Regions for their initial site ranking needs.

FREDERIC A. ZAFRAN

EDUCATION

Drexel University, M.S., Environmental Science (1979)
Michigan State University, B.S., Zoology (1973)
University of Pennsylvania, Limnology (1978)
Temple University, Biochemistry and Physiology (1973)

SUMMARY

Mr. Zafran is a Senior Environmental Scientist and Project Manager with expertise in the assessment of impacts of toxic substances and hazardous waste on environmental and biological systems. He is experienced in conducting exposure, hazard and risk assessments of contaminants released to all environmental media, evaluating impacts to both human and nonhuman receptors. Mr. Zafran's experience includes the assessment (fate and effects) of nonconventional, conventional and priority toxic pollutants (CWA Section 307a.1 compounds); drinking water additives; pesticides; industrial solvents; synfuels and synfuel products; dredge and fill materials; sewage sludge; coal ash; and complex hazardous wastes. Mr. Zafran's background encompasses work in environmental chemistry, ecology, and toxicology, as well as water quality planning and management.

EXPERIENCE

Mr. Zafran is currently managing a number of Work Assignments on the Mission Support Contract for EPA Region V. On Delivery Order (DO) No. 036 (Development and Implementation of Methods for Identifying Priority Groundwater Areas), Mr. Zafran and a staff of seven scientists are developing an approach for spatially delineating areas for ground-water resource management and protection. These methods will be field tested by SAIC in two pilot areas in EPA Region V. Mr. Zafran is also responsible for the preparation of Remedial Action Plans (DO Nos. 031 and 032) for Deer Lake and Torch Lake in Michigan. In these assessments, SAIC is evaluating environmental conditions in the river and lake systems, and developing a systematic and comprehensive approach to restoring beneficial uses.

Mr. Zafran has been extensively involved in public health and environmental assessment of hazardous waste sites. He is presently contributing to the Feasibility Study for the Stringfellow Hazardous Waste Disposal Site and is responsible for the public health risk assessment and environmental evaluation of remedial action alternatives. Mr. Zafran was SAIC/ETG Project Manager on a contract for the Department of Energy to evaluate the extent of waste site contamination at the Savannah River Plant in Aiken, South Carolina, and to identify and select remedial action alternatives. He was

Verified for accuracy by:

Frederic A. Zafran Date: 9/25/86

SAIC

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation

responsible for the following assessments: (1) selection of indicator contaminants for 26 waste sites; (2) development and application of methods for characterizing long-term risks to human health for nonradioactive contaminants; (3) methods development for public health risk assessment (acute toxicity) of transportation and waste-site closure accidents; and (4) review of transport models for ecosystem impact assessment. Mr. Zafran recently completed an assessment of potential long- and short-term risks to human health of release of chemicals from the proposed EPA Full Containment Hazardous Waste Research Facility in Cincinnati, Ohio.

For the EPA Office of Policy Analysis, Mr. Zafran contributed to a study on the comparative risks to human health of sources of ground-water contamination. He refined the approach to comparative risk analysis and characterized the release, transport, and transformation of indicator compounds from selected sources.

Mr. Zafran was involved in a Phase II Installation Restoration Program assessment of past waste management activities at McEntire Air National Guard Base. He evaluated the results of onsite ground-water monitoring, examining the potential for offsite migration of contaminants and assessing associated risks to human health.

Mr. Zafran has assisted the EPA Office of Solid Waste (OSW) in reviewing applications submitted by industry for RCRA Part B permits. In addition, he has reviewed numerous delisting petitions for exclusion of waste generated at specific facilities, from listing under RCRA as hazardous waste. Also for OSW, Mr. Zafran assisted in evaluating the Vertical Horizontal Spread (VHS) ground-water transport model proposed by EPA for use in predicting levels of contaminants at receptor wells. In addition to evaluating the appropriateness of the model for its intended use, Mr. Zafran developed a method for estimating concentration of organic compounds in leachate from land farmed waste, or waste disposed in landfills. The approach involved predicting the equilibrium partitioning of contaminants between aqueous and solid phases of soil-water systems.

For the Chemical Manufacturers Association, Mr. Zafran recently prepared an overview of methods for characterizing risks to public health of long-term, low-level release of chemicals from industrial facilities. For ARCO Chemical Company, he reviewed and sysnthesized information on mammalian toxicology and human healths effects of exposure to stoddards solvents.

Mr. Zafran was technical reviewer of the EPA report "Health Assessment Document for Nickel." Prepared by the Office of Research and Development. The report serves as a source document for agency-wide use.

Verified for accuracy by:

Frederic A. Zafran Date: 9/25/86

SAIC

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation

Mr. Zafran has provided support to the EPA Office of Drinking Water in the development of National Primary Drinking Water Standards. He has: (1) conducted a study of chemical leaching tests to determine the extent of release of pollutants from surface in contact with potable water; (2) evaluated the potential for ground-water contamination by pesticides; and (3) assessed the environmental transport and transformation of synthetic organic chemicals and their occurrence in air, water, soil, and food.

Mr. Zafran was involved in the development of a water quality management plan for the Grand Calumet River/Indiana Harbor Canal. He conducted a critical evaluation of the State's water quality criteria and standard program, developed a method for evaluating the existing sediment contamination problem, and used this method to identify and rank sediment contaminants of concern to aquatic life and human health.

As Work Assignment Manager on the Water Quality Based Program Contract for the EPA Office of Water Regulations and Standards, Mr. Zafran was responsible for: (1) developing hazard assessments (aquatic ecological effects and mammalian/ human health effects) for 20 nonpriority pollutants found to be incompatible with the workings of POTWs; and (2) preparing a background and review document on methods for the derivation of sediment criteria and their application under CWA, MPRSA, RCRA, and CERCLA. Mr. Zafran was also technical contributor to an Environmental Impact Statement on the disposal of coal ash in the waters of the New York Bight. He evaluated the toxic impact to marine species associated with direct exposure to waste ash or contaminants released therefrom, and the potential for effects on human health and welfare.

Mr. Zafran conducted a study of the impact of coal liquefaction and shale oil products on aquatic systems. This work for the Office of Toxic Substances involved the assessment of the toxicity of compounds characteristic of synfuels that are responsible for major environmental effects: polycyclic aromatic hydrocarbons, polynuclear heterocyclic aromatic bases, water soluble aliphatic and aromatic hydrocarbons, and trace metals.

Mr. Zafran contributed to the development of a field guide for EPA and the Coast Guard, on responding to the spill of sinking chemicals in aquatic systems. On the effort, Mr. Zafran outlined an approach to the following evaluations: (1) characterization of discharged materials and the environmental setting; (2) determination of the extent of contaminant transport; (3) evaluation of environmental impacts; (4) assessment of the need for response; and (5) establishment of response objectives.

For the Office of Analysis and Evaluation, Mr. Zafran conducted a study of environmental quality problems of the Narrangansett Bay estuary. This included the physical/chemical characterization of the estuarine system, and examination of uses of the Bay and an evaluation of water quality problems, wetland loss, and shoreline

Verified for accuracy by:

Frederic A. Zafran Date: 9/25/86

SAIC

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation

erosion. Also for this office, Mr. Zafran assisted in developing a five-year estuarine quality and protection program plan. He identified and evaluated research needs in the following six topical areas: estuarine characterization, site-specific criteria development, use attainability analyses, wasteload allocation techniques, monitoring, and benefit-cost assessment.

Mr. Zafran conducted a review of the available scientific literature on physical transport processes of the Alaskan Outer Continental Shelf to determine adequacy of data for ocean discharge criteria evaluation. This work assisted EPA in the NPDES permitting process for oil and gas exploration, development, and production activities.

Mr. Zafran was Work Assignment Manager on a project for the EPA Office of Federal Activities to assess the extent to which the 404 Program (Dredge or Fill Program) addresses and supports research essential to the protection of sensitive aquatic resources. Analysis of existing research and future needs facilitated the development of a broad-based program plan for 404-related research activities.

Mr. Zafran conducted a preliminary study of the impacts of incineration of sewage sludge on human health and the environment. Specifically, he provided the EPA Sludge Task Force with an assessment of contaminants likely to be emitted to the atmosphere, a quantification of emissions factors, and an identification of pollutants of major concern. For the Office of Technology Assessment, Mr. Zafran prepared a comparative overview of ocean disposal of sewage sludge and disposal in terrestrial environments.

Mr. Zafran was extensively involved in the development of regulatory support documents for Toxic Substances Conrol Act Section 4, priority chemicals (Office of Pesticides and Toxic Substances). He was responsible for the analysis of information on pollutant emission, environmental transport, and transformation as it relates to occupational and general population exposures. Also for OPTS, Mr. Zafran has prepared numerous Chemical Hazard Information Profiles, providing background health and exposure data in support of risk assessment and test rules development processes.

PREVIOUS EXPERIENCE

Prior to working for SAIC, Mr. Zafran was employed by the Krusen Center for Biomedical Research and Engineering, and was involved in the study of neuromuscular function in human locomotion. While in graduate school, Mr. Zafran worked as consultant (health systems planner) to the Pennsylvania Department of Health, representing the Drexel University Environmental Studies Institute.

NANDKISHORE KAUSHIK

EDUCATION

University of Maryland, M.S., Environmental Engineering (1984)
Indian Institute of Technology, B.S., Chemical Engineering (1982)

BACKGROUND SUMMARY

Mr. Kaushik is a Chemical/Environmental Engineer with over three years experience in toxic/hazardous wastes management including remedial investigations/feasibility studies (RI/FS); RCRA compliance; remedial action planning, design and implementation; solid waste disposal and management; and environmental assessments and impact statements. He is experienced in the design of water and wastewater facilities including sludge handling and management; industrial wastes characterization and treatment processes; process design and development; and water reclamation, recycle and reuse.

EXPERIENCE

Mr. Kaushik is an environmental engineer with SAIC's Engineering Services Section. Currently he is involved in the implementation of Air Force IRP (Installation Restoration Program) studies to determine the degree of environmental degradation and remedial measures required at a number of Air Force Bases throughout the country. Mr. Kaushik's responsibilities include: evaluation of site investigation analyses including groundwater, surface water and soil/sediment sampling data; assessment of the nature and extent of the contamination problem; risk assessment and development of a preliminary baseline public health evaluation; preliminary screening, evaluation and final selection of appropriate remedial action measures; preparation of final reports; and design of the selected remedial actions (if required).

Prior to joining SAIC, Mr. Kaushik was an environmental engineer with an A/E firm in Northern Virginia. With this firm, Mr. Kaushik was the principal investigator for a variety of engineering studies and design projects from conceptual studies to plans and specifications. His responsibilities included project management with budget control and scheduling, coordination with other disciplines within and outside the firm, proposal preparation and client interaction.

Mr. Kaushik led a technical role in the preparation of Remedial Investigation Plans and Preliminary Engineering Design for construction of two hazardous material storage buildings; for hazardous air emissions control at a nitration facility; and to rectify two leaking hazardous waste storage lagoons. Work involved review and assessment of groundwater monitoring data, development and identification of remedial technologies, evaluation of Part B permit application, assessment of compliance with all RCRA, OSHA and NPDES regulations and local fire ordinances, preparation of conceptual and process design and development of cost estimates for remedial alternatives.

Verified for accuracy by: Nandkishore Kaushik Date: 9/25/87

SAIC®

Use or disclosure of data contained on this sheet is subject to the restriction on the title page of this proposal or quotation.

Mr. Kaushik was a project leader in the technical evaluation of RI/FS Work Plans for two Superfund sites. Among the documents reviewed were work plans, engineering studies and technical reports; clean-up technologies and treatment methods; engineering plans of corrective action measures. Recommendations were made subsequently to determine potential liability of responsible parties.

For the U.S. EPA in Denver, Mr. Kaushik implemented and conducted environmental audits at potable water facilities (over 300 in number) in the State of Wyoming. He inspected the various sites, sampled and tested the water and prepared improvement recommendations report.

Mr. Kaushik has conducted Potentially Responsible Party (PRP) searches in support of EPA's hazardous wastes management program. He was involved in the Solid Waste Management project for Montgomery County, Maryland in which feasible alternatives for disposal of the County's solid wastes were evaluated and ranked. Alternatives that were considered included mass burn, resource recovery facility and extension of existing landfilling operation.

Mr. Kaushik is experienced in the preparation of construction contract documents including detailed plans and specifications, cost estimates and process design computations; and providing construction period services such as shop drawing review and site visits during construction. He has been involved in the design of a variety of projects on wastewater treatment and sludge handling facilities e.g., the installation of dissolved air flotation (DAF) units, decant tanks and upgrading of waste activated sludge pumping station at Western Branch WTP, Maryland. The design work also included: Bench-scale treatment process evaluation; permmitting and regulatory assistance; start-up and training services; preparation of operation and maintenance manuals; and waste recycle and reuse evaluation.

Mr. Kaushik was a research assistant with the Civil Engineering Department at the University of Maryland from September 1982 through May 1984. In this capacity, he researched physical and chemical methods of zinc removal through precipitation and electrochemical techniques which later became part of his thesis work for the Master degree program. He also taught an undergraduate laboratory course where the work included counseling, assessment and supervision of student performance in course work.

SAIC

APPENDIX L: SOIL GAS SURVEY

SOIL GAS SURVEY

HANCOCK FIELD

SYRACUSE, NEW YORK

PREPARED BY

TARGET ENVIRONMENTAL SERVICES, INC.

5513 TWIN KNOLLS ROAD

COLUMBIA, MARYLAND 21045

DECEMBER 1986

Introduction

On November 13 and 14, 1986, TARGET Environmental Services, Inc. (TARGET) conducted a soil gas survey on a portion of the Air National Guard facility at Hancock Field, Syracuse, New York. The purpose of the survey was to detect and delineate subsurface hydrocarbons present at the site as a result of fire training activities utilizing JP-4 fuel.

Field Procedures

TARGET collected a total of thirty-four (34) gas samples in the execution of the survey. Of these, thirty (30) were soil gas samples collected at locations shown on Figure 1. Two (2) ambient air samples and two (2) nitrogen blanks were also collected for quality control/quality assurance purposes.

To obtain the soil gas samples, a 1/2 inch hole was produced to a depth of two (2) feet using a slide hammer. Prior to sampling, the entire sampling system was purged with an inert gas (nitrogen). A specially designed stainless steel probe was then inserted to the full depth of the hole and packed off at the surface. A sample of in-situ soil gas was withdrawn through the probe and used to purge the sampling system. A second sample of soil gas was then withdrawn through the probe and encapsulated in a pre-evacuated glass vial at 2 atmospheres of pressure. The self-sealing vial was detached from the sampling system and stored for laboratory analysis.

After each use the probe was decontaminated by washing with soapy distilled water. Distilled water was then used for rinsing away the soap residue. The probe was then dried by rinsing with

reagent grade methyl alcohol and evaporating the remaining fluid by passing nitrogen through the equipment.

Laboratory Procedures

Samples collected during the field phase of the survey were analyzed on site using a chromatograph equipped with a flame ionization detector for benzene, toluene, xylenes, and total volatile organics content. Calibration of the analytical equipment was performed on a daily basis using a curve and injection of standard gases of known concentrations. Retention times of the compounds in the standards were used to identify the unknown compounds in the samples. A standard was run after every three samples to ensure validity of the initial curve. One out of every ten samples was a blank analysis of laboratory air, and one out of every ten samples was a duplicate analysis.

Results

The results of the laboratory analyses for benzene, toluene, xylenes, and total volatiles are shown in Table 1. The 2 ppb detection limit for summed xylenes was not exceeded in any of the samples. Benzene, toluene, and total volatiles, however, occurred in detectable concentrations in samples from eleven (11) stations. These values were mapped and contoured to produce Figures 2, 3, and 4 respectively.

The benzene map, Figure 2, shows a ring of high benzene concentrations around the octagonal concrete pad of the fire training area. The product occurrence indicated by the benzene appears to be entirely within the area enclosed by the earthen berm

to the north, west, and east of the concrete pad. The 1 ppb contour shows a lobate extension of the product occurrence to the northwest from the immediate vicinity of the pad.

Also indicated by the benzene map is a minor product occurrence on the west side of Thompson Road, at stations 19 and 20. The concentrations at these locations are very low (1-2 ppb), and indicate that only low levels of fuel product are present at the points tested. Since no samples were collected to the south, west, and east, it is impossible to establish if this is truly a minor occurrence or only the margin of one more significant.

Examination of the toluene map, Figure 3, and the total volatiles map, Figure 4, reveals the same product distribution as indicated in Figure 2. Once again, the product around the fire training area is restricted to the ground encircled by the earthern berm. The highest concentrations occur as a narrow band immediately east and west of the concrete pad. At the northern margin of the pad the concentrations are lower, but the zone of occurrence extends further from the pad. In both figures the lobate extension to the northwest is again observed, as is the minor occurrence at stations 19 and 20.

Conclusions

1. Fuel product was detected at the site occurring as a halo of elevated concentrations surrounding the fire training pad. Product concentrations declined rapidly with distance from the pad, except the northwest where a lobate extension is seen.
2. Product occurrence around the fire training pad appears confined to the area encircled by the earthern berm.

3. Minor product concentrations were also observed at two stations located on the west side of Thompson Road. Because of the lack of stations surrounding these locations, it is unknown whether these two samples represent a minor occurrence, or only the margin of one more significant.

REPORT: Magnetometer Survey
Hancock Field Site
Onondaga County, New York

SAIC Subcontract No.:
15-870048-76

Gentlemen:

We have completed the magnetometer surveys for Disposal Sites D-1 and D-3 at Hancock Field in Onandoaga County, New York.

Initial activities included control gridding of both sites using a Brunton compass and 300-foot measuring tape. The grids were laid out using Magnetic North, not True North. Any reference to compass direction in the report implies Magnetic North unless stated otherwise. A East-West baseline was established at each site, with North-South transect lines spaced 50 feet apart. Along each transect line, wooden stakes were driven into the ground at 100-foot intervals, producing a 50-foot by 100-foot reference grid. Over this reference grid, magnetometer data were collected along each survey line at 10-foot intervals, with 25 feet between each survey line. Survey lines were oriented in a Magnetic North-South direction. The magnetometer data for both sites are given in the Appendix.

For Disposal Site D-1, a key reference stake (00 +00) was established, and is MN 131 E and 280 feet from GW-2. From this location the East-West baseline was established.

For Disposal Site D-3, a key reference stake (00 +00) was established and is MN 90 W and 100 feet from GW-6. From this location the East-West baseline was established.

PROGRAM

The magnetometer survey was made using a EG&G Proton Magnetometer G-856. The proton magnetometer measures the total intensity of the earth's magnetic field relative to known and unknown external interferences (buried ferrous material, etc.).

The proton magnetometer utilizes the precession of

116 WEST MAIN ST., CLINTON, NEW JERSEY 08809, TELEPHONE 201•735•9390

spinning protons or nuclei of the hydrogen atom to measure the intensity of the earth's magnetic field. The spinning protons act as small magnetic dipoles. When an electrical current is generated by the coil the protons temporarily align themselves to the electric current. When the current is removed, the protons spin in the direction of the earth's magnetic field or are aligned to influences caused by external interferences (ferrous material, etc.). As the protons spin they generate a small electrical signal. This signal is recorded in Gammas by the G-856.

Analysis of magnetometer data involves recognizing and characterizing local disturbances in the earth's magnetic field arising from local changes in magnetization. Ferrous material is generally the major cause of such disturbances. The disturbance (anomaly) is usually recorded as high and low magnetic values (dipole signature). Natural disturbances in the earth's magnetic field were recorded by repeated measurements at a base station at regular intervals (1/2 to 1 hour) during the surveys. Natural disturbances were relatively small, averaging approximately 15 gammas over a 8 hour period.

Manual and computer interpretation techniques allowed us to differentiate "noise" (fences, buildings, powerlines, etc.) from unknown buried ferrous material. The dipole signatures not affected by the influence of known external interferences are shown on the base map as anomalous zones. The magnitude of an anomaly is proportional to both the mass and depth of the buried ferrous material.

DESCRIPTION OF MAPS

Two maps (A and B) were made for each site. Both maps show the reference grid stake locations and distances, magnetometer survey lines, and observed surface debris. Surface debris includes concrete, re-bar, trash, bricks, and various metal objects. Due to the varying amount of snow cover during the survey, some surface metal may not have been observed. Boundaries of observed surface debris lying outside of the survey area are inferred.

Interpretative contour lines are presented on Map A of each site. These are intended as a generalized view of the magnetometer data collected at the sites. The contour interval is 1000 gammas, with contour lines labelled as (gammas x 10) + 50,000, (ie: the label 700 represents 57,000 gammas). Background values of the magnetometer data are in the range 56,400 - 56,600 gammas.

CONCLUSIONS AND RECOMMENDATIONS

Anomalous zones and suggested test pit locations are shown on Map B of each site. The data indicates that on both sites, two major categories of subsurface conditions exist: an area with fairly

continuous amounts of buried ferrous material which represents the major dumping area, and an area with more scattered amounts of ferrous material.

At each site, the data indicates that the majority of the major dumping area contains buried ferrous material, with the shaded anomalous zones indicating the largest concentrations of buried ferrous material. Areas outside of the major dumping area, and not indicated as anomalous zones, may contain small amounts of scattered buried ferrous material. Boundaries of anomalous zones lying outside of the survey area are inferred.

On Disposal Site D-1, the northern boundary of the major dumping area is parrallel to and 60 feet south of the dirt access road, and the western boundary is located approximately along grid transect line -250 (magnetometer survey line 28). The eastern and southern boundaries extend at least to the top edge of the slope, which is the boundary of the magnetometer survey. South of the top edge of the slope along grid transect line -50 there is a ridge where surface trash was observed.

On Disposal Site D-3, the northern boundary of the major dumping area is along the dirt access road, until grid location 00 - 200, at which point the northern boundary jogs to the east along baseline -200. The western, southern, and eastern boundaries extend at least to the top edge of the slope, which is the boundary of the magnetometer survey.

In areas where large amounts of surface metal are present (especially along the edge of the slopes of the disposal areas), anomalous zones are not shown due to the large amount of interference. Anomalous zones which are near or include small areas of observed surface debris indicate that there is additional buried ferrous material at these locations.

Suggested test pit locations are shown on the map. The information gathered from these test pits will best catergorize the type of buried ferrous material present and their boundaries.

Based on initial analysis of the data, test pit locations were staked out in the field to facilitate excavation of test pits in areas with obvious buried ferrous material. These locations are marked in the field by orange wooden stakes labelled with the grid location, a red flag tied to the stake, and blue flagging tied to a nearby tall object. Upon further interpretation of the data, additional suggested test pit locations were determined, and are shown on the map. (Test pit locations marked in the field are also shown on the map, and are denoted with an arrow.)

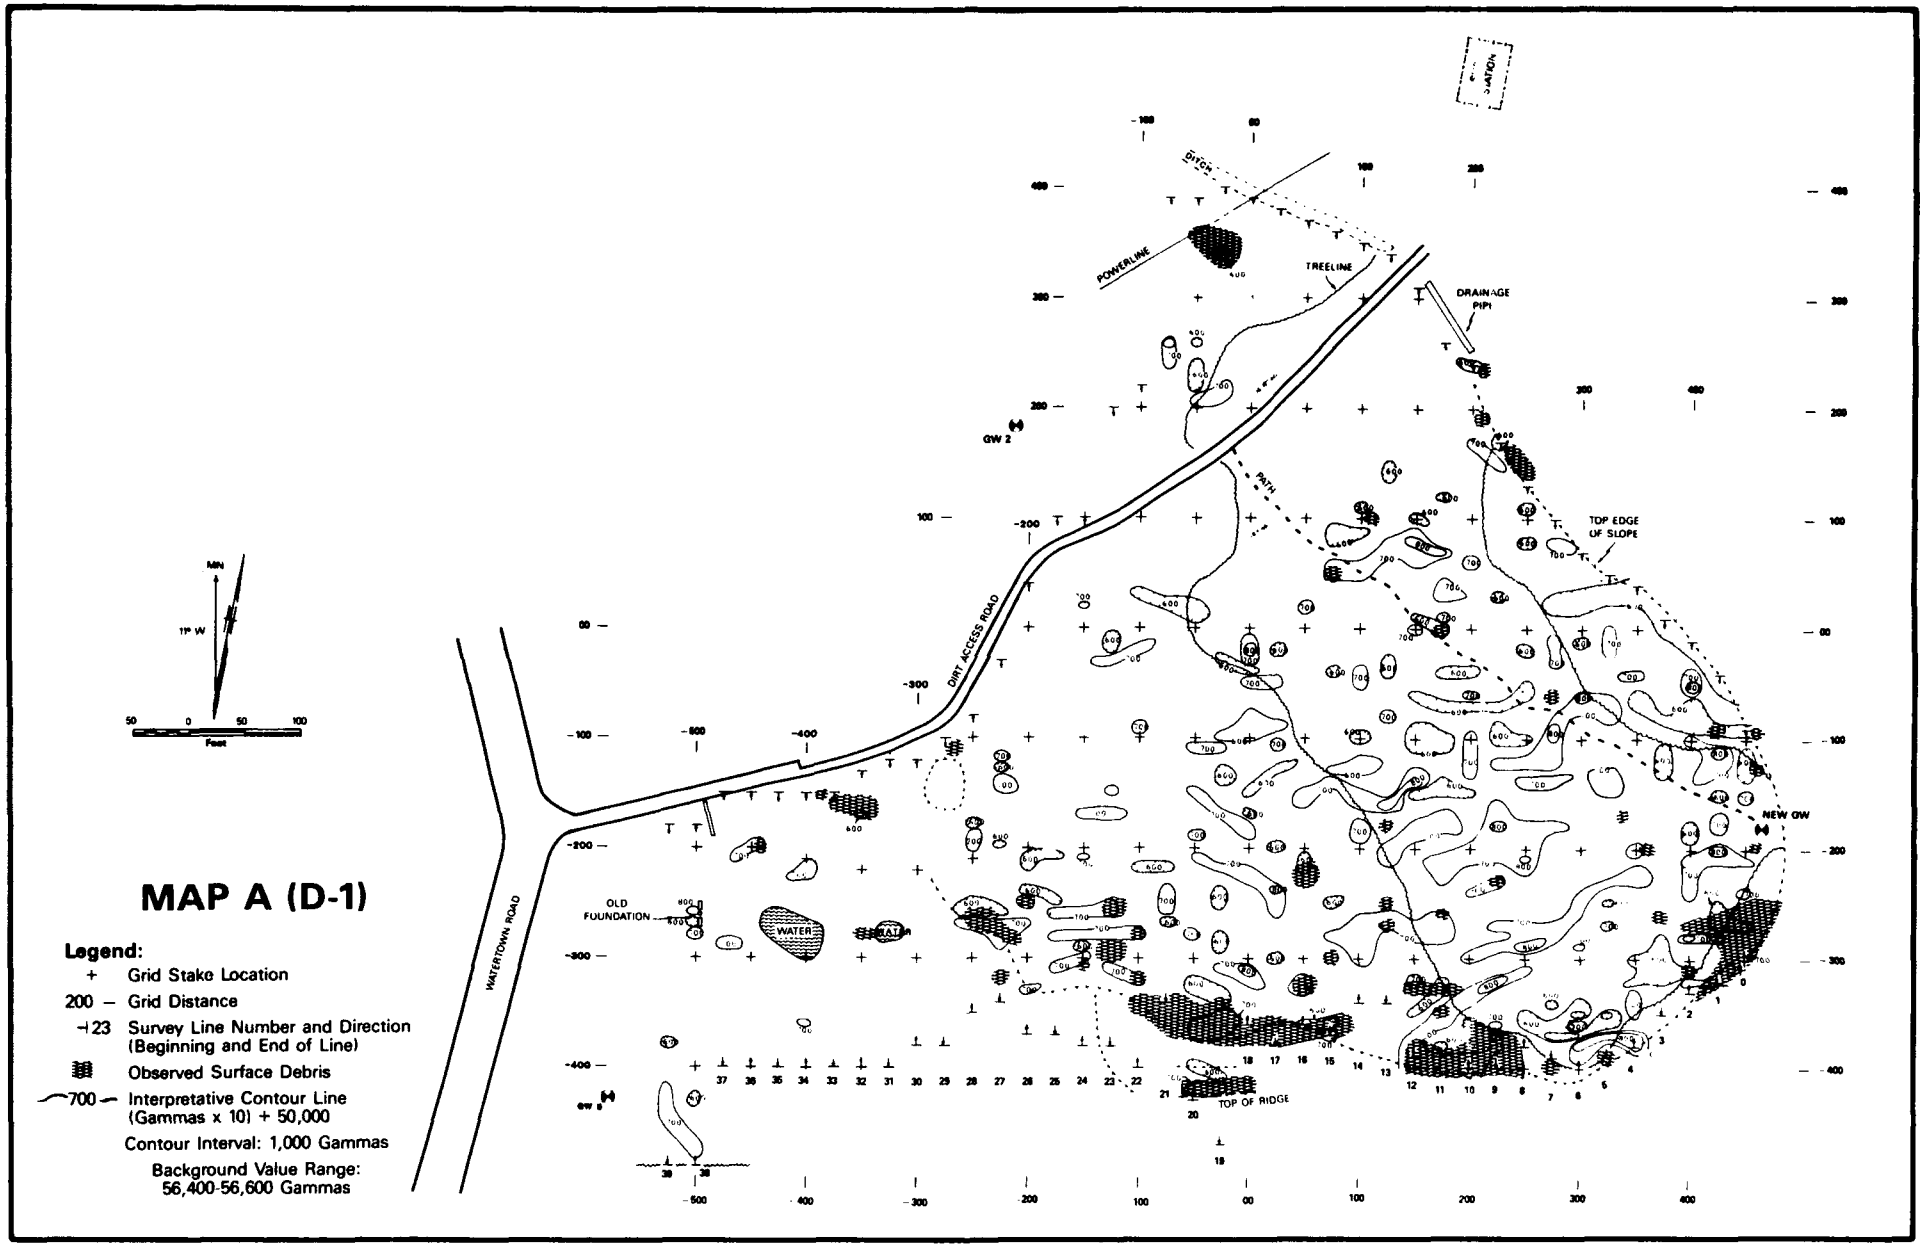

If there are any questions concerning this report, please do not hesitate to contact us. It was a pleasure to have worked with you on this project.

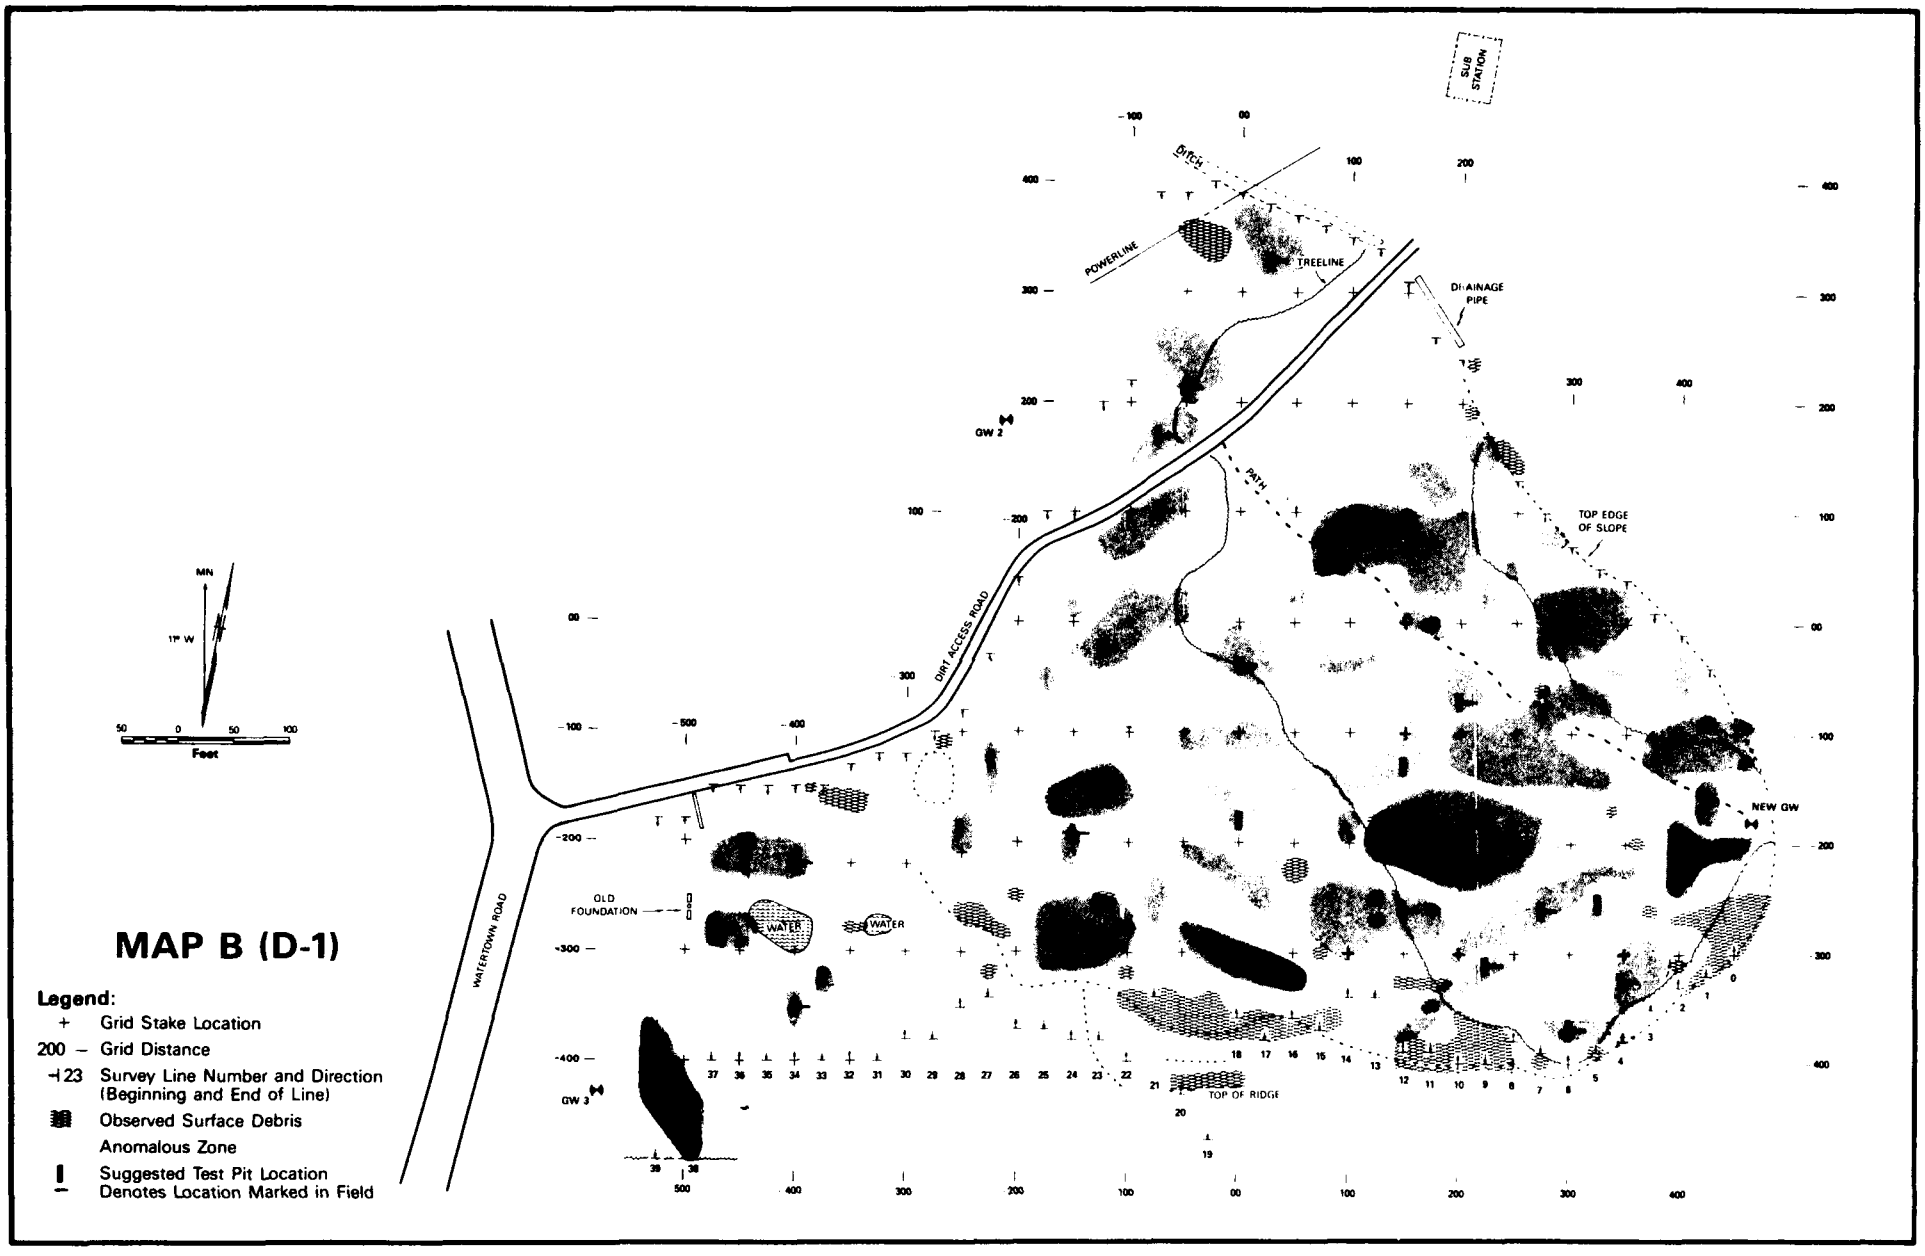

Very truly yours,
Delta Geophysical Services
