#### 1.0 INTRODUCTION AND OVERVIEW

#### 1.1 Introduction:

This document is the Executive Summary of the Phase II Energy Report for the Energy Engineering Analysis Program (EEAP) for the Worms, West Germany Military Community. The purpose of this document is to present analysis of potential energy conservation projects at each of the sites. The EEAP provides engineering studies of Army facilities to identify and analyze facility energy conservation projects. This program has been completed, is being performed, or is planned for all Army facilities worldwide. This project provides for completion of that program for Worms Military Community, with sites at various locations throughout the Community area. Work is being performed under the direction of the European Division of the U.S. Army Corp of Engineers under Contract No. DACA90-81-C-0096. The study is being performed by A & E International/Newcomb & Boyd, Consulting Engineers, a joint venture, with home offices located in Atlanta, Georgia. Local engineering support for the project is being provided by Lahmeyer International, GMBH.

#### 1.2 Worms Military Community Overview:

The U.S. Army Military Community Activity, Worms, consists of a headquarters at Taukkunen Barracks in Worms, a Sub-community facility in Weierhof, and 21 separate installations and sites at various locations within the 525 square mile community area. The descriptions herein refer only to the installations surveyed as part of Phase I. Installations and buildings in the Community to be surveyed were selected during Phase I in a joint meeting of Community, Corps and A/E representatives. Refer to Section 1.3.3 for a discussion of the selection of installations. Figures 1.1 and 1.2 show the location of each installation on area maps.

#### 1.2.1 Kriegsfeld Ammo Depot (GY 035):

Located near Kriegsfeld, this site contains troop billets, community support facilities, and administrative and maintenance buildings as well as ammunition storage facilities.

1.2.2 De La Police Kaserne (GY 144):

Located in Worms, the site contains troop billets, administrative and storage facilities, a computer installation, and two grade schools.

1.2.3 Thomas Jefferson Village (GY 241):

Located in Worms, the site contains multifamily housing units and community support facilities including a commissary, school, and youth center.

1.2.4 Gruenstadt AAFES Depot (GY 256):

The facility contains a large bakery, ice cream plant, meat processing plant, and attendant cold storage and dry goods warehouses. Maintenance shops are also housed at this site in Gruenstadt.

1.2.5 Haide Labor Services Camp (GY 390):

Barracks, mess hall, and vehicle repair shop are located at this site near Haide.

1.2.6 Schoenborn Missile Station (GY 434):

The facility, located in Schoenborn, is divided into 2 sites. One site contains troop billets, recreation, motor repair, and warehouse facilities. The launch site contains a ready building and heated storage barns, one of which is currently used as office space.

1.2.7 Quirnheim Missile Station (GY 435):

The facility located near Quirnheim is presently unoccupied and undergoing renovation. It is similar in layout to Schoenborn with separate administration/ troop quarters and missile launch areas.

1.2.8 Worms R&U Area (GY 512):

The facilities engineers are headquartered at this installation in Worms. The site contains maintenance and repair shops, warehouses, and an administration building.

1.2.9 Taukkunen Barracks (GY 606):

Headquarters of the Worms Military Community, Taukkunen Barracks in Worms is composed of administrative buildings, community support facilities, communications and computer facilities, and recreational facilities. 1.2.10 Weierhof Family Housing (GY 692):

Located in Weierhof, this site contains multifamily housing units and community support facilities such as a school, chapel, and youth center. Facility engineering also has maintenance shops located at Weierhof.

1.2.11 Worms QM Area (GY 775):

This facility consists of one furniture warehouse located in Worms.

1.2.12 Dannenfels Communication Station (GY 885):

Located near Dannenfels, the installation consists of a small administrative building and communications building.

1.2.13 Hardenburg Communications Station (GY 887):

This facility located at Hardenburg consists of troop billets, mess hall, administrative building, and communications building.

1.2.14 Lohnsfeld Communications Station (GY 889):

Located at Lohnsfeld, the station consists of a barracks and receiver building.

1.2.15 Austin Radio Relay Station (GY A01):

This site contains a barracks with mess hall, a receiver, and communications building. The relay station is located on Donnersberg.

1.2.16 Gruenstadt Communication Station (GY A27):

Located near Gruenstadt, the facility contains barracks, recreation building, maintenance and administration buildings, and mobile communications equipment.

1.3 EEAP Scope and Process:

1.3.1 EEAP Scope:

The objectives of the EEAP as stated in the project Schedule of Title 1 Services are:

- "a. Develop a systematic plan of projects that will result in the reduction of energy consumption in compliance with the objectives set forth in the Army Facilities Energy Plan without decreasing the readiness posture of the Army.
- b. Use and incorporate applicable data and results of related studies, past and current, as feasible.
- c. Develop coordinated base wide energy systems plans for each military community.
- d. Prepare Program Development Brochures (PDB's),
  DD Forms 1391, and supporting documentation for feasible energy conservation projects.
- e. Include in the program studies all methods of energy conservation which are practical (in so far as the state-of-the-art is reasonably firm) and economically feasible in accordance with guidance given.

f. List and prioritize all recommended energy conservation projects."

A complete copy of the Schedule of Services is included in the Data Report. EEAP project activity is divided into 4 increments:

#### 1.3.1.1 Increment A:

Energy conservation projects involving modification and improvements to existing buildings are included under this increment. All projects will be evaluated according to Energy Conservation Investment Program (ECIP) criteria and ranked according to Savings to Investment Ratio (SIR). Planning and programming documents for recommended ECIP projects will be prepared.

#### 1.3.1.2 Increment B:

This increment includes energy conservation projects for utilities and energy distribution systems. Computerized energy monitoring and control systems (EMCS) will also be evaluated under this increment. All projects will be economically evaluated using ECIP criteria, and planning and programming documents will be prepared for recommended projects.

#### 1.3.1.3 Increment F:

This increment includes recommendations for modifications and changes in system operations to conserve energy. These recommendations are to fall within the Military Community's funding authority of \$200,000 for alteration type work and \$500,000 each for maintenance and repair work. Additional tasks under

this increment include analysis of the energy requirements of planned facilities listed in the Military Community's Master Plan, recommendation for additional training of facilities engineer personnel, and a study of the replacement of expendable equipment with more energy efficient types. All energy conservation measures and projects from all increments are to be summarized and prioritized under this increment.

#### 1.3.1.4 Increment G:

Projects whose costs exceed the local community's funding authority and have an SIR greater than 1, but an ESIR less than 1, qualify for inclusion under Increment G. These projects are those which are too costly for inclusion in Increment F and save dollars, but not enough energy to qualify for ECIP funding under Increments A and B.

These projects would be funded from maintenance, repair (OMA), and minor construction projects (MMCA) funds. However, no Increment G projects were identified during this analysis.

#### 1.3.2 EEAP Process:

An EEAP project is performed in three phases as follows:

#### 1.3.2.1 Phase I:

The primary purpose of this phase is to gather energy related site data (written and verbal) and perform a field survey of the site to identify existing facility physical and operational conditions. The Preliminary Submittal occurs at the end of Phase I and documents the data gathered during Phase I. This information is contained in the Revised Data Report.

#### 1.3.2.2 Phase II:

During this phase, the information obtained during Phase I is analyzed to identify energy conservation projects. Once those projects are identified, they are analyzed to project potential savings and cost which would occur if the projects were implemented. The savings and cost are analyzed using standardized economic procedures and then prioritized based on that economic evaluation. The Interim Submittal is provided at the end of Phase II and documents the project selection and analysis process. The Interim Submittal consists of the Energy Report and other miscellaneous documents.

#### 1.3.2.3 Phase III:

During this phase, funding documents (Forms 1391 and Program Development Brochures) are prepared for those projects identified in Phase II as having economic characteristics which satisfy the appropriate criteria (ECIP). At the completion of Phase III, the Pre-final Submittal is made and includes all proposed funding documents. Government comments on the Pre-final Submittal are then incorporated in a Final Submittal.

#### 1.3.3 Project Scope:

The work in this project includes both buildings and utility systems. Funding for the project is not sufficient to perform detailed survey and analysis of every single building in the community; therefore, two different survey procedures were applied. A detailed building survey aimed at collecting sufficient data to create a computer model of the building's energy use profile was performed on a limited number of representative buildings. The remaining buildings were surveyed in somewhat less detail to catalogue existing equipment and conditions and correlate the building with one of the buildings to be modeled by computer.

A "kick off" meeting was conducted in the community prior to the commencement of the Phase I field survey with representatives of the community, European Division Corps of Engineers, and the A/E in attendance. At this meeting the list of installations was reviewed and the installations listed in Figure 1.3 omitted from the survey. The building lists of the remaining installations were then reviewed. Buildings such as guard towers, unheated warehouses, and ammunition storage facilities were deleted from the survey due to low energy consumption and minimal opportunity for energy conservation. The list of buildings to be surveyed in detail for computer modeling was also finalized. Refer to Figure 1.4 for the list of installations surveyed. Figure 1.5 contains a list of buildings surveyed with the buildings surveyed in detail noted.

In addition to buildings, the utility systems at each site are included in the scope of the investigation. Utility systems included are boiler plants, electrical and thermal distribution, and exterior lighting.

#### 1.4 Executive Summary Scope:

This report provides a summary of the energy and cost analysis leading to recommendation of proposed energy conservation projects documented in the Energy Report. The Energy Report's prime objective is to use the data gathered during site visits and field inspections to select, analyze savings, estimate cost and evaluate economic criteria for energy conservation opportunities. Section 2.0 of this report provides illustration of the existing energy situation at each site based on the available information provided by the Community. Energy conservation opportunities (ECOs) considered for selection, or reasons for their rejection are summarized in Section 3.0 of this report. These ECO's are derived from the Army Facilities Energy Plan, community suggestions, and experience on other projects. Section 4.0 of this Executive Summary briefly describes the various energy conservation projects developed as a result of our analy-Three types of projects were identified including sis. ECIP project, energy conservation projects to be funded though the use of Form 4283's and Increment F projects. No projects meeting the qualifications for Increment G were identified (see Section 1.3.1.4).

Section 5.0 of this Summary addresses the impact on energy consumption of implementing the various energy conservation project.

#### 1.5 Phase II Methodology:

- 1.5.1 Objectives: The primary end product of EEAP Phase II is a consolidated list of architectural, mechanical, and electrical modification projects which will result in a reduction of energy consumption. The list includes estimated construction cost and energy saved for each project along with appropriate economic indicators (SIR) as dictated by ECIP criteria. The list is arranged in order of best (largest) SIR. From this list, Community and Corps of Engineers personnel will coordinate selection of projects for preparation of funding documents (Form 1391, PDBs) and the time frame for execution of those projects. Funding documents will be prepared for those selected projects as a part of Phase III of the EEAP program.
- 1.5.2 Methodology: The Phase II analysis was accomplished using the following six basic steps:
  - Step 1 Prepare a master list of energy conservation opportunities (ECO) for buildings and utility systems based on Phase I experience and the list of ECOs included in the Army Facilities Energy Plan.
  - Step 2 For each building and utility system at each installation, select those ECOs from the master list which are applicable according to the Phase I survey data.
  - Step 3 Calculate energy savings for each ECO/building/system combination. The calculation process uses a combination of computerized and manual methods. Manual methods are used where the ECOs are simple

and are not affected by other ECOs. Computer analysis is used for building ECOs where many interrelated factors affect the results. The computer analysis consists of a base-line and modified analysis. The base-line run is based on existing conditions and operations. Subsequent runs simulate performance after the energy conservation project under study is implemented. The difference between those runs are the savings estimated for that ECO.

- Step 4 Calculate the cost to implement each ECO selected for each building. General unit cost have been developed from manufacturer's quotes and contracting experience provided by Lameyer International. Those unit costs are multiplied times the quantity of occurrences in a building or system to compute the total installation cost. All costs in the Phase II analysis are based on FY84 prices. After projects are selected and scheduled following Phase II, the cost will be escalated and updated to the time at which the project is finally scheduled.
- Step 5 Based on the savings and cost identified in Steps 3 and 4, economic analysis as defined in ECIP criteria is performed. Economic parameters include Total Discounted Savings, and SIR. These are summarized in a table and listed in order based on SIR.

Step 6 - A suggested packaging scheme for combining individual ECOs for individual buildings into projects is prepared. The packaging could be based on installation (i.e., all work in the Taukkunen installation) or type (i.e., all roof insulation on pitched roofs), or, most likely, some combination of installation, type work, and energy savings (SIR).

#### 1.6 Phase III Preparation:

As previously stated, Phase III of the EEAP program consists of preparation of funding documents (Form 1391 and Project Development Brochures). These documents will be prepared based on the government comments returned on this report submittal. Prior to beginning work on Phase III, it is requested that the latest criteria for preparation of these programming documents be furnished. Criteria furnished at the beginning of this project may have changed and the latest version should be used to avoid unnecessary modifications and changes after the Phase III submittal.

#### 2.0 EXISTING ENERGY SITUATION

#### 2.1 Background:

One of the requirements of the EEAP program is to examine the existing energy situation at each site where an EEAP study is performed. There are several reasons this effort is included. One of the prime motivations is the Army Facilities Energy Plan objective to reduce energy usage by 20 percent by the year FY85 in comparison to a base year of FY75. In an EEAP study, one of the objectives is to identify the base year (FY75) consumption and compare the current energy situation to that value. Based on this comparison, some judgement can be made as to additional effort required in terms of new construction projects to f allow reductions to meet the goal.

In addition to comparison with the FY85 energy goal, examination of the existing energy situation can provide an indication of the relative importance of each type or component of energy consumption. For example, by comparing how much energy is used for heating versus the consumption for domestic water heating, the study may establish priorities for those items which have the greatest potential for energy savings. One difficulty which arises in performing this type of analysis is the general lack of sub-metering data of a particular installation's energy consumption. Since most Army facilities were constructed during a time when energy costs were relatively unimportant, very little emphasis in the past has been placed on actual metering of energy usage for a particular function. For example, it's impossible in most cases to examine actual metered data of individual building's energy consumption within a facility or the usage of energy for different activities within a building. Since this

metered data is not available, engineering estimates have to be made to determine the data.

A third objective in examining the existing energy situation at a facility is to provide an overview prior to the detailed point by point energy conservation opportunity evaluation. Because the detailed analysis is so voluminous, it's easy to lose track of the objective of the EEAP program.

#### 2.2 General Description:

All Worms Military Community sites utilize electricity purchased from local electric utilities. These utility companies then bill the U.S. Army for the energy consumed at each installation. The price of electricity varies for each installation with the total cost of electricity composed of charges for kilowatt - hour (KWH) and kilowatt (KW) demand.

Electricity is utilized for a variety of tasks including lighting, operation of heating system distribution equipment, and office and household equipment. Data processing and communications equipment with its associated mechanical coding systems also consume electricity.

Fossil fuels including coal, oil (number 2 and 6), and natural gas are consumed to provide space heating, domestic hot water and process steam. While space heating accounts for the major fraction of fossil fuel energy consumed at most installations, housing areas, troop billets, and mess halls use large quantities of domestic hot water and heat for food preparation.

The Gruenstadt AAFES Depot houses a large bakery, ice cream manufacturing plant, and meat processing plant.

Each of these industries consume process energy including electricity for refrigeration, steam for domestic hot water generation and process heating, and natural gas in direct fired ovens.

#### 2.3 Energy Consumption Components:

As discussed earlier, no detailed sub-metering data is available for the sites to provide a break down of energy consumption by component. Computer modeling and engineering estimating techniques have been used to assess constituent energy consumption.

2.4 Utility Metering:

#### 2.4.1 Electricity:

The majority of sites in the Worms Military Community receive electricity through and are billed from one revenue meter. Sites such as Taukkunen Barracks which have more than one revenue meter do not bill activities within the site separately, and thus no advantage exists for the use or installation of additional sub-meters. Some family housing units at Thomas Jefferson Village contain individual apartment electric meters; however, Army policy prohibits charging occupants with monthly utility costs. Consequently, their use can only be for evaluating the effectiveness of energy conservation programs. Additional metering as part of an electrical demand control system may be advantageous.

### 2.4.2 Fuels:

Records of monthly coal and fuel oil usage are recorded for each boiler plant. Natural gas is

metered at each building with gas service. The installation of additional metering devices would be quite expensive and is not recommended.

#### 2.5 Electrical Energy:

- 2.5.1 Information on Electrical Energy Consumption in total kilowatt hours and kilowatt demand was requested for fiscal years 1981, 1982, and 1983, as well as data for fiscal year 1975, which is to serve as the base for comparison of energy conservation goals. This data is contained in the PHASE I DATA REPORT and presented in both tabular and graphic forms. Refer to Section 2.7, Total Energy Consumption and Figures 2.3 through 2.18 for a representation of energy consumption by installation and year.
- 2.5.2 The price of electricity varies for each installation in the Worms Community. The total cost of electricity is composed of charges for kilowatt-hour (KWH) consumption, kilowatt (KW) demand, and power factor correction. The price per KWH paid varies depending on the season (Summer versus Winter) and time of usage (normal versus off-peak). No installation currently pays for power factor correction. At the time of the field survey, De La Police Kaserne had a low power factor averaging .83. It has since been corrected. Charges for each component of the electric bill for each installation is included in Figure 2.1 as of Jan. '84. Also included in this figure is the average total price per KWH for each installation. Figure 2.2 lists electric energy costs in Deutsch Marks per million BTUs (DM/MBTU) and dollars per million BTUs (\$/MBTU).

#### 2.6 Fuels

- 2.6.1 Several types of Fossil Fuels are utilized for providing space heating, domestic hot water, and process steam. These include natural gas, coal, and fuel oil (both number 2 and number 6). Consumption of heating fuels by installation are included in the PHASE I DATA REPORT. This information is presented in tabular and graphic form for each fuel for each fuel type used by each installation. Refer to Section 2.7, Total Energy Consumption and Figures 2.3 through 2.18 for a representation of energy consumption by installation and year.
- 2.6.2 Prices for oil, natural gas, and coal were obtained from the Utilities Branch of Facilities Engineering in Worms and from the USAREUR Energy Center in Rheinau, Germany. These prices are listed below.

Number 2 Fuel Oil	= \$.5109 DM/Liter, Worms
	\$.5207 DM/Liter, Weierhof
Number 6 Fuel Oil	= \$.48093 DM/Kg., Gruenstadt
Natural Gas	<pre>= 126.00 DM/Year, Meter Charge + .9130 DM/Cubic Meter, Worms</pre>
Coal:	

Anthracite	Stove	=	\$115.14/Metric	Ton
Anthracite	Nut	=	\$112.51/Metric	Ton
Anthracite	Pea	=	\$ 99.52/Metric	Ton
Bituminous	High Vol	=	\$ 69.00/Metric	Ton
	Medium	=	\$ 70.87/Metric	Ton

Transportation Changes = \$33.70/Metric Ton, Anthracite = \$37.20 Metric Ton, Bituminous

These energy costs were converted into the units Deutsch Marks per Million BTUS (DM/MBTU) for use in the economic analysis.

To accomplish this the following energy conversion factors obtained from the ECIP Guidance Criteria dated Feb. 18, 1983 were used:

1 KWH Electricity	=	11,600 BTU
1 Gallon #2 Oil	=	138,700 BTU
*1 Gallon #6 Oil	=	150,000 BTU
1000 FT <sup>3</sup> Natural Gas	=	1,031,000 BTU
l Short Ton Anthracite Coal	=	25,400,000 BTU
1 Short Ton Bituminous Coat	=	24,580,000 BTU

\*This conversion factor was taken from NAVFAC ECIP Guide dated Feb. 1983.

Using these factors and metric conversions, the following energy costs were calculated:

Anthracite (stove) Coal = 14.885 DM/MBTU = \$5.907/MBTU Bituminous (medium) Coal = 11.168 DM/MBTU = \$4.432/MBTU Number 2 Fuel Oil (Worms) = 13.942 DM/MBTU = \$5.533/MBTU (Weierhof) = 14.209 DM/MBTU = \$5.638/MBTU Number 6 Fuel Oil (Worms) = 11.788 DM/MBTU = \$4.678/MBTU Natural Gas = 25.076 DM/MBTU = \$9.951/MBTU

Note: MBTU = 1 MILLION BTU'S =  $10^{6}$  BTU. \$1.00 = 2.52 DM Energy Savings and economic calculations were performed using these prices and data on the energy source used in each building as determined during the PHASE I survey.

#### 2.7 Total Energy Consumption:

As part of the PHASE I Data Report, all quantities of each form of energy consumed by each facility were converted to BTUS. These are presented graphically in the figures of Section 7 of the Data Report. Graphs depicting monthly energy consumption by energy type and graphs illustrating total annual energy consumption were included. These annual energy consumption graphs and an analysis of the percent change in energy consumption for each form of energy used in fiscal years 1975, 1980, 1981, 1982, and 1983 for each installation are reproduced in Figures 2.3 through 2.19. In creating these graphs of total energy consumption in BTUS, the energy conversion factors from the ECIP Guidance Criteria listed above were used.

#### 2.8 Energy Consumption Analysis:

Examining these graphs and figures, several trends become evident. At most installations, consumption of electricity and fuels peak during the winter months. These peaks suggest that heating and its associated auxiliary loads are a major energy use and a prime target for energy conservation efforts. During the summer months, fuels are used for domestic hot water heating and process loads. With mechanical cooling used in only a small number of installations, summer electrical use is generally composed of a base load of lights and equipment. Note, however, at Gruenstadt AAFES Depot, that where a great deal of mechanical refrigeration equipment is used, electrical consumption peaks during the summer months. Administrative areas such as Taukkunen Barracks that use air conditioning and

have a high appliance equipment load exhibit a smaller seasonal variation.

The general trend from fiscal year 1975 to present shows an increase in consumption of electrical energy. This increase is due in part to a growing community population and to the increase in use of equipment including data processing centers and office appliances. Fuel consumption at most installations has declined due to community energy conservation efforts. Increases at other communities may be attributed to an expansion or change in the mission performed at that site.

#### 2.9 Summary:

Through the examination of historic energy consumption data, it is evident that space heating and its associated auxiliary loads are the major energy user. Energy conservation efforts directed at reducing heat loss through building envelope modification and improving heating system efficiency offer great potential for savings as illustrated in this report. Other key areas for energy conservation include the reduction of heating plant usage during summer months by reducing domestic hot water loads and trimming electrical consumption by improving component efficiencies and equipment control.

NOTES:

- KW demand charges are given in DM/KW demand per year based on the average of the three highest montha. If the average demand of the 3 highest months was 360 KW for Kriegnfeld then the demand charge = (300 x 276.82 DM) + (60 x 209.62 DM) = 92,623.20 DM/YEAR or 7,968.60 DM/MONTH :
- KWH consumption charges are given in PF/KWH for normal and off-peak hours for summer and winter seanons. 2.
- Total average cost equals total cost for electricity including all charges for demand consumption and power factor correction for 1 year divided by the total KWH consumption for that year. Figures are in DM/KWH, <del>،</del>

÷

# ELECTRICITY

3.0 ENERGY CONSERVATION OPPORTUNITY (ECO) SELECTION

## 3.1 Introduction:

The objective of the EEAP studies is to identify military construction projects which will reduce energy consumption at Army facilities. These construction projects generally consist of several "energy conservation opportunities" logically combined in a manner to form a construction project. Energy conservation opportunities are the individual elements of work which can be performed to save energy. For example, replacing single glazed windows with double glazed windows is an energy conservation opportunity. Adding insulation to an existing roof is another example of an energy conservation opportunity. Those two ECOs might be combined for several buildings to be implemented as part of a single construction project.

## 3.2 ECO's Investigated:

One of the first steps in an EEAP study is to identify those energy conservation opportunities which will be analyzed as a part of the study. Once those items are identified, their applicability to a particular site or a particular building must be determined through judgement based on the field survey data included in the data report. The Army Facilities Energy Plan provides several lists of ECOs which have been successful at Army facilities.

An excerpt of this list was included in the Schedule of Title I Services for this project and includes those projects proven to be effective at Army Facilities in Europe. See Table 3.1. These ECO's were examined for their applicability to the Community's buildings and with minor exceptions and additions of the other ECO's

identified during the Field Survey, compose the master list of opportunities examined at each installation. Refer to Table 3.2.

Specific exclusions of items from the USAREUR ECO list include the following:

- Connect to district heating Field Survey investigations revealed that no sources of district heat were available at any installation.
- Generate domestic hot water with heat pumps -The demand for domestic hot water during summer months when heat pumps are most effective is either too large in the case of family housing units or too small to make heat pump units economically attractive.
- Employ spot heaters In most installations using unit heaters, activities are performed throughout the space, making spot heaters impractical.
- Individual metering of family housing units As described in Section 2.4.1, because Army regulations prohibit charging occupants for utility costs, little benefit can be realized. Some family housing units in the Community presently have individual meters installed, but no programs for their use have been implemented.

In preparing the master list, ECO's were grouped according to "trade" into Architectural, Mechanical, and Electrical divisions.

Tables indicating which ECO's were to be investigated in the Phase II analysis for each building were prepared. These tables were submitted to the Community for review during Phase II, Simultaneously, a current list of planned and funded projects was obtained from the community.

÷

Those projects which have already received funding are not to be analyzed. Unfunded projects generated by the Community including those in the design process are to be treated as non-existent and full analysis under Phase II was performed.

One ECO often studied for large military bases is installation of a Base-wide type EMCS; for the Worms Community this is not applicable. A single system could not practically control all sites since they are widely separated and function independently from a facilities operation standpoint. Cost of communications line leasing between sites would be prohibitive. An additional factor to consider is the lack of air conditioning equipment for EMCS control since very few units are present, and those that are serve critical computer/communications facilities which cannot be controlled for energy conservation. Other potential EMCS control for heating systems is largely handled functionally by existing local optimization control panels which include time clock, temperature reset, and temperature shut-off functions.

Many facilities are to small to justify an EMCS for that site alone.
#### TABLE 3.1 USAEUR ECO'S (From Army Facilities Energy Plan)

- 1. Zone existing multiple use facilities to reduce energy consumption in minimal use areas.
- 2. Reschedule utilization for existing facilities.
- 3. Consolidate services into permanent buildings through alteration or new construction.
- Connect to district heating in order to purchase or sell energy.
- 5. Inter connect existing power plants.
- 6. Consolidate existing power plants where forecastable non-recurring maintenance cost can be demonstrated.
- 7. Convert to more energy efficient fuels.
- Improve existing power plant efficiency through the installation of flue gas dampers, turbulators in fire tube boilers and oxygen trim control.
- 9. Insulate existing supply and return piping.
- 10. Return condensate.
- Convert existing energy distribution systems to utilize more efficient medium.
- 12. Recover heat from processes such as boiler blowdown, refrigerant gas, exhaust air from laundries and messhalls, destratification of air.

- 13. Supplement the generation of domestic hot water through installation of a heat pump.
- 14. Decentralize domestic hot water heaters.
- 15. Curtail availability of energy to domestic hot water heaters.
- 16. Reduce domestic hot water temperature.
- 17. Insulate existing domestic hot water storage tanks.
- 18. Install shower flow restrictors.
- 19. Improve street lighting efficiency be delamping (reduction of lighting level) or replacement with low or high pressure sodium.
- 20. Relamp with fluorescent, H.P. sodium or other more energy efficient lighting.
- 21. Control light levels automatically.
- 22. Utilize photocell switches.
- 23. Replace incandescent lamps with fluorescent or H.P. sodium.
- 24. Replace mercury vapor with high pressure sodium.
- 25. Utilize high efficiency ballasts.
- 26. Employ spot heating in lieu of existing unit heaters.
- 27. Individual vs. stairwell or area metering of military family housing.

- 28. Recommend preventive maintenance program procedures for high efficiency motor replacement.
- 29. Provide or improve existing controls such as thermostatic radiator valves, outside air reset, night setback, duty cycling and economizer cycles.
- 30. Insulate basement ceilings, walls, attic floors and roofs.
- 31. Install caulking and weather stripping.
- 32. Install storm or energy efficient windows, double glaze existing windows, reduce window area, install translucent panels, upgrade by replacement, install thermal barriers, modify sky lights.
- 33. Replace existing doors, install vestibules, air curtains and load dock seals.
- 34. Study the feasibility of peak demand shedding.

#### ARCHITECTURAL

INSULATE ROOF OR CEILING

ELECTRICAL (con't.)

DISCONNECT ELECTRIC WATER COOLERS

CONSOLIDATE ELECTRIC COFFEE MAKERS

TURN OFF ELECTRICAL APPLIANCES WHEN NOT IN USE

REPLACE EXISTING LIGHTING SYSTEM WITH MORE EFFICIENT SYSTEM

ADJUST OUTDOOR LIGHTING CONTROLS

#### 4.0 PROJECT DEVELOPMENT

#### 4.1 Introduction:

Once the ECOs were selected for each building, the next step in the EEAP process was calculation of the savings which would result from and the cost to implement each ECO in each building. The savings from various ECOs have been calculated using a combination of manual and computerized analysis techniques.

Estimated costs have been calculated based on the extent of work in each building. Unit prices used in the estimate were obtained from Lameyer International, GMBH located in Frankfurt, West Germany. Lameyer International is a mechanical consulting and contracting firm. All construction cost estimates are in Deutsch Marks and are for FY83.

This savings and cost data for each ECO was used to compute economic parameters to determine the viability of a particular project. This economic analysis has been performed in accordance with ENERGY CONSERVATION INVEST-MENT PROGRAM (ECIP) GUIDANCE dated 15 February 1985, which was furnished as criteria for the revision of this EEAP study. That ECIP guidance requires the computation of a number of economic measures. These include:

1. ECO construction cost (Deutsch Marks).

- 2. Total annual energy savings.
- 3. Annual cost savings (\$).
- 4. Total discounted cost savings (\$).

5. Discounted savings/investment ratio (SIR).

6. Discounted energy savings/investment ratio (ESIR).

Having performed the economic analysis, ECO's not meeting the minimum economic criteria of savings/investment ratio (SIR) greater than 1.0 were dropped. The remaining projects were sorted and combined to form projects falling into one of three project categories.

- 1. ECIP Projects.
- 2. Community Energy Conservation Projects.

3. Increment F Projects.

This process is described in some detail in Section 6.0 of the Energy Report.

#### 4.2 ECIP Projects:

ECO's with SIR's and ESIR's greater than 1.0 were combined according to criteria supplied by the Community to form projects meeting the minimum project cost requirement by the ECIP criteria. For family housing, projects must cost \$100,000 or more. All other ECIP projects must be of at least \$200,000.

For the Worms Military Community, 8 ECIP projects were created. Two projects include insulation of family housing units. Three projects include building insulation in non-housing structures at 12 of the Community installations. Two projects include the consolidation of boiler plants. The final project is for the installation of an Energy Monitoring and Control System (EMCS) at one installation. Summary sheets for each ECIP project containing cost, savings and economic data are presented in Tables 4.1 through 4.7. Additional prioritization of these ECIP projects and discussion of their impact on Community Energy Consumption is contained in Section 5.0 of this Report.

#### 4.3 Community Energy Conservation Projects:

Economically viable projects whose construction costs were less than the ECIP minimum and could not be effectively combined to reach that minimum were grouped into a separate category. These projects will be funded by the community. Project documents (Form 4283) were prepared. For the Worms Community, a total of 38 separate projects were identified. Of these projects, 6 involve architectural modifications, 14 are mechanical projects, and 18 include electrical modifications. A list of these projects is contained in Table 4.8.

#### 4.4 Increment F Projects:

Many ECO's studied were of little or no cost to implement and produced significant energy savings. These projects, such as fluorescent lamp replacement, reduction of domestic hot water temperature, and weatherstripping, are classified as Increment F projects. A separate Increment F report listing the projects identified and providing guidance on their implementation has been prepared. This report also includes recommendations on the purchase of new equipment and suggests additional training programs for Community maintenance personnel which emphasizes energy conservation techniques.

# 5.0 PROJECT IMPACT

#### 5.1 Introduction:

The ultimate goal of the EEAP process is to conserve energy and save money. It is easy to loose sight of this goal however and get lost in the reams of paper, and millions of calculations that compose the supporting documentation of the EEAP study. In the following sections, energy savings associated with each project developed for each energy source used are compared with present energy consumption and energy consumption of the reference year FY 75.

÷

# 5.2 Projected Energy Savings:

Tables 5.1 through 5.16 summarize energy savings for each type of energy conservation project for each installation. Energy savings are listed in MBTU's using energy equivalency conversion factors supplied in the ECIP criteria. In the interest of being concise, the total energy savings by fuel type for all Increment F projects is listed rather than listing each Increment F project separately. For more detailed discussion of energy savings for each project, refer to the Increment F report.

Results of these energy conservation projects impact on annual energy consumption is presented graphically in Figures 5.17 through 5.32. These figures show total energy consumption for FY 75, FY 83 and projected energy usage after energy conservation project implementation for each installation.

Table 5.33 lists the total energy consumption in MBTU/year by installation for FY 75, FY 83, and the projected consumption after the implementation of all ECO's.

Percent change in energy consumption is also tabulated. Because complete utility data for each installation for FY 75 was not available, it is not possible to comment on energy savings for the entire Community with respect to the base line year. However, as compared with FY 83, the implementation of all ECO's will save 103,363 MBTU/year which is equivalent to a 14.94% reduction in energy consumption.

#### 5.3 ECIP Project Ranking:

The eight ECIP projects identified through the EEAP process are listed in Table 5.34 in order of SIR. Additional summary data on project cost and savings is included to aid in project programming.
