Librarian Engineering

EXECUTIVE SUMMARY

## I. INTRODUCTION

A. General

1. This EEAF study was performed on the two major installations on USMCA Vicenza, Italy: Camp Ederle and Villaggio.

2. It analyzes the energy consumption patterns of calendar year 1980 and evaluates the energy conservation program established for 1981.

3. The field work commenced in January 1981 and was completed in August of that year.

4. The analysis made extensive use of BLAST (Building Loads And System Thermodynamics).

5. New policies for determining heating plant efficiency are recommended.

6. No new funded projects have been developed.

B. Results

1. Recommended actions will save  $37.9 \times 10^9$  Btu/yr worth \$192,000 in 1980, halt a contemplated \$5 million investment in a co-generation project, and save an additional \$136,000 per year financial losses incidental to the \$5 million.

2. Energy consumption has fallen 21% in the study area since 1975.

3. 1985 energy consumption will be 26% less than 1975 levels.

## II. ENERGY CONSUMPTION

A. Past, Present, and Future

1. The study areas had a reported FY 1975 energy consumption of  $285.5 \times 10^9$  Btu.

2. During the period analyzed in this report--calendar year 1980--records indicate a consumption of  $226.5 \times 10^9$  Btu, 21% less than the 1975 baseline.

3. Formidable curtailments and voluntary but strict compliance with the Italian heating restrictions will have lowered consumption further during 1981, but these practices are not expected to continue.

**FIGURE 1.1  
PAST AND FUTURE  
ENERGY CONSUMPTION  
USMCA-VICENZA**

4. If all planned community projects, including the insulation projects, are completed, estimated FY 1985 consumption will be  $186.8 \times 10^9$  Btu. If insulation projects are dropped, estimated FY 1985 consumption will be approximately  $210.5 \times 10^9$  Btu, 26% less than the 1975 baseline. Figure 1.1 illustrates this historical progression in yearly consumption.

### B. Energy Use Patterns

1. The distribution of energy among its various uses was analyzed using BLAST (Building Loads and System Thermodynamics). This distribution is summarized in Tables I and II below.

TABLE I  
DISTRIBUTION OF 1980 VICENZA ENERGY USE  
(both Ederle and Villaggio)

<u>USE</u>	<u><math>10^9</math> Btu</u>	<u>%</u>
Space Heating	104.4	45.1
Distribution System Losses	5.0	2.2
Domestic Hot Water	6.6	2.9
Heating Plant Losses	60.9	26.9
Building Electrical	17.1	7.5
Air Conditioning	14.8	6.5
Heating Plant Electrical	4.9	2.2
Perimeter and Street Lighting	1.1	.5
Electrical System Losses	.7	.3
L.P. Gas (cooking)	<u>11.0</u>	<u>4.9</u>
	226.5	100.0

TABLE II  
ESTIMATED DISTRIBUTION OF 1983 VICENZA ENERGY USE  
 (both Ederle and Villaggio)

<u>USE</u>	<u>10<sup>9</sup> Btu</u>	<u>%</u>
Space Heating	94.0	44.7
Distribution System Losses	5.0	2.4
Domestic Hot Water	6.6	3.1
Heating Plant Losses	35.3	26.4
Building Electrical	17.1	8.1
Air Conditioning	14.8	7.0
Heating Plant Electrical	4.9	2.3
Perimeter and Street Lighting	1.1	.5
Electrical System Losses	.7	.3
L.P. Gas (cooking)	11.0	5.2
	210.5	100.0

2. The distribution of energy by sources is given in Table III below.

TABLE III  
ENERGY CONSUMPTION BY SOURCE, CY 1980  
USMCA VICENZA

<u>Source</u>	<u>Amount</u>	<u>Energy</u>	<u>Cost</u>
Electric Energy	11.8 x 10 <sup>6</sup> kWhr	40.2 x 10 <sup>9</sup> Btu	\$489,100
Electric Demand	---	---	\$2,500
#5 Fuel Oil	1,327,700 gallons	198 x 10 <sup>9</sup> Btu	\$61,400
LP Gas	437,400 liters	11.5 x 10 <sup>9</sup> Btu	\$2,235
		269.7 x 10 <sup>9</sup> Btu	\$1,515,235

3. A picture of the energy flow on each installation is shown on the Input-Output diagrams in Volume II.

### C. Typical Building Energy Consumption

1. All the buildings in the study area were assigned to one of nine building types. Descriptions and energy parameters for each of these types can be found in Volume III.

2. "Average" buildings of each type were constructed from audit data using hand calculating techniques. The year-round energy consumption characteristics of each "average" building was ascertained using annual BLAST.

### D. Heating Plant Consumption

1. The calculated monthly consumption for the two Vicenza heating plants are given below.

#### MONTHLY CONSUMPTION, BDERLE 206

<u>Month</u>	<u>Input (10<sup>9</sup> Btu)</u>	<u>Output (10<sup>9</sup> Btu)</u>	<u>Efficiency</u>
Jan	24.3	16.4	.677
Feb	15.7	10.3	.654
Mar	15.7	10.3	.653
Apr	6.6	3.9	.588
May	3.6	1.9	.519
Jun	.7	.3	.469
Jul	.7	.3	.469
Aug	.7	.3	.469
Sep	2.4	1.2	.504
Oct	5.8	3.4	.579
Nov	13.3	8.5	.641
Dec	19.7	13.1	.667

MONTHLY CONSUMPTION, VILLAGGIO 301

<u>Month</u>	<u>Input (10<sup>9</sup> Btu)</u>	<u>Output (10<sup>9</sup> Btu)</u>	<u>Efficiency</u>
Jan	19.2	12.8	.669
Feb	13.4	8.6	.646
Mar	13.1	8.5	.648
Apr	4.5	2.7	.588
May	.8	.2	.301
Jun	.8	.2	.301
Jul	.8	.2	.301
Aug	.8	.2	.301
Sep	.8	.2	.301
Oct	4.4	2.5	.561
Nov	11.8	7.5	.636
Dec	16.7	10.7	.641

III. ENERGY CONSERVATION OPPORTUNITIES ASSESSEDA. Community Projects

1. ECIP parameters were calculated for the funded projects in the Vicenza Community Energy Conservation Plan. These are shown below.

ECIP PARAMETERS OF COMMUNITY PROJECTS

<u>Project</u>	<u>Cost</u> <u>\$10<sup>3</sup></u>	<u>Savings</u> <u>10<sup>6</sup> Btu</u>	<u>Benefit</u> <u>\$10<sup>3</sup></u>	<u>W/C</u>	<u>E/C</u>	<u>Payback</u> <u>Years</u>
II.1.d Summer EX	17	26	.78	.95	1.5	142*
II.1.e Summer EX	17	40	1.2	.97	2.4	91*
II.1.g Solar for 210	10	15	.5	.05	1.5	143
II.1.i comm. cases	281	48	1.4	-	.17	1,405

\* As assessed by the study team.

2. Additional Measures Assessed

1. The possible use of coal as a boiler fuel for Vicenza.
2. A load shedding system for Camp Ederle.
3. Electric meters for tenant units.
4. #2 oil burning summer hot water heaters for Ederle and Villaggio.
5. Generalized solar hot water heating.
6. EMCS.
7. Double roofs for family houses to reduce summer heat gain.

IV. PROJECTS

1. We have no projects to add to Vicenza's existing program.

**V. RECOMMENDED ENERGY MANAGEMENT PLAN**

1. The effectiveness of Vicenza's existing energy management activities is attested to by the 21% reduction achieved by the community before the study began and by their performance on recent USAREUR energy conservation competitions.

2. The Vicenza EK department has been restaffed and reorganized since the close of the study in January 1982. However, those recommendations designed to increase the department's ability to review and administer projects prepared by A-E firms, as well as those meant to decrease its relative isolation, should be considered. Master planning should give considerable weight to energy conservation from consolidation of planned construction.

3. Vicenza has a higher proportion of social, athletic, and dependent support activities than other communities encountered by the study team (Livorno in Italy and Karlsruhe in Germany). Cutbacks in these areas, such as no after-dark athletics, no air conditioning in theaters, clubs, and libraries, and similar actions, are possible and well-known to the community command. We have taken no position concerning such steps.

4. Concerning the community's energy savings projects, funded projects dealing with insulating existing buildings, wholesale replacement of doors and windows, and building or distribution system rewiring should be de-emphasized unless required for non-energy-related reasons. No more solar hot water projects should be planned. EMCS should not be installed.

5. Boiler efficiency tests based on stack gas should be instituted.

6. Both active and passive solar devices and other passive energy conservation features should be incorporated into the designs of all future construction.

VI. OTHER STUDY RESULTS

1. Additional investigations of several topics were required to faithfully analyze the energy conservation and economic characteristics of the Vicenza community. These additional topics included predicting Italian prices into the next decade, and using the BLAST computer program to model typical military bases.

2. The course of future prices in Italy was forecast using information published by the Department of Energy and from an econometric model of the world economy developed by the University of Pennsylvania and the University of Bologna, among others. These projections are described in Appendix F-1.

3. A BLAST model of Camp Ederle and Villaggio della Pace based on nine average building types was used to determine the paths followed by funds and fuels consumed on Vicenza through to their final loss to the environment as waste heat.
