16. Abstract Angle-ply graphite/epoxy and graphite/S-glass/epoxy laminates were characterized in uniaxial tension at strain rates ranging from quasi-static to over $500s^{-1}$. Laminate ring specimens of $[+15]_{2s}$, $[+22.5]_{2s}$, $[+30]_{2s}$, $[+45]_{2s}$, $[+60]_{2s}$, $[+67.5]_{2s}$, and $[+75]_{2s}$ layups were loaded under internal pressure. Results were presented in the form of stress-strain curves to failure. Properties determined included moduli, Poisson's ratios, strength, and ultimate strain. In all seven laminates for the two materials tested the modulus and strength increase with strain rate. The effect of strain rate varies with layup, being lowest for the fiber dominated $[+15]_{2s}$ laminates and highest for the matrix dominated $[+75]_{2s}$ laminates. The highest increments over the static values are 10 percent to 25 percent for the $[+15]_{2s}$ layup and 200 percent to 275 percent for the $[+75]_{2s}$ layup. Ultimate strains do not show any significant trends with strain rate. In almost all cases the ultimate strain values are within ± 20 percent of the mean value and in half of the cases the deviations from the mean are less than 10 percent.

FOREWORD

This is the Final Report on IIT Research Institute Project No. K06013 (formerly M06026), "High Strain Rate Properties of Angle-Ply Composite Laminates," prepared by IITRI for NASA-Lewis Research Center, under Contract No. NAS3-21016. The work described in this report was conducted in the period July 11, 1977 to April 11, 1981. Dr. C. C. Chamis was the NASA-Lewis Project Manager. Dr. I. M. Daniel formerly of IITRI was the Principal Investigator. Additional contributions to the work reported herein were made by Messrs. W. G. Hamilton, G. M. Koller, T. Niro, and S. W. Schramm of IITRI, Dr. T. Liber of Travenol Laboratories, and Mr. R. H. LaBedz of Broutman and Associates.

HIGH STRAIN RATE PROPERTIES OF ANGLE-PLY COMPOSITE LAMINATES

ABSTRACT

Angle-ply graphite/epoxy and graphite/S-glass/epoxy laminates were characterized in uniaxial tension at strain rates ranging from quasi-static to over 500s^{-1} . Laminate ring specimens of $[\pm 15]_{2s}$, $[\pm 22.5]_{2s}$, $[\pm 30]_{2s}$, $[\pm 45]_{2s}$, $[\pm 60]_{2s}$, $[\pm 67.5]_{2s}$ and $[\pm 75]_{2s}$ layups were loaded under internal pressure. Results were presented in the form of stress-strain curves to failure. Properties determined included moduli, Poisson's ratios, strength, and ultimate strain. In all seven laminates for the two materials tested the modulus and strength increase with strain rate. The effect of strain rate varies with layup, being lowest for the fiber dominated $[\pm 15]_{2s}$ laminates and highest for the matrix dominated $[\pm 75]_{2s}$ laminates. The highest increments over the static values are 10% to 25% for the $[\pm 15]_{2s}$ layup and 200% to 275% for the $[\pm 75]_{2s}$ layup. Ultimate strains do not show any significant trends with strain rate. In almost all cases the ultimate strain values are within $\pm 20\%$ of the mean value and in half of the cases the deviations from the mean are less than 10%.

TABLE OF CONTENTS

3-33	Strain records in steel ring and 80AS/20S/PR288 [± 30] _{2s} graphite/S-glass/epoxy ring under dynamic loading for Specimen No. 54-5 (0.65 g shotgun powder).	3-58
3-34	Stress-strain curves for dynamically loaded [± 30] _{2s} 80AS/20S/PR288 graphite/S-glass/epoxy ring, Specimen No. 54-2.	3-58
3-35	Stress-strain curves for dynamically loaded [± 30] _{2s} 80AS/20S/PR288 graphite/S-glass/epoxy ring, Specimen No. 54-3.	3-58
3-36	Stress-strain curves for dynamically loaded [± 30] _{2s} 80AS/20S/PR288 graphite/S-glass/epoxy ring, Specimen No. 54-5.	3-58
3-37	Strain records in steel ring and [± 45] _{2s} SP288/AS graphite/epoxy ring under dynamic loading for Specimen No. 24-11 (0.65 g shotgun powder).	3-58
3-38	Strain records in steel ring and [± 45] _{2s} SP288/AS graphite/epoxy ring under dynamic loading for Specimen No. 52-2 (0.65 g shotgun powder).	3-58
3-39	Strain records in steel ring and [± 45] _{2s} SP288/AS graphite/epoxy ring under dynamic loading for Specimen No. 52-3 (0.65 g shotgun powder).	3-58
3-40	Strain records in steel ring and [± 45] _{2s} SP288/AS graphite/epoxy ring under dynamic loading for Specimen No. 52-4 (0.65 g shotgun powder).	3-61
3-41	Stress-strain curves for dynamically loaded [± 45] _{2s} SP288/AS graphite/epoxy ring, Specimen No. 24-11.	3-62
3-42	Stress-strain curves for dynamically loaded [± 45] _{2s} SP288/AS graphite/epoxy ring, Specimen No. 52-2.	3-63
3-43	Stress-strain curves for dynamically loaded [± 45] _{2s} SP288/AS graphite/epoxy ring, Specimen No. 52-3.	3-64
3-44	Stress-strain curves for dynamically loaded [± 45] _{2s} SP288/AS graphite/epoxy ring, Specimen No. 52-4.	3-65
3-45	Strain records in steel ring and 80AS/20S/PR288 [± 45] _{2s} graphite/S-glass/epoxy ring under dynamic loading for Specimen No. 25-9 (0.65 g shotgun powder).	3-66

HIGH STRAIN RATE PROPERTIES OF ANGLE-PLY COMPOSITE LAMINATES

1. INTRODUCTION

In Part I of this report methods were described for testing and characterization of composite materials at strain rates ranging from quasi-static to over 500s^{-1} . Three unidirectional materials were characterized: SP288/T300 graphite/epoxy, SP288/AS graphite/epoxy, and 80AS/20S/PR288 graphite/S-glass/epoxy.

It was found that the longitudinal modulus increases moderately with strain rate by up to 20%, but the longitudinal strength and ultimate strain did not vary much. Transverse modulus and strength increase sharply with strain rate, reaching values up to three times the static value. The in-plane shear modulus and shear strength increase noticeably with strain rate by up to approximately 65%. In all cases, it was found that ultimate strains did not vary with strain rate in any significant manner.

In Part II of this report the same experimental methods were used to characterize unidirectional off-axis laminates in the same range of strain rates. Rings of $[22.5_g]$, $[30_g]$, and $[45_g]$ layups were tested. Two materials were characterized: SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy. It was found that in all three laminates of both materials the modulus and strength increase sharply with strain rate, reaching values roughly 100%, 150%, and 200% higher than corresponding static values for the $[22.5_g]$, $[30_g]$, and $[45_g]$ laminates, respectively. In the case of ultimate strain no definite trends were established, but the maximum deviation from the average was less than 18%.

The objective of the task described in this Part III of the report is to characterize angle-ply composite laminates in uniaxial tension at three strain rates. The same material systems were characterized as in the case of the off-axis laminates. The three strain rates selected are quasi-static, intermediate, and high rates ranging from 10^{-4}s^{-1} to over 500s^{-1} . All characterization tests were conducted by testing thin rings 10.16 cm (4 in.) in diameter, 2.54 cm (1 in.) wide, and 8-ply thick under internal pressure. Rings of

$[\pm 15]_{2S}$, $[\pm 22.5]_{2S}$, $[\pm 30]_{2S}$, $[\pm 45]_{2S}$, $[\pm 60]_{2S}$, $[\pm 67.5]_{2S}$, and $[\pm 75]_{2S}$ layups were tested. Three replications per test were used. The data were analyzed according to procedures described in Part I of this report. Results were presented in the form of stress-strain curves to failure. Properties determined included initial, secant, and terminal strain rates; initial, secant, and terminal modulus and Poisson's ratio; and strength and ultimate strain. The effects of strain rate on the various properties are discussed below.

2. QUASI-STATIC TENSILE PROPERTIES OF ANGLE-PLY LAMINATES

Quasi-static tensile properties of $[\pm\theta]_{2S}$ laminates were obtained by testing rings instrumented with strain gages under internal pressure. Three rings were tested for each of the two material systems, the SP288/AS graphite/epoxy and the 80AS/20S/PR288 graphite/S-glass/epoxy, and for each of the values of $\theta = 15^\circ, 22.5^\circ, 30^\circ, 45^\circ, 60^\circ, 67.5^\circ, \text{ and } 75^\circ$. Each ring was instrumented with a 2-gage rosette with elements in the axial and circumferential directions.

Stress-strain curves for all specimens tested are shown in Figures 2-1 through 2-41. Values for the modulus, Poisson's ratio, strength, and ultimate strain computed from these curves are shown in these figures and summarized in Tables 2-1 and 2-2. All but the $[\pm 15]_{2S}$ specimens show nonlinear strain response to failure. Difficulties were encountered with the $[\pm 45]_{2S}$ specimens due to excessive deformation of the rings. These specimens deformed into a conical shape and allowed the bladder to extrude through the opening between the sides of the ring specimen and the steel plates in contact with them. For these reasons only lower bounds are given in Tables 2-1 and 2-2 for the strength and ultimate strain values of these specimens.

Tables 2-1 and 2-2 include also results for the modulus and Poisson's ratio calculated using measured unidirectional properties. The agreement between experimental and predicted values is satisfactory. The calculated properties were obtained by using a computer program called SQ5. This program is a point stress analysis of a laminate under in-plane loads, moments, and temperature effects. The formulation uses the usual lamination theory whereby the laminate constitutive relations are derived from those of each ply of the laminate.

The modulus of the hybrid laminates is lower than that of the graphite/epoxy laminates for $0^\circ \leq \theta < 45^\circ$, but the relationship is reversed for $45^\circ \leq \theta \leq 90^\circ$. The strength of the hybrid laminates is consistently lower than that of the graphite/epoxy laminates for all layups. Poisson's ratios for the hybrid

laminates are lower than those for the graphite/epoxy for $0^\circ \leq \theta \leq 22.5^\circ$, but no significant differences exist for $\theta \geq 30^\circ$. The ultimate strain in the hybrid material is not significantly different from that of the graphite/epoxy for $0^\circ \leq \theta \leq 30^\circ$, but it becomes smaller than that of the graphite/epoxy material for $\theta \geq 45^\circ$.

3. INTERMEDIATE STRAIN RATE TENSILE PROPERTIES OF ANGLE-PLY LAMINATES

3.1 $[\pm 15]_{2s}$ LAMINATES

Intermediate rate tensile properties of $[\pm 15]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Three rings of each material were loaded dynamically using 650 mg of slow burning pistol powder (red dot) in the pressure chamber of the fixture. The circumferential and axial strains in the composite rings and the circumferential strain in the steel calibration ring were recorded in every case.

Strain records for the three graphite/epoxy rings are shown in Figures 3-1, 3-2, and 3-3 (Specimen Nos. 35-7, 35-10, and 35-11). These data were analyzed following the procedures described in Part I of this report (Section 3.3.2). Results in the form of dynamic stress-strain curves are shown in Figures 3-4, 3-5, and 3-6. Results for the three rings tested are tabulated in Table 3-1. The initial strain rates range between $9s^{-1}$ and $20s^{-1}$, and the average (secant) rates between $36s^{-1}$ and $52s^{-1}$. The times to failure range between 184 μs and 213 μs . The initial and secant moduli of 121 GPa (17.5×10^6 psi) and 123 GPa (17.8×10^6 psi), respectively, are higher than the static modulus of 105 GPa (15.2×10^6 psi) by 15% and 17%, respectively. The average initial and secant Poisson's ratios of 0.80 and 0.81 are a little lower than the static value of 0.86. The average dynamic strength of 1049 MPa (152 ksi) is much higher than the static strength of 823 MPa (119 ksi). The increase in dynamic strength is higher than the increase in dynamic modulus. The average dynamic ultimate strain of 0.0086 is higher than the static value of 0.0078.

Strain records for the three hybrid rings are shown in Figures 3-7, 3-8, and 3-9 (Specimen Nos. 36-6, 36-10, and 36-11). The corresponding dynamic stress-strain curves are shown in Figures 3-10, 3-11, and 3-12. Results are tabulated in Table 3-2. The initial strain rates range between $16s^{-1}$ and $18s^{-1}$, and the average (secant) rates between $41s^{-1}$ and $45s^{-1}$. The time to failure ranges between 222 μs and 270 μs . The initial and secant moduli of

104 GPa (15.1×10^6 psi) and 95 GPa (13.7×10^6 psi), respectively, are higher than and equal to, respectively, the initial static modulus of 95 GPa (13.7×10^6 psi). The average initial and secant Poisson's ratios of 0.44 and 0.50 are lower than the static value of 0.68. The average dynamic strength of 968 MPa (140 ksi) is higher than the static strength of 806 MPa (117 ksi). The average dynamic ultimate strain of 0.0103 is higher than the static value of 0.0084.

3.2 $[\pm 22.5]_{2s}$ LAMINATES

Intermediate rate tensile properties of $[\pm 22.5]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Three rings of each material were loaded dynamically using 650 mg pistol powder in the pressure chamber of the fixture.

Strain records for the three graphite/epoxy rings tested are shown in Figures 3-13, 3-14, and 3-15 (Specimen Nos. 33-10, 33-11, and 33-13). The corresponding dynamic stress-strain curves are shown in Figures 3-16, 3-17, and 3-18. Results are tabulated in Table 3-3. The initial strain rates range between $8s^{-1}$ and $30s^{-1}$ and the average (secant) between $40s^{-1}$ and $48s^{-1}$. The times to failure range between 187 μs and 221 μs . The initial and secant moduli of 78.4 GPa (11.4×10^6 psi) and 84.0 GPa (12.2×10^6 psi), respectively, are close to the static initial modulus of 81.4 GPa (11.8×10^6 psi). The average dynamic strength of 770 MPa (112 ksi) is exactly equal to the static strength. The dynamic ultimate strain of 0.0093 is lower than the static value of 0.0103.

Strain records for the three hybrid rings are shown in Figures 3-19, 3-20, and 3-21 (Specimen Nos. 34-2, 34-10, and 34-11). The corresponding dynamic stress-strain curves are shown in Figures 3-22, 3-23, and 3-24. Results are tabulated in Table 3-4. The initial strain rates range between $9s^{-1}$ and $31s^{-1}$ and the average (secant) rates between $35s^{-1}$ and $57s^{-1}$. The times to failure range between 181 μs and 275 μs . The initial and secant moduli of 75.7 GPa (11.0×10^6 psi) and 72.5 GPa (10.5×10^6 psi), respectively, are a little higher than the static initial modulus of 68.5 GPa

(9.9×10^6 psi). The average dynamic strength of 752 MPa (109 ksi) is higher than the static strength of 653 MPa (94.6 ksi). The dynamic strain of 0.0104 is exactly equal to the static value.

3.3 $[\pm 30]_{2S}$ LAMINATES

Intermediate rate tensile properties of $[\pm 30]_{2S}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing three rings of each material under dynamic internal pressure. The pressure was produced by detonating 650 mg pistol powder in the pressure chamber of the fixture.

Strain records for the three graphite/epoxy rings tested are shown in Figures 3-25, 3-26, and 3-27 (Specimen Nos. 28-2, 28-12, and 28-13). The corresponding dynamic stress-strain curves are shown in Figures 3-28, 3-29, and 3-30. Results are tabulated in Table 3-5. The initial strain rates range between $10s^{-1}$ and $17s^{-1}$, and the average (secant) rates between $49s^{-1}$ and $73s^{-1}$. The times to failure range between 195 μs and 237 μs . The initial and secant moduli of 48.4 GPa (7.02×10^6 psi) and 44.7 GPa (6.48×10^6 psi), respectively, are noticeably lower than the static initial modulus of 58.6 GPa (8.50×10^6 psi). The average dynamic strength of 571 MPa (83×10^6 psi) is almost equal to the static strength of 566 MPa (82 ksi). The dynamic ultimate strain of 0.0128 is almost equal to the static value of 0.0132.

Strain records for the three hybrid rings are shown in Figures 3-31, 3-32, and 3-33 (Specimen Nos. 54-2, 54-3, and 54-5). The corresponding dynamic stress-strain curves are shown in Figures 3-34, 3-35, and 3-36. Results are tabulated in Table 3-6. The initial strain rates range between $12s^{-1}$ and $22s^{-1}$, and the average (secant) rates between $56s^{-1}$ and $85s^{-1}$. The times to failure range between 179 μs and 224 μs . The initial and secant moduli of 43.5 GPa (6.31×10^6 psi) and 41.9 GPa (6.07×10^6 psi), respectively, are a little lower than the static value of 44.9 GPa (6.51×10^6 psi). The dynamic initial and secant Poisson's ratios of 1.11 and 1.23 are lower than the static value of 1.26. The average dynamic strength of 611 MPa (89 ksi) is higher than the static strength of 503 MPa (73 ksi). The dynamic ultimate strain of 0.0144 is very close to the static value of 0.0139 as in the case mentioned before.

3.4 $[\pm 45]_{2s}$ LAMINATES

Intermediate strain rate tensile properties of $[\pm 45]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Four rings of each material were loaded dynamically using 650 mg pistol powder in the pressure chamber of the fixture.

Strain records for the four graphite/epoxy rings tested are shown in Figures 3-37 through 3-40 (Specimen Nos. 24-11, 52-2, 52-3, and 52-4). The corresponding dynamic stress-strain curves are shown in Figures 3-41 through 3-44. Results are tabulated in Table 3-7. The initial strain rates range between $10s^{-1}$ and $17s^{-1}$ and the average (secant) rates between $66s^{-1}$ and $101s^{-1}$. The times to failure range between 300 μs and 348 μs . The initial and secant moduli of 19.1 GPa (2.77×10^6 psi) and 17.6 GPa (2.55×10^6 psi), respectively, are both lower than the static modulus of 20.4 GPa (2.95×10^6 psi). This difference may be due in part to the fact that three of the specimens were taken from a different tube (No. 52) which was fabricated much later than tube No. 24 from which the static specimens came. The moduli for Specimen No. 24-11 are much closer to the static modulus. The average dynamic Poisson's ratio of 0.85 is higher than the static value of 0.69. The average dynamic strength of 494 MPa (72 ksi) is much higher than the low bound of 224 MPa (32.5 ksi) established by static testing. On the other hand, the dynamic ultimate strain of 0.0279 is lower than the lower bound established by static testing. Again, the value of 0.0348 for Specimen No. 24-11 is more in line with the static results.

Strain records for the four hybrid rings are shown in Figure 3-45 through 3-48 (Specimen Nos. 25-9, 53-1, 53-4, and 53-5). The corresponding dynamic stress-strain curves are shown in Figures 3-49 through 3-52. Results are tabulated in Table 3-8. The initial strain rates range between $7s^{-1}$ and $30s^{-1}$ and the average (secant) rates between $81s^{-1}$ and $163s^{-1}$. The times to failure range between 171 μs and 344 μs . The initial modulus of 21.1 GPa (3.06×10^6 psi) is only slightly lower than the static modulus of 21.5 GPa (3.12×10^6 psi). The overall average Poisson's ratio of 0.71 is a little lower than the static value of 0.74. The average dynamic strength of 371 MPa (54 ksi) is much higher than the lower bound of 191 MPa (27.7 ksi) established by static testing. The dynamic ultimate strain of 0.0270 is very close to the lower bound of 0.0265 established by static testing.

3.5 $[\pm 60]_{2s}$ LAMINATES

Intermediate strain rate tensile properties of $[\pm 60]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Three rings of each material were loaded dynamically using 650 mg pistol powder in the pressure chamber of the fixture.

Strain records for the three graphite/epoxy rings tested are shown in Figures 3-53, 3-54, and 3-55 (Specimen Nos. 22-9, 22-10, and 22-11). The corresponding dynamic stress-strain curves are shown in Figures 3-56, 3-57, and 3-58. Results are tabulated in Table 3-9. The initial strain rates range between $16s^{-1}$ and $27s^{-1}$, and the average (secant) rates between $44s^{-1}$ and $84s^{-1}$. The times to failure range between 196 μs and 281 μs . The initial and secant moduli of 23.0 GPa (3.34×10^6 psi) and 13.9 GPa (2.01×10^6 psi), respectively, are higher than the initial static modulus of 13.4 GPa (1.95×10^6 psi) by 71% and 3%, respectively. The average Poisson's ratio of 0.32 is identical to the static value. The average dynamic strength of 182 MPa (26.4 ksi) is appreciably higher than the static strength of 105 MPa (15.2 ksi), by approximately the same percentage (73%) as the initial modulus. The average dynamic ultimate strain of 0.0134 is slightly higher than the static value of 0.0120.

Strain records for the three hybrid rings tested are shown in Figures 3-59, 3-60, and 3-61 (Specimen Nos. 23-7, 23-10, and 23-11). The corresponding dynamic stress-strain curves are shown in Figures 3-62, 3-63, and 3-64. Results are tabulated in Table 3-10. The initial strain rates range between $20s^{-1}$ and $35s^{-1}$, and the average (secant) rates between $51s^{-1}$ and $75s^{-1}$. The times to failure range between 155 μs and 219 μs . The initial modulus of 24.7 GPa (3.58×10^6 psi) is much higher than the static modulus of 15.2 GPa (2.20×10^6 psi). The average initial and secant Poisson's ratio of 0.31 is only slightly higher than the static value of 0.29. The average dynamic strength of 155.5 MPa (22.5 ksi) is much higher than the static strength of 94.8 MPa (13.7 ksi). The increase in dynamic strength outpaces the increase in dynamic modulus. The average dynamic ultimate strain of 0.0112 is higher than the static value of 0.0087.

3.6 $[\pm 67.5]_{2s}$ LAMINATES

Intermediate strain rate tensile properties of $[\pm 67.5]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Three rings of each material were loaded dynamically using 650 mg pistol powder in the pressure chamber of the fixture.

Strain records for the three graphite/epoxy rings tested are shown in Figures 3-65, 3-66, and 3-67 (Specimen Nos. 26-10, 26-11, and 26-13). The corresponding dynamic stress-strain curves are shown in Figure 3-68, 3-69, and 3-70. Results are tabulated in Table 3-11. The initial strain rates range between $19s^{-1}$ and $35s^{-1}$ and the average (secant) rates between $58s^{-1}$ and $89s^{-1}$. The times to failure vary between $123 \mu s$ and $158 \mu s$. The initial and secant moduli of 17.3 GPa ($2.51 \times 10^6 \text{ psi}$) and 12.8 GPa ($1.86 \times 10^6 \text{ psi}$), respectively, are higher than the initial static modulus of 12.0 GPa ($1.74 \times 10^6 \text{ psi}$). The average initial and secant Poisson's ratio is equal to the static value of 0.17. The average dynamic strength of 132.2 MPa (19.2 ksi) is higher than the static strength of 85.1 MPa (12.3 ksi) by 56%. The average dynamic ultimate strain of 0.0103 is higher than the static value of 0.0081.

Strain records for the three hybrid rings tested are shown in Figures 3-71, 3-72, and 3-73 (Specimen Nos. 27-10, 27-11, and 27-13). The corresponding dynamic stress-strain curves are shown in Figures 3-74, 3-75, and 3-76. Results are tabulated in Table 3-12. The initial strain rates range between $23s^{-1}$ and $49s^{-1}$ and the average (secant) rates between $56s^{-1}$ and $71s^{-1}$. The times to failure vary between $130 \mu s$ and $151 \mu s$. The initial and secant moduli of 20.3 GPa ($2.94 \times 10^6 \text{ psi}$) and 15.7 GPa ($2.28 \times 10^6 \text{ psi}$), respectively, are higher than the initial static modulus of 14.4 GPa ($2.08 \times 10^6 \text{ psi}$) by 41% and 10%, respectively. The average initial and secant Poisson's ratio of 0.14 is slightly lower than the static value of 0.16. The average dynamic strength of 136.6 MPa (19.8 ksi) is much higher than the static strength of 76.1 MPa (11.0 ksi) by a higher percentage than the dynamic modulus. The average dynamic ultimate strain of 0.0087 is higher than the static value of 0.0062.

3.7 $[\pm 75]_{2s}$ LAMINATES

Intermediate strain rate tensile properties of $[\pm 75]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Three rings of each material were loaded dynamically using 650 mg pistol powder in the pressure chamber of the fixture.

Valid data were obtained only for one of the three graphite/epoxy rings tested, Specimen No. 20-12. Strain records and the corresponding dynamic stress-strain curve for this specimen are shown in Figures 3-77 and 3-78, respectively. Results are tabulated in Table 3-13. The initial and secant strain rates are $19s^{-1}$ and $45s^{-1}$, respectively, and the time to failure is 201 μs . The initial modulus of 19.7 GPa (2.86×10^6 psi) is much higher than the static modulus of 11.2 GPa (1.63×10^6 psi). The average Poisson's ratio of 0.06 is lower than the static value of 0.09. The dynamic strength of 98.3 MPa (14.2 ksi) is higher than the static strength of 74.8 MPa (10.8 ksi) by 31%. The dynamic ultimate strain of 0.0090 is also higher than the static value of 0.0076 by 18%.

Strain records for the three hybrid rings tested are shown in Figures 3-79, 3-80, and 3-81 (Specimen Nos. 21-10, 21-11, and 21-12). The corresponding dynamic stress-strain curves are shown in Figures 3-82, 3-83, and 3-84. Results are tabulated in Table 3-14. The initial strain rates range between $28s^{-1}$ and $37s^{-1}$ and the average (secant) rates between $62s^{-1}$ and $68s^{-1}$. The times to failure range between 107 μs and 111 μs . The initial modulus of 16.9 GPa (2.45×10^6 psi) is a little higher than the static modulus of 15.5 GPa (2.25×10^6 psi). The overall average Poisson's ratio of 0.08 is slightly lower than the static value of 0.10. The average dynamic strength of 94.9 MPa (13.8 ksi) is higher than the static strength of 61.4 MPa (8.9 ksi) by 55%. The dynamic ultimate strain of 0.0070 is also higher than the static value of 0.0047 by 49%.

4. HIGH STRAIN RATE TENSILE PROPERTIES OF ANGLE-PLY LAMINATES

4.1 $[\pm 15]_{2S}$ LAMINATES

High strain rate tensile properties of $[\pm 15]_{2S}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Three rings of each material were loaded dynamically using 100 mg PETN detonators in the pressure chamber of the fixture. The circumferential and axial strains in the composite ring and the circumferential strain in the calibration steel ring were recorded in every case.

Strain and strain derivative records for the three graphite/epoxy rings tested are shown in Figures 4-1 through 4-9 (Specimen Nos. 35-2, 35-4, and 35-6). These data were analyzed following procedures described in Part I of this report. Dynamic stress-strain curves obtained by the digital processing oscilloscope are shown in Figures 4-10, 4-11, and 4-12. Results for the three rings tested are tabulated in Table 4-1. The initial strain rates range between $130s^{-1}$ and $250s^{-1}$ and the average (secant) rates between $175s^{-1}$ and $254s^{-1}$. The times to failure range between 35 μs and 44 μs . The initial and secant moduli of 113.2 GPa (16.4×10^6 psi) and 117.8 GPa (17.1×10^6 psi), respectively, are higher than the static modulus of 104.5 GPa (15.2×10^6 psi) by 8% and 12%, respectively. The overall average Poisson's ratio of 0.80 is lower than the static value of 0.86. The average dynamic strength of 1029 MPa (149 ksi) is higher than the static strength of 823 MPa (119.3 ksi) by 25%. The increase in dynamic strength is higher than the increase in dynamic modulus. The average dynamic ultimate strain of 0.0088 is higher than the static value of 0.0078. This trend in properties is related to some change in failure modes from those under quasi-static to those under dynamic loading conditions. Quasi-static failure modes include pronounced interlaminar shear failures. Under dynamic conditions, with the higher rate-dependent, matrix-dominated interlaminar shear properties, there is more brittle-like behavior with failures dominated primarily by fiber fractures.

35-6	250	113.9 (16.5)	-
<u>Ultimate Properties</u>			
	<u>Time to Failure (t_f), μs</u>	<u>Strength ($S_{\theta\theta T}$), MPa (ksi)</u>	<u>Strain ($\epsilon_{\theta\theta T}^u$)</u>
35-2	40	1080 (156)	0.0097
35-4	35	973 (141)	0.0089
35-6	44	1035 (150)	0.0077

Strain and strain derivative records for the three hybrid rings are shown in Figures 4-13 through 4-21 (Specimen Nos. 36-2, 36-4, and 36-7). Dynamic stress-strain curves are shown in Figures 4-22, 4-23, and 4-24. Results for the three rings tested are tabulated in Table 4-2. The initial strain rates range between $125s^{-1}$ and $150s^{-1}$ and the average (secant) rates between $173s^{-1}$ and $210s^{-1}$. The times to failure range between $40\ \mu s$ and $45\ \mu s$. The initial and secant moduli of $133.2\ \text{GPa}$ ($19.3 \times 10^6\ \text{psi}$) and $101.2\ \text{GPa}$ ($14.7 \times 10^6\ \text{psi}$), respectively, are higher than the static modulus of $94.5\ \text{GPa}$ ($13.7 \times 10^6\ \text{psi}$) by 41% and 7%, respectively. The average Poisson's ratio of 0.90 is higher than the static value of 0.68. The dynamic strength of $837\ \text{MPa}$ (121 ksi) is only slightly higher than the static one of $806\ \text{MPa}$ (117 ksi). This trend is contrary to the one observed in the graphite/epoxy specimens. The dynamic ultimate strain of 0.0083 is approximately equal to the static value of 0.0084.

4.2 $[\pm 22.5]_{2s}$ LAMINATES

High strain rate tensile properties of $[\pm 22.5]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Three rings of each material were loaded dynamically using 100 mg PETN detonators in the pressure chamber of the fixture. In one case, the pressure on the steel ring was also measured with a Manganin alloy gage.

Strain and strain derivative records for the three graphite/epoxy rings tested are shown in Figures 4-25 through 4-33 (Specimen Nos. 33-4, 33-6, and 33-7). Dynamic stress-strain curves are shown in Figures 4-34, 4-35, and 4-36. Results are tabulated in Table 4-3. The initial strain rates range between $130s^{-1}$ and $150s^{-1}$ and the average (secant) rates between $184s^{-1}$ and $211s^{-1}$. The times to failure range between $38\ \mu s$ and $46\ \mu s$. The initial and secant moduli of $131.7\ \text{GPa}$ ($19.1 \times 10^6\ \text{psi}$) and $93.4\ \text{GPa}$ ($13.5 \times 10^6\ \text{psi}$), respectively, are higher than the static modulus of $81.4\ \text{GPa}$ ($11.8 \times 10^6\ \text{psi}$) by 62% and 15%, respectively. The average dynamic secant Poisson's ratio of 1.22 is slightly higher than the static one of 1.18. The average dynamic strength of $790\ \text{MPa}$ (115 ksi) is only slightly higher than the static one of $773\ \text{MPa}$ (112 ksi). However, the dynamic ultimate strain of 0.0084 is appreciably lower than the static value of 0.0103.

33-6	38	673 (98)	0.0070
33-7	44	890 (129)	0.0093

Strain and strain derivative records for the three hybrid rings are shown in Figures 4-37 through 4-45 (Specimen Nos. 34-4, 34-6, and 34-7). Dynamic stress-strain curves are shown in Figures 4-46, 4-47, and 4-48. Results are tabulated in Table 4-4. The initial strain rates range between 130s^{-1} and 140s^{-1} and the average (secant) rates between 198s^{-1} and 246s^{-1} . The times to failure range between $45\ \mu\text{s}$ and $46\ \mu\text{s}$. The initial and secant moduli of $126.1\ \text{GPa}$ ($18.3 \times 10^6\ \text{psi}$) and $76.5\ \text{GPa}$ ($11.1 \times 10^6\ \text{psi}$), respectively, are higher than the static modulus of $68.5\ \text{GPa}$ ($9.9 \times 10^6\ \text{psi}$) by 84% and 12%, respectively. The average dynamic Poisson's ratio of 0.97 is higher than the static one of 0.83. The average dynamic strength of $731\ \text{MPa}$ (106 ksi) is higher than the static strength of $653\ \text{MPa}$ (95 ksi) by 12%. The dynamic ultimate strain of 0.0095 is somewhat lower than the static value of 0.0104.

4.3 $[\pm 30]_{2S}$ LAMINATES

High strain rate tensile properties of $[\pm 30]_{2S}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure. Initially, 100 mg PETN detonators were used in the pressure chamber of the fixture. The pressure pulse produced by this loading, as seen from the strain response of the steel ring, reaches its peak in approximately $40\ \mu\text{s}$. The time to failure, however, is somewhat longer than that, which makes the analysis of the data very difficult. It was decided to modify the explosive detonation to produce a longer, but sufficiently intense, pressure pulse. The originally used black powder, or bullseye powder, was sufficiently slow-burning to produce a long pulse, but the intensity of this pulse was too low and resulted in relatively low strain rates. To boost the explosive energy of the normally fuel-rich bullseye powder potassium perchlorate (KClO_4) and aluminum powder were mixed in. All subsequent tests were conducted using 520 mg of each component above in the pressure chamber. The resulting pressure pulse was longer than the time to failure of the $[\pm 30]_{2S}$ specimens and only slightly shorter than that for the $[\pm 45]_{2S}$ specimens.

One difficulty encountered in the past was in pinpointing the exact time of failure of the composite specimens. If initial failure does not happen to occur exactly at a gage location, the strain readings at the unfailed locations

TABLE 4-4. HIGH STRAIN RATE TENSILE PROPERTIES OF [22.5]_{2s}
80AS/20S/PR288 GRAPHITE/S-GLASS/EPOXY

<u>Specimen Number</u>	<u>Strain Rate ($\dot{\epsilon}_{\theta\theta}$), s⁻¹</u>	<u>Modulus ($E_{\theta\theta}$), GPa (10⁶ psi)</u>	<u>Poisson's Ratio ($\nu_{\theta\alpha}$)</u>

34-7	45	716 (104)	0.0094

continue to increase for some time after initial failure. To overcome this uncertainty a conductive ribbon was bonded around the entire circumference of the ring and connected to one of the tabs of one strain gage. The ribbon is a Micromeritics Ni-clad copper ribbon of 0.025 mm x 0.397 mm (0.001 in. x 1/64 in.) cross section. This ribbon is first bonded on a strip of 104 type glass scrimcloth with Epon 815/V40 adhesive. After curing, the ribbon with the scrimcloth strip is bonded on the composite ring with Micromeritics AE10 adhesive and connected in series with one of the leads of a circumferential strain gage. When the specimen fails at any point around the circumference the ribbon breaks and strain readings from the gage connected to the ribbon are interrupted.

Tests on the $[\pm 30]_{2S}$ laminates were repeated using a 1560 mg mixture of equal amounts of bullseye pistol powder, potassium perchlorate ($KClO_4$), and aluminum dust. Strain and strain derivative records for the three graphite/epoxy rings tested are shown in Figures 4-49 through 4-55 (Specimen Nos. 28-9, 28-10, and 28-11). Stress-strain curves are shown in Figures 4-56, 4-57, and 4-58. Results are tabulated in Table 4-5. The initial strain rates range between $200s^{-1}$ and $230s^{-1}$ and the average (secant) rates between $285s^{-1}$ and $320s^{-1}$. The times to failure range between 44 μs and 45 μs . The initial and secant moduli of 85.7 GPa (12.4×10^6 psi) and 49.8 GPa (7.2×10^6 psi), respectively, are higher and lower than the static modulus of 58.6 GPa (8.5×10^6 psi) by 46% and 15%, respectively. The average dynamic Poisson's ratio of 1.21 is only slightly lower than the static one of 1.25. The average dynamic strength of 660 MPa (96 ksi) is higher than the static one of 566 MPa (82 ksi) by 17%. The dynamic ultimate strain of 0.0133 is almost equal to the static value of 0.0132.

Strain and strain derivative records for the three hybrid rings are shown in Figures 4-59 through 4-64 (Specimen Nos. 29-10, 29-11, and 29-12). Stress-strain curves are shown in Figures 4-65, 4-66, and 4-67. Results are tabulated in Table 4-6. The initial strain rates range between $190s^{-1}$ and $230s^{-1}$ and the average (secant) rates between $300s^{-1}$ and $340s^{-1}$. The times to failure range between 40 μs and 43 μs . The initial and secant moduli of 93.5 GPa (13.6×10^6 psi) and 51.5 GPa (7.5×10^6 psi), respectively, are higher than the static modulus of 44.9 GPa (6.51×10^6 psi) by 108% and 15%, respectively.

29-12	230	84.0 (12.2)	1.09
<u>Secant Properties</u>			
29-10	300	59.8 (8.7)	1.13
29-11	340	48.1 (7.0)	1.00
29-12	333	46.6 (6.8)	1.05
<u>Terminal Properties</u>			
29-10	400	48.8 (7.1)	1.79
29-11	440	41.1 (6.0)	1.48
29-12	480	39.2 (5.7)	1.25
<u>Ultimate Properties</u>			
	<u>Time to Failure (t_f), μs</u>	<u>Strength ($S_{\theta\theta T}$), MPa (ksi)</u>	<u>Strain ($\epsilon_{\theta\theta T}^U$)</u>
29-10	40	699 (101)	0.0116
29-11	43	707 (102)	0.0147
29-12	43	666 (97)	0.0143

The average dynamic Poisson's ratio of 1.09 is lower than the static one of 1.26. The average dynamic strength of 690 MPa (100 ksi) is much higher than the static one of 503 MPa (73 ksi) by 37%. The dynamic ultimate strain of 0.0135 is only slightly lower than the static value of 0.0139.

Comparison of the results for the graphite/epoxy and hybrid $[\pm 30]_{2S}$ specimens (Tables 4-5 and 4-6) shows that the hybrid specimens have higher dynamic moduli and strength than the graphite/epoxy ones. This is contrary to the trend in static values. This phenomenon, for which no ready explanation is available, was not noticed in the $[\pm 22.5]_{2S}$ specimens.

4.4 $[\pm 45]_{2S}$ LAMINATES

High strain rate tensile properties of $[\pm 45]_{2S}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained by testing rings under dynamic internal pressure using a 1.56 g mixture of pistol powder, $KClO_4$, and aluminum dust in the pressure chamber of the fixture.

Strain and strain derivative records for the three graphite/epoxy rings tested are shown in Figures 4-68 through 4-76 (Specimen Nos. 24-11, 24-12, and 24-13). The corresponding stress-strain curves are shown in Figures 4-77, 4-78, and 4-79. These curves were extrapolated up to the maximum strain measured in the composite ring (ultimate strain). Results are tabulated in Table 4-7. The initial strain rates range between $140s^{-1}$ and $200s^{-1}$ and the average (secant) rates between $220s^{-1}$ and $440s^{-1}$. The times to failure range between 68 μs and 91 μs . The initial and secant moduli of 111.4 GPa (16.15×10^6 psi) and 40.3 GPa (5.83×10^6 psi), respectively, are much higher than the static modulus of 20.4 GPa (2.95×10^6 psi). The secant modulus above was based on the extrapolated stress-strain curve. The average initial Poisson's ratio of 0.78 is also higher than the static value of 0.69. The average dynamic strength obtained approximately by extrapolation of the stress-strain curve is 927 MPa (134 ksi) which is much higher than the static strength of 224 MPa (32.5 ksi). The average dynamic ultimate strain of 0.0245 is lower than the static value of 0.0305.

Strain and strain derivative records for the three hybrid rings tested are shown in Figures 4-80 through 4-88 (Specimen Nos. 25-11, 25-12, and 25-13). The corresponding stress-strain curves are shown in Figures 4-89, 4-90, and

24-11	550	8.6 (1.25)	0.91
24-12	435	26.9 (3.90)	0.99
24-13	260	25.9 (3.75)	0.75
<u>Ultimate Properties</u>			
	<u>Time to Failure (t_f), μs</u>	<u>Strength ($S_{\theta\theta T}$), MPa (ksi)</u>	<u>Strain ($\epsilon_{\theta\theta T}^u$)</u>
24-11	>70	738 (107)	0.0310
24-12	68	1000 (145)	0.0225
24-13	91	1042 (151)	0.0200

4-91. Results are tabulated in Table 4-8. The initial strain rates range between 250s^{-1} and 300s^{-1} and the average (secant) rates between 550s^{-1} and 560s^{-1} . The times to failure range between $52\ \mu\text{s}$ and $70\ \mu\text{s}$.

The initial dynamic modulus of $50.8\ \text{GPa}$ ($7.37 \times 10^6\ \text{psi}$) is much higher than the static modulus of $21.5\ \text{GPa}$ ($3.12 \times 10^6\ \text{psi}$). The average Poisson's ratio (initial and secant) of 0.76 is slightly higher than the static value of 0.74 . The average dynamic strength of $711\ \text{MPa}$ ($103\ \text{ksi}$) is much higher than the static strength of $191\ \text{MPa}$ ($28\ \text{ksi}$). The average dynamic ultimate strain, based on the larger recorded values in each specimen, of 0.0353 is also higher than the highest static value recorded (0.0265). It should be noted that the static value for strength and ultimate strain are lower bounds since the specimens could not be tested to ultimate failure.

4.5 $[\pm 60]_{2s}$ LAMINATES

High strain rate tensile properties of $[\pm 60]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained in a similar manner as before.

Strain and strain derivative records for the three graphite/epoxy rings tested are shown in Figures 4-92 through 4-100 (Specimen Nos. 22-6, 22-7, and 22-8). The corresponding stress-strain curves are shown in Figures 4-101, 4-102, and 4-103. Results are tabulated in Table 4-9. The initial strain rates range between 220s^{-1} and 280s^{-1} and the average (secant) rates between 307s^{-1} and 398s^{-1} . The times to failure range between $41\ \mu\text{s}$ and $44\ \mu\text{s}$. The initial and secant moduli of $45.5\ \text{GPa}$ ($6.59 \times 10^6\ \text{psi}$) and $34.6\ \text{GPa}$ ($5.02 \times 10^6\ \text{psi}$), respectively, are much higher than the static modulus of $13.4\ \text{GPa}$ ($1.95 \times 10^6\ \text{psi}$). The average secant Poisson's ratio of 0.34 is only slightly higher than the static value of 0.32 . The average dynamic strength of $511\ \text{MPa}$ ($74\ \text{ksi}$) is much higher than the static strength of $105\ \text{MPa}$ ($15.2\ \text{ksi}$). The average dynamic ultimate strain of 0.0145 is higher than the static value of 0.0120 .

Strain and strain derivative records for the three hybrid rings are shown in Figures 4-104 through 4-112 (Specimen Nos. 23-2, 23-4, and 23-6). The corresponding stress-strain curves are shown in Figures 4-113, 4-114, and 4-115. Results are tabulated in Table 4-10. The initial strain rates range

23-6	600	38.0 (5.50)	0.16
<u>Ultimate Properties</u>			
	<u>Time to Failure (t_f), μs</u>	<u>Strength ($S_{\theta\theta T}$), MPa (ksi)</u>	<u>Strain ($\epsilon_{\theta\theta T}^u$)</u>
23-2	51	535 (78)	0.0102
23-4	40	545 (79)	0.0115
23-6	42	618 (89)	0.0148

between 140s^{-1} and 270s^{-1} and the average (secant) rates between 200s^{-1} and 352s^{-1} . The times to failure range between $40\ \mu\text{s}$ and $51\ \mu\text{s}$. The initial and secant moduli of $48.0\ \text{GPa}$ ($6.96 \times 10^6\ \text{psi}$) and $47.4\ \text{GPa}$ ($6.86 \times 10^6\ \text{psi}$), respectively, are much higher than the static modulus of $15.2\ \text{GPa}$ ($2.20 \times 10^6\ \text{psi}$). The average secant Poisson's ratio of 0.29 is exactly equal to the static value. The average dynamic strength of $566\ \text{MPa}$ ($82\ \text{ksi}$) is much higher than the static strength of $94.8\ \text{MPa}$ ($13.7\ \text{ksi}$). The average dynamic ultimate strain of 0.0122 is appreciably higher than the static value of 0.0087 .

Comparison of the results above with those for the similarly oriented graphite/epoxy specimens shows that the hybrid specimens have higher dynamic moduli and strength than the graphite/epoxy specimens. This is contrary to the trend in static strength values.

4.6 $[\pm 67.5]_{2S}$ LAMINATES

High strain rate tensile properties of $[\pm 67.5]_{2S}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained as for the other laminates before.

Strain and strain derivative records for the three graphite/epoxy rings tested are shown in Figures 4-116 through 4-124 (Specimen Nos. 26-2, 26-4, and 26-6). The corresponding stress-strain curves are shown in Figures 4-125, 4-126, and 4-127. Results are tabulated in Table 4-11. The initial strain rates range between 200s^{-1} and 290s^{-1} and the average (secant) rates between 230s^{-1} and 310s^{-1} . The times to failure range between $30\ \mu\text{s}$ and $44\ \mu\text{s}$. The initial and secant moduli of $48.8\ \text{GPa}$ ($7.07 \times 10^6\ \text{psi}$) and $36.2\ \text{GPa}$ ($5.24 \times 10^6\ \text{psi}$), respectively, are much higher than the static modulus of $12.0\ \text{GPa}$ ($1.74 \times 10^6\ \text{psi}$). The average Poisson's ratio of 0.19 is only slightly higher than the static value of 0.17 . The average dynamic strength of $339\ \text{MPa}$ ($49\ \text{ksi}$) is much higher than the static strength of $85.1\ \text{MPa}$ ($12.3\ \text{ksi}$). The average dynamic ultimate strain of 0.0096 is somewhat higher than the static value of 0.0081 .

Strain and strain derivative records for the three hybrid rings tested are shown in Figures 4-128 through 4-136 (Specimen Nos. 27-2, 27-4, and 27-6). The corresponding stress-strain curves are shown in Figures 4-137, 4-138, and 4-139. Results are tabulated in Table 4-12. The initial strain rates range

27-4	204	44.7 (6.48)	0.19
27-6	300	80.2 (11.62)	0.23
<u>Secant Properties</u>			
27-2	224	54.3 (7.86)	0.21
27-4	204	36.5 (5.29)	0.24
27-6	280	37.3 (5.40)	0.16
<u>Terminal Properties</u>			
27-2	180	75.9 (11.00)	0.21
27-4	205	26.9 (3.90)	0.21
27-6	375	22.4 (3.25)	0.08
<u>Ultimate Properties</u>			
	<u>Time to Failure (t_f), μs</u>	<u>Strength ($S_{\theta\theta T}$), MPa (ksi)</u>	<u>Strain ($\epsilon_{\theta\theta T}^u$)</u>
27-2	39	474 (69)	0.0087
27-4	38	280 (41)	0.0078
27-6	30	311 (45)	0.0085

between $204s^{-1}$ and $300s^{-1}$ and the average (secant) rates between $204s^{-1}$ and $280s^{-1}$. The times to failure range between $30\ \mu s$ and $39\ \mu s$. The initial modulus for Specimen No. 27-6 is excessively high as seen also in the stress-strain curve of Figure 4-139. In comparing dynamic and static values for the moduli, the value for Specimen No. 27-6 was not considered. The initial and secant dynamic moduli of $45.0\ \text{GPa}$ ($6.52 \times 10^6\ \text{psi}$) and $42.7\ \text{GPa}$ ($6.18 \times 10^6\ \text{psi}$), respectively, are much higher than the static modulus of $14.4\ \text{GPa}$ ($2.08 \times 10^6\ \text{psi}$). The average Poisson's ratio of 0.20 is also higher than the static value of 0.16. The average dynamic strength of $356\ \text{MPa}$ (52 ksi) is much higher than the static strength of $76.1\ \text{MPa}$ (11.0 ksi). The average dynamic ultimate strain of 0.0083 is higher than the static value of 0.0062.

Comparison of these results with those of the graphite/epoxy specimens show that the hybrid specimens have higher dynamic moduli and strength than the graphite/epoxy specimens. This is contrary to the trend in static strength values.

4.7 $[\pm 75]_{2s}$ LAMINATES

High strain rate properties of $[\pm 75]_{2s}$ SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy were obtained as for the other laminates before.

Strain and strain derivative records for the three graphite/epoxy rings tested are shown in Figures 4-140 through 4-148 (Specimen Nos. 20-2, 20-4, and 20-7). The corresponding stress-strain curves are shown in Figures 4-149, 4-150, and 4-151. Results are tabulated in Table 4-13. The initial strain rates range between $220s^{-1}$ and $245s^{-1}$ and the average (secant) rates between $253s^{-1}$ and $286s^{-1}$. The times to failure range between $29\ \mu s$ and $30\ \mu s$. The initial and secant dynamic moduli of $45.2\ \text{GPa}$ ($6.55 \times 10^6\ \text{psi}$) and $36.1\ \text{GPa}$ ($5.24 \times 10^6\ \text{psi}$), respectively, are much higher than the static modulus of $11.2\ \text{GPa}$ ($1.63 \times 10^6\ \text{psi}$). It was difficult to obtain reliable values for dynamic Poisson's ratio because of the large scatter in the transverse strain data. The average dynamic strength of $290\ \text{MPa}$ (42 ksi) is much higher than the static strength of $75\ \text{MPa}$ (10.8 ksi). The average dynamic ultimate strain of 0.0081 is slightly higher than the static value of 0.0076.

TABLE 4-13. HIGH STRAIN RATE TENSILE PROPERTIES OF [± 75]_{2s}
SP288/AS GRAPHITE/EPOXY

<u>Specimen Number</u>	<u>Strain Rate ($\dot{\epsilon}_{\theta\theta}$), s⁻¹</u>	<u>Modulus ($E_{\theta\theta}$), GPa (10⁶ psi)</u>	<u>Poisson's Ratio ($\nu_{\theta x}$)</u>
<u>Initial Properties</u>			
20-2	220	43.3 (6.28)	-
20-4	245	54.7 (7.93)	-
20-7	225	37.6 (5.45)	-
<u>Secant Properties</u>			
20-2	277	36.6 (5.30)	0.18
20-4	253	38.1 (5.53)	-
20-7	286	33.6 (4.87)	0.12
<u>Terminal Properties</u>			
20-2	320	30.5 (4.42)	-
20-4	295	26.6 (3.85)	-
20-7	330	32.1 (4.65)	-
<u>Ultimate Properties</u>			
	<u>Time to Failure (t_f), μs</u>	<u>Strength ($S_{\theta\theta T}$), MPa (ksi)</u>	<u>Strain ($\epsilon_{\theta\theta T}^u$)</u>
20-2	30	304 (44)	0.0083
20-4	30	290 (42)	0.0076
20-7	29	278 (40)	0.0083

Strain and strain derivative records for the three hybrid rings tested are shown in Figures 4-152 through 4-160 (Specimen Nos. 21-2, 21-4, and 21-6). The corresponding stress-strain curves are shown in Figures 4-161, 4-162, and 4-163. Results are tabulated in Table 4-14. The initial strain rates range between 140s^{-1} and 260s^{-1} and the average (secant) rates between 215s^{-1} and 290s^{-1} . The times to failure range between $24\ \mu\text{s}$ and $27\ \mu\text{s}$. The initial and secant moduli of $45.1\ \text{GPa}$ ($6.53 \times 10^6\ \text{psi}$) and $35.1\ \text{GPa}$ ($5.09 \times 10^6\ \text{psi}$), respectively, are much higher than the static modulus of $15.5\ \text{GPa}$ ($2.25 \times 10^6\ \text{psi}$). It was difficult to obtain reliable values for dynamic Poisson's ratio, because of the large scatter in the transverse strain data. The average dynamic strength of $223\ \text{MPa}$ ($32\ \text{ksi}$) is much higher than the static strength of $61.4\ \text{GPa}$ ($8.9 \times 10^6\ \text{psi}$). The average dynamic ultimate strain of 0.0066 is also higher than the static value of 0.0047 .

5. SUMMARY AND CONCLUSIONS

Methods developed and described in Part I of this report were applied to the characterization of angle-ply laminates. Two material systems, SP288/AS graphite/epoxy and 80AS/20S/PR288 graphite/S-glass/epoxy, were characterized in uniaxial tension at three strain rates, ranging from quasi-static to over 500s^{-1} . Laminate ring specimens of $[\pm 15]_{2S}$, $[\pm 22.5]_{2S}$, $[\pm 30]_{2S}$, $[\pm 45]_{2S}$, $[\pm 60]_{2S}$, $[\pm 67.5]_{2S}$, and $[\pm 75]_{2S}$ layups were loaded under internal pressure. Results were obtained and presented in the form of stress-strain curves to failure. Properties determined included moduli, Poisson's ratios, strength, and ultimate strain.

In many cases the dynamic stress-strain curves show irregularities. This is a result of a magnification effect of some small experimental scatter and possibly electronic noise effects in the strain data. Small deviations in the recorded strain data can have a large influence on the strain rate and strain acceleration. The terms including strain acceleration effects can be a substantial portion of the computed effective stress. No meaningful observations could be made of the failure patterns because the specimens were shattered into many small pieces under the dynamic loading used.

Average results for all specimens tested are tabulated in Tables 5-1 through 5-14. The effect of strain rate varies with layup, being lowest for the fiber dominated $[\pm 15]_{2S}$ laminates and highest for the matrix dominated $[\pm 75]_{2S}$ laminates. The initial and secant moduli show small increases with strain rate for the $[\pm 15]_{2S}$ layup. The average increase with strain rate for the secant modulus increases from 10% for the $[\pm 15]_{2S}$ layup to over 200% for the $[\pm 75]_{2S}$ laminates. The highest strength increments over the static values vary from approximately 14% for the $[\pm 15]_{2S}$ layup to 275% for the $[\pm 75]_{2S}$ layup. The ultimate strains in general do not show any significant trends with strain rate for all layups. In six of the fourteen types of specimens tested the ultimate strains at the various strain rates were within $\pm 10\%$ of the mean value. In five other groups of specimens the ultimate strain variations were within $\pm 20\%$ of the mean. In the case of the two $[\pm 45]_{2S}$ groups the results were not conclusive because only lower bounds were obtained for the static ultimate strain.

OFFICE OF THE DIRECTOR

**NEW NTIS
ABSTRACT NEWSLETTERS!**

Dear Professional:

I wish I could tell you how much time and money the NTIS Abstract Newsletters could save you.

But, I can't. Because I don't know how much time and money you unknowingly spend on costly research that actually duplicates the work of others. Yet this research information is readily available to you when you know how to access it.

That's what NTIS Abstract Newsletters are all about.

NTIS Abstract Newsletters Summarize
70,000 New Reports Annually

You see, NTIS information specialists index, analyze, and categorize 70,000 new research documents a year. Each report is judged for its potential value for thousands of current subscribers. Then it is summarized in a brief abstract and published in one or more Newsletters. You receive only those abstracts of interest to your professional field.

NTIS exists to help you find--and provide you with--research results and information. You'll know what you need to know--when you need to know it--with NTIS Abstract Newsletters.

The Newsletters are a speedy, comprehensive, economical way for you to keep current on the latest research and to cut your risk of duplicating work already available in a report from NTIS.

Your Newsletters will suggest possible directions and starting points for your own research. Knowing research applications of others will help you get more out of every research dollar you invest.

Worldwide Sources

The NTIS collection also contains selected information on scientific and technical developments around the world.

NTIS is now actively expanding its sources of foreign technology to add to more than 300,000 foreign reports already on hand--including translated materials from the U.S.S.R., other Eastern European countries, Japan, and major Western countries.

Low Subscription Rate

By now, you may well be apprehensive over the cost of this remarkable Newsletter service. If so, you will be pleasantly surprised to learn you can subscribe to the *Energy Abstract Newsletter*, for example, for about \$1.83 a week!

NTIS is a unique self-supporting Government agency offering economical information products and services on a cost-recovery basis.

You Get Reports on Research Not Published By Any Other Source

NTIS Abstract Newsletters let you know about all Government-sponsored research in your field. Each week you'll learn about research not reported or available from any other source.

And when you spot a report you need, NTIS can provide it for you in a matter of days, usually for about \$14 in paper copy or only \$4.50 in microfiche. Your Newsletters contain a handy report order form for your convenience.

Annual Subject Index Included

Your subscription includes an Annual Subject Index to give permanent reference value to your Newsletter.

Of course, your subscription is tax deductible as a business expense in most instances.

More than that, when you consider the wasted time and costly mistakes the Newsletters can help you avoid, you will begin to appreciate what a practical investment NTIS Abstract Newsletters really are. For example:

- *MANUFACTURING TECHNOLOGY*: one of the newest Newsletters that meets industry's most pressing need right now...brings news of the latest research on robotics and CAD/CAM. \$125*
- *FOREIGN TECHNOLOGY*: abstracts of latest technological and scientific research in all fields from Japan, United Kingdom, France, U.S.S.R., and countries all over the world. SPECIAL CHARTER RATE: \$75*
- *ENVIRONMENTAL POLLUTION & CONTROL*: one of the most sought after Newsletters covering air, noise, solid wastes, water, pesticides, radiation, health and safety and environmental impact statements. \$95*
- *ENERGY*: brings you a wealth of information on energy use; supply and demand; power and heat generation; energy policies, regulations and studies; engines and fuels, and much more. \$95*
- *COMPUTERS, CONTROL, AND INFORMATION THEORY*: important information, and lots of it, concerning this, one of the fastest growing and most competitive industries worldwide. \$95*
- *MATERIAL SCIENCES*: applicable to nearly every industry with abstracts touching on a huge variety of processes and products. \$80*
- *MEDICINE & BIOLOGY*: covers an enormous range of information from anatomy to zoology. Every facet of medicine and biology is touched upon. \$75*

And any one of the abstracts in these Newsletters may be the added element of success for your ongoing research, contract proposals, cost reduction efforts, and profits.

NTIS regularly publishes information not available elsewhere, and frequently brings you news of research before it appears in professional journals and magazines. You simply should not risk acting without benefit of complete, current information on what's happening in Government-sponsored research in your field.

You need NTIS Abstract Newsletters and here's how to order them.

Complete the order form at the bottom of this letter and mail it back today to the address below. You may use any of the options listed in order to pay for your subscription.

You are guaranteed satisfaction. If your Newsletters do not satisfy you for any reason, you may cancel and receive a credit or refund for the balance of your subscriptions.

I invite you to subscribe today.

Sincerely,

Joseph F. Caponio
Acting Director
