

National Dredging Needs of Ports and Harbors in the U.S.

Literature Search

DTIC QUALITY INSPECTED 1

***The National Dredging Needs Study of Ports and Harbors
Literature Search***

This report is part of a series of reports which are being published by the U.S. Army Corps of Engineers during the National Dredging Needs Study. It is a survey of available information on dredging and associated points of contact.

The National Dredging Needs Study of Ports and Harbors - Literature Search, IWR Report 95-NDN-1, prepared by DRI/McGraw-Hill for the Navigation Analysis Division, Institute for Water Resources, October 1995, 72 pp.

A number of reports presenting the result of the first phase are expected to be published in 1996, in addition to this report, including:

Historical Economic Perspective of Ports, IWR Report, prepared by the Navigation Analysis Division, Institute for Water Resources.

Annual Review/Interim Report, IWR Report, prepared by the Navigation Analysis Division, Institute for Water Resources.

Foreign Ports Comparison, IWR Report, prepared by DRI/McGraw-Hill for the Navigation Analysis Division, Institute for Water Resources.

Final Dredging Needs Report, IWR Report, prepared by the Navigation Analysis Division, Institute for Water Resources.

For further information on the National Dredging Needs Study of Ports and Harbors, contact either:

DISCLAIMER NOTICE

THIS DOCUMENT IS BEST QUALITY AVAILABLE. THE COPY FURNISHED TO DTIC CONTAINED A SIGNIFICANT NUMBER OF PAGES WHICH DO NOT REPRODUCE LEGIBLY.

Acknowledgments

This document is one of a series of reports which responds to Section 402, Water Resources Development Act of 1992, which authorizes the conduct of such studies as necessary to provide a report to Congress assessing the dredging needs of the national ports and harbors. This report was prepared under contract by DRI/McGraw-Hill. The work was directed by Mr. Phillip J. Thorpe, Study Manager of the National Dredging Needs of Ports and Harbors program.

Christine Montoney assisted in this effort and performed the final editing of the document.

Headquarters oversight for the National Dredging Needs program is provided by the Directorate of Civil Works through G. Edward Dickey, Planning Division, and Robert M. Daniel, Chief, Formulation/Evaluation Branch. Norman T. Edwards is the program monitor for the study. The Corps of Engineers Institute for Water Resources (IWR) has detailed management responsibility under Kyle E. Schilling, Director of the Institute and Robert A. Pietrowsky, Chief, Navigation Analysis Division.

Chapter 1 - Introduction

This report is part of the National Dredging Needs Study which responds to Section 402 of the Water Resources and Development Act of 1992. The Act authorized the conduct of such studies as necessary to provide a report to Congress assessing the dredging needs of the national ports and harbors of the U.S. The study is a macro level assessment of national port and harbor dredging needs and will include: 1) an analysis of the existing and projected future project depths; 2) an examination of the types and sizes of vessels used under existing and future conditions; 3) an analysis of existing and future world trade patterns; 4) an assessment of the future national waterside infrastructure needs; and 5) a comparison of depths of the United States and selected world ports.

The study is being conducted in a series of phases some of which are sequential in nature, but many that overlap and will be conducted simultaneously. An interim report will be prepared to summarize the Existing Dredging Needs of Ports and Harbors by the end of FY 1996 along with several other interim study products. A final report summarizing the entire study will be completed by the end of FY 1997. The study phases are listed below:

- I Study Preparation and Initiation
- II Literature Review and Historical Economic Perspective
- III Identify National (Deepwater) Ports and Harbors
- IV Develop Dredging Needs Determinants
- V Identify and Analyze Competitive World Ports
- VI Identify Existing Dredging Needs
- VII Identify Future Dredging Needs
- VIII Evaluate Total Dredging Needs of Ports and Harbors
- IX Develop Management Tools for Comprehensive Database

This report is the Literature Search for the National Dredging Needs Study, and it serves as an overview and executive summary for the bibliography developed by DRI/McGraw-Hill for the U.S. Army Corps of Engineers, Institute for Water Resources (IWR). The report documents a literature search of existing studies and reports from both public and private sources, which includes information regarding:

- the status and capacities of U.S. ports
- the commercial use and baseline economic growth of U.S. ports
- projected growth and potential capacity problems at U.S. ports
- trade impacts from public policy decisions such as the North American Free Trade Agreement

The literature search was conducted via on-line databases, interviews with government associations and private companies, and visits to major transportation libraries. The bibliography presented in Appendix A, as well as an accompanying electronic version, includes 232 citations. Copies of all works cited were not obtained, but an effort has been made to obtain all of the particularly important works.

*The National Dredging Needs Study
of Ports and Harbors - Literature Search*

No bibliography is ever complete. The best possible effort has been undertaken to catalog all relevant publications and databases, and now relies on users of the bibliography to identify significant sources not yet included. In particular, this bibliography is likely to be incomplete on studies commissioned for internal use only by public or private organizations.

Definitions

Before proceeding further, it is necessary to clarify the specific definition used in this report of some commonly used marine terms. An accepted definition of a **port** is a harbor area that has marine terminal facilities for transferring cargo/passengers between ships/boats and land. A **harbor** is an area of water affording a natural or artificial refuge for ships. It does not have to have marine terminal facilities, and only those harbors that do can also be called a port. There are 573 "ports" in the United States as defined by the Water Commerce Statistics Center of the Corps of Engineers.

Access to these ports are provided by **channels** or **waterways** which rarely are naturally deep. In many cases, the federal government is responsible for providing adequate channel depth through the U.S. Army Corps of Engineers. These areas of Corps responsibility are often called **federal channels** and are officially designated as Corps **projects**. Almost all ports have federal Corps of Engineers projects at them, though the projects may not cover the entire port. There may also be multiple Corps of Engineers projects for a given port. The Corps of Engineers has 926 port and harbor projects, with 296 **deepwater** projects (or deep draft), with depths greater than 14 feet and 630 **shallow water** projects (or shallow draft) with depths less than or equal to 14 feet. Most of the **deepwater ports** are **coastal or Great Lakes ports**, while **shallow water ports** are located on the **inland waterway system** of the Mississippi River and Tributaries.

Purpose

The purpose of the Literature Search of the National Dredging Needs Study is to present a synopsis of existing literature concerning the current situation of ports in the United States. The studies included discuss the following pertinent issues: current port capacity; forecast of trade; forecast of capacity; environmental dredging impediments or beneficial uses; technological changes; policy impacts; dredging maintenance; dredging construction; economics and finance; legislative; and current trade. The information contained in these studies, as a group, describe the current status of the U.S. port system. This description, in accordance with the intended result of this task, relates levels of commercial use and its projected growth, usage of harbors and expected changes in that usage, and the development of landside facilities to port capacities, physical limitations of the ports and harbors, and trade impacts on ports caused by policy decisions.

These port studies have been produced by various public and private organizations that have an interest in U.S. ports and harbors, world fleets, and commodity flows. The literature that has been compiled in this task will be used in other parts of this study to evaluate the commercial use of ports and harbors in the United States and their prospect for growth, landside access to port facilities, physical limitations of ports

*The National Dredging Needs Study
of Ports and Harbors - Literature Search*

and harbors, and trade impacts on ports resulting from national policy issues, such as the North American Free Trade Agreement (NAFTA). The purpose of this comprehensive research effort is to gain the necessary background knowledge to make impartial decisions concerning the United States' ports and their dredging needs.

The contribution of U.S. ports to the health of national and regional economies has been long understood. National ports and harbors are crucial links in the transportation network, and handle over 95% of the U.S.'s international trade (almost \$500 billion per year). The U.S. Department of Transportation, Maritime Administration estimates that cargo activity at U.S. ports supported 1.5 million jobs in 1991, contributed \$70 billion to the gross national product, and provided \$52 billion in personal income. Yet, as Erik Stromberg, past President of the American Association of Port Authorities (AAPA), has noted, "Too often ports and the freight and cargo that move through them are the forgotten stepchildren in the debate on our national transportation infrastructure needs."¹

Deepwater ports in the United States are operating in an era marked by a myriad of opportunities and challenges: the expectation of rapid growth in international trade, particularly following the passage of NAFTA and now General Agreement on Tariffs and Trade (GATT), consolidation and a movement toward larger ships with fewer ports of call in the global shipping industry; heightened environmental vigilance; and rapid technological advancements.

Increasingly, dredging -- both for maintenance and expansion purposes -- is being identified as a key development need facing a number of major deepwater ports throughout the United States. In a recent survey by the AAPA, dredging and disposal was listed as an issue of significant concern by 54% of all ports -- including more than two-thirds of all ports along the East Coast.² Says Stromberg of the AAPA, "[C]apital financing for port development projects and the adoption of national policies that recognize the need to invest in dredging navigation channels as well as provide efficient landside access to port facilities are the preeminent issues for our nation's ports." Unfortunately, a comprehensive database of the dredging needs of national ports and harbors has not been available to policy-makers to date. To this end, section 402 of the Water Resources Development Act of 1992 authorizes the conduct of such studies as necessary to provide a report to Congress that assesses the dredging needs of the national ports and harbors of the United States.

Contacts

An initial list of 28 organizations was developed to contact for this literature search. In most cases, these organizations were contacted initially by telephone. The majority of these organizations were cooperative and contributed copies of reports, publications lists, and so forth. We were able to construct a second-tier group of contacts through direct referrals by members of the initial list, as well as citations in publications collected from the initial group.

Organizations contacted included:

- U.S. Army Corps of Engineers
- U.S. Department of Transportation, Maritime Administration
- U.S. Department of Transportation, Federal Transit Administration
- U.S. Department of Transportation, Bureau of Transportation Statistics
- U.S. Department of the Interior, Fish and Wildlife Service
- U.S. Department of the Interior, Ecological Service
- U.S. Environmental Protection Agency
- U.S. Department of Commerce, National Technical Information Service
- Congress of the United States, House and Senate Committees on Commerce, Science, and Transportation
- National Research Council, Transportation Research Board
- National Research Council, Marine Board
- American Association of Port Authorities
- International Association of Ports and Harbors
- United Nations Conference on Trade and Development
- Society of Naval Architects and Marine Engineers
- American Association of State Highway and Transportation Officials
- Port Authority of New York and New Jersey

We supplemented this list of public agencies and professional associations by contacting leading private vendors of shipping and port-related data, including:

- Drewery Shipping Consultants
- Fairplay Information Systems
- Lloyd's of London Press
- Containerization International Magazine
- BRL Marine Database
- Clarkson's
- Fernley's

A complete list of contacts is included in the Appendix.

In addition, a number of libraries specializing in transportation or maritime policy were visited or contacted, including:

- U.S. Department of Transportation, Volpe Transportation Systems Center (Cambridge, MA)
- American Association of Port Authorities (Alexandria, VA)
- U.S. Coast Guard Academy (Groton, CT)
- U.S. Merchant Marine Academy and National Maritime Research Center (Kings Point, NY)
- Harvard University (Cambridge, MA)
- Massachusetts Institute of Technology (Cambridge, MA)
- Massachusetts Maritime Academy (Buzzards Bay, MA)
- State University of New York at Stony Brook
- Woods Hole Oceanographic Institute (Woods Hole, MA)

Finally, we utilized a number of on-line search services, including:

- Transportation Research Information Services (TRIS)
- Lexis/Nexus
- Government documents
- United Nations documents

Criteria for Inclusion

The following guidelines were established for inclusion of items in the bibliography:

- U.S. government official reports have priority for inclusion, but specific studies of individual ports are, in general, not appropriate for this database. For regularly updated reports, only the most recent versions are cited.
- Relevant U.S. government databases covering transportation and trade also have priority for inclusion.
- Textbooks with relevant subject matter are included, in general, if they were published within the last ten years.
- Consulting studies for general sale are included, in general, if they were conducted within the last five years.
- Studies that focus on coastal and Great Lakes ports are included in the bibliography, but articles on inland ports are excluded.
- Studies of key foreign reports are included if there are references to dredging or vessel sizes that will be handled in the future.

*The National Dredging Needs Study
of Ports and Harbors - Literature Search*

- Landmark legislation and regulations relating to the dredging process may be included in the database, but Congressional and other public testimony, in general, are excluded.
- Old one-time studies, in general, are excluded from the database under the assumption that the most critical and well-received works will be updated on a periodic basis.
- Studies focusing on labor practices, port management, maritime security, terminal operations, technology, or engineering are not included unless they contained specific mention of dredging.
- Studies by individual port authorities or local universities used primarily for marketing and promotion purposes are not included in the database.

These guidelines were followed as much as possible, but some exceptions were made on a case-by-case basis when relevant material was present.

Format of Bibliography

This bibliography was designed to be detailed yet easy to use and analyze. Basic information available for each entry includes:

- Author of the article or study
- Source name, location, and phone number
- Title of the article or study
- Publication date and/or frequency
- Indication of whether a copy of the study has been obtained
- Media type (hard-copy, electronic, or both)
- Brief description of the purpose and key conclusions of the study, when a copy of the full study or an abstract has been obtained

The studies have also been classified under two dimensions: level of analysis, and subject. Level of analysis includes:

- International
- National
- Regional
- Port-Specific
- or any combination of the above

Subject categories include:

- Current port capacity
- Forecasts of capacity

- Current trade activity
- Forecasts of trade
- Maintenance dredging (federal or non-federal)
- Construction dredging (federal or non-federal)
- Environmental (impediments to dredging, or beneficial uses of dredged material)
- Economics and finance
- Technological changes
- Legislative
- Policy impacts
- NAFTA
- Seminal studies
- Other

Studies can be classified in one or more of the above categories.

A detailed reference guide to the bibliography is available in Appendix A.

Description of the Bibliography

The bibliography developed for this task includes 232 entries. Copies of 55 entries (24%) have been obtained.

About 30% of the entries in the bibliography have been published in the past five years. An additional 16% are updated on an annual basis (or at some other regular frequency), and thus have been released in the last 1-2 years. Only about 16% of the entries were published more than a decade ago with no update.

The entries in the bibliography show great diversity in terms of level of analysis. More than 54% include information at the national (United States) level, and 41% have port-specific analysis. About 31% of the entries have international analysis. Regional analysis tends to be underrepresented, accounting for just 15% of the entries.

The bibliography covers an array of subjects. The three most common subjects are current capacity and characteristics of ports; current trade activity; and technology. Each of these topics accounts for about 30% of the entries in the database. Issues directly related to dredging -- including construction and maintenance dredging, environmental impediments, and beneficial uses of dredged material -- are represented in 15% to 23% of the entries. Policy impacts, legislation, economics, and finance also are common subjects. Few forecasts of trade or capacity are included in the database.

Although 23.7% of the database entries include the subject of policy impacts, the subject of NAFTA specifically is discussed much less frequently. Only 1.3% of the entries include an analysis of NAFTA: *Waterways, Rail, and International Trade Issues*, *Maritime Transportation Strategic Planning*, and *Landside Access to U.S. Ports*. NAFTA plays a significant role in encouraging competition and strategic

Chapter 2 - Seminal Works

Ten works in this bibliography have been identified as “seminal.” These sources -- some lengthy, some relatively brief -- are noteworthy for their effort to address one or many aspects of the dredging issue in a thorough, understandable fashion.

Excerpts of the 10 works follow.

Beneficial Uses of Dredged Material: A Practical Guide

Sponsor: Permanent International Association of Navigation Congresses (Brussels)

Date of Publication: 1992

Format: Hard-copy report, 36 pages

Level of analysis: International

Subjects covered: Beneficial uses of dredged material, impediments to dredging, maintenance dredging, construction dredging

This report addresses one of the central issues in the dredging debate facing many ports: use of the dredged material. The central premise is that the majority of dredged material is suitable for reuse, rather than disposal, and thus should be treated as a valuable resource. The publication is intended for a wide audience including port authorities, regulators, environmentalists, and the public, and is written in nontechnical language.

One of the useful features of this publication is its presentation of a methodology for the handling of dredged material that first considers whether the material is contaminated; second characterizes the material, and considers beneficial use options and available sites to determine whether a beneficial use is a technical possibility; and third, examines public policy, environmental impact, and cost/benefit analysis to determine whether a recommended use is an acceptable solution.³

The schematic divides dredged materials into five types: rock; gravel and sand; consolidated clay; silt and soft clay; and mixtures of any of the above. Beneficial uses fall into three categories: engineered uses such as land creation and improvement, beaches, and offshore berms; product uses such as construction materials, topsoil, and aquaculture; and environmental enhancement such as upland habitats, wetland creation, and multipurpose site enhancement.

The publication's major shortfall is that it does not provide much insight into contamination criteria, on the grounds that acceptable limits vary throughout the world and change over time.

³ Permanent International Association of Navigation Congresses, *Beneficial Uses of Dredged Material: A Practical Guide*, Brussels, 1992, p. 8.

Dredging Coastal Ports: An Assessment of the Issues

Sponsor: National Research Council, Commission on Engineering and Technical Systems, Marine Board

Publisher: National Academy Press (Washington, D.C.)

Date of Publication: 1985

Format: Hard-copy report, 212 pages

Level of analysis: National, Port-Specific

Subjects covered: Current capacity, forecast of capacity, dredging (construction and maintenance), environment (impediments to dredging and beneficial uses of dredged material), economics and finance, legislative, policy impacts, technology

Although ten years old now, *Dredging Coastal Ports* still stands out as one of the most complete treatments of the dredging issue that is publicly available. *Dredging Coastal Ports* is considered to be somewhat of a primer on the subject.

At the request of the U.S. Army Corps of Engineers, the Marine Board conducted a two-year study “to appraise the nation’s needs for dredging in coastal ports for the near- and mid-term future.”⁴ Primary authorship for the study rested in a committee of 13 specialists drawn from universities, dredging companies, shipping companies, railroads, manufacturers, and port authorities, along with representatives from the Corps, the U.S. Coast Guard, and the U.S. Maritime Administration.

The report sets out to answer six questions -- all of which remain critical issues today:

- Does the United States need additional port capacity to handle larger ships?
- Is dredging the most attractive way for the United States to handle larger ships?
- How should dredging be funded and what are the implications for dredging of various funding approaches?
- What are the causes of the slowdown in decision making for local projects and the stalemate for federal projects, and what are the ways to bring increased speed, predictability, and stability to the decision making process?
- What are the problems associated with design and implementation of new construction and maintenance dredging and how can they be dealt with?
- What are the environmental problems associated with dredging and how can they be effectively managed?

⁴ National Research Council, Marine Board, *Dredging Coastal Ports: An Assessment of the Issues*, National Academy Press (Washington, D.C.), 1985, p vii.

The Marine Board's research came at a time of heightened awareness of capacity problems at the nation's ports, following the energy crises of the 1970s and evidence of a stalemate in the port construction decision-making process. The report's central conclusion is "that the nation needs additional capacity to handle large vessels and that such a capacity should exist on each of the nation's coasts."⁵ Importantly, the committee notes that this conclusion is not based on detailed economic analysis nor consensus in the expert community (a review of existing literature "found only disagreement"). Rather, the committee's belief was that in view of an uncertain future for international trade and transportation and a long lead time for major federal dredging projects, the nation would be best served by commencing dredging projects now to ensure adaptability in the future.⁶

Due to the disagreement amongst the experts at the time, a comprehensive forecast of the specific depths that would be required to meet the expected national dredging needs was not included. This did not detract, however, from the Marine Board's conclusion that dredging projects must be commenced sooner rather than later.

This argument rings true, and even more so today. Indeed, one could argue that international trade is becoming increasingly important to individual nations. Over the past decade, trade (the combined value of imports and exports) has swelled from 17.7% to 26.6% of inflation-adjusted Gross Domestic Product in the U.S. DRI's U.S. Economic Service projects that this share could top 50% by 2020. A number of landmark events in the past decade -- the collapse of the Soviet Union and end of the Cold War, the devaluation of the dollar in 1985, the implementation of the Free Trade Agreement with Canada in 1989 and the North American Free Trade Agreement in 1994, the new General Agreement on Tariffs and Trade in 1994 -- have shown the growing importance of international trade. In addition to these historical events, expectations of explosive growth in many East Asian and Latin American nations indicate that it is reasonable to assume that international trade will triple over the next 25 years. If this is the case, then the recommendations of this report take on even greater urgency.

The report moves on from a fairly general introduction to a detailed examination of specific topics such as options for handling larger vessels; funding issues; the institutional decision-making process; technical considerations and needs to be met in dredging U.S. ports; and environmental issues. The discussion at times becomes technical. Appendices include general design criteria for dredged navigational facilities; a list of public policies and legislation pertinent to dredging; and a list of commissioned papers and background materials used in the study.

⁵ Ibid., p. 2

⁶ Ibid., p. 3

Dredging for Development

Sponsor: International Association of Ports and Harbors, Committee on Port and Ship Safety, Environment, and Construction, Dredging Task Force

Publisher: IAPH (Tokyo)

Date of Publication: 1991 (third edition)

Format: Hard-copy report, 60 pages

Level of analysis: International

Subjects covered: Dredging (construction and maintenance), environment (impediments to dredging and beneficial uses of dredged material), economics and finance, technology

Dredging for Development is a layman's guide to the subject of dredging, intended particularly for government officials and port managers from developing countries. However, because the publication is written in non-technical language and provides a broad overview with moderate detail, it is also useful as an introductory tool for a U.S. policy-maker unfamiliar with the dredging process.

Topics covered include the nature, importance, and objectives of dredging; the nature, excavation; transport, and disposal of dredged materials; types and choice of dredging equipment; the port development process; and international agreements on environmental issues. The treatment of most of these topics is somewhat cursory, with an emphasis on the logistical and technical issues involved in the dredging process. This approach stands in contrast to the policy focus of most other entries in the bibliography.

Appendices include a section on typical dredging contract provisions; a report on port development activities of the World Bank; a listing of relevant international organizations and lending institutions; and a bibliography.

Environmental Considerations for Port and Harbor Developments

Authors: John D. Davis, Scott MacKnight, IMO Staff, Others

Sponsor: World Bank, in association with the International Maritime Organization

Publisher: World Bank (Washington D.C.): Technical Paper Number 126, Transport and the Environment Series

Date: 1990

Format: Hard-copy, 83 pages

Level of analysis: International

Subjects covered: Environmental (impediments to dredging, beneficial uses of dredged material), dredging (construction and maintenance), policy impact.

Environmental Considerations for Port and Harbor Development is arguably the most complete treatment we could find on the range of environmental issues involved in port-related projects. The paper is aimed at World Bank staff and the staff of the bank's borrowers who are associated with lending operations

involving port development, but is useful for port managers, engineers, and government officials. The paper is cited in several other works as an authoritative source of environmental information.

Indeed, the most useful section of the report may be a comprehensive "check list" of environmental issues that typically need to be considered in port planning projects, accompanied by additional information and guidance on how to proceed with each item. A listing of sources is particularly useful. Issues covered include the impacts of dredging and dredged-material disposal; construction of piers, breakwaters and other structures; alteration of ship traffic patterns; ship discharges; detection and clean-up of spills; waterfront industry discharges; relocation and land use disputes; air-borne emissions; hazardous cargoes; and other related topics. The discussion can be technical at times.

An appendix examines the "Environmentally Sound Disposal of Dredged Materials," an issue the World Bank's research identified as of critical importance. Without careful consideration of the impact of regulations on dredged-material disposal, the authors note, ports in many industrialized nations could have trouble maintaining their navigation access.⁷ This appendix looks at quality standards for dredged materials, international regulations governing the environment, the effect of environmental restrictions on dredging, and disposal options.

Environmental Regulatory Process: Does It Work? Dredging U.S. Ports

Sponsor: National Research Council, Transportation Research Board

Date of Publication: 1994

Format: Hard-copy report, 62 pages

Level of analysis: National, Port-Specific

Subjects covered: Environmental dredging impediments, technological changes, policy impacts, dredging maintenance, dredging construction, legislative

This study summarizes a key session on the dredging of U.S. ports presented at the Transportation Research Board's (TRB) 73rd Annual Meeting on January 11, 1994. The session was sponsored by TRB's Committee on Ports and Waterways and Committee on Environmental Analysis in Transportation. Four of the participants represented the perspective of the regulated organization, while four other participants represented the regulator's perspective. The session focused on the institutional gridlock that confronts dredging projects.

Although dredging harbors and shipping lanes is a relatively simple process from an engineering viewpoint, from an environmentalist perspective this process is quite complex. Local, state, and federal governments regulate the dredging process with various policies that influence the local level.

⁷ Davis, John D., Scott MacKnight, International Maritime Organization staff, and Others, *Environmental Considerations in Port and Harbor Development*, World Bank Technical Paper Number 126, Transport and the Environment Series (Washington D.C.), 1990, p. 51

*The National Dredging Needs Study
of Ports and Harbors - Literature Search*

Current government regulations attempt to mutually encourage environmental and economic benefits of individual dredging projects. Critics argue, however, that these regulations act to increase the barriers to the dredging projects. A technological lag exists between detecting and resolving environmental problems, and the permitting process is much too lengthy and complex.

The report proceeds to recommend more focused leadership by regulatory agencies, including stricter deadlines and quicker response times. Federal, state, and local governments, as well as individual ports and local environmental interest groups should become involved in reforming the regulatory process of dredging ports.

Port Development in the United States

Sponsor: International Association of Ports and Harbors

Author: John M. Pisani, Director, Office of Port and Intermodal Development, Maritime Administration, U.S. Department of Transportation

Publisher: IAPH Foundation (Tokyo)

Date of Publication: 1989 (third edition)

Format: Hard-copy report, 49 pages

Level of analysis: National

Subjects covered: Current capacity, forecast of capacity, current trade, dredging (construction and maintenance), environment (impediments to dredging and beneficial uses of dredged material), economics and finance, policy impact, technology

Port Development in the United States is an issues paper prepared by John M. Pisani, Director of the Office of Port and Intermodal Development at the Maritime Administration, for the annual IAPH conference in 1989. As such, it is somewhat of an unofficial statement of MarAd's viewpoint on port development. The paper is intended for an international audience with a limited background in U.S. port policy.

Pisani sets out to examine the current status, key issues, and future outlook for U.S. ports, including ocean, Great Lakes, and inland waterways. Topics covered include current port capacity and trade; current and projected funding sources; environmental, safety, and security issues. Pisani's central conclusion is that deepwater ports in the U.S. enjoyed relative prosperity at the end of the 1980s, but will face a number of challenges through the end of the century, including:

- the need to invest in modern terminal facilities to handle larger ships and decrease vessel turnaround time
- the trend toward fewer ports of call and a concentration of activity at port "load centers"
- intermodal access issues, including the need to modify intermodal terminal facilities for double-stack train technology

- the development of new computer information and automation systems
- the need to contain port labor costs
- and the need to optimize capacity utilization.⁸

Focused discussion of dredging is limited.

The publication is particularly noteworthy for the type of data presented, including: the distribution of ports by region, cargo type, and terminal type; top U.S. ports for oceanborne foreign trade; and double-stack rail service. Other useful features include a summary of the landmark Water Resources Development Act of 1986, and a summary of U.S. environmental and safety laws related to ports.

A Report to Congress on the Status of the Public Ports of the United States

Sponsor: U.S. Department of Transportation, Maritime Administration

Date of Publication: Annual

Format: Hard-copy; length varies by year

Level of analysis: National, Regional, Port-Specific

Subjects covered: Current capacity, current trade, environment (impediments to dredging, beneficial uses of dredged material), dredging (maintenance and construction), technology, economics and finance, policy impact, legislation

Congress has ordered the Secretary of Transportation to submit each year a report on the public ports of the United States, examining three topics:

- economic and technological development of the ports
- extent to which the ports contribute to the national welfare and security
- factors that may impede the continued development of the ports⁹

Prepared annually by the Maritime Administration, this report is useful as the official DOT statement on ports in the U.S. MarAd's reports to Congress certainly do not break any new ground, but are useful for providing a quick summary as well as year-to-year comparisons of the performance and challenges of U.S. ports.

⁸ Pisani, John M., *Port Development in the United States (Status, Issues, and Outlook)*, The IAPH Foundation (Tokyo), 1989, pp. 32-40.

⁹ Title 49, United States Code, Section 308(c)

*The National Dredging Needs Study
of Ports and Harbors - Literature Search*

The report to Congress typically is divided into two sections: a data-intensive overview of current conditions in the port industry, including foreign and domestic trade, containerization, historical and projected capital expenditures, and summary income statements. The second section provides a broad look at major issues facing ports, including financing, environment, permitting and dredged material disposal, intermodal land transportation access, and land use conflicts. Pertinent federal legislation is also reviewed.

Transportation Statistics Annual Report

Authors: Rolf R. Schmitt, Editor-in-Chief

Sponsor: U.S. Department of Transportation, Bureau of Transportation Statistics

Date: Annual (1994 is most recent)

Format: Hard-copy, 205 pages

Level of analysis: National, regional, port-specific.

Subjects covered: Current capacity, environment, policy impact, other.

The Transportation Statistics Annual Report is the keystone publication of the U.S. Department of Transportation's Bureau of Transportation Statistics (BTS). As such, this report serves as a useful reference on the current state of not only the transportation sector, but also the statistics that describe and evaluate it. In the views of the authors, the state of both transportation and transportation statistics is cloudy.

The transportation system portrayed in this work is one in which passenger travel and freight movements continue to increase, while the size and capacity of the infrastructure on which these movements take place have not expanded significantly. Innovations such as intermodal networks, parcel express delivery, and just-in-time inventory management have contributed to major gains in freight transportation service, while at the same time passenger service is deteriorating due to increasing congestion on interstate highways and a shift to hub-and-spoke air travel systems.¹⁰ A better understanding of the transportation system, the authors argue, will require better coverage and increased quality of existing data, as well as the design of new indicators.

The report is organized by topic rather than mode, with chapters on the role of transportation in the economy; an inventory of the existing transportation network; current usage levels and performance indicators; costs; safety; environmental impact; and similar topics. Concluding chapters make recommendations for new or improved data sources, and the BTS' future agenda. An appendix outlines current transportation data programs.

Water (and air) transportation tends to be downplayed in favor of surface modes, but the report provides some useful observations on how ports and waterways tie into the overall transportation network. The report is impressive in its breadth of discussion and data, yet is extremely readable.

Urban Ports and Harbor Management

Editor: Marc J. Hershman

Publisher: Taylor & Francis (New York)

Date of Publication: 1988

Format: Textbook, 354 pages

Level of analysis: National, Port-Specific

Subjects covered: Current capacity, environment (impediments to dredging), technology, economics and finance, policy impact, legislation

Urban Ports and Harbor Management is a comprehensive textbook examining the evolving role of the public port agency in managing the natural resources of urban harbors at a time of conflicting demands over use and policy. Often-cited, the book likely is a vital manual for port authority managers. For study of the dredging issue, it is useful through both its individual chapters on relevant topics such as federal port policy and environmental mitigation, as well as the broad context it provides in viewing the port not only as a transportation node, but also a "maritime cultural resource."¹¹ *Urban Ports and Harbor Management* is a highly readable publication, noteworthy for its broad-brush approach, its mix of perspectives, and its frequent use of case studies.

The central theme of the book is the idea that ports and harbors are critical resources from a variety of perspectives (transportation, economic development, environment, recreation), but that conflicts over use and tangled regulatory powers have prevented concerted planning and necessary investment programs. Because of its governmental powers and land and financial resources, the public port agency, Hershman argues, is in a unique position to lead the development of a collective vision for harbor management.

Individual chapters in the book are written by experts from a wide spectrum of fields. Chapters of particular interest include:

- a discussion of the physical characteristics of harbors, including explanation of a number of technical terms;
- a review of federal port policy, including the role of key agencies, with the conclusion that the federal government needs to establish a focal point for attention to port development issues¹²;

¹¹ Hershman, Marc J., editor, *Urban Ports and Harbor Management: Responding to Change along U.S. Waterfronts*, Taylor and Francis (New York), 1988, p. vii.

¹² Ibid., p. 118

- an analysis of the impact of containerization on port competition, facility needs, and intermodal access, arguing that containerized general cargo shipping is the most far-reaching technological development facing shippers and ports in the past 30 years¹³;
- and an examination of the role of the port in environmental mitigation, often related to dredging projects, with the argument that ports should take a pro-active role in resource assessment and mitigation to reduce permit delays and uncertainty in the planning process¹⁴.

Other chapters explore the historical development of ports; the role of the port in fostering economic development, particularly in non-cargo areas; the status of the modern fishport; the role of small-boat marinas; trends in waterfront revitalization; a study of port organization plans and methods of ensuring accountability; and an interview with Professor Thomas J. Dowd of the Institute for Marine Studies at the University of Washington on port finances. A glossary provides definitions of key words.

Vessel and Port Technologies at the Turn of the Century

Authors: Mark L. Chadwin, Wayne K Talley

Source: Old Dominion University

Sponsor: Transportation Research Board (Washington, D.C.)

Date of Publication: 1992

Format: Article, 24 pages

Level of analysis: International

Subjects covered: Technology, current capacity, forecast of capacity.

Although it only briefly touches the dredging issue, *Vessel and Port Technologies at the Turn of the Century* is noteworthy as a concise description of expected technological developments over the next decade that will shape the operating environment for deep-water ports. The paper was researched by two authors from Old Dominion University for the Transportation Research Board.

The authors take the middle-of-the-road approach that most changes in the design and operation of vessels and ports through the start of the 21st century will be evolutionary, not revolutionary. This approach stems from two reasons: first, shipping is an increasingly mature industry; and second, the authors envision no major technological breakthroughs or economic shifts (i.e., a dramatic increase in energy prices) in this next decade. Instead, the next decade is likely to be characterized by “the widening application of existing patterns and the more complete exploitation of technologies already exploited.”¹⁵

Among the major changes expected by the authors:

- Containerization of cargoes will grow throughout the 1990s, but at a slower rate than in the past.

¹³ Ibid., p. 125

¹⁴ Ibid., p. 256

¹⁵ Chadwin, Mark L. and Wayne K. Talley, Old Dominion University, *Vessel and Port Technologies at the Turn of the Century*, Transportation Research Board (Washington D.C.), January 1992, p. 2

- Excess capacity will plague the shipping industry at least through the mid 1990s, although the long-term supply-demand balance is unclear.
- Gearless cellular vessels will dominate the major routes, but roll-on, roll-off and other vessel types will remain in operation due to their flexibility and military applications
- Radical new designs are unlikely, but greater use of hydrofoils or hovercraft to transport priority containers on shorter routes is possible.
- Ocean carriers will continue to consolidate and cut costs, while also pursuing product differentiation.
- Competition will increase between ports, with certain ports emerging as "winners" by becoming load-centers for major carriers, while other ports are relegated to feeder port status.¹⁶

In terms of dredging, perhaps the key trend identified in the report is that container ships are expected to grow larger as common perceptions about geographic, commercial, and technological limits disappear. In the 1980s, the authors point out, the physical limits of the Panama Canal were seen as the upward bound on container ship size. However, the rapid growth in trans-Pacific trade, along with the rise of double-stack trains and other intermodal services that permit "landbridging" across the United States, has eliminated this barrier. Similarly, the focus of container activity at a handful of load centers (Singapore, Rotterdam, Los Angeles-Long Beach) has made building larger container ships cost-effective. Container ships have economies of scale while at sea, but diseconomies of scale while in port. Hence, "jumbo" container ships with capacity of 5,000-6,000 TEUs are likely by the end of the decade.¹⁷

The implication of this scenario is that major deep-water ports will need to remain committed to maintenance dredging and channel-deepening projects to accommodate these larger ships and remain competitive. However, container activity should continue to focus on a handful of load center ports (such as L.A.-Long Beach), with barge service or overland service to feeder port cities. Understanding which ports are likely to achieve and maintain this load center status will help the Corps and other planning agencies allocate scarce dollars for dredging projects. Feeder ports may not require any deepening projects since they would not receive the larger ships. Moreover, if usage of hydrofoils and hovercraft grows to the levels expected, channel or berth depth could become a less significant issue for many small to medium sized ports. Indeed, while the authors expect ports to complete the current "bubble" of investment projects, they note that -- in the absence of radical changes in ship design -- port investment will shift toward rapidly industrializing nations in Asia, the Pacific, Eastern Europe, and Latin America.¹⁸

Appendix A - Bibliography Entries

NATIONAL DREDGING NEEDS STUDY OF PORTS AND HARBORS BIBLIOGRAPHY FIELD DESCRIPTIONS

The following is a description of the information which comprises the bibliography produced for this task. The bibliography is presented in two tables, each with the 232 entries, as shown in the formats below. The information is arranged by type as field entries in the row entry for each bibliography item.

TABLE 1

AUTHOR: Author of the article or study. Last name first.

TITLE: Title of the article or study

SOURCE : Organization that published or sponsored the study.

SOURCE LOCATION: Location of the publisher or organization that sponsored the study.

SOURCE PHONE NUMBER: Phone number of the publisher or study sponsor.

DATE: Date (by year only) that study was conducted, when available.

AT IWR: Indicates whether a copy of this study was obtained for USACE/WRSC/IWR. Designated by (Y)es or (N)o.

LEVEL: This field indicates whether the scope of the item is International, National, Regional, or Port Specific.

DESCRIPTION ON ARTICLE: Provides a brief description of the article or study.

SEMINAL WORK: Provides indicator for those studies identified as seminal works.

MEDIA TYPE: Provides indication of whether publication is available in printed form (H- for hardcopy) and machine readable format (S - for softcopy)

TABLE 2

This table repeats the **Author, Title, and Source** before identifying which subjects are covered in the scope of the study. The table starts on page 49, and the subjects are as follows:

CURRENT PORT CAPACITY (CC)

FORECAST OF TRADE (FT)

FORECAST OF CAPACITY (FC)

ENVIRONMENTAL - Dredging Impediments (EDI) or Beneficial Uses (EDB)

TECHNOLOGICAL CHANGES (T)

POLICY IMPACTS (PI)

DREDGING MAINTENANCE - Federal (DMF) or Non-Federal (DMNF)

DREDGING CONSTRUCTION - Federal (DCF) or Non-Federal (DCNF)

ECONOMICS AND FINANCE (EF)

LEGISLATIVE (L)

CURRENT TRADE (CT)

NAFTA (T)

OTHER (O)

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302, and to the Office of Management and Budget, Paperwork Reduction Project (0704-0188), Washington, DC 20503.

1. AGENCY USE ONLY (Leave blank)	2. REPORT DATE October 1995	3. REPORT TYPE AND DATES COVERED Final	
4. TITLE AND SUBTITLE The National Dredging Needs Study of Ports and Harbors - Literature Search		5. FUNDING NUMBERS	
6. AUTHOR(S) DRI/McGraw-Hill Washington, DC		8. PERFORMING ORGANIZATION REPORT NUMBER IWR Report 95-NDN-1	
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES) U.S. Army Corps of Engineers Water Resources Support Center Institute for Water Resources, Casey Building 7701 Telegraph Road Alexandria, VA 22315-3868		10. SPONSORING / MONITORING AGENCY REPORT NUMBER	
9. SPONSORING / MONITORING AGENCY NAME(S) AND ADDRESS(ES) U.S. Army Corps of Engineers, Headquarters 20 Massachusetts Avenue, NW, Pulaski Building Washington, DC 20314-1000		11. SUPPLEMENTARY NOTES Available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161, (703) 487-4650	
12a. DISTRIBUTION / AVAILABILITY STATEMENT Approved for public release; unlimited		12b. DISTRIBUTION CODE	
13. ABSTRACT (Maximum 200 words) This Literature Search presents a synopsis of existing literature concerning the current situation of ports in the United States. The studies and reports which were reviewed are from public and private sources and discuss the following pertinent issues: port capacity; forecast of trade; forecast of capacity; environmental dredging impediments or beneficial uses; technological changes; policy impacts; dredging maintenance; dredging construction; economics and finance; legislative and current trade. These studies and reports, as a group, describe the current status of the U.S. port system and relate levels of commercial use, projected growth, usage of harbors, development of landside facilities, physical limitations of the ports, and trade impacts caused by policy decisions. A bibliography is presented which includes 232 citations.			
14. SUBJECT TERMS Deep draft navigation bibliography; port status; port capacity; forecast of trade & capacity, environmental dredging impediments, policy impacts		15. NUMBER OF PAGES 79	
		16. PRICE CODE	
17. SECURITY CLASSIFICATION OF REPORT Unclassified	18. SECURITY CLASSIFICATION OF THIS PAGE Unclassified	19. SECURITY CLASSIFICATION OF ABSTRACT Unclassified	20. LIMITATION OF ABSTRACT Unlimited
