Certificate Information

The following Ada implementation was tested and determined to pass ACVC 1.11. Testing was completed on 18 December 1990.

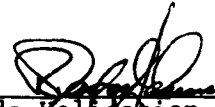

Compiler Name and Version: Alliant FX/Ada Compiler, Version 2.3  
Host Computer System: Alliant FX/80 under Concentrix, Release 5.7  
Target Computer System: Alliant FX/80 under Concentrix, Release 5.7  
Customer Agreement Number: 90-10-18-ACS

A more detailed description of this Ada implementation is found in section 3.1 of this report.

As a result of this validation effort, Validation Certificate 901218W1.11106 is awarded to Alliant Computer Systems Corporation. This certificate expires on 1 March 1993.

This report has been reviewed and is approved.

DECLARATION OF CONFORMANCE

Compiler Implementor: Alliant Computer Systems Corporation  
Ada Validation Facility: ASD/SCEL, Wright-Patterson AFB OH 45433-6503  
Ada Compiler Validation Capability Version: 1.11

Base Configuration

Base Compiler Name: Alliant FX/Ada Compiler, Version 2.3  
Host Architecture ISA: Alliant FX/80 OS&Ver#: Concentrix Release 5.7  
Target Architecture ISA: Alliant FX/80 OS&Ver#: Concentrix Release 5.7

Implementor's Declaration

I, the undersigned, representing Alliant, have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compilers listed in this declaration. I declare that Alliant Computer Systems Corporation is the owner of record of the Ada language compilers listed above and, as such, is responsible for maintaining said compilers in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for Ada language compilers listed in the declaration shall be made only in the owner's corporate name.

Andrew F. Halford  
Alliant Computer Systems Corporation

## CHAPTER 1

### INTRODUCTION

The Ada implementation described above was tested according to the Ada Validation Procedures [Pro90] against the Ada Standard [Ada83] using the current Ada Compiler Validation Capability (ACVC). This Validation Summary Report (VSR) gives an account of the testing of this Ada implementation. For any technical terms used in this report, the reader is referred to [Pro90]. A detailed description of the ACVC may be found in the current ACVC User's Guide [UG89].

#### 1.1 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the Ada Certification Body may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject implementation has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from the AVF which performed this validation or from:

National Technical Information Service  
5285 Port Royal Road  
Springfield VA 22161

Questions regarding this report or the validation test results should be directed to the AVF which performed this validation or to:

Ada Validation Organization  
Institute for Defense Analyses  
1801 North Beauregard Street  
Alexandria VA 22311

## INTRODUCTION

### 1.3 ACVC TEST CLASSES

Compliance of Ada implementations is tested by means of the ACVC. The ACVC contains a collection of test programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable. Class B and class L tests are expected to produce errors at compile time and link time, respectively.

The executable tests are written in a self-checking manner and produce a PASSED, FAILED, or NOT APPLICABLE message indicating the result when they are executed. Three Ada library units, the packages REPORT and SPRT13, and the procedure CHECK FILE are used for this purpose. The package REPORT also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The package SPRT13 is used by many tests for Chapter 13 of the Ada Standard. The procedure CHECK FILE is used to check the contents of text files written by some of the Class C tests for Chapter 14 of the Ada Standard. The operation of REPORT and CHECK FILE is checked by a set of executable tests. If these units are not operating correctly, validation testing is discontinued.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that all violations of the Ada Standard are detected. Some of the class B tests contain legal Ada code which must not be flagged illegal by the compiler. This behavior is also verified.

Class L tests check that an Ada implementation correctly detects violation of the Ada Standard involving multiple, separately compiled units. Errors are expected at link time, and execution is attempted.

In some tests of the ACVC, certain macro strings have to be replaced by implementation-specific values -- for example, the largest integer. A list of the values used for this implementation is provided in Appendix A. In addition to these anticipated test modifications, additional changes may be required to remove unforeseen conflicts between the tests and implementation-dependent characteristics. The modifications required for this implementation are described in section 2.3.

For each Ada implementation, a customized test suite is produced by the AVF. This customization consists of making the modifications described in the preceding paragraph, removing withdrawn tests (see section 2.1) and, possibly some inapplicable tests (see Section 3.2 and [UG89]).

In order to pass an ACVC an Ada implementation must process each test of the customized test suite according to the Ada Standard.

#### 1.4 DEFINITION OF TERMS

Ada Compiler	The software and any needed hardware that have to be added to a given host and target computer system to allow transformation of Ada programs into executable form and execution thereof.
Ada Compiler Validation Capability (ACVC)	The means for testing compliance of Ada implementations, consisting of the test suite, the support programs, the ACVC user's guide and the template for the validation summary report.
Ada Implementation	An Ada compiler with its host computer system and its target computer system.
Ada Joint Program Office (AJPO)	The part of the certification body which provides policy and guidance for the Ada certification system.
Ada Validation Facility (AVF)	The part of the certification body which carries out the procedures required to establish the compliance of an Ada implementation.
Ada Validation Organization (AVO)	The part of the certification body that provides technical guidance for operations of the Ada certification system.
Compliance of an Ada Implementation	The ability of the implementation to pass an ACVC version.
Computer System	A functional unit, consisting of one or more computers and associated software, that uses common storage for all or part of a program and also for all or part of the data necessary for the execution of the program; executes user-written or user-designated programs; performs user-designated data manipulation, including arithmetic operations and logic operations; and that can execute programs that modify themselves during execution. A computer system may be a stand-alone unit or may consist of several inter-connected units.

## INTRODUCTION

Conformity	Fulfillment by a product, process or service of all requirements specified.
Customer	An individual or corporate entity who enters into an agreement with an AVF which specifies the terms and conditions for AVF services (of any kind) to be performed.
Declaration of Conformance	A formal statement from a customer assuring that conformity is realized or attainable on the Ada implementation for which validation status is realized.
Host Computer System	A computer system where Ada source programs are transformed into executable form.
Inapplicable test	A test that contains one or more test objectives found to be irrelevant for the given Ada implementation.
ISO	International Organization for Standardization.
LRM	The Ada standard, or Language Reference Manual, published as ANSI/MIL-STD-1815A-1983 and ISO 8652-1987. Citations from the LRM take the form "<section>.<subsection>:<paragraph>."
Operating System	Software that controls the execution of programs and that provides services such as resource allocation, scheduling, input/output control, and data management. Usually, operating systems are predominantly software, but partial or complete hardware implementations are possible.
Target Computer System	A computer system where the executable form of Ada programs are executed.
Validated Ada Compiler	The compiler of a validated Ada implementation.
Validated Ada Implementation	An Ada implementation that has been validated successfully either by AVF testing or by registration [Pro90].
Validation	The process of checking the conformity of an Ada compiler to the Ada programming language and of issuing a certificate for this implementation.
Withdrawn test	A test found to be incorrect and not used in conformity testing. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains erroneous or illegal use of the Ada programming language.

## CHAPTER 2

### IMPLEMENTATION DEPENDENCIES

#### 2.1 WITHDRAWN TESTS

The following tests have been withdrawn by the AVO. The rationale for withdrawing each test is available from either the AVO or the AVF. The publication date for this list of withdrawn tests is 21 November 1990.

E28005C	B28006C	C34006D	C35702A	B41308B	C43004A
C45114A	C45346A	C45612B	C45651A	C46022A	B49008A
A74006A	C74308A	B83022B	B83022H	B83025B	B83025D

CE2107I	CE2117A	CE2117B	CE2119B	CE2205B	CE2405A
CE3111C	CE3116A	CE3118A	CE3411B	CE3412B	CE3607B
CE3607C	CE3607D	CE3812A	CE3814A	CE3902B	

#### 2.2 INAPPLICABLE TESTS

A test is inapplicable if it contains test objectives which are irrelevant for a given Ada implementation. The inapplicability criteria for some tests are explained in documents issued by ISO and the AJPO known as Ada Issues and commonly referenced in the format AI-dddd. For this implementation, the following tests were inapplicable for the reasons indicated; references to Ada Issues are included as appropriate.

## IMPLEMENTATION DEPENDENCIES

The following 201 tests have floating-point type declarations requiring more digits than `SYSTEM.MAX_DIGITS`:

C24113L..Y (14 tests)	C35705L..Y (14 tests)
C35706L..Y (14 tests)	C35707L..Y (14 tests)
C35708L..Y (14 tests)	C35802L..Z (15 tests)
C45241L..Y (14 tests)	C45321L..Y (14 tests)
C45421L..Y (14 tests)	C45521L..Z (15 tests)
C45524L..Z (15 tests)	C45621L..Z (15 tests)
C45641L..Y (14 tests)	C46012L..Z (15 tests)

The following 21 tests check for the predefined type `LONG_INTEGER`:

C35404C	C45231C	C45304C	C45411C	C45412C
C45502C	C45503C	C45504C	C45504F	C45611C
C45612C	C45613C	C45614C	C45631C	C45632C
B52004D	C55B07A	B55B09C	B86001W	C86006C
CD7101F				

C35702B, C35713C, B86001U, and C86006G check for the predefined type `LONG_FLOAT`.

C35713D and B86001Z check for a predefined floating-point type with a name other than `FLOAT`, `LONG_FLOAT`, or `SHORT_FLOAT`.

A35801E checks that `FLOAT'FIRST..FLOAT'LAST` may be used as a range constraint in a floating-point type declaration; for this implementation, that range exceeds the range of safe numbers of the largest predefined floating-point type and must be rejected. (See section 2.3.)

C45531M..P (4 tests) and C45532M..P (4 tests) check fixed-point operations for types that require a `SYSTEM.MAX_MANTISSA` of 47 or greater.

C45624A checks that the proper exception is raised if `MACHINE_OVERFLOW` is `FALSE` for floating point types with digits 5. For this implementation, `MACHINE_OVERFLOW` is `TRUE`.

C45624B checks that the proper exception is raised if `MACHINE_OVERFLOW` is `FALSE` for floating point types with digits 6. For this implementation, `MACHINE_OVERFLOW` is `TRUE`.

C86001F recompiles package `SYSTEM`, making package `TEXT_IO`, and hence package `REPORT`, obsolete. For this implementation, the package `TEXT_IO` is dependent upon package `SYSTEM`.

B86001Y checks for a predefined fixed-point type other than `DURATION`.

C96005B checks for values of type `DURATION'BASE` that are outside the range of `DURATION`. There are no such values for this implementation.

IMPLEMENTATION DEPENDENCIES

CD1009C uses a representation clause specifying a non-default size for a floating-point type.

CD2A84A, CD2A84E, CD2A84I..J (2 tests), and CD2A84O use representation clauses specifying non-default sizes for access types.

The tests listed in the following table are not applicable because the given file operations are supported for the given combination of mode and file access method.

Test	File Operation	Mode	File Access Method
CE2102D	CREATE	IN FILE	SEQUENTIAL IO
CE2102E	CREATE	OUT FILE	SEQUENTIAL IO
CE2102F	CREATE	INOUT FILE	DIRECT IO
CE2102I	CREATE	IN FILE	DIRECT IO
CE2102J	CREATE	OUT FILE	DIRECT IO
CE2102N	OPEN	IN FILE	SEQUENTIAL IO
CE2102O	RESET	IN FILE	SEQUENTIAL IO
CE2102P	OPEN	OUT FILE	SEQUENTIAL IO
CE2102Q	RESET	OUT FILE	SEQUENTIAL IO
CE2102R	OPEN	INOUT FILE	DIRECT IO
CE2102S	RESET	INOUT FILE	DIRECT IO
CE2102T	OPEN	IN FILE	DIRECT IO
CE2102U	RESET	IN FILE	DIRECT IO
CE2102V	OPEN	OUT FILE	DIRECT IO
CE2102W	RESET	OUT FILE	DIRECT IO
CE3102E	CREATE	IN FILE	TEXT IO
CE3102F	RESET	Any Mode	TEXT IO
CE3102G	DELETE	-----	TEXT IO
CE3102I	CREATE	OUT FILE	TEXT IO
CE3102J	OPEN	IN FILE	TEXT IO
CE3102K	OPEN	OUT FILE	TEXT IO

CE2203A checks that WRITE raises USE\_ERROR if the capacity of the external file is exceeded for SEQUENTIAL\_IO. This implementation does not restrict file capacity.

CE2403A checks that WRITE raises USE\_ERROR if the capacity of the external file is exceeded for DIRECT\_IO. This implementation does not restrict file capacity.

CE3304A checks that USE\_ERROR is raised if a call to SET LINE LENGTH or SET PAGE LENGTH specifies a value that is inappropriate for the external file. This implementation does not have inappropriate values for either line length or page length.

CE3413B checks that PAGE raises LAYOUT\_ERROR when the value of the page number exceeds COUNT'LAST. For this implementation, the value of COUNT'LAST is greater than 150000 making the checking of this objective impractical.

## IMPLEMENTATION DEPENDENCIES

### 2.3 TEST MODIFICATIONS

Modifications (see section 1.3) were required for 14 tests.

The following tests were split into two or more tests because this implementation did not report the violations of the Ada Standard in the way expected by the original tests.

B24009A	B33301B	B38003A	B38003B	B38009A	B38009B
B85008G	B85008H	BC1303F	BC3005B	BD2B03A	BD2D03A
BD4003A					

A35801E was graded inapplicable by Evaluation Modification as directed by the AVO. The compiler rejects the use of the range `FLOAT'FIRST..FLOAT'LAST` as the range constraint of a floating-point type declaration because the bounds lie outside of the range of safe numbers (cf. LRM 3.5.7:12).

CHAPTER 3  
PROCESSING INFORMATION

3.1 TESTING ENVIRONMENT

The Ada implementation tested in this validation effort is described adequately by the information given in the initial pages of this report.

For a point of contact for technical information about this Ada implementation system, see:

Alliant Computer Systems Corporation  
One Monarch Drive  
Littleton MA 01460

For a point of contact for sales information about this Ada implementation system, see:

Alliant Computer Systems Corporation  
One Monarch Drive  
Littleton MA 01460

Testing of this Ada implementation was conducted at the customer's site by a validation team from the AVF.

3.2 SUMMARY OF TEST RESULTS

An Ada Implementation passes a given ACVC version if it processes each test of the customized test suite in accordance with the Ada Programming Language Standard, whether the test is applicable or inapplicable; otherwise, the Ada Implementation fails the ACVC [Pro90].

## PROCESSING INFORMATION

For all processed tests (inapplicable and applicable), a result was obtained that conforms to the Ada Programming Language Standard.

a) Total Number of Applicable Tests	3814
b) Total Number of Withdrawn Tests	83
c) Processed Inapplicable Tests	72
d) Non-Processed I/O Tests	0
e) Non-Processed Floating-Point Precision Tests	201
f) Total Number of Inapplicable Tests	273
g) Total Number of Tests for ACVC 1.11	4170

All I/O tests of the test suite were processed because this implementation supports a file system. The above number of floating-point tests were not processed because they used floating-point precision exceeding that supported by the implementation. When this compiler was tested, the tests listed in section 2.1 had been withdrawn because of test errors.

### 3.3 TEST EXECUTION

Version 1.11 of the ACVC comprises 4170 tests. When this compiler was tested, the tests listed in section 2.1 had been withdrawn because of test errors. The AVF determined that 273 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 201 executable tests that use floating-point precision exceeding that supported by the implementation. In addition, the modified tests mentioned in section 2.3 were also processed.

A magnetic tape containing the customized test suite (see section 1.3) was taken on-site by the validation team for processing. The contents of the magnetic tape were loaded directly onto the host computer.

After the test files were loaded onto the host computer, the full set of tests was processed by the Ada implementation.

Testing was performed using command scripts provided by the customer and reviewed by the validation team. See Appendix B for a complete listing of the processing options for this implementation. It also indicates the default options. The options invoked explicitly for validation testing during this test were:

- w suppress warnings
- M link the test into an executable image

## PROCESSING INFORMATION

Test output, compiler and linker listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

APPENDIX A  
MACRO PARAMETERS

This appendix contains the macro parameters used for customizing the ACVC. The meaning and purpose of these parameters are explained in [UG89]. The following macro parameters are defined in terms of the value V of \$MAX\_IN\_LEN which is the maximum input line length permitted for the tested implementation. For these parameters, Ada string expressions are given rather than the macro values themselves.

Macro Parameter	Macro Value
\$MAX_IN_LEN	499
\$BIG_ID1	(1..V-1 => 'A', V => '1')
\$BIG_ID2	(1..V-1 => 'A', V => '2')
\$BIG_ID3	(1..V/2 => 'A') & '3' & (1..V-1-V/2 => 'A')
\$BIG_ID4	(1..V/2 => 'A') & '4' & (1..V-1-V/2 => 'A')
\$BIG_INT_LIT	(1..V-3 => '0') & "298"
\$BIG_REAL_LIT	(1..V-5 => '0') & "690.0"
\$BIG_STRING1	'"' & (1..V/2 => 'A') & "'"
\$BIG_STRING2	'"' & (1..V-1-V/2 => 'A') & '1' & "'"
\$BLANKS	(1..V-20 => ' ')
\$MAX_LEN_INT_BASED_LITERAL	"2:" & (1..V-5 => '0') & "11:"
\$MAX_LEN_REAL_BASED_LITERAL	"16:" & (1..V-7 => '0') & "F.E:"

MACRO PARAMETERS

\$MAX\_STRING\_LITERAL    '' & (1..V-2 => 'A') & ''

The following table contains the values for the remaining macro parameters.

Macro Parameter	Macro Value
\$ACC_SIZE	32
\$ALIGNMENT	4
\$COUNT_LAST	2_147_483_647
\$DEFAULT_MEM_SIZE	16_777_216
\$DEFAULT_STOR_UNIT	8
\$DEFAULT_SYS_NAME	FX_UNIX
\$DELTA_DOC	0.0000000004656612873077392578125
\$ENTRY_ADDRESS	SYSTEM.PHYSICAL_ADDRESS(16#40#)
\$ENTRY_ADDRESS1	SYSTEM.PHYSICAL_ADDRESS(16#80#)
\$ENTRY_ADDRESS2	SYSTEM.PHYSICAL_ADDRESS(16#100#)
\$FIELD_LAST	2_147_483_647
\$FILE_TERMINATOR	' '
\$FIXED_NAME	NO_SUCH_TYPE
\$FLOAT_NAME	NO_SUCH_TYPE
\$FORM_STRING	""
\$FORM_STRING2	"CANNOT_RESTRICT_FILE_CAPACITY"
\$GREATER_THAN_DURATION	100_000.0
\$GREATER_THAN_DURATION BASE LAST	10_000_000.0
\$GREATER_THAN_FLOAT_BASE LAST	1.8E+308
\$GREATER_THAN_FLOAT_SAFE LARGE	5.0E307
\$GREATER_THAN_SHORT_FLOAT_SAFE_LARGE

APPENDIX B  
COMPILATION SYSTEM OPTIONS

The compiler options of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this appendix are to compiler documentation and not to this report.

LINKER OPTIONS

The linker options of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this appendix are to linker documentation and not to this report.

## COMPILATION SYSTEM OPTIONS

### NAME

ada - FX/Ada compiler

### SYNOPSIS

ada [options] [ada\_source.a ...] [ld\_options] [object\_file.o]...

### DESCRIPTION

Compiles the specified Ada source files into object files and optionally (if -M is specified) links the object files into an executable file. Object files from previous Ada compilations are implicitly included as needed. Object files from non-Ada compilations can be explicitly included by specifying the names of the .o files.

Source files must reside in directories that are FX/ADS libraries (see a.mklib); source file names must end in .a (a period followed by the letter a in lowercase). Output object files are placed in the invisible subdirectory .objects and are not visible as .o files in the FX/ADS library. Separate compilation information is placed in the invisible subdirectory .nets.

If error processing (-e, -E, -el, -El, or -ev) is not specified, the raw error messages are written to standard error output. If you want to process the raw error messages with e.error, redirect standard error output to a file (> & filename at the end of the command line).

### OPTIONS

- a file\_name  
(archive) Treats file\_name.a as an archive file rather than an Ada source file.
- d (dependencies) Analyze the source file for dependencies only. No syntax analysis occurs and no object files are produced. Used by a.make to establish dependencies among new files.
- e (error) Writes error lines and diagnostics to standard output. Only one of the -e or -E options should be used.
- E [file|directory]  
(error) Writes error lines and diagnostics to standard output and writes the raw error messages to the specified file. The name of the file defaults to ada\_source.err; if a directory name is specified, the output is placed in ada\_source.err in that directory. Only one of the -e or -E options should be used.

## COMPILATION SYSTEM OPTIONS

- el (error listing) Writes a full listing with interspersed diagnostics to standard output, if any errors occur. Only one of the -el or -El options should be used.
  
- El [file|directory] (error listing) Writes a full listing with interspersed diagnostics to standard output and writes the raw error messages to the specified file, if any errors occur. The name of the file defaults to ada\_source.err; if a directory name is specified, the output is placed in ada\_source.err in that directory. Only one of the -el or -El options should be used.
  
- ev (error vi) Embeds the raw error messages in the source file and calls vi on the source file.
  
- lx (link) Includes the library libx.a from /lib, /usr/lib, or /usr/local/lib. This option is a link option and must not precede the name of a file that references the library. See the Concentrix ld command.
  
- M unit\_name (main) Produces an executable program using the named program unit as the main program. The main program must be either a parameterless procedure or a parameterless function returning an integer.
  
- M ada\_source.a (main) Like -M unit\_name, except that the unit name is assumed to be the root name of the source file that follows
  
- o executable\_file (output) Names the output executable file; by default, the executable file is named a.out. The -M option must also be specified.
  
- O[n] (optimize) Optimizes the output code. An optional digit limits the number of optimization passes; 9 specifies maximum optimization. The default number of optimization passes is 1.
  
- pg Produces a program that (at program execution time) monitors the calling of routines and writes a gmon.out file. The Concentrix command gprof -A processes this file.
  
- R library (recompile instantiation) Forces an analysis of all generic instantiations, causing reinstantiation of any that are out of date.

## COMPILATION SYSTEM OPTIONS

- S (suppress) Applies the pragma SUPPRESS to the entire compilation.
- sh (show) Shows the pathname of the tool actually called.
- T (timing) Prints timing information for the compilation.
- u (update) Updates the library ada.lib even if syntax errors are present.
- v (verbose) Prints the compiler version number, the date and time of compilation, and summary information concerning the compilation.
- w (warnings) Suppresses warning diagnostics.

### EXAMPLES

The following example compiles the source file hello.a

```
ada hello.a
```

The following example compiles the source file hello.a and produces an executable program named a.out. The main program is the program unit named hello.

```
ada -M hello.a
```

The following example compiles the source files termspec.a, termbody.a, and hanoi.a, and produces an executable program named a.out. The main program is the program unit named hanoi.

```
ada -M hanoi termspec.a termbody.a hanoi.a
```

The following example compiles the source file hello.a and produces an executable program named hello. The main program is the program unit named hello.

```
ada -o hello -M hello.a
```

The following example writes error lines and diagnostics to standard output.

```
ada -e -o hello -M hello.a
```

The following example writes a listing with interspersed diagnostics to standard output and the raw error messages to hello.err.

```
ada -El -o hello -M hello.a
```

## COMPILATION SYSTEM OPTIONS

### FILES

FILE.A - Ada source input file  
/tmp/file.\$\$ - code file created by front end  
ada.lib - FX/Ads directory information file  
gnrx.lib - FX/Ads generics library information file  
GVAS table - GVAS table in the current FX/ADA project  
ada.lock - lock link to ada.lib, for mutual exclusion  
GVAS\_table.LOCK - lock link to GVAS\_table, for mutual  
exclusion

### SEE ALSO

a.das, a.error, a.ld, a.mklib, ld(1)

### DIAGNOSTICS

The diagnostics produced by the VADS compiler are intended to be self-explanatory. Most refer to the RM. Each RM reference includes a section number and optionally, a paragraph number enclosed in parentheses.

APPENDIX C

APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in Chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of this Ada implementation, as described in this Appendix, are provided by the customer. Unless specifically noted otherwise, references in this Appendix are to compiler documentation and not to this report. Implementation-specific portions of the package STANDARD, which are not a part of Appendix F, are:

```
package STANDARD is
.....
type INTEGER is range -2147483648 .. 2147483647;
type SHORT_INTEGER is range -32768 .. 32767;
type TINY_INTEGER is range -128 .. 127;

type FLOAT is digits 15 range
-1.79769313486235E+308 .. +1.79769313486235E+308;
type SHORT_FLOAT is digits 6
range -3.40283E+38 .. 3.40283E+38;

type DURATION is delta 0.001 range -2147483.648 .. 2147483.647;
.....
end STANDARD;
```

ATTACHMENT V

APPENDIX F. Implementation-Dependent Characteristics

FX/Ada release 2.3 Compiler

1. "Implementation-Dependent Pragmas"

INLINE\_ONLY Pragma

The `INLINE_ONLY` pragma, when used in the same way as pragma `INLINE`, indicates to the compiler that the sub-program must always be inlined. This pragma also suppresses the generation of a callable version of the routine which saves code space.

BUILT\_IN Pragma

The `BUILT_IN` pragma is used in the implementation of some predefined Ada packages, but provides no user access. It is used only to implement code bodies for which no actual Ada body can be provided, for example the `MACHINE_CODE` package.

RESOURCE Pragma

The `RESOURCE` pragma specifies the resource class of the task (or tasks of a task type) or the resource class of the main program. It is used to force a task to execute on a particular resource class when multiple processors are used to execute an Ada program. This pragma takes a static expression of the type `RESOURCE_TYPE` declared in package `SYSTEM`. This pragma is only allowed within the specification of a task unit or immediately within the outermost declarative part of a main program.

SHARE\_CODE Pragma

The `SHARE_CODE` pragma takes the name of a generic instantiation or a generic unit as the first argument and one of the identifiers `TRUE` or `FALSE` as the second argument. This pragma is only allowed immediately at the place of a declarative item in a declarative part or package specification, or after a library unit in a compilation, but before any subsequent compilation unit.

#### EXTERNAL\_NAME Pragma

The EXTERNAL\_NAME pragma takes the name of a subprogram or variable defined in Ada and allows the user to specify an external name that may be used to reference the entity from other languages. The pragma is allowed at the place of a declarative item in a package specification and must apply to an object declared earlier in the same package specification.

#### INTERFACE\_NAME Pragma

The INTERFACE\_NAME pragma takes the name of a variable defined in another language and allows it to be referenced directly in Ada. The pragma will replace all occurrences of the variable name with an external reference to the second, link\_argument. The pragma is allowed at the place of a declarative item in a package specification and must apply to an object declared earlier in the same package specification. The object must be declared as a scalar or an access type. The object cannot be any of the following:

- a loop variable,
- a constant,
- an initialized variable,
- an array, or
- a record.

The INTERFACE\_NAME pragma is also used to provide an external link name to a subprogram which has been defined using the INTERFACE pragma.

#### IMPLICIT\_CODE Pragma

Takes one of the identifiers ON or OFF as the single argument. This pragma is only allowed within a machine code procedure. It specifies that implicit code generated by the compiler be allowed or disallowed. A warning is issued if OFF is used and any implicit code needs to be generated. The default is ON.

#### LINK\_WITH Pragma

The LINK\_WITH pragma specifies a command to add to the a.ld link line. This pragma takes one argument, a string.

#### NON\_REENTRANT

This pragma takes one argument which can be the name of either a library subprogram or a subprogram declared immediately within a library package spec or body. It indicates to the compiler that the subprogram will not be called recursively allowing the compiler to perform specific optimizations. The pragma can be applied to a

subprogram or a set of overloaded subprogram within a package spec or package body.

#### NOT\_ELABORATED

This pragma can only appear in a library package specification. It indicates that the package will not be elaborated because it is either part of the RTS, a configuration package or an Ada package that is referenced from a language other than Ada. The presence of this pragma suppresses the generation of elaboration code and issues warnings if elaboration code is required.

## 2. Implementation of Predefined Pragmas

#### CONTROLLED

This pragma is recognized by the implementation but has no effect.

#### ELABORATE

This pragma is implemented as described in Appendix B of the Ada RM.

#### INLINE

This pragma is implemented as described in Appendix B of the Ada RM.

#### INTERFACE

This pragma supports calls to 'C', Pascal, and FORTRAN functions. The Ada subprograms can be either functions or procedures. The types of parameters and the result type for functions must be scalar, access or the predefined type ADDRESS in SYSTEM. All parameters must have mode IN. Record and array objects can be passed by reference using the ADDRESS attribute.

#### LIST

This pragma is implemented as described in Appendix B of the Ada RM.

#### MEMORY\_SIZE

This pragma is recognized by the implementation. The implementation does not allow SYSTEM to be modified by means of pragmas, the SYSTEM package must be recompiled.

#### OPTIMIZE

This pragma is recognized by the implementation but has no effect.

#### PACK

This pragma will cause the compiler to choose a non-aligned representation for composite types. It will not cause objects to be packed at the bit level.

#### PAGE

This pragma is implemented as described in Appendix B of the Ada RM.

#### PRIORITY

This pragma is implemented as described in Appendix B of the Ada RM.

#### SHARED

This pragma is recognized by the implementation but has no effect.

#### STORAGE\_UNIT

This pragma is recognized by the implementation. The implementation does not allow SYSTEM to be modified by means of pragmas, the SYSTEM package must be recompiled.

#### SUPPRESS

This pragma is implemented as described, except that RANGE\_CHECK and DIVISION\_CHECK cannot be suppressed.

#### SYSTEM\_NAME

This pragma is recognized by the implementation. The implementation does not allow SYSTEM to be modified by means of pragmas, the SYSTEM package must be recompiled.

### 3. Implementation-Dependent Attributes

P'REFREF'u>(120u+1n) .br For a prefix that denotes an object, a program unit, a label, or an entry.

This attribute denotes the effective address of the

first of the storage units allocated to P. For a sub-program, package, task unit, or label, it refers to the address of the machine code associated with the corresponding body or statement. For an entry for which an address clause has been given, it refers to the corresponding hardware interrupt. The attribute is of the type OPERAND defined in the package MACHINE\_CODE. The attribute is only allowed within a machine code procedure.

See section F.4.8 for more information on the use of this attribute.

(For a package, task unit, or entry, the 'REF attribute is not supported.)

#### 4. Values of Predefined Attributes

Attributes of the pre-defined type DURATION  
(a fixed-point type)

first is -2147483.648  
last is 2147483.647

```
NO_ADDR : constant ADDRESS := 0;
```

```
end SYSTEM;
```

## 6. Restrictions On Representation Clauses

### Pragma PACK

In the absence of pragma PACK record components are padded so as to provide for efficient access by the target hardware. Pragma PACK applied to a record eliminates the padding where possible. Pragma PACK has no other effect on the storage allocated for record components, so a record representation is required to make record components smaller. Bit packing is not supported for components larger than STORAGE\_UNIT. Components smaller than STORAGE\_UNIT will be bit packed within a storage unit. Objects and larger components are packed to the nearest whole STORAGE\_UNIT.

### Length Clauses

For scalar types, a length clause which is a size specification will compress storage to the number of bits required to represent the range of the subtype. For fixed, short\_float, and access types, this is 32. For float, this is 64.

A size specification applied to a composite type with components of composite types will not cause compression of component storage. To allocate the minimal number of bits for records of composite types, an explicit record representation clause must be given

with length clauses for each component. An error will be issued if there is insufficient space allocated. Component clauses need not be aligned on STORAGE\_UNIT boundaries. A component of a record representation clause may not specify fewer bits for a component type than would be used for values of the type.

Size specifications (T'SIZE) are not supported for task types. Specifications of storage for a task activation (T'SORAGE\_SIZE) is supported. The minimum storage size for task activations is 5120, but can be larger depending on the size of data objects declared in the task.

The size specification T'SMALL is not supported except when the representation specification is the same as the value 'SMALL for the base type.

Specification of collection size is supported.

#### Address Clauses

Address clauses are supported for uninitialized variables and constants. They are not supported by the compiler for subprograms, packages, and task units.

## Interrupts

Interrupt entries are supported for UNIX signals. The Ada for clause gives the UNIX signal number. The following is the meaning associated with the valid UNIX signals:

1	SIGHUP	hangup
2	SIGINT	interrupt
3	SIGQUIT	quit
4	SIGILL	illegal instruction (not reset when caught)
5	SIGTRAP	trace trap (not reset when caught)
6	SIGIOT	IOT instruction
7	SIGEMT	EMT instruction
8	SIGFPE	floating point exception
9	SIGKILL	kill (cannot be caught or ignored)
10	SIGBUS	bus error
11	SIGSEGV	segmentation violation
12	SIGSYS	bad argument to system call
13	SIGPIPE	write on a pipe with no one to read it
14	SIGALRM	alarm clock
15	SIGTERM	software termination signal from kill
16	SIGURG	urgent condition on IO channel
17	SIGSTOP	sendable stop signal not from tty
18	SIGTSTP	stop signal from tty
19	SIGCONT	continue a stopped process
20	SIGCHLD	to parent on child stop or exit
21	SIGTTIN	to readers pgrp upon background tty read
22	SIGTTOU	like TTIN for output if (tp->t_local&LTOSTOP)
23	SIGIO	input/output possible signal
24	SIGXCPU	exceeded CPU time limit
25	SIGXFSZ	exceeded file size limit
26	SIGVTALRM	virtual time alarm
27	SIGPROF	profiling time alarm
28	SIGWINCH	window changed

## Representation Attributes

The ADDRESS attribute is not supported for packages and task entries. The compiler issues a warning message and the value which is type SYSTEM.ADDRESS is SYSTEM.NO\_ADDR.

## Machine Code Insertions

Machine code insertions are supported.

The general definition of the package MACHINE\_CODE provides an assembly language interface for the target machine. It provides the necessary record type(s) needed in the code statement, an enumeration type of all the opcode mnemonics, a set of register definitions, and a set of addressing mode functions.

The general syntax of a machine code statement is as follows:

```
CODE_n' ( opcode, operand {, operand} );
```

where n indicates the number of operands in the aggregate.

A special case arises for a variable number of operands. The operands are listed within a subaggregate. The format is as follows:

```
CODE_N' ( opcode, (operand {, operand}) );
```

For those opcodes that require no operands, named notation must be used (cf. RM 4.3(4)).

```
CODE_0' ( op => opcode );
```

The opcode must be an enumeration literal (i.e. it cannot be an object, attribute, or a rename).

An operand can only be an entity defined in MACHINE\_CODE or the 'REF attribute.

The arguments to any of the functions defined in MACHINE\_CODE must be static expressions, string literals, or the functions defined in MACHINE\_CODE. The 'REF attribute may not be used as an argument in any of these functions.

Inline expansion of machine code procedures is supported.

7. Conventions for Implementation-generated Names

There are no implementation-generated names.

8. Interpretation of Expressions in Address Clauses

Address clauses are supported for constants and variables. Address clauses for interrupts are interpreted as described above.

9. Restrictions on Unchecked Conversions

None.

10. Restrictions on Unchecked Deallocations

None.

11. Implementation Characteristics of I/O Packages

The input output packages are implemented as specified in Chapter 14 of the LRM. IO characteristics are dictated by the underlying Unix IO subsystem which is bit-stream oriented for disc IO and block oriented for tape IO. Other devices have additional characteristics.

Ada Sequential\_IO and Direct\_IO is implemented such that reads and writes call the Unix system calls read(2) and write(2). If you instantiate Sequential\_IO or Direct\_IO with a constrained type, there is a one-to-one correspondence between Ada read/writes to UNIX read/writes. Otherwise, there are 2 Unix reads/writes to one Ada read/write, one for the size and one for the data.

12. Implementation Limits

The following limits are actually enforced by the implementation. It is not intended to imply that resources up to or even near these limits are available to every program.

### Line Length

The implementation supports a maximum line length of 500 characters including the end of line character.

### Record and Array Sizes

The maximum size of a statically sized array or record type is 4,000,000 x STORAGE\_UNITS. A record type or array type declaration that exceeds these limits will generate a warning message.

### Default Stack Size for Tasks

In the absence of an explicit STORAGE\_SIZE length specification every task except the main program is allocated a fixed size stack of 10,240 STORAGE\_UNITS. This is the value returned by T'SORAGE\_SIZE for a task type T. The minimum stack size for tasks is 5120.

### Default Collection Size

In the absence of an explicit STORAGE\_SIZE length attribute the default collection size for an access type is 100 times the size of the designated type. This is the value returned by T'SORAGE\_SIZE for an access type T.

### Limit on Declared Objects

There is an absolute limit of 6,000,000 x STORAGE\_UNITS for objects declared statically within a compilation unit. If this value is exceeded the compiler will terminate the compilation of the unit with a FATAL error message.
