Ligand Field Stabization Energy Control of Metal Ion Binding

(a) Summary

The goal of this project has been to investigate the factors that contribute to metal ion binding specificity to peptides. The studies have been performed using a series of derivatives of a consensus zinc finger peptide. The parent peptide has the sequence ProTyrLysCysProGluCysGlyLysSerPheSerGlnLys-AspSerLeuValLysHisGlnArgThrHisThrGly where the residues involved in direct interactions with the metal ions are shown in boldface. Our studies have led to three major results described in separate publications.

(i) Electronic effects can account for the metal binding binding preferences for selected metal ions. Thus, the preferences of a series of peptides with tetrahedral binding sites of the form Cys_nHis_{4-n} for zinc(II) over cobalt(II) can be accounted for in terms of changes in ligand field stablization energy accompanying the transition from an octahedral site in aqueous solution to a tetrahedral site within a peptide. In addition, for this same series of peptides, the affinity for cadmium(II) markedly increases as the number of cysteine ligands increases. This result can be rationalized in terms of hard-soft acid-base effects.

Beth Allyn Krizek, Denise L. Merkle, and Jeremy M. Berg, "Ligand Variation and Metal Ion Binding Specificity in Zinc Finger Peptides", <u>Inorganic</u> <u>Chemistry</u>, 32, 937-940 (1993).

(ii) These zinc finger peptides will bind other metal ions including iron(II), nickel(II), and manganese(II) to produce paramagnetic species with distorted tetrahedral geometries. For these metal ions, metal binding specificity is not as easily rationalized in a quantitative sense. Thus, for manganese(II), the binding affinity is much lower than that expected based on ligand field stabilization energy effects. The strong preference of this ion for oxygen rather than nitrogen or sulfur ligands predominates in this case. For nickel(II), the affinity is much higher than that expected from ligand field stabilization energy effects. This is presumably due to the fact that small distortions of the metal binding site away from tetrahedral geometry can significantly reduce the ligand field stabilization energy penalty upon binding.

Beth Allyn Krizek and Jeremy M. Berg, "Complexes of Zinc Finger Peptides with Ni²⁺ and Fe²⁺, Inorganic Chemistry, 31, 2984-2986 (1992).

(iii) A truncated peptide that lacked one of the normal metal binding residues was prepared. This peptide binds metal ions with one coordination site available for the binding of exogenous ligands such as water, chloride, imidazole, or thiolates. The binding affinities of these monodentate ligands were determined and were found to be in the millimolar range. Attempts to use these peptide-metal complexes as catalysts for model reactions executed by zinc-containing enzymes were not successful.

Distribution List for Final Reports

Attach a copy of the REPORT DOCUMENTATION PAGE (DD FORM 1473) to your final report as the first page and mail two copies (including the postcard labelled DTIC FORM 50) to:

Defense Technical Information Center Building 5, Cameron Station Alexandria, VA 22314

This allows other investigators to obtain copies of your report directly from DTIC. DTIC will fill out the postcard DTIC ACCESSION NOTICE (DTIC FORM 50) and return it to you with their number for your report. When you refer people to DTIC to get a copy of your report, give this number to expedite the request.

Mail one copy to each of the following and attach this very page to the back of your report – otherwise the folks below will think they have mistakenly received a copy meant for the Molecular Biology Program):

- (a) Dr. Michael Marron ONR Code 1141 Molecular Biology Program 800 N. Quincy Street Arlington, VA 22217-5000
- (b) Administrative Grants Officer ONR Resident Representative (address varies - see copy of your grant/contract)
- (c) Director, Applied Research Directorate ONR Code 12
 800 N. Quincy Street Arlington, VA 22217-5000
- (d) Director Office of Naval Technology Code 22 800 N. Quincy Street Arlington, VA 22217-5000
