NAVAL AIR WARFARE CENTER WEAPONS DIVISION

FOREWORD

This publication combines a single source for all tidal and lunar data for operational locations of the Naval Air Warfare Center for use in Calendar Year 1995.

Mr. R. Helvey, Head, Geophysics Analysis Section; Mr. C. Fisk and Mr. B. Cohenour, Task Engineers; Mr. J. S. Rosenthal, Head, Geophysics Branch; Mr. W. Leslie, Associate Range Division Operations Officer; CAPT M. D. Barrett, Deputy Pacific Ranges and Facilities Department Director; and W. L. Bruton, Head, Test Operations Division, have approved this report for publication. OPSEC review by Mr. M. Flores.

INTRODUCTION

This publication combines a single source for all tidal and lunar data for operational locations of the Naval Air Warfare Center Weapons Division for use in Calendar Year 1995.

The data presentations are in two main divisions: one for Point Mugu and San Nicolas Island, and the other for the Barking Sands area. Within each division, the times of moonrise and moonset and tidal data are given. Appendixes provide information on lunar phases, sunrise and sunset times and calculation of the tide at any time. This publication is issued annually. Information regarding this data may be obtained from the Geophysics Branch of the Pacific Ranges and Facilities Department.

Special tidal data requests (ranges, heights at any time, and/or graphical depictions of each) for Point Mugu, San Nicolas Island, and Barking Sands, as well as for other locations, can be made by contacting the authors of this report at the Naval Air Warfare Center Weapons Division (805) 989-8383.

DATA SOURCE AND TIME REFERENCES

The data given here have been prepared from information contained in Tide Tables for the West Coast of North and South America including the Hawaiian Islands, 1995, published by the National Ocean Service.

For Point Mugu and San Nicolas Island, all times listed are Pacific Standard Time (PST), add eight hours to obtain Universal Coordinated Time (UCT or Z). When Daylight Savings Time (PDT) is in effect, one hour is to be added to the times given. In 1995, Pacific Daylight Time is scheduled to commence at 0200 PST on Sunday, 2 April, and to end at 0200 PDT on Sunday, 29 October.

For the Barking Sands Area, all times listed are Alaska-Hawaii Standard Time (AHST); add ten hours to obtain UCT. Daylight Savings Time is not observed in Hawaii.

TIDAL DATA

The ranges of tidal heights that may be expected at Point Mugu and San Nicolas Island are shown in Table 1. The range of heights for the primary harbor in the Barking Sands area, Port Allen, is shown in Table 2. The times and height of high and low tides for 1995 at Point Mugu are given in Tables 4 through 15, and at San Nicolas Island in Tables 16 through 27. Similar tide data for Port Allen are given in Tables 29 through 40.

TABLE 1. Tidal Ranges for Point Mugu and San Nicolas Island

Point Mugu		
Tidal Levels	Height (Ft)	Occurrence
Extreme high water	6.84	0842, Dec 22
Mean tide level (mean sea level)	2.74	
Extreme low water	-1.67	1542, Jan 01
Tidal Ranges	Height (Ft)	Occurrence(s)
Maximum	8.48	Jan 01, Dec 22
Minimum	1.84	Sep 18

San Nicolas Island		
Tidal Levels	Height (Ft)	Occurrence
Extreme high water	6.27	0848, Dec 22
Mean tide level (mean sea level)	2.51	
Extreme low water	-1.53	1548, Jan 01
Tidal Ranges	Height (Ft)	Occurrence(s)
Maximum	7.77	Jan 01, Dec 22
Minimum	1.69	Sep 18

TABLE 2. Tidal Ranges for Port Allen

Tidal Levels	Height (Ft)
Extreme high water	2.3
Mean higher high water	1.6
Mean high water	1.0
Mean tide level (mean sea level)	0.7
Mean low water	0.5
Mean lower low water	-0.1
Extreme low water	-0.3

These tables list the times and heights of high and low tide for each month of the year and chronologically through each day. The heights are all measured from mean lower low water and are values for a sea unaffected by wind waves or swell. The height and character of the sea surface are influenced by factors other than the predictable positions of the moon and sun, and thus are likely to be higher or lower than computed values indicate.

LUNAR DATA

Times of moonrise and moonset for the Point Mugu-San Nicolas Island area in 1995 are given in Table 3, and for the Barking Sands area in Table 28, preceding the tidal data for the respective stations. Information regarding the phases of the moon in 1995 is found in Appendix B.

HEIGHT OF THE TIDE AT ANY TIME

The height of the tide at times intermediate to the times of high and low water is needed on occasion, and may be computed by numerical methods. An example of the method, (adapted from Table 3 of the data source), is presented here, using the predicted tides for a day at Point Mugu.

Problem: Given that the predicted times and heights of the tides are:

<u>TIME</u>	<u>HEIGHT</u>
0039	4.9
0814	0.2
1510	3.1
1933	2.4

What is the height of the tide at 0300?

Numerical Method

The duration of fall is 08h 14m - 00h 39m = 7h 35m

The time after high water is 03h 00m - 00h 39m = 2h 21m

The range of tide is 4.9 - 0.2 = 4.7 feet

Entering Table A-1 at the duration of fall of 7h 40m, which is the nearest value to 6h 35m, the nearest value on the horizontal line to 2h 21m is 2h 18m after high water. Following down this column to its intersection with a range of 4.5 feet which is the nearest value to 4.7 feet, one obtains 0.9 which, being calculated from high water, must be subtracted from 4.9. The approximate height at 0300 is therefore 4.0 feet.

When the duration of rise or fall is greater than 10h 40m, enter the table with one-half the given duration and with one-half the time from nearest high or low water; but if the duration of rise or fall is less than 4h 00m, enter the table with double the given duration and time.

1. Obtain from the predictions the high water and low water, one of which is before and the other after the time for which the height is required. The difference between the times of occurrence of these tides is the duration of rise or fall, and the difference between heights is the range of tide for the above table. Find the difference between the nearest high or low water and the time for which the height is required.
2. Enter the table with the duration of rise or fall, printed in heavy-faced type, which most nearly agrees with the actual value, and on that horizontal line find the time from the nearest high or low water which agrees most nearly with the corresponding actual difference. The correction sought is in the column directly below on the line with the range of tide.
3. When the nearest tide is high water, subtract the correction.
4. When the nearest tide is low water, add the correction.

GRAPHICAL METHOD

If the height of the tide is required for a number of times on a certain day the fill tide curve for the day, may be obtained by the *one-quarter, one-tenth rule*. The procedure is as follows:

1. On cross-section paper plot the high and low water points in the order of their occurrence for the day, measuring time horizontally and height vertically. These are the basic points for the curve.
2. Draw light straight lines connecting the points representing successive high and low waters.
3. Divide each of these straight lines into four equal parts. The halfway point of each line gives another point for the curve.
4. At the quarter point adjacent to high water, draw a vertical line above the point, and at the quarter point adjacent to low water, draw a vertical line below the point, making the length of these lines equal to one-tenth of the range between the high and low waters used. The points marking the ends of these vertical lines give two additional intermediate points for the curve.
5. Draw a smooth curve through the points of high and low waters and the intermediate points, making the curve well rounded near high and low waters. This curve will approximate the actual tide curve and heights for any time of the day may be readily scaled from it. The resulting graph is shown in Figure A-1.

CAUTION

Both methods presented are based on the assumption that the rise and fall conform to simple cosine curves. Therefore the heights obtained will be approximate. The roughness of approximation will vary as the tide curve differs from a cosine curve.

EQUINOXES, SOLSTICES, AND LUNAR PHASES 1995

The dates and times for Vernal and Autumnal Equinoxes and Summer and Winter Solstices during 1995 are listed in Table B-1. The 1995 dates and times for phases of the moon are given in Table B-2. Times are Pacific Standard Time, add 1 hour when Daylight Savings Time is in effect; add 2 hours for times in the Barking Sands area.

TABLE B-1. Equinoxes and Solstices, 1995, Point Mugu Area

Vernal Equinox	20 March	1814 PST	Beginning of Spring Day and night equal length
Summer Solstice	21 June	1234 PST	Beginning of Summer Greatest duration daylight
Autumnal Equinox	23 September	0413 PST	Beginning of Autumn Day and night equal length
Winter Solstice	22 December	0017 PST	Beginning of Winter Greatest duration darkness

Because the earth's period of revolution about the sun (365.24+ days) is not evenly divisible by the moon's period of revolution about the earth (27.321 days), the dates and times of lunar phases, moonrise and moonset, and tidal data must be recomputed for each year. The following information, however, is based on geometrical relationships and holds true for all times:

1. The New Moon rises at sunrise, crosses the meridian at noon, and sets at sunset.
2. The First Quarter Moon rises at noon, crosses the meridian at sunset, and sets at sunrise.
3. The Full Moon rises at sunset, crosses the meridian at midnight, and sets at sunrise.
4. The Last Quarter Moon rises at midnight, crosses the meridian at sunrise and sets at noon.
