13. ABSTRACT (Maximum 200 words)  
We recently demonstrated an innovative new idea that permits light scattering measurements at an angle of zero degrees for the first time. The idea is based on the use of coherent beam coupling in a nonlinear, photorefractive crystal of BaTiO<sub>3</sub> to separate the scattered light from the unscattered direct beam. The present problem is to extend these ideas to (a) angular distribution measurements; (b) measurements of the phase as well as the amplitude (i.e. both real and imaginary parts) of the 0° scattering; and (c) determination of the effects of coherent scattering at 0°. We have successfully measured the angular distribution of forward light scattering from quartz fibers of radii from 15 mm to 30 mm. Data have been obtained in the angular range of 0° to 0.3° with an angular resolution of better than 0.01°. The results are in good agreement with theory. Finally, the existence of coherent scattering effects at zero degrees have been considered and analyzed theoretically. Experimental data have been obtained that confirm these coherent scattering affects in suspensions of polystyrene spheres.

## A. STATEMENT OF THE PROBLEM STUDIED

We recently demonstrated an innovative new idea that permits light scattering measurements at an angle of zero degrees. The idea is based on the use of coherent beam coupling in a nonlinear, photorefractive crystal of BaTiO<sub>3</sub> to separate the scattered light from the unscattered direct beam. The present problem is to extend these ideas to (a) angular distribution measurements; (b) measurements of the phase as well as the amplitude (i.e. both the real and imaginary parts) of the 0° scattering; and (c) determination of the effects of coherent scattering at 0°.

## B. SUMMARY OF THE MOST IMPORTANT RESULTS

The angular distribution of forward light scattering from quartz fibers of radii from 15 μm to 30 μm was successfully measured. Data have been obtained at a wavelength of 514 nm in the angular range of 0° to 0.3° with an angular resolution of better than 0.01°; this is the first time such measurements have been possible in this important angular region. The results are in good agreement with theory. See publications 1, 4, and 5 below.

The existence of coherent scattering effects at zero degrees have been considered and analyzed theoretically. Experimental data have been obtained that confirm these coherent scattering effects in suspensions of polystyrene spheres. See publication 3 below.
