FROM THE ARMY ACQUISITION EXECUTIVE

Protecting Information

Throughout history, commanders have sought to leverage information to achieve a decisive advantage over the enemy. The information and information-based weapon systems of our Army's digitized force will provide commanders with an unprecedented level of information superiority. These systems will allow commanders to not only dominate the battlefield, but also to maintain situational control in operations other than war. Systems such as the Army Battle Command System (ABCS) dissipate the Clausewitzian "fog of war" by providing commanders with near total visibility over the battlespace, enabling them to execute attacks on the best targets, at the most opportune times, with the most effective weapon systems.

Our information-age Army will march on its computers. While providing an unparalleled capability to focus combat power, these same computers, when not properly protected, will also be our Achilles' heel. In a global information environment, sophisticated but unprotected military computer systems are subject to debilitating remote attacks that can disrupt or corrupt the information or completely shut down the systems. The disruption of troop movement and resupply data or the corruption of blood types in a blood-bank database may cause commanders and soldiers to lose faith in the availability and integrity of their information and the reliability of their information systems. This threat is real and is with us now. As noted by Michael Vatis, Deputy Assistant Director of the FBI and Head of the new National Information Protection Center (NIPC), "... computer viruses and attacks that can overflow buffers and shut networks down are available off the Web. We have concrete information about several foreign countries that are developing programs to target the U.S. and our critical infrastructure."

Reacting to cyber attacks in early 1998, the Deputy Secretary of Defense directed DOD to establish "positive control" over its information systems and networks and develop cyber intrusion detection action plans to ensure the availability, integrity, and authenticity of Defense information. In response to this directive, the Army Information Assurance (IA) Office formulated the Network Security Improvement Program (NSIP).

NSIP is a comprehensive program of innovative policies and procedures, state-of-the-art hardware and software technological security solutions, and new training initiatives designed to protect the Army's critical information infrastructure from the sustaining base to the deployed force. Its phased approach ensures the availability, integrity, authenticity, and confidentiality of the Army's tactical and sustaining base information and information systems across the full spectrum of conflict. NSIP establishes policies and tactics, techniques, and procedures (TTP); identifies enabling technologies; and integrates IA security tools into the command, control, communications, computers, and intelligence (C4I) architecture of sustaining base installations and into the design of battlefield information systems, networks, and the network infrastructure of the digitized force.

Phase I of NSIP, "Perimeter Defense," instituted 24x7 worldwide monitoring. This effort incorporates intrusion detection systems (IDSs) to oversee the Army's unclassified network gateways and more than 450 critical servers. In addition, the IDSs allow a near-real-time graphic view of the status of all network routers, both classified and unclassified. The Army also implemented the DOD-mandated Information Assurance

Vulnerability Alert (IAVA) "positive control" process to disseminate system vulnerability information and direct that vulnerabilities be corrected. The Army's training and certification programs for system administrators and network managers, information system security officers and managers, and user-level personnel were accelerated, as was the development of IDS and firewall training courses.

Phase II of NSIP, "Defense in Depth," implements a layered architecture of security tools and processes from the perimeter down to the user to protect systems from external exploitation and attack. Phase II directs the following:

- Identification of all "backdoors" into Army networks and protection of all circuits that connect to Army installations;
- Development of policies, procedures, and hardware and software solutions necessary for hardening Army SECRET Internet Protocol Router Network (SIPRNet) circuits;
- Expansion of system administrator and network manager security training laboratories in the United States and funding of new training laboratories for Europe and Korea;
- Central procurement of network and host-based IDS and firewall licenses;
- Migration to Remote Authentication Dial-In User System (RADIUS) compliant identification and authentication during use of all modem dial-in services;
- Acceleration and integration of new and emerging technologies, e.g., biometrics, to replace traditional user identification and password procedures;
- Acceleration of the Army public key infrastructure effort; and
- Development of event correlation and data reduction tools to reduce the number of personnel required to analyze the exponential increase in data from multiple security sensors.

Phase III of NSIP calls for "Integration of Security Tools Into the First Digitized Division (FDD) and Sustaining Base Interface to Deployed Forces." During this phase, network security initiatives and emerging technologies are being integrated into the design of battlefield information systems, networks, and the network infrastructure of the FDD. This will create a secure interface through tactical gateways between the sustaining base and deployed forces that is transparent to the user.

Command and control of the information-age Army is dependent on information systems. For too long, the security of unclassified Army networks and systems was not given sufficient focus. Security assessments were often only documentation reviews—that is "paper drills" with insufficient hands-on efforts to determine if the systems and networks were vulnerable to unauthorized intrusions. The Army is now serious about the security of its systems and networks and is taking the necessary steps to provide a robust protection program.

ABOUT THE COVER

Using the latest technology and the best expertise, the Army is currently engaged in a major effort to ensure the confidentiality of information and information systems used by commanders and their staffs.

INTERVIEW WITH KEITH CHARLES DEPUTY ASSISTANT SECRETARY OF THE ARMY FOR PLANS, PROGRAMS AND POLICY AND DEPUTY DIRECTOR FOR ACQUISITION CAREER MANAGEMENT

Interviewed by *Army RD&A* Managing Editor Cynthia D. Hermes
and *Army RD&A* Editor-in-Chief Harvey Bleicher

A *Army RD&A*: The 10th anniversary of the Army Acquisition Corps (AAC) is currently being celebrated. How would you assess the AAC after its first decade?

Charles: We established the AAC in 1989 comprised solely of uniformed members. We were actually ahead of the other Services because they didn't start their Acquisition Corps until 1991 when the Defense Acquisition Workforce Improvement Act [DAWIA] went into effect. About 5 years ago, however, the Army fell substantially behind the Air Force and the Navy in establishing a civilian Acquisition Corps component. But Gilbert F. Decker, the Army Acquisition Executive at that time, and then Director for Acquisition Career Management LTG Ronald V. Hite put substantial new emphasis on the AAC. As a result of this emphasis, the Army is ahead of everyone again and I think the Army's Acquisition Corps is the best in DOD. In fact, I believe that the Acquisition Corps Directors in both the Navy and the Air Force would trade their Acquisition Corps for the Army's hands down.

Army RD&A: As the prime architect in re-engineering and revitalizing the AAC, you are credited with much of the success it now enjoys. What actions do you now plan to undertake to ensure the continued success of the AAC?

Charles: I don't know if I should be credited with the success of the AAC because a lot of hard-working people, most of them from the field, spent a great deal of time helping us figure out how to put the AAC back together. That was almost 4 years ago.

Relative to the AAC's continued success, I believe that we must have two simultaneous, ongoing efforts. First, we must have constant two-way communication with careerists in the field. We need to inform them about what we are planning to do. Then, we need them to tell us their requirements. Second, and simultaneously, we must ensure that the careerists understand our actions. We must stay focused on current Army priorities and, more important, the priorities 5 years from now. If we only relied on one of these

efforts, I think we'd miss the boat. If we only rely on careerists' requirements, they may not know where the Army is going. Likewise, if we only looked at the Army's priorities and not at where our careerists are today, we'd have no way of knowing if we can get the careerists where they need to be 5 years from now. So, we've got to do both simultaneously.

Army RD&A: How would you compare the qualifications of the Army Acquisition Workforce (AAW) today with those of a decade earlier?

Charles: I'd be nuts if I didn't say that they're better. But you have to understand that the

"better" may just mean we now do a better job of keeping records. We've always had a high-quality officer corps in the AAC because the military always paid attention to career development and central personnel management. Until recently, however, we never paid much attention to civilian records. Now we do.

Acquisition Civilian Record Briefs (ACRBs) and Individual Development Plans (IDPs) are primary ingredients to central civilian management. For example, 4 years ago we didn't know how many of our GS-12s and GS-13s had graduate degrees, which is a very large percentage of the population. We didn't have that information because we had no central database to obtain it. However, we made a commitment about 3 years ago to have central files for civilians.

Army RD&A: What are the three most important things that an AAW member should do to ensure a successful career in the acquisition field?

Charles: First, members must establish a reasonable career goal for themselves. If they don't have a goal, even an imperfect one, they will end up wasting a lot of time and effort. It's much better to focus on a goal and start building toward that goal, even if it's wrong, as opposed to shotgunning the horizon with all kinds of training courses which, in combination, add up to nothing. So first of all, an AAW member must have a focused and reasonable goal.

Second, to remain competitive, members must understand their competition. As our central database improves, we will be able to publish information on either the entire workforce or the workforce in a specific geographic region. For example, if a GS-11 Series 1102 employee in Huntsville, AL, wants to know the qualifications of GS-11 Series 1102 employees in a specific area, or the entire Army, we can provide that information. This permits them to know what their competitive status is using objective measures such as academic qualifications, the number of functional areas others have, and certification levels of other employees. Once individuals have this information, all they need to do is build a plan to stay competitive. If a person establishes a reasonable goal, becomes aware of the competition, and

stays competitive, they can't miss. It's a pretty simple formula and we will help them. We'll help them get the information about their competition, and we will provide for the schooling they need to stay competitive. No one else in the federal government has the kind of opportunities that we have in the AAW.

Army RD&A: What importance do you place on central records?

Charles: As I noted before, if we don't have a quality central database on civilians, we can't credibly tell careerists about their competition. I place a great deal of importance on that information.

Relative to the importance of the ACRB, I want to stress that it is becoming the primary tool to represent the individual in a competitive environment. I recently convened an Acquisition Education, Training and Experience Board and the first piece of paper in every file was an ACRB. The board starts its deliberations with the ACRB because it is a very convenient way to look at a whole person on one piece of paper. Actually, the ACRB is formatted exactly like the Officer Record Brief (ORB). This helps civilians to be competitive with their military counterparts because the same board reviews both the ORB and the ACRB. Thus, the board can easily compare the qualifications of two individuals. Therefore, I think the ACRB is essential.

The IDP is also very important. It forces individuals and their supervisors to establish a plan on how to stay competitive. The plan is actually an agreement between employees and their supervisors relative to what it takes to be competitive; what education, training, and

experience will be planned and when; and what else is needed to stay competitive.

The IDP and the ACRB also allow us to measure supervisor and senior rater support for career development. Both the IDP and ACRB are automated and interconnected. As such, with good ACRBs, I can look at an organization by unit identification code, press a button, and the ACRBs will show me the requirements of the entire population. I can then press another button and get a summary of everything that's been approved on an IDP by an organization, which shows the command's commitment to satisfy the requirements. I can compare those two and determine whether the command is supporting the career development of its personnel and how much of a backlog it has.

I might add that in April 1996, a memo related to career development was signed by the Assistant Secretary of the Army for Manpower and Reserve Affairs and the [then] Assistant Secretary of the Army for Research, Development and Acquisition. That memo states that anyone in charge of an acquisition organization will have as their first measure of performance in either their Officer Evaluation Report or the civilian equivalent what they have done for the career development of the AAW members of their organization.

I also want to stress that support is constantly growing in the workforce for serious career development. That support has always been there for the military side, but it's beginning to grow substantially on the civilian side.

What the Personnel Demo does for Acquisition Workforce members is substantially increase their ability to move through the system very quickly and receive many more benefits, including the potential for larger bonuses.

Army RD&A: What benefits do operational experience assignments provide to the Army and to the AAW?

Charles: A lot of civilians in the AAW have never seen the fighting Army and I don't think they can serve any Defense institution to the optimum until they do. The civilian Acquisition Workforce needs to see the fighting force up close and personal, spend a night in the field with them, or serve in a contingency contracting assignment in an area such as Kosovo. There's no doubt in my mind that there is substantial benefit in having an AAW member see the fighting Army. And I don't mean the Army Training and Doctrine Command or Army Materiel Command. I mean the Forces Command, 8th Army, or our forces in Europe—the fighting force.

Army RD&A: The AAC/AAW Roadshow briefings, which were recently renamed Army Acquisition Workforce 2000, are one of your ongoing initiatives to communicate with the workforce. How successful have these briefings been and what type of feedback have you received from them?

Charles: After nearly 4 years of doing this in my spare time, I think the most difficult problem we have is communication. False information starts with rumors. I can spend two complete Roadshow cycles, talk to 20,000 people in 1 year, and still not correct false information. For example, everyone thinks that if they get picked for the Competitive Development Group (CDG), they will immediately have to move. I *cannot* get that rumor turned around. It is not true now and never has been true. I think people are going to believe what they want to believe regardless of what they hear.

During the first round of Roadshow briefings about 3 years ago, I wondered if we should have metal detectors at the door. People were hostile. They were used to hearing Army Headquarters make promises and not deliver anything. We made promises and didn't deliver.

The questions we received 3 years ago were conceptual ones. Today they are very focused, informed, and detailed. For example, someone recently asked, "I saw that 98 percent of the first two year groups

of CDG selectees had master's degrees. Does that mean that master's degrees are required to be a CDG selectee?"

The questions we receive at these briefings probably help us even more than they help the workforce. They allow us to get a better understanding of how the workforce feels about Program A, B, or C. We try to allow 30 to 45 minutes for comments, but it normally turns out to be 2 hours or longer in an auditorium holding about 700 to 1,000 people. I think the Roadshows are very useful.

Army RD&A: In an interview with Army RD&A in 1992, you provided some suggestions for controlling costs in the acquisition process, particularly during times of declining resources. How successful has the Army been in controlling cost growth?

Charles: We haven't had any huge explosions in cost growth in the last 6 or 7 years. The biggest problem with cost growth prior to 1992 was program perturbation because we kept changing the guidance we provided to the program manager (PM). We took his money, changed his schedule, changed his requirement, and made other substantial changes. All of that caused significant cost growth.

We've managed to provide a fair amount of stability during the past 6 or 7 years even though we've had major reductions. One of the key reasons for this is that my Equipping Program Evaluation Group Co-Chair MG Joseph M. Cosumano, his predecessor LTG Ronald E. Adams (then a major general), and I adamantly refused to take salami-slice reductions. Taking money piecemeal drives up the cost of impacted programs so much that OSD or Congress ends up killing them anyway. So, we have been absolutely adamant that the only way we would take reductions was to kill a program. That's the only way that makes sense with the number and size of the programs that we have. I think we've done as good as can be expected in a continuing decline of resources.

I think those days of declining resources are over, however. I believe resources for research, development, and acquisition are on the rise. I'm looking

forward to the next 4 or 5 years because I believe we will be able to fix some things that we were unable to fix during the past 6 or 7 years.

Army RD&A: You also indicated in a 1992 interview with Army RD&A regarding your role as Deputy Assistant Secretary of the Army for Plans, Programs and Policy that your office should be viewed as an organization that solves problems. If this is still valid, what are some of the key problems your office is currently addressing?

Charles: In my estimation, one of the things that causes problems in the field is too much involvement from Army Headquarters in policy, oversight, and in reviewing decisions. If we want efficiency, we've got to put the authority to make decisions at the lowest possible level.

Since the early 1990s, we have been delegating as much authority as possible to program executive officers (PEOs), deputies for systems acquisition, and PMs. In fact, I gave them my entire statutory reprogramming threshold. This eliminated a huge pile of paper that constantly came in here from people in the field asking to move \$1 million from one account to another. Previously, I had to sign and approve it, the Assistant Secretary of the Army (Financial Management and Comptroller) had to sign and approve it, we'd send it back, and then we moved the money. Now they tell us after they move it. We are delegating as much authority to the field as we can. This permits decisions to be made more quickly and, frankly, better decisions are made closer to the problem.

When employees come to work for me, I tell them that they will be given all kinds of priorities and they won't know which one to do first. These priorities may include requests from the White House, the Speaker of the House, the Secretary of Defense, and the Secretary of the Army, or a request from a PM for assistance. When I ask employees which one they would do first, they all say the one from the President. I say, "Wrong." I don't mean any disrespect to the President, but the way to decide what to do first is to determine the request that touches a real soldier closest and quickest. The request from the President may come first if a soldier in the

field is at risk. However, if the one from the President involves some contractor who wants a contract, and the other is from a PM who needs something in order to field equipment to soldiers, it doesn't take a Rhodes scholar to figure out which one to do first.

This is what I mean by saying my office solves problems. We focus on the field first. If the field calls, we drop everything and help them. Even if individuals taking the call are not the ones responsible, they help by figuring out who *is* responsible. We never say, "We don't do windows."

Army RD&A: You have been highly supportive of the DOD Civilian Acquisition Personnel Demonstration Project. What do you hope to achieve with it, and how has the workforce responded to it since its implementation?

Charles: I've had to be supportive because my organization is in charge of its development for all of OSD. What is so interesting about the Personnel Demo is that a lot of time was spent looking at all other demos, and we picked the best parts of all of them and then "pushed the envelope" whenever we could.

The first real plus of our Personnel Demo is that our broadbands [pay range] are much broader than those of most other demos. Whenever the broadband level is broad, a personnel action can be eliminated, thus saving time while also increasing the authority of supervisors and senior raters. For example, a supervisor can adjust the pay of an individual in the highest broadband, from a GS-14 Step 1 to a GS-15 Step 10, without having to go through a civilian personnel office. The action goes directly to the Defense Finance and Accounting Service and the pay is adjusted.

The biggest concern of the workforce, however, is that we have given too much authority to supervisors. If a supervisor is not objective, an employee could be adversely impacted because of a personality conflict. My response is that the same thing can happen under the

current system because there are no checks and balances outside of the rater and senior rater. At least with the Personnel Demo, we've tried to provide a check and balance approach. For example, in our pay pool, all supervisors must defend their decisions in front of their peers and the pay pool manager (the senior supervisor). If employees work in a very tiny organization with only two first-line supervisors who are both corrupt, and the senior rater isn't any better, they're not any better off in the Personnel Demo. But, they're not any worse off either. We tried to do what we could to make the system a little more objective.

What the Personnel Demo does for Acquisition Workforce members is substantially increase their ability to move through the system very quickly and receive many more benefits, including the potential for larger bonuses.

The Personnel Demo involves a written contract between an individual and a supervisor that says the individual understands the organization's mission and what he or she will do to contribute to accomplishing that mission. Contributions must be objective and measurable. At the end of a rating period, a supervisor evaluates these contributions and determines if they were completed on time and assesses their value to the organization. The supervisor then goes through a series of scorings to provide a number that helps determine appropriate compensation for each individual. In many

cases, it may be far more than what an individual makes now.

With regard to the response of the workforce to the Personnel Demo, I believe the main problem is communication. Those members who have received the information and taken the time to really understand the demo generally seem to be very supportive. The Personnel Demo is very different from anything that has ever been done in the federal government. It is much like the private sector because it permits things to happen very quickly and with less bureaucratic structure, which is really great for employees.

The unions have been the most challenging aspect of the Personnel Demo. Initially, they were against the demo, but they have had a substantial change of heart. In fact, about 3 weeks ago, I met with the President of the American Federation of Government Employees (AFGE) in Huntsville, AL. He is strongly supportive of the Personnel Demo now, even though he was against it a year and a half ago. The PEO, Command, Control and Communications Systems has informed me that the AFGE President at Fort Monmouth, NJ, has also changed his position and is now for the Personnel Demo.

Army RD&A: Is there anything else you would like to discuss?

Charles: In conclusion, I would like to remind everyone of two things: first, we in acquisition have a unique opportunity. Congress has recently acted multiple times to simplify what we do, to make career development of our workforce a priority, and to simplify our personnel rules. No one else in the executive branch of the government has these authorities. We need to take full advantage of this unique point in our history.

Second, we must never lose sight of our mission—supporting the soldier. We provide what our soldiers need to be the best—the most lethal, the most survivable—simply, the best.

ACERT: ENSURING AUTOMATED INFORMATION SYSTEMS SECURITY

MAJ Glen Teasley and CPT David Papas

Introduction

As the Army strengthens its "front line" in the war against hackers, viruses, and "worms," the Army Computer Emergency Response Team (ACERT) is expanding its protection of the Army's electronic highways using the latest technology and the best expertise. The ACERT is the Army's operational element for computer network defense. The ACERT conducts command and control protection operations in support of the U.S. Army to ensure the availability, integrity, and confidentiality of information and information systems used by commanders and their staffs worldwide. The ACERT is a division of the Land Information Warfare Activity (LIWA), which is located within the U.S. Army Intelligence and Security Command at Fort Belvoir, VA.

Organizational Structure

The ACERT is comprised of three branches: the Regional Computer Emergency Response Team (RCERT), the ACERT Coordination Center (ACERT/CC), and the Computer Defense Assistance Branch.

The RCERT Branch manages the functional and operational support requirements of four field RCERTs: RCERT Pacific at Fort Shafter, HI;

RCERT Europe in Mannheim, Germany; RCERT CONUS at Fort Huachuca, AZ; and RCERT Korea in Taegu, Korea. (Note: RCERT Korea is scheduled for initial operational capability in FY00.) The RCERTs are collocated with the Army Signal Command's (ASC's) Theater Network and Systems Operation Centers (TNSOCs). By leveraging both the ASC's network operational function and the ACERT's network security function, the Army provides enhanced network support with a constant vigilance for network security. The close working relationship among the ACERT, RCERTs, and TNSOCs ensures the Army's ability to communicate worldwide in a secure manner.

The ACERT/CC receives computer incident and intrusion reports, conducts analysis of vulnerabilities, and provides technical assistance to network and system administrators and managers. In addition, it analyzes new viruses and anti-virus software and monitors network intrusion devices that support investigations conducted by the Criminal Investigation Command (CID).

The Computer Defense Assistance Branch provides a tool for Army commanders and their staffs to assess their network security. The Computer Defense Assistance Program (CDAP) is

designed as a "white hat" external assessment; the results are shared only with the unit assessed. Commanders use the information to improve their network security and lessen the vulnerabilities that may allow unauthorized access.

CDAP objectives focus on the overall security configuration of the networks and identifying potential points of unauthorized access into networks. Objectives also focus on validating vulnerabilities and assessing the depth and degree of a potential compromise, and recommending methods, techniques, and configuration modifications needed to secure the scanned networks.

ACERT's Mission

In December 1998, the Army Deputy Chief of Staff designated the ACERT as the Army component for the Joint Task Force-Computer Network Defense (JTF-CND). In this capacity, the Director of the LIWA directs Army actions to ensure the security of all Army networks. On a daily basis, the ACERT is fully engaged as a synchronized component of the JTF-CND team protecting DOD networks worldwide.

In its mission to protect Army networks, the ACERT coordinates daily with organizations both internal and external to the Army. Within the Army, the ACERT coordinates with the Office of the Deputy Chief of Staff for Operations and Plans (ODCSOPS); the Office of the Director of Information Systems for Command, Control, Communications and Computers (ODISC4); the Office of the Deputy Chief of Staff for Intelligence; ASC; and CID. Outside the Army, the ACERT coordinates with the following organizations and agencies: the Air Force CERT, the Navy Computer Incident Response Team (CIRT), DOD CERT (formerly known as Defense Information Systems Agency ASSIST), the Marine Corps CERT, the Coast Guard CERT, the Federal Computer Incident Response Capability, the Carnegie Mellon University CERT, and the FBI's National Infrastructure Protection Center. Coordination encompasses collaborating technical efforts to assess vulnerabilities and make recommended solutions.

To capture the massive amounts of information required to maintain

situational awareness, the ACERT has developed a database that stores data on all reported or identified incidents and intrusions to Army automated information systems. In addition, in conjunction with the Air Force CERT and Navy CIRT, ACERT has developed the first joint CERT database. This database will allow ACERT, JTF-CND, and other Service CERTs to share information and conduct analyses on incidents to identify attack indicator profiles. The goal is to correlate these profiles with all new data to proactively determine if a suspicious event is an attack. In this way, the three CERTs and JTF-CND can share information and identify possible threats.

Potential Threats

There are many potential threats to computers and computer networks. These include poor computer security practices, disgruntled employees, hackers, worms, and "malicious logic." Poor computer security practices are actions taken, or not taken, by users and system administrators that leave the computer or network vulnerable to others. Poor security practices include lack of passwords or poor password usage, systems not running anti-virus software, system administrators not updating anti-virus software at least once every 2 weeks, and users not checking files received from unknown sources.

Disgruntled employees can be a major threat because they have direct access to the computer network and the information on the network. Because they already have access, it is easy for the disgruntled employee to destroy or alter data, take sensitive information, or disrupt normal operations.

Hackers are people who attempt to gain unauthorized access into the automated information systems of other people or other companies. A hacker may attempt to break into a system for fun with no intent to cause damage or may attempt to penetrate a computer system for malicious reasons.

The term malicious logic refers to harmful code that includes viruses, worms, and Trojan horses. A virus is a piece of computer code designed to infect other codes and files and cause some unexpected and, for the victim, usually undesirable event. A worm is a

program that duplicates itself repeatedly, potentially causing network congestion and or complete shutdown. A Trojan horse is a program in which malicious or harmful code is contained inside an apparently harmless program in such a way that it can gain control of a computer system and do its own chosen form of damage. The most devastating forms of Trojan horse programs can destroy a hard disk or render the host computer totally useless.

There are multiple inherent risks in operating computers and computer networks. These include denial of service attempts, disruption of normal service, altered or destroyed data, hardware damage, and loss of sensitive information. A denial of service is an action that prevents any part of an automated information system from functioning in accordance with its intended purpose. With computer networks, the result is often a communications failure, which results in the loss of connectivity between computers on the network. In a denial of service, one or more computers may not be able to communicate with other network computers. Closely related to a denial of service is a disruption in normal operations. In this case, an automated information system can still function, but its functionality is degraded.

Data can be destroyed by user error, such as deleting a file or not saving a document regularly, or by an outsider altering or deleting a file. Damage to hardware is another risk. Loss of

sensitive information occurs when data stored on a computer are stolen. People steal information for several reasons: monetary gain, industrial espionage, notoriety, or simple challenge. These risks are exploited by many different threats.

Countering The Threat

Countermeasures are actions taken to reduce or eliminate vulnerabilities to automated information systems. Countermeasures are categorized as reactive or proactive.

Reactive countermeasures begin with the detection and identification of an incident or an intrusion. An incident is an attempt, successful or unsuccessful, to discover information on the configuration of a computer system and the services it provides or to gain unauthorized access to it. An intrusion is a subset of an incident in which the intruder has successfully gained unauthorized entry into an automated information system, or has successfully exceeded authorization on it.

System administrators or operators who detect any automated information system security incident are required by Army Regulation AR 380-19 (*Information Systems Security*) to immediately report the incident to the Information Systems Security Officer, who will notify the installation systems security manager. Concurrently, the system administrator or operator will notify the appropriate RCERT and request technical assistance. The RCERT verifies that an incident or intrusion has occurred and reports it to the ACERT. If an intrusion has occurred, the ACERT reports it to the ODCSOPS Information Operations Division, DOD CERT, and JTF-CND. The ACERT also notifies both the Army CID's Computer Crime Resident Agency and the Army Case Control Office at the U.S. Army Intelligence and Security Command.

The ACERT or appropriate RCERT can dispatch a team to assist local commands in taking appropriate action in response to a computer intrusion. The team provides technical assistance to the installation systems security manager and system administrator to restore the affected system. The team also provides technical assistance to the CID to determine the source of the attack.

***In its mission
to protect
Army networks,
the ACERT
coordinates daily
with organizations
both internal
and external
to the Army.***

Proactive counter-measures are actions to prevent accessibility to automated information systems. These actions include ensuring the security of system configurations, conducting system vulnerability assessments, using and updating anti-virus software, and alerting system administrators of new vulnerabilities. The ACERT has posted system configuration guidelines on the ACERT Web page to assist system administrators in making their systems as secure as possible. In addition, the Computer Defense Assistance Branch conducts vulnerability assessments of networks via an eight-step assessment program.

Anti-virus Initiatives

The Army uses both the Norton and MacAfee anti-virus programs. The ACERT receives updates from both vendors on a weekly basis or more often as new updates are released. These updates are tested by the ACERT prior to disseminating them to the Army via the ACERT Web page. The ACERT recommends using both Norton and MacAfee, one for the clients and the other for the server.

The ACERT monitors the Army's Information Assurance Vulnerability Alert (IAVA) process. The IAVA process is a DOD-mandated process for disseminating information and required actions on serious vulnerabilities to or attacks on DOD automated information systems. The ACERT publishes IAVA messages to disseminate information and required actions on new and critical vulnerabilities to automated information systems. IAVA messages are disseminated to all Army major commands by a general service message and to all subscribers via the ACERT list server. IAVA messages are directed by DOD CERT, JTF-CND, ODISC4, or the ACERT. The IAVA process for the Army requires that information assurance officers at major commands report receipt of an IAVA message within 5 days and report compliance with the required actions or submit a waiver within 30 days. This timeline can be accelerated

depending on the criticality of the vulnerabilities addressed. The status of IAVA compliance by the major commands is monitored in the Army by both the ODISC4 and ODCSOPS, and in DOD by JTF-CND and the Deputy Secretary of Defense.

Future Initiatives

The ACERT is moving into the future with two initiatives: a fully integrated incident database and predictive analysis. The ACERT is implementing a predictive analysis process to proactively identify potential attacks against Army networks. Predicting network attacks provides commanders a means for selecting the best course of action for protecting networks. The predictive analysis capability of the ACERT's Analytical Section is integrated into a multifaceted Land Information Warfare Activity analytical architecture. This structure also includes vulnerability assessment analysis via the Information Operations Vulnerability Assessment Division and the Computer Defense Assistance Program, reverse engineering and technical analysis of hacker tools via the LIWA Laboratory, and threat analysis via the LIWA Information Division's Intelligence Branch.

Additional Information

For additional information, the ACERT and RCERTs can be contacted as follows: **ACERT:** Toll Free 1-888-203-6332, Commercial (703) 706-1113, DSN 235-1113, Worldwide DSN (312) 235-1113; **RCERT CONUS:** Commercial (520) 538-2482, DSN 879-2482; **RCERT Europe:** Commercial

(011-49) 0621-730-5232, Worldwide DSN (314) 380-5232; **RCERT Pacific:** Commercial (808) 438-7999, Worldwide DSN (315) 438-7999; **RCERT Korea:** Commercial 011-82-2-7915-9967, Worldwide DSN (315) 725-9967. The ACERT Web site is at www.acert.belvoir.army.mil.

Conclusion

The ACERT is a key Army element for ensuring the availability, integrity, and confidentiality of information and information systems used by commanders and their staffs world-wide. Under the command and control of the LIWA Director, the ACERT maintains a vigilant watch for the numerous threats to Army automated information systems and networks.

MAJ GLEN TEASLEY is the ACERT Operations Officer for the Land Information Warfare Activity at Fort Belvoir, VA. He holds a B.S. degree in science from the Pennsylvania State University and is a graduate of the Army's Computer Science School.

CPT DAVID PAPAS is the Chief, ACERT Coordination Center for the Land Information Warfare Activity at Fort Belvoir, VA. He holds B.S. degrees in computer science software programming and systems engineering from the University of Southern Mississippi and is a graduate of the Army's Computer Science School.

INFORMATION ASSURANCE IN THE INFORMATION AGE

COL John C. Deal, COL Michael F. Brown,
and Phillip J. Loranger

Introduction

In 1889, Almon B. Strowger was an undertaker in Kansas City. It turns out that his business was compromised by a local telephone operator—the girlfriend of Strowger's local competitor in the undertaking business across town. It seems that every time a prospective customer called the local telephone operator for information on available undertakers, she would direct them to her friend. This apparently upset Almon Strowger enough that he set out to develop an automatic electromechanical switchboard that would eliminate the intervention of an operator; in other words, he wanted to remove human access to the control of the switch mechanism.

It is important to note that in 1889, telephone connections were performed manually. In 1892, the first automatic electromechanical switch went into commercial operation in the United Kingdom. This step-by-step or progressive control switch became known as the "Strowger Switch," and many are still in operation today. The lesson to be learned from this is that pathways providing access to the control of a circuit or packet data switch matrix, control system, or data repository can be exploited.

This historical vignette is instructive because it reveals the fundamental problem with data networks today. The primary purpose of Strowger's invention was to deny human access to the control of the information system—in Strowger's case, control of the circuit switch matrix. Unfortunately, today's data network architecture has mixed the control pathways with the communications or packet switch pathways. One can characterize this as a truly "open architecture." Therein lies the problem or vulnerability.

Networking Fundamentals

To identify the required measures to reduce or eliminate internal or external risks associated with computer and data switch networks, we must first understand the fundamentals of data networking, its capabilities, and its vulnerabilities. Without going into great detail, data networks are software intensive. Information packets are exchanged between elements that comprise a network that invokes various operations. These software "commands," also known as "primitives," tell the network what to do, such as set up a connection, tear down a connection, transfer a file, or allow remote interaction. These commands or requests for services originate from both client terminals and server terminals as well as packet data switches. One can exploit these commands to make the network do what the individual desires or gain access to an information source connected to the network.

Currently, there are approximately 3 million computers and 20 million users that make up the Internet, which is a global amalgamation of networks of networks. The current metric is that this network is doubling every 8 months. And there seems to be no abatement to this rate of growth as more and more business and financial processes and services are automated. This seemingly chaotic construct which, from its inception, has evolved over time with no real architectural blueprint or master plan, achieves a high degree of interoperability by an established and mandated set of protocols as specified by the Internet Architecture Board; the enforcement mechanism being if you bring your network to the Internet it either complies with these protocols or it doesn't connect. The Internet uses the Transmission Control Protocol/Internet Protocol (TCP/IP) suite

of protocols to allow file transfers, remote log ins, e-mail capability, searching of the World Wide Web, and access to newsgroups and chat services.

The increasing reliance on data networks by the corporate world and small businesses as well as governmental agencies is made even more dependent as these organizations' data networks become increasingly interconnected. This exponential growth in interconnects creates more pathways for exploitation. The dilemma now facing the corporate world, small businesses, and government is how to balance openness with security. Succinctly, the deviant or dark side of society (hackers) exploit these vulnerabilities for illicit purposes while the rest of society struggles with finding ways to protect its systems for licit purposes. Thus, the environment we find ourselves in is a new "arms race" for the information age. It is "spy versus spy." It is the hacker versus the network security professional. As hackers develop new ways to exploit, network administrators develop new ways to protect their networks from malicious intrusions.

Defensive Tools

Informed network administrators obviously do everything they can to deny the hackers' ability to exploit known vulnerabilities. What readily available defensive tools do network administrators have at their disposal? Without question, the best defense is a good access management philosophy. Passwords are the most widely used access method employed today and, therefore, are the most widely exploited. The latest and greatest hacker tools, developed by and for hackers, make the once foolproof use of passwords insufficient defense against a determined hacker. That, combined with

the almost insurmountable hurdle of enforcing strict password generation policies, makes it necessary to look at alternative methods of access management and control. In this new arena, biometrics has become the clear leader.

Fingerprint, iris, retinal, and voice recognition promise greater and more reliable control of access to computer networks. Hackers may be able to guess or crack a password, but the degree of difficulty associated with mimicking a voice pattern or duplicating a fingerprint approaches the unattainable, especially if coupled with strong identification authentication. Biometrics embedded across our system of systems will ensure only authorized individuals gain access to critical computer networks and information. Biometrics, in conjunction with other emerging information assurance technologies, can prove to be the solution to keeping criminals out of our systems.

Further, operating systems along with many applications have inherent security features that can be exploited by a knowledgeable network administrator. Thus, it is critically important that network and systems administrators be well versed about all the defensive tools embedded in the operating system under their control. These include setting file access control lists (ACLs) and execution command permissions; establishing IP allow/deny lists that further restrict access to a list of IP networks or individual IP host addresses (e.g., for UNIX machines, a TCP wrapper or a hosts.deny list can be used); using Secure Socket Layer Version 3 (SSL), which encrypts sessions from a user's Web client to the Web server; reverse Domain Name Service (DNS) lookup for limiting access to only registered hosts and workstations in a specific Internet domain (e.g., **army.mil**); and user time of day access control which, for Windows NT servers, further restricts users to specific hours and days of the week.

Without going into more detail, network administrators can build much more elaborate network security architectures. Commonly used are intrusion detection software systems that constantly screen all IP traffic for unauthorized entries by scanning data traffic and looking for profiles within data packets that indicate hacker activity. These packages are normally installed on a workstation connected to a device known as a security router, which routes all IP traffic to the

IDS. The IDS system is installed where the private network connects to the public Internet. Firewalls, which are designed to deny entry by unauthorized users, are also installed at network entry points or in front of a server with sensitive information.

Other evolving capabilities include public key infrastructure (PKI), which uses public and private encryption keys for all data transactions over the Internet or within an Intranet and virtual private networks (VPNs), which is a newly developed protocol that literally creates a private network within a public network.

In summary, defensive measures can be broken down into three parts: **prevention**, **detection**, and **response or reaction**. Prevention consists of procedural fixes such as passwords, user certification, and both physical and personal security measures. It does an organization no good to allow questionable employees access to their networks. Awareness training goes a long way in building defense in depth among the workforce. An informed workforce aids in protecting an organization's sensitive information. Firewalls using packet filters and proxy agents work well against unsophisticated hackers but are still vulnerable to the experienced hacker.

The defensive tools noted above will serve most network administrators well. Detection of intrusion is key either by constantly reviewing system logs for unauthorized activity or through the installation of intrusion detection software systems that can be connected to alarm and alert notification systems.

Finally, timely and appropriate response must be built into an organization's or government agency's network defense protocol. Responses consist of changing all password files; requiring all users to reauthenticate and reroute data traffic; tightening IP filters and firewalls; certify revocation; taking the system down and rebooting the system; and the most extreme measure of all—totally disconnecting an internal network from all external networks. This last response works for external attacks but not internal attacks. Tracking an insider is both easy and hard. It is easy because the attacker is located within a general area and can be traced; it is hard because the attacker usually possesses inside information about the network.

Conclusion

The "arms race" is on. The winner is yet to be determined, but vigilant and

relentless application of the defensive measures described in this article will go a long way toward thwarting malicious attacks. Further, continued research and development of new technologies such as biometrics, VPN, and PKI promise significant protection in the near future. All of these new technologies have one common attribute: denial of human access to the control pathways of a computer network system. Almon Strowger got it right 100 years ago.

COL JOHN C. DEAL is Commander of the U.S. Army Information Systems Engineering Command, Fort Huachuca, AZ. He holds an M.S. degree in electrical engineering from the Naval Postgraduate School, an M.A. degree in national security and strategic studies from the Naval War College, and an M.A. degree in international relations from Salve Regina University.

COL MICHAEL F. BROWN is Director for Information Assurance in the Office of the Director of Information Systems for Command, Control, Communications and Computers. He has a B.S. degree in education from the State University of New York at Geneseo, a master of education from the University of Pennsylvania at Bloomsburg, and his public school administrative degree from Bucknell University.

PHILLIP J. LORANGER is Chief of the Command and Control Protect Division in the Office of the Director of Information Systems for Command, Control, Communications and Computers. He has a B.S. in business administration and management from the University of Maryland and a master of technology with a concentration in information security from Eastern Michigan University.

PROTECTING THE DIGITIZED FORCE

Robert R. Lehnes and John Skrletts

Introduction

Traditionally, tactical battlefield automation systems have been operated in a stovepipe environment, thus limiting their exposure to external threats. This was accomplished by restricting both local and remote user access and only allowing point-to-point communications for information exchange between different hosts. This is an acceptable, if not desirable, mode of operation from a security perspective. However, it does not foster the desired information flow for the digitized force. The goal of the digitized force is to easily provide information transfer between a host

anywhere on the sustaining base to a computer deployed with an individual soldier in the field. The network used to deliver this information will be comprised of several different types of communication systems. This capability represents great technical challenges for the First Digitized Division (FDD). Additionally, we must enhance the architecture with security measures to protect the networks and systems, and these protective mechanisms must uphold system performance.

High-Level Network Topology

The FDD network is actually com-

prised of several distinct networks that are physically interconnected. Data is transferred through the use of standard protocols. For echelons brigade and above, the primary interconnecting wide area network (WAN) is comprised of an Internet protocol network over asynchronous transfer mode backbone. This network also provides connectivity to the sustaining base and the joint and allied networks. Hosts at the brigade and division are typically grouped in Tactical Operations Centers (TOCs). Figure 1 shows a typical brigade level TOC and its interconnection to the WAN via a small extension node. For intra-TOC

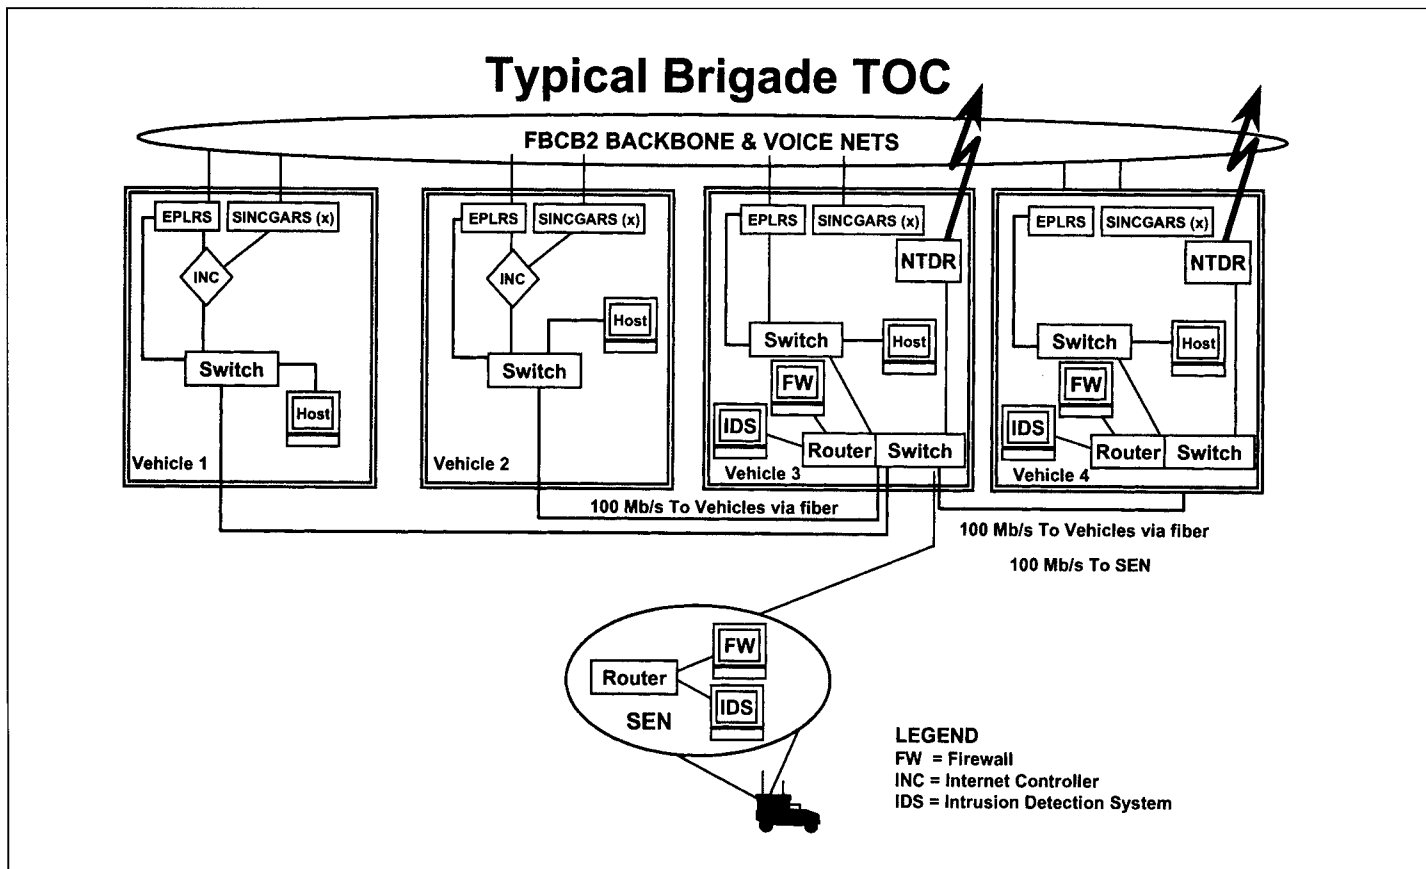

Figure 1.

communications, a local area network (LAN) is used. A Near Term Digital Radio (NTDR) provides WAN connectivity to the battalion level as well as backup capabilities for brigade and above. Finally, the Single Channel Ground and Airborne Radio System (SINGARS) and Enhanced Position Location Reporting System (EPLRS) provide connectivity to the Force XXI Battle Command Brigade and Below (FBCB2) situational awareness networks known as the "tactical Internet."

For battalion-level TOCs, the primary WAN provider is the NTDR for all inter-TOC communications. Figure 2 shows a typical battalion-level TOC and its connectivity. For intra-TOC communications, a LAN is used. The desire at this level is to use a wireless LAN to accommodate the higher mobility requirements for this level of operations. Again, the SINGARS and EPLRS provide connectivity to the FBCB2 situational awareness networks.

The Security Challenge

Are we really talking about a military intranet with controlled access? The answer is not black or white. We must recognize that we have to support operations other than war. While doing so, the digitized systems will be used in networks comprised of nontraditional military communication systems. Even if tactical systems were operating totally within a military intranet during a deployment, because of the interconnection to the sustaining base and joint or allied networks, there is a good probability that the tactical systems may be exposed to network attacks.

So what is it we are trying to protect against? First, we are trying to prevent unauthorized access to our network and our hosts. This unauthorized access could be viewed as your classic "hacker" attack. We must also protect against the insider who decides to launch a malicious internal attack, as well as the operator who inadvertently performs

procedures having the same effect. These two categories may be considered the "classical" threats to all data networks. In addition to these, on the tactical side, we must also address the capture of a host. It may be argued that this is just a special case of insider attack. However, we must also assume that this type of attack would be launched by a more sophisticated operator, and it would be more difficult to detect.

Many people may say that these threats are the same for all data networks. This is true. The challenge, however, is applying mechanisms that will work in the tactical environment. These mechanisms must contend for the same limited bandwidth available in the tactical network. This greatly affects our ability to monitor the network. There are also the physical limitations such as space, weight, and power in the tactical environment. This precludes using many commercial off-the-shelf (COTS) products. Tactical communication networks are very dynamic. Again, this makes it difficult to use many of the COTS solutions available today. There is also the consideration of ease of use of the security mechanisms. We cannot provide security mechanisms so complex that the soldier will not use them.

How Do We Protect The Digitized Force?

We will apply the defense in-depth strategy of protect, detect, and respond. We will do this through the use of COTS products to the maximum extent possible. When COTS products are not available or practical (particularly in the more bandwidth-limited networks), we will resort to adaptations and developments of new products. The defense in-depth strategy for FDD will be applied at the perimeter (division external interfaces), network, and host levels.

At the host level, we begin by reviewing the services that the system needs to operate and shutting down those that are not required. If a service that is required is deemed vulnerable, its use is limited or restricted. Additionally, we attempt to ensure that all security-related software patches are loaded on

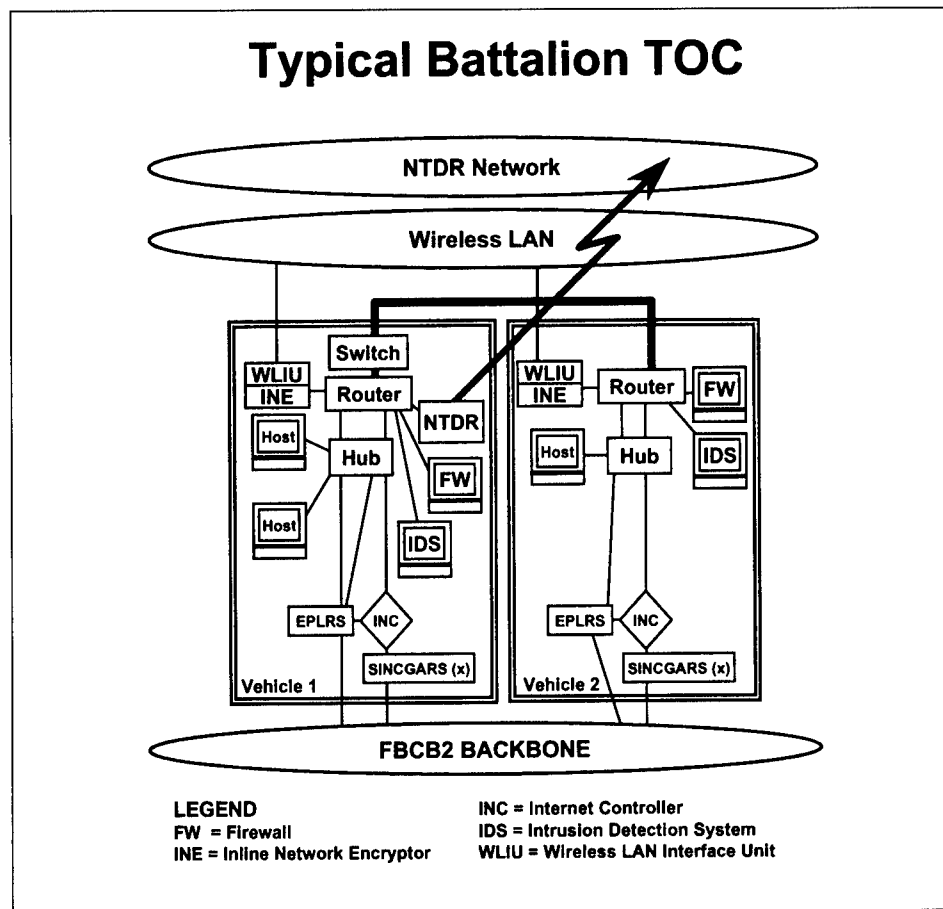

Figure 2.

We cannot provide security mechanisms so complex that the soldier will not use them.

battalion network system control. This cell will have the necessary tools and personnel to collect the sensor information, analyze it, and coordinate a response to detected attacks. In larger deployments, a Local Computer Emergency Response Team (CERT) or deployable Regional

tors, and will be able to intelligently detect new types of attacks.

Conclusion

We will probably not have anything in the near future that can meet all our desires. However, we must continue to look for solutions that will help protect our systems from the threats we know today. We also recognize that the technologies employed within the digitization efforts will evolve with time, as will the threats. With the changes, we will have to continually assess our security posture and incorporate new capabilities for our systems.

our systems. To use the systems, all hosts require user identification and authentication. All systems identify and authenticate themselves to the network to gain access. Finally, we are employing host-level intrusion detection system (IDS)-like capabilities, as well as software that provides a host firewall capability.

At the network level, we are fortunate that all of the communication systems employed were designed with strong link encryption. This naturally limits access to the networks. In addition to the link encryption, we also restrict host computer access to the network and network services. Access to essential network components for configuring and monitoring is restricted to authorized personnel. At the TOCs and essential service components, firewalls will be placed to protect the hosts. In most locations, there will be a network intrusion detection system (NIDS) behind these firewalls.

The final layer of protection (or first layer depending on your view) is the perimeter protection. Again, we are fortunate that the external interfaces are typically covered with strong link encryption and the natural access control this provides. At this level, we will have a strong firewall capability with NIDS sitting behind the walls monitoring the information flow.

The other major area of discussion is the monitoring of the sensors and a response through the mechanisms described previously. Currently, a division-level information assurance cell will be formed and housed at the signal

CERT may assist. The CERT would provide more in-depth analysis of the potential attacks. This process follows the current thinking in the Army Network Security Improvement Program (NSIP). We will continue to work with the NSIP as the program moves from the sustaining base to the boundary (sustaining base to tactical) and into the tactical environment.

What Does The Future Hold?

There are many areas in which we will try to strengthen our security posture for the digitized forces. The first area we would like to address is stronger identification and authentication. There have been great advances in biometrics, which will aid in this area. However, there is additional work required to make them reliable for the tactical environment.

Recently, there has been great emphasis on the development of the Public Key Infrastructure (PKI). We will have to apply PKI to our Web functions, as well as continue to review PKI-enabled programs for other applications. Again, PKI may be used to increase our ability to identify and authenticate. Naturally, we look to the development and employment of true host-based IDS and firewall capabilities. All of these capabilities present a challenge to application in the bandwidth-starved tactical environment.

This brings us to the last great challenge for the future, the development of a highly capable management system. We are looking for a solution that doesn't burden existing communications, can reduce the number of false attack indica-

ROBERT R. LEHNES is Deputy Program Executive Officer Communications Systems, Program Executive Office for Command, Control and Communications Systems, Fort Monmouth, NJ. Lehnese holds a B.S. in electrical engineering from the Newark College of Engineering, an M.S. in management science and computer science from Fairleigh Dickinson University, and an M.S. in national resource strategy from the National Defense University.

JOHN SKRLETTS is the Information System Security Manager, Program Executive Office for Command, Control and Communications Systems, Fort Monmouth, NJ. He has a B.S. in mechanical engineering from The Ohio State University, an M.S. in engineering from the University of Pennsylvania, and is a graduate of the Defense Systems Management College.

COMMUNICATIONS FOR THE FIRST DIGITIZED DIVISION

LTC Curtis H. Nutbrown
and Jay W. Latham

Introduction

Information superiority will be an essential ingredient for the U.S. Army as it transitions to Force XXI. Force XXI units must have information superiority to collect, process, and disseminate an uninterrupted flow of information while exploiting or denying an adversary's ability to do the same. This applies to all operational concepts, including dominant maneuver, precision engagement, and focused logistics.

The First Digitized Division (FDD) is the Army's first major stride toward Force XXI. The FDD communication infrastructure must provide the capability to swiftly and reliably deliver information to support the information dominance that is a cornerstone of this fundamental shift in warfighting. This article discusses why the FDD communication network is needed and what systems make up this network.

New Applications

First, it is essential to understand the Army Battle Command System (ABCS) and applications that use and depend on the FDD communication network.

The ABCS is an integrated suite of command and control (C2) systems that provides commanders and their staffs the ability to assemble and analyze information, develop plans and orders, and monitor the battlefield while simultaneously planning future opera-

tions. The ABCS consists of the Army Tactical Command and Control System, the Global Command and Control System-Army, and Force XXI Battle Command Brigade and Below (FBCB2). In tandem, these systems address different facets of the following warfighter requirements:

- *Dominant Maneuver.* Dominant maneuver is gained through the successful use of two key building blocks: situational awareness (SA) and situational understanding.

Situational awareness is the requirement to share location and status of friendly and enemy forces across the battlefield. It answers three basic questions: "Where am I?," "Where are my buddies?," and "Where is the enemy?" SA information consists of position and status reports from each vehicle and command center, battlefield geometry, and intelligence on the enemy obtained through various sensors. To support this, FDD communication systems must distribute status messages to and from thousands of locations quickly to protect the value of this perishable information.

Situational understanding is the requirement for commanders and their staffs to collaborate in real time to get an accurate, coordinated assessment of the situation to fight the current battle and to plan for future operations. Information flows through real-time voice, data, and

video streams from battlefield video teleconferencing (BVTC) and collaborative planning systems.

To support this, communication systems must distribute large volumes of information quickly and provide reliable voice, data, and video communications among numerous dynamic battle command organizations.

- *Precision Engagement.* This is the requirement for responsive and accurate targeting and battle damage assessment over extended ranges. Reducing sensor-to-shooter time results in a greater percentage of mobile targets destroyed. FDD communication systems must provide fast delivery of time-sensitive targeting information while connecting sensors and shooters separated by hundreds of kilometers.

- *Focused Logistics.* This is the requirement for streamlined ordering and tracking of parts and supplies and shifting these assets, even while en route, to deliver tailored logistic packages. The goal is to get the right supplies to the right place at the right time while reducing the so-called "iron mountain" of spare parts and supplies.

The communication systems must support the passage of large volumes of logistical, medical, and personnel information to track supplies and information to support this requirement.

Information superiority will be an essential ingredient for the U.S. Army as it transitions to Force XXI.

New Doctrine

The communication infrastructure must support the new doctrine for Force XXI units. This new doctrine is based on the tenets of a large, nonlinear battlefield using smaller, more lethal forces. The current division area of responsibility (60 by 100 kilometers) will increase to 120 by 200 kilometers. This implies a greater dispersion of forces, the need for greater mobility and flexibility, and communication systems that can cover these extended distances.

Terrestrial Communications

Ground-based systems will be used to handle the preponderance of communications for the FDD. Tactical radios will be used to stitch together the geographically dispersed forces and provide the communication support necessary for the proper flow of information on the battlefield.

Communication systems at the squad, platoon, company, battalion, and brigade levels must support voice traffic and data traffic generated by FBCB2-equipped weapon platforms. The data consist of relatively small SA and C2 messages, such as position location and call for fire. Communication systems that support these users follow.

Enhanced Position Location Reporting System (EPLRS). This system will provide the data distribution backbone for units at brigade and below. To support the FBCB2, these radios will be placed in weapon platforms such as the M1 tank and the M2 Infantry Fighting Vehicle. The EPLRS radio supports on-the-move communications while distributing SA data and C2 messages. Recent EPLRS enhancements have dramatically improved its ability to support these traffic types, however, the data rates limit communications to messaging. The EPLRS is strictly a data radio and must be augmented by a

Single Channel Ground and Airborne Radio System (SINCGARS) for voice communications.

SINCGARS. The SINCGARS is a low-cost radio that provides both voice and limited-data capability. It is used for voice, SA, and C2 data messaging. Enhancements to the SINCGARS have been made to increase the range and data capacity of the radios while also providing improvements for dismounted soldiers (e.g., 50-percent reduction in size and weight and longer battery life). Together, the EPLRS and the SINCGARS establish a tactical Internet to support the FBCB2 System.

Communications between tactical operations centers (TOCs) require the use of larger capacity communication systems. These systems support the flow of high-bandwidth applications such as BVTC and collaborative planning between TOCs. The following systems support TOC-to-TOC communications.

Mobile Subscriber Equipment (MSE). MSE provides long-haul capabilities at separate battalion, brigade, division, and higher headquarters. MSE is undergoing major enhancements for the FDD to provide support for large amounts of voice, data, and video traffic that facilitate real-time planning and decisionmaking. High Capacity Line of Sight radios will replace the existing MSE Line of Sight (LOS) radios to increase range and network bandwidth. For example, an operations order that takes 9 minutes to transmit in the legacy MSE network will take less than 5 seconds to transmit in the upgraded FDD network. Asynchronous Transfer Mode (ATM) switches will be integrated into the network to increase efficiency. The ATM switch improves efficiency by dynamically allocating the bandwidth between video and data traffic. The FDD network will incorporate firewalls and intrusion detection systems to secure

data from cyber attacks by unauthorized users. Finally, the network will incorporate commercial software that will be extended into the TOCs to provide plug-and-play capability for host users in the FDD.

Near Term Digital Radio (NTDR). This is an interim radio system that supports SA, C2, and collaborative applications. It provides the brigade and below TOC-to-TOC data backbone for the more mobile TOCs (e.g., maneuver battalion) and also for C2 platforms that have high data-rate requirements. In addition, when a TOC that has MSE connectivity jumps or splits, the NTDR will provide the mobile half with on-the-move data connectivity. The NTDR is a data-only radio; thus, it must be augmented by the SINCGARS for voice communications.

Satellite Communication

Satellite communication is an essential component of the FDD communication infrastructure, connecting units that tactical LOS radio systems simply cannot link. Satellite range extension is necessary to connect TOCs dispersed over large areas, connect reconnaissance troops back to their TOCs, extend the FBCB2 tactical Internet, and link early-entry forces to their sustaining base. The following satellite systems are being fielded for the FDD.

Secure, Mobile Antijam, Reliable Tactical Terminal (SMART-T). This system provides range extension for the MSE network. SMART-T is a highly mobile satellite system that is mounted on a High Mobility Multipurpose Wheeled Vehicle. It supports voice, data, and video traffic, and it provides secure, antijam, and low probability of intercept and detection communications. In addition, the system supports unmanned operation after setup.

Global Broadcast System (GBS). The GBS is the backbone for large bandwidth, high-speed, one-way satellite broadcast services for a variety of video, data, imagery, mapping, and intelligence products. Transit-cased GBS receiver suites will be located from division down to battalion TOCs for the FDD. The GBS supports user traffic with multiple levels of security and information dissemination requirements. This system will also be capable of supporting in-theater injection. The theater injection point provides the capability to uplink information in-theater into the GBS so that it can be delivered to the TOCs.

Single Channel Antijam Manportable Terminal (SCAMP). The SCAMP is a portable satellite terminal for voice and low data-rate applications. The SCAMP interoperates with Military Strategic and Tactical Relay satellites to provide antijam, range extension with a low probability of intercept and detection. This system will provide voice and data communication services, and it is also being evaluated to extend the tactical Internet and provide an alternative path for communications between TOCs (primarily brigade and battalion).

Spitfire. The Spitfire is a manpack radio that supports voice and low data-rate applications. For the FDD, Spitfire will be used to extend warfighter, intelligence, and fire support networks; extend the tactical Internet; and link reconnaissance platoons with each other and their brigade TOC. These radios will be paired with a military router. These routers provide a commercial data interface front-end to the Spitfire radio, providing plug-and-play interoperability with other network components.

Seamless Interoperability

The communication digitization activities within the Program Executive Office for Command, Control and Communications Systems (PEO-C3S) have focused on developing a seamless, interoperable, plug-and-play network of networks to support information flow both vertically and horizontally within the FDD.

Situational understanding is the requirement for commanders and their staffs to collaborate in real time to get an accurate, coordinated assessment of the situation to fight the current battle and to plan for future operations.

The fundamental approach is to leverage the civilian sector and commercial Internet. This allows computers to exchange information, despite both heterogeneous networks and computers and connectivity that varies over time. De facto commercial network standards and products are used to the maximum extent applicable to support this.

The hub of this interoperability is at the TOCs, where commercial routers connect the various communication systems into a large, secure, and integrated Wide Area Network (WAN). The TOC Local Area Network routers connect host computers in the TOCs to the WAN.

The different communication systems and routers, in conjunction, provide an efficient network. With several communication systems connecting vehicles and TOCs, an attack on or loss of a communication system will not isolate a vehicle or TOC. Additionally, the routers automatically choose the

most efficient path to send traffic. If one communication system fails, the routers will send that traffic over another path.

Conclusion

The PEO-C3S community is committed to delivering an integrated communication network that is warfightable, sustainable, and trainable. The FDD communication systems that comprise this integrated network are on track to successfully support the increased flow of information that the operational concepts of dominant maneuver, precision engagement, and focused logistics require on the future battlefield. As we move toward Force XXI, this information superiority supports the dispersed, fast-paced, nonlinear battles that the U.S. Army expects to dominate in the future.

LTC CURTIS H. NUTBROWN is the Assistant Project Manager for Digitization in the Project Manager Office, Warfighter Information Network-Terrestrial, and the Coordinator for the Information Transport Integrated Product Team (IPT) in PEO-C3S. He holds a B.S. degree in civil engineering from the U.S. Military Academy and an M.S. degree in management from the Naval Postgraduate School. He is also a graduate of the Command and General Staff College.

JAY W. LATHAM is a Technical Manager for Battlefield Systems at MITRE Corp. and the Technical Advisor to the Information Transport IPT. He has a B.S. degree from Rice University and an M.S. degree in operations research from Columbia University.

Editor's Note: On Oct. 1, 1999, the U.S. Army Materiel Command's Test and Evaluation Command (TECOM) and the U.S. Army Operational Test and Evaluation Command (OPTEC) will be consolidated into the U.S. Army Test and Evaluation Command (ATEC). TECOM, which will be renamed the Army Developmental Test Command (ADTC), will be a subordinate command of ATEC and remain located at Aberdeen Proving Ground.

Introduction

Military doctrine today, and for the next generation, requires commanders, joint warfighters, and logisticians to see the battlefield and the status of all their assets in near real time. As the Army moves to the digitized battlefield and implements the operational concepts found in Joint Vision 2010 and the Army After Next, it will have a great need for information superiority—the ability to collect, process, and disseminate an uninterrupted flow of information. The Revolution in Military Affairs relies heavily on the acquisition community to field the technology that will have a tremendous impact on future military operations. To do this, the Army needs faster and better feedback from the field to continually improve our combat and support systems and validate models and simulations. TECOM has systems that can be exploited to help make full spectrum dominance and focused logistics a near-term reality.

The Versatile Information System, Integrated, On-line, Nationwide (VISION) is a test and evaluation (T&E) initiative aimed at integrating information technology with instrumentation technology to provide a single data stream for equipment from concept to combat. VISION focuses the power of existing systems and, through key technology insertions, creates a virtual library that allows current and future decisionmakers to receive information on demand while participating in the process.

VISION consists of five components:

- The Army Test Incident Reporting System (ATIRS);
- Data links to the testing, training, and logistic and support communities;
- Web browser and client server interfaces;
- The Advanced Distributed Modular Acquisition System (ADMAS); and
- Platform-independent computer systems with portable software.

Implementing Strategies

TECOM is implementing VISION through four strategies: real-time integrated applications, software re-engineer-

Total Asset Visibility . . .

THE VERSATILE INFORMATION SYSTEM, INTEGRATED, ON-LINE, NATIONWIDE

John B. Ruhl

ing, multimedia computing techniques, and high-performance computing applications.

TECOM began implementing VISION by linking ATIRS to its existing family of onboard, computer-based data acquisition systems developed by the Aberdeen Test Center (ATC) to test military vehicles. This first step built on ATC's successful efforts to develop real-time integrated applications and then transfer this technology within the acquisition community. The result of this effort will lead to powerful and flexible embedded instrumentation on weapon systems and the ability to move the instrumentation data anywhere it is needed.

ATIRS is an integrated information system originally developed to manage and process reliability, availability, and maintainability (RAM) data for complex testing of Army materiel. ATIRS also provides non-RAM data such as system and subsystem performance and safety information. ATIRS is ideal for recording and analyzing data from other sources, and it has significant growth potential because it can accommodate both classified and unclassified data.

A major technology improvement to ATIRS is the highly configurable, Windows-based personal computer (PC) front-end that facilitates data entry and allows easy customizing using its built-in forms editor. ATIRS offers a variety of features including automated data collection and transmission, data organization and categorization, data summarization for standard and customized reports, data analysis and archiving, online access, and electronic mailing.

The ATIRS network is a powerful, distributed database that connects TECOM

test centers. OPTEC as well as contractors are transmitting data to ATIRS. It provides one-stop shopping for receipt of contractor test data as well as data from government developmental and operational tests.

Approximately 1,000 users have access to ATIRS. Government and contractor personnel routinely query the 2,000 active distributed databases. Other historical data are archived offline and can be retrieved upon request. Security and data separation are critical issues, especially with the introduction of Web technology. Multilevel security mechanisms such as firewalls, screening routers, and state-saving technologies to track user access across computer systems are used to protect data.

VISION is revolutionizing the test planning and reporting process by establishing an automated mechanism to reuse test data. The capability now exists for online test reporting. All available test-related information is stored online and includes detailed test plans, international and local test operating procedures, test incident and related test-specific data, images, video, project news, meeting minutes, points of contact, and data from onboard instrumentation.

As TECOM improves its T&E knowledge base and leverages its embedded instrumentation capabilities, VISION will provide important links and feedback to the modeling and simulation, training, and logistic communities. As military units conduct training exercises, they use PCs to collect data on strategy, tactics, and unit performance. This information can easily be uploaded or linked to VISION to integrate equipment performance and provide global feedback on how equipment

was employed in the tactical scenario and how it performed in conjunction with the soldier—a total system approach. These lessons learned can be shared with all interested players—developers, logisticians, battle labs, Army schools, and major commands. This field information is very important to the modeling and simulation community.

Models and simulations used to streamline the acquisition process are validated using developmental test data. As the use of modeling and simulation in testing increases, it reduces the amount of live testing, which in turn reduces the data set available for validation. The next logical data set to use in the validation process should be field data. Field commanders can also be provided vital safety and performance information to improve their situational awareness. Full implementation of VISION will provide this mechanism.

The next generation of ADMAS, common instrumentation, will be small, robust, and even more powerful. The philosophy behind ADMAS is to start with common, versatile hardware and software. From there, specialized plug-and-play modules can be added to tailor data requirements. Size, weight, power, and durability issues are addressed through ruggedized commercial off-the-shelf hardware.

A built-in Web interface was chosen to make it easier for the operator to interact with the instrumentation. The operator can quickly configure the system, observe critical parameters of ongoing tests, and perform quick-look algorithms on the downloaded data. An online help service provides sufficient information to set up the hardware and software and to troubleshoot problems with the system. All data collected by ADMAS can be locally stored, telemetered, or downloaded to a host computer where it can be formatted, processed, and databased using a wide variety of tools.

The second implementing strategy, software re-engineering, is underway in conjunction with updating old software programs to new 32- and 64-bit environments. Web-based user interfaces provide easy access to multiple data sources across the distributed system. Revised programs will be compliant with standard architectures like DOD high-level architecture. This will improve software independence across different platforms and provide even greater access in the future.

The third strategy employs multimedia computer technologies. VISION is explor-

ing direct voice data entry techniques to streamline the data collection process. This technology is critical, especially during training exercises. If soldiers in the field need to collect and enter data, they cannot be expected to fill out a form or keypunch data into a computer. They will be able to use their existing communication devices to activate a nearby computer node, such as a division tactical operations center or a central server already connected to the VISION network, and enter data through voice commands. A collaborative effort is underway between TECOM and the Army Research Laboratory (ARL) to field voice data entry techniques by year's end.

The final strategy leverages the DOD High Performance Computer Modernization Program's computational power, mass data storage, and high-speed network architecture to manage very large data sets. VISION uses the Defense Research Engineering Network to take advantage of its scaleable asynchronous transfer mode technology for increased bandwidth and connectivity. In addition, the ARL Major Shared Resource Center and the National Center for Supercomputing Applications are building knowledge-management tools, including scientific and information visualization applications, data fusion, and data mining capabilities that will directly support VISION's knowledge-management capabilities.

Additional Applications

Even though the tools for VISION are being developed to support the T&E community, they have much broader applications. VISION can help make focused logistics a reality. Although the military can move forces from their CONUS bases to any location in the world, logistics projection remains a problem. What items are needed, where, and when? To answer this, the Army requires asset visibility at the weapon-platform or system level. The VISION concept, employing embedded instrumentation coupled with voice data entry, can provide the missing link for total asset visibility on each piece of equipment.

As a unit is mobilized, the embedded instrumentation provides vehicle health checks and tactical status. For example, the instrumentation can interface with the vehicle onboard diagnostics to provide engine and electrical component status, engine hours, miles, ammo status, fuel status, and global positioning system data interface. Using voice data entry, the crew can easily provide changes as needed. As the unit moves to its objective, artificial intelligence, data fusion, and dynamic Web

technologies (processes already being researched for VISION) will process, separate, sequence, prioritize, and store or transmit the data when and where needed. TECOM is working with the Project Manager, Test, Measurement and Diagnostics Equipment (PM, TMDE) to enhance their embedded diagnostics program to accomplish this.

VISION tools, coupled with modeling and simulation tools developed for TECOM's Virtual Proving Ground (VPG), can provide input to battlefield and logistic simulations. VISION's virtual library can provide reliability and performance statistics, and VPG can provide digitized maps and other synthetic environments to feed warfighter simulations for logistic predictions. Each time a unit conducts training, these systems can be used to provide continuous evaluation and strengthen their validation.

Conclusion

VISION is needed today to support the Revolution in Military Affairs. This system, which was initiated to meet the test and evaluation community's requirements, also has the potential to significantly improve joint warfighters' capabilities. TECOM and its partners are committed to providing these tools to increase military effectiveness on the future battlefield.

JOHN B. RUHL is currently detailed to HQ TECOM as the Project Manager for VISION. He has an M.S. degree in operations research from the University of Baltimore and master's degrees in business administration and finance from Loyola College. He is a graduate of the U.S. Army Command and General Staff College and is Level III certified in test and evaluation. He is also a lieutenant colonel in the Army Reserve.

THE FUTURES LAB: THE COMMANDER'S GATEWAY TO THE FUTURE

MAJ Eugene F. Stockel and CPT Steven J. Nosbisch

Introduction

How do you command and control digitized forces in the 21st century? The Battle Command Battle Laboratory at Fort Leavenworth, KS, (BCBL-L) is charged with answering this question. May 1999 marked a major step forward in this endeavor with the initiation of construction of the Battle Command Futures Lab, a new state-of-the-art experimentation facility located at the Command and General Staff College (CGSC). This facility will support the Army's ongoing efforts to exploit 21st century technology to maintain information dominance over potential future adversaries.

The Battle Command Battle Lab is a geographically dispersed organization with facilities at three locations. Each facility focuses on a different aspect of command and control technology. The Fort Leavenworth, KS, facility provides overall direction for the lab and works on the "art" or concepts and principles of command and information operations. The Fort Gordon, GA, facility works on technical means of command, and the Fort Huachuca, AZ, location works on intelligence collection and dissemination and electronic warfare. Together, these three elements are responsible for integrating all Army Training and Doctrine Command (TRADOC) activities related to battle command and information warfare. The Futures Lab will play a significant role in the accomplishment of these missions.

Challenges And Goals

The challenge for the Futures Lab is to develop information technology that provides battlefield commanders the ability to manage, synthesize, and employ the enormous volumes of data and information available through advanced communications and sensor technologies.

The Army's advance toward digitization

will fundamentally alter the decision-making framework between commanders and their staffs. The shift will be from a methodical and laborious analytical process that is staff centered to a technologically enhanced, rapid decisionmaking process that is commander centered. Numerous Army research and development (R&D) efforts focus on furthering this shift in the decisionmaking paradigm. The objective is decision support systems that enable the commander to exploit the increased operational tempo, mobility, and lethality of digitized forces.

The Futures Lab will provide a robust capability to integrate and experiment with emerging technologies, organizational structures, and processes focused on the human dimension of battle command. The goal is accelerated decisionmaking, enhanced visualization, and improved human-computer interfaces. Concepts and technologies that address immediate operational requirements can be quickly transitioned into existing acquisition programs. Recent successes include Grenadier Brat, a beyond line-of-sight tracking capability that enables commanders to monitor forces operating deep within enemy areas of operations. Another success story is the Maneuver Control System-Phoenix (MCS-P). The MCS-P was a Battle Lab modification of the MCS. The MCS-P demonstrated increased functionality for the MCS, and many of the functions were subsequently incorporated into the MCS Program.

The Futures Lab will provide the bridge between Force XXI and the Army After Next (AAN). It is a true, low-risk testbed for integrating, exploring, and evaluating technologies and concepts that may not have an impact for 10 to 15 years. Through experimentation, the Battle Lab will gain insights and make recommendations con-

cerning the entire spectrum of future doctrine, training, leader development, organizations, materiel, and soldiers (DTLOMS) as it relates to battle command.

TRADOC'S future operational capabilities (FOCs) are key to the efforts of the BCBL-L. These FOCs provide the means to screen and focus potential emerging cognitive insights and technologies that address future battle command requirements. To explore potential DTLOMS solutions, the BCBL-L concentrates its effort on six of the FOC statements: providing a common operational picture, facilitating data dissemination, developing decision and planning support tools, enabling hands-free operations, developing commander and battle staff training capabilities, and identifying requirements for commanding modular organizations.

While exploring technology is an important function of the Futures Lab, its analytical focus centers on the intellectual domain of the battle command. This includes exploring alternative staff roles, functions, and structures. Insights into the intellectual domain lay the groundwork for potential revolutionary changes to decision-making that will enable the AAN operations. Facilitating these changes makes the Futures Lab the commander's gateway to the future.

An important aspect of the Futures Lab is its close proximity to other facilities at Fort Leavenworth. All are dedicated to making the Army's vision for the 21st century a reality. In addition, being situated at the CGSC gives the Futures Lab ready access to 1,000 field grade officers who can exercise and evaluate promising technologies and DTLOMS solutions for the attainment of FOCs. Nowhere else in the Army is there such a concentration of future digital leaders. As more units are provided with digital systems, the CGSC

students will become an essential source for operator insights, feedback, and analysis. The Futures Lab will provide the venue for capturing their experiences for the benefit of developers working on future battle command requirements.

Benefits To Other Programs

Several ongoing battle command programs will benefit from the establishment of the Futures Lab. These programs include Strike Force; the Training, Leader Development, Soldiers Task Force (TLS TF) initiative; the Army Communications-Electronics Command's (CECOM's) Command Post XXI (CPXXI) Advanced Technology Demonstration Program; and the Defense Advanced Research Projects Agency's (DARPA's) Command Post of the Future (CPOF) and High Performance Knowledge Base (HPKB) Programs.

In coordination with Fort Knox, KY, the BCBL-L is developing the joint command, control, communications, computers, intelligence, surveillance, and reconnaissance (JC4ISR) requirements for the Strike Force Headquarters. Strike Force will be a highly deployable medium-weight force designed to execute missions across the full operational spectrum. The Strike Force warfighting concept includes an advanced headquarters design that has corps/division communication and sensor capabilities built into a brigade headquarters and headquarters company footprint. By 2005, the BCBL-L envisions products for the Strike Force headquarters operations and information node that will include the organization, personnel, and joint links. The BCBL-L will leverage DARPA's CPOF and CECOM's CPXXI efforts to integrate technology into the Strike Force organization.

The TLS TF initiative is an effort led by the Combined Arms Center to develop a strategy that focuses and synchronizes training support packages/training evaluation strategies; research, development, and acquisition; and operational test and evaluation efforts in the training, leader development, and soldier system domains. The purpose of this initiative is to train adaptive leaders to handle the complexities of their operational domains in the 21st century. The strategy will be developed within the Strike Force operational environment.

The initial focus of the TLS TF effort is on operational leadership. The Task Force will identify the skills, knowledge, and attributes (SKA) required for Strike Force personnel; produce Strike Force SKA

learning models for the institution and unit; and adapt SKA learning models for the light and heavy forces across the Total Army. TLS TF efforts will be synchronized with all aspects of Strike Force evolutionary work.

CECOM's CPXXI goal is to develop, integrate, and transition technologies for an extremely agile, revolutionary tactical headquarters. The headquarters includes a command node in the battlespace and a control node in sanctuary. This effort supports Strike Force requirements and Joint Vision 2010 and leads to the Army After Next. CPXXI will integrate information-processing tools that present the commander with comprehensible battle-field information. Advanced technical approaches such as online analytical processing and data mining will be pursued to facilitate a continuous, adaptive process leading to better and timely decisions.

The CPOF is a DARPA-sponsored, 5-year R&D program to design, develop, test, and evaluate prototype systems for use in a joint command post environment. DARPA is partnered with the BCBL-L, the Mounted Maneuver Battlespace Lab at Fort Knox, KY, and the Marine Corps Warfighting Lab at Quantico, VA, which serve as operational advocates (OAs) to the program manager. The BCBL-L is the Army's lead for the OA Team.

The CPOF Program goal is to improve the speed and quality of command decisionmaking while improving the mobility and survivability of the command complex. CPOF is a concept environment, not a fixed or stationary command and control facility. DARPA's approach is to provide an intuitive, well-integrated, easy-to-use, decision-centered, information environment where commanders and their staffs can quickly understand an evolving battlefield situation, select the best course of action, communicate orders to implementing units, and monitor and supervise execution.

Finally, another DARPA program is the HPKB Program. This program attempts to "push the envelope" in knowledge-base technology. Knowledge-base technology will facilitate the development of automated planning and decision support tools for the warfighter. Key tenets of the program are developing large, reusable knowledge bases rapidly, demonstrating the novel capabilities that these knowledge bases provide (transcend expert systems and approaches), and demonstrating benefits that support future battle command requirements.

Conclusion

The Army's digitization effort is a daunting, but essential task. The Battle Command Battle Lab's Futures Laboratory will provide the means to experiment with, assess, and provide the leap-ahead technologies and concepts necessary for the Army to continue as the force of decision in protecting our vital national interests far into the 21st century.

For further information, visit the Fort Leavenworth Battle Command Battle Lab's Web site at <http://cacfs.army.mil>.

MAJ EUGENE F. STOCKEL is a Senior Project Officer responsible for automated decision support systems and technology at the Battle Command Battle Lab, Fort Leavenworth, KS. He has a bachelor's degree from the U.S. Military Academy and an M.B.A. from George Mason University. He is a graduate of the Defense Systems Management College and the U.S. Army Command and General Staff College.

CPT STEVEN J. NOSBISCH is a Project Officer responsible for automated decision support systems and technology at the Battle Command Battle Lab, Fort Leavenworth, KS. He is a 1994 graduate of the University of Northern Iowa, Cedar Falls.

Introduction

We often read about technological enhancements to our tactical equipment, improvements that give the U.S. military a decisive, significant advantage that, ultimately, will save lives on the modern battlefield. Yet, technology is only as good as the user allows it to be. The American industrial base can build a better "mousetrap" for the Services. However, if the Service trying to catch the mouse cannot figure out how the trap works, or the trap simply does not work as intended, then it is useless. Operational testing and evaluation is the military's method to ensure Service members receive the finest quality equipment that is easy to use, readily available, supportable, durable, maintainable under adverse conditions, and interoperable with other Services and our allies. Reducing operational testing and evaluation, either through decrementing resources or streamlining the operational testing and evaluation process, will degrade our ability to dominate the battlefield, bring mobilization to a successful completion, and return our forces home safely.

Operational Testing Versus Laboratory Testing

Operational testing places new or updated technology into the capable hands of our well-trained Service members. The general purpose of operational testing is to allow Service members to use equipment in an operational manner as they would when they deploy. Terrain is carefully selected to mimic the terrain that forces encounter during an actual mobilization. In addition, simulated opposing forces are strategically placed to add realism, making sure test units deploy in a tactically sound manner. For example, a test unit that places a tactical operations center high above a tree line to improve line-of-sight to get better radio reception will "lose it" (i.e., the test unit will be destroyed by enemy action). Ground noise and/or jamming is also added to simulate communication interference that U.S. forces are likely to encounter during mobilization. Unit-level maintenance personnel examine their ability to repair the new equipment within operational constraints and parameters.

Laboratory testing, in contrast with

Cornerstone For Success . . .

OPERATIONAL TESTING AND EVALUATION

John Di Genio

"The American acquisition team must make sure ... soldiers have the equipment they need to get to the action quickly, win decisively, and come home safely."

*— Paul J. Hoepfer
Assistant Secretary of the Army
(Acquisition, Logistics and Technology)*

operational testing, occurs within a highly predictable, controlled environment. Skilled technicians, employed by the contractor, test the equipment under ideal conditions without the realism and stress encountered during mobilization.

Statistically, normalcy can be assumed in laboratory testing because conditions are highly regulated. However, operational testing is unpredictable. As such, a normal distribution usually cannot be assumed. Therefore, in most cases, nonparametric statistical applications need to be employed to measure the performance of the equipment undergoing operational testing and evaluation.

A system may operate well during laboratory testing. However, the same system might fall apart in the hands of trained military users applying added stress to the new item during realistic operational testing.

Operational Concerns

The Test and Evaluation Master Plan (TEMP) outlines those critical operational issues and concerns (COIC) that require testing. Operations research (OR) analysts develop a detailed hierarchy of questions that need to be answered to determine if the equipment is operationally sound and can withstand the rigors of modern deployment. These questions become the basis (elements) of the operational test and evaluation database. Furthermore, OR analysts develop decision criteria, such as, "What is the test team going to measure?" This could include message completion rates; miles driven; hits scored; and establishment of throughputs; "What constitutes a successful event?;" "How many attempts should the equipment be given to succeed?" The operational test and evaluation database and decision criteria are added to the TEMP. The test team determines the best test unit to

execute the TEMP, that is, the unit that can optimally measure each of the COIC in an operational environment within a specified period.

Data Collectors

It would be very difficult to conduct an unbiased, statistically sound test without data collectors. These dedicated people accompany the test unit to objectively "score" the event being observed. Data collectors endure the same rigors and conditions as military test unit personnel. Imagine the sight of a civilian data collector observing communication events taking place between a division artillery forward observer and his fire support team during a heavy rainstorm at night!

Although some data can be collected mechanically, a human data collector can give perspective to what actually happened during an event or a series of events. For example, "smart" machinery recorded a series of successful events for a piece of equipment. However, the human data collector accurately recorded that the equipment was used in an operationally unsound manner. Therefore, the data collected during that series of events had to be purged.

The data collector's keen sense of commitment and situational awareness allows him or her to objectively record what occurred. Such dedication by a select few makes the difference between a viable system that enhances our capability to achieve success on the current battlefield and the dour consequences of mission failure. Data collectors act as neutral "referees" in scoring observations as a success or failure. Although data collectors accompany the test unit, they do not aid the military user in operating the equipment under test.

Data Authentication

Data have to be "authenticated" prior to formal inclusion in an operational test and evaluation database. That is, do the scored observations reflect what has actually occurred? More important, do the events reflect data collected in an operationally sound environment? Data authentication groups review the data and ask critical questions about a system's performance. These questions

may be related to readability, availability, maintenance, and the machine-human interface.

A system can perform well under ideal conditions during deployment. However, it is useless if it cannot withstand the rigors of deployment in diverse landscapes and under different (often adverse) climatic conditions. For example, a communication system would have limited value if it breaks down in a wet, tropical environment. Likewise, a system that performs well and is easily maintained in an operational environment, but requires a great deal of human effort to operate or takes a long time to set up, will be of little value on the modern battlefield where speed and accuracy are essential.

The data authentication groups critically review these issues by asking such questions as, "Why is the system operating like this?" "Is training sufficient?" "Is the system too hard to use in battle?" "Why is the system breaking down or malfunctioning?" The test team and operational evaluators work together to find answers to these questions.

The premature release of data, i.e., before the data authentication group has reviewed the data, can have severe consequences. Contractor personnel may get the false impression that the system is a success. Operational evaluators may be tempted to use the system in an unsound manner to achieve the required number of events to terminate the test early, thereby ending the deployment. The premature release of data could result in costly litigation.

Test And Evaluation Report

The test team and operational evaluators prepare the Test and Evaluation Report, which explains how the item was tested, the operational test and evaluation database, and the evaluation. This is the ultimate "moment of truth" for the system under test. The evaluators review the data and determine if unbiased, statistical evidence supports full-scale production of the system. Test results are forwarded to Secretary of Defense levels for review. Eventually, the results of operational testing and evaluation receive congressional review and scrutiny.

Conclusion

Operational testing and evaluation helps ensure that Service members receive the finest quality equipment to accomplish their mission with minimal risk. Whenever we hear about a new technology "breakthrough," we should remember that a lot of dedicated folks made sure that the new item met (in many cases, exceeded) critical operational standards and requirements. This dedication manifests itself in our ability to achieve battlefield dominance. Putting the equipment in the hands of the military user is the best way to determine if the system works as intended under operational conditions. Additionally, if the system is not user friendly, it will have little value during mobilization. Likewise, if the item cannot withstand the stressful, adverse conditions of the modern battlefield, it will be of little or no use during contingency operations.

Operational testing and evaluation is an unbiased "experiment" in an unpredictable, dynamic environment.

JOHN DI GENIO is a Program Analyst at Headquarters, U.S. Forces Korea/Eighth U.S. Army, Seoul, Korea. He is a graduate of the Army Management Staff College and has completed the Operational Research Systems Analyst Military Applications Course.

DEFENSE CONTRACT MANAGEMENT COMMAND IN THE BALKANS

Introduction

Logistics support for the U.S. military in the Balkans has increasingly become a contracted operation since the end of the Bosnian War in 1995. For this reason, the presence of a DOD contract administration team is a requirement. Since the U.S. military presence in Bosnia, Croatia, and Hungary began with Operation Joint Endeavor in late 1995, the Defense Contract Management Command (DCMC) has provided Contingency Contract Administration Service (CCAS) teams to fill this need.

DCMC's Role

"We are the interface between the military units on the ground and the contractors providing their logistics support," states Army COL Dwight E. Thomas, Commander of DCMC CCAS Team 11, headquartered at Eagle Base in Bosnia. "Almost all of the daily logistic support that the soldier, sailor, airman, or Marine on the ground receives is authorized by a DCMC contract administrator. DCMC is the only unit that can direct the contractor to begin work or to make any changes to a project. We also sign off on all completed work to ensure that the job was done according to the contract specifications," he adds.

This logistics support comes primarily from Brown and Root Services Corp. (BRSC), the prime contractor for logistic services in the region. BRSC or its subcontractors do all the major construction such as living

Two armed HMMWVs prepare to leave Eagle Base, Bosnia.

MAJ Terry McElroy

quarters, dining facilities, and roads on the major bases and the outlying base camps and hilltops. It also provides daily log services such as troop laundry, mail delivery, dining facility operations, water and petroleum storage and distribution, shuttle bus service, and trash collection and disposal.

OJF Sustainment

DCMC administers both the \$498 million Operation Joint Forge (OJF) Sustainment contract with BRSC and the \$63 million Interpreter contract with TRW-BDM. The OJF Sustainment contract is a cost-plus-award-fee contract let by the Army Corps of Engineers (COE) in Winchester, VA. Every 6 months, U.S. Army Europe (USAREUR), the COE Procuring Contracting Officer, and officials from Task Force Eagle, the National Support Element, and DCMC review contractor performance. BRSC recently won the OJF Sustainment contract rebid for 1 year plus 4 option years.

CCAS Teams

Overseeing all of this is a huge assignment for the DCMC team, which consists of 24 members. "We've got high-caliber people on the DCMC CCAS teams that come over here. They routinely put in 12-hour days, 7 days a week, for months on end. The quality of the services the troops receive is a tribute not only to Brown and Root, but to the DCMC team providing surveillance of it all for the government," said Thomas.

The DCMC CCAS teams consist of civilian and military contract administrators, property specialists, quality assurance specialists, and fuel specialists who are mostly volunteers for the 6-month mission. In addition, DCMC is training contracting officer representatives (CORs) for individual units.

The DCMC CCAS team personnel come from DCMC contract administration offices all across the United States. Each team conducts a 6-month tour in Bosnia, Hungary, and Croatia. Thomas feels that the changing nature of the missions that the U.S. military performs makes it imperative that both military and civilian members can operate in a contingency environment. "This is not something you can train for at home station. Those that have contingency contracting experience will have increased value to the command and to the Department of Defense in the future," says Thomas.

Contract Administrators And Property Specialists. Contract administrators and property specialists oversee the \$140 million of government property it takes to conduct so varied a mission. According to author MAJ McElroy, Chief of Property Administration for CCAS Team 11, the government is required to conduct an annual audit to ensure that the contractor maintains accountability for all the

property in its possession. "To keep costs to USAREUR down, a lot of military vehicles and equipment are temporarily transferred to the contractor for its use. We need to ensure all this property is maintained and accounted for because it is still government property that must be returned to the government at the end of the contractor's mission," McElroy adds.

Quality Assurance Specialists. Quality assurance specialists (QASs) check all the new construction in the OJF area of operations. "Along with the customer, we sign off on all new construction," said Dave Guindon, Lead Quality Assurance (QA) Representative on Team 11. "However, our QA specialists also verify that daily work orders are completed correctly. This lets the customer know that he or she is receiving a high quality of service. We try to keep the customer involved in the process as much as possible. We value their input, and don't want them to feel that they have no say in the products or services they are receiving. However, they still must come through DCMC with changes or suggestions. DCMC's presence gives both the contractor and the customer a single point of contact to ensure nothing slips through the cracks," explains Guindon.

DCMC QASs must sign off on work in all of Multinational Division-North, the U.S. sector of Bosnia. This sometimes means they must travel more than 100 miles a day to outlying base camps. The governing force protection rules in the area make traveling even tougher. These rules require that all team members traveling off base wear a helmet and flak jacket and require that an armed military member be present in each vehicle. Vehicles must travel in two- or four-vehicle convoys, depending how far they are going. "It's not unusual for us to require eight people and four vehicles to have one of our QA specialists sign off on a construction project. We realize the force protection rules are for our own good, and we work within them, but this is another reason why we are training CORs. A slowdown in our travel shouldn't impact the customer, and if we can get a satisfactory product into the customer's hands quicker, we want to do that," says MAJ John Hess, Team 11 Deputy Commander.

Fuel Specialists. Fuel specialists are responsible for the quality of all the contract fuel delivered to U.S. forces in the Balkans and Hungary. This includes diesel fuel for vehicles, heating fuel, and all aircraft fuel. "These DCMC fuel specialists are the unsung heroes of this

Plywood SEA-hut clusters were built to replace tent cities on Bosnian base camps.

team," said Thomas. "These six personnel must travel to refineries and fuel storage sites across three countries to ensure that the fuel being delivered contains the correct additives and is not contaminated. [In 1 month recently,] they signed off on more than 2 million gallons of all types of fuel. Operation Joint Forge would quickly come to a halt without these DCMC professionals on the job."

CORs. As part of its customer orientation, DCMC has begun a contracting officer's representative training program that allows using units to have more control over how projects are carried out. According to Thomas, "With such a small DCMC team, we can't always get out and look at every project or service we'd like to. The recent construction boom on the base camps forced us to apply a risk-management approach to prioritizing what our QASs could do in the time they had available. Low-priority projects sometimes

DCMC Quality Assurance Specialist Paul Gerard checks water purification equipment at Coyote Base, Bosnia.

had to wait. However, with trained CORs, units can pre-approve work until our QASs can get out to see it themselves. This gives the using units a feeling that they are part of the process, as well as lightening the load on our quality assurance specialists."

Conclusion

The DCMC will continue to provide contract administration services as long as U.S. military forces remain in the Balkans region.

Thomas explains, "DCMC's mission is to provide world-class contract administration services in all environments. Whether during peacetime or in a contingency operation, we provide the logistics support the warfighter needs to complete his mission. One Command, One Focus."

MAJ TERRY MCELROY was a Contracting Staff Officer at Headquarters, DCMC, when he wrote this article. He recently completed a tour as the Chief of Property Administration for DCMC CCAS Team 11 in Bosnia. He is now assigned to the Office of the Assistant Secretary of the Army (Acquisition, Logistics and Technology). McElroy holds a B.A. in communications from the University of Scranton and an M.A. in acquisition management from the Florida Institute of Technology.

Introduction

The expansion of America's military industrial base has always been an important concern for DOD. The downsizing of the military in the early 1990s resulted in an economic shock that drastically reduced the amount of federal dollars available for Defense spending. Consequently, a void developed in our nation's military industrial manufacturing base. Evidence of this particular phenomenon was apparent in the growing attrition rate among qualified military contractors. Unfortunately, manufacturing became an exercise relegated to the bundling of production requirements among a dwindling number of qualified sources. Declining levels of production meant less demand for materiel and resulted in the further erosion of an already limited supplier base. DOD recognized a need to establish new sources of qualified subcontractors and suppliers, but its biggest challenge remained locating businesses with the capabilities necessary to fulfill its requirements.

The Pilot Mentor Protégé Program

The Pilot Mentor-Protégé Program (PMPP) emerged in response to these challenges faced by the Defense industry. The program primarily focuses on teaming prime government contractors with small disadvantaged business units (SDBUs). The short-term objective of the PMPP is increasing the number of subcontractors from an existing pool of businesses. Its long-term goals are to expand competition and lower manufacturing costs.

To meet the challenge of a shrinking military industrial base, DOD focused on the existing manufacturing base. According to the National Contract Management Association, the use of subcontractors had proportionally increased to meet the growing demands of a rapidly changing technology. DOD envisioned applying a similar approach under Section 8(a) of the 1960 Small Business Act to encourage further expansion of subcontracting in manufacturing operations. Therefore, the concept of teaming or partnering SDBUs with prime contractors re-emerged as a key strategy.

The PMPP was established by the Secretary of Defense under the FY91 Defense Authorization Act. Ultimately, the program will provide prime

PILOT MENTOR-PROTÉGÉ PROGRAM

CPT David M. Kaczmarek

contractors the incentive to help SDBUs perform as either a subcontractor or supplier. Moreover, the program offers two types of incentives designed to motivate prime contractors: credit and reimbursement. The former provides monetary credit contingent on achieving a particular subcontracting goal, and the latter reimburses for the costs incurred during the development process.

Detailed information about the program can be found in *Defense Federal Acquisition Regulations (DFARs) I-108 and I-109*. Typically, reimbursement helps the prime contractor recover costs associated with mentor labor, assistance from historically black colleges and universities, and minority institutions.

The key to implementing a successful mentor-protégé (MP) agreement is commitment and trust between a mentor and protégé. Relationships frequently involve significant transfers of technology and human expertise. The transfers are necessary for protégés to achieve compliance with Defense industry standards. Therefore, a protégé firm must be willing to initially accept significant upfront costs. Likewise, mentors must be committed to providing hands-on training through use of their expert knowledge base. Ultimately, the protégé benefits from an accelerated learning curve and eventually is able to perform independent manufacturing or supply operations.

DOD has closely tracked the progress of the PMPP since its inception in 1991. In an analysis presented in June 1998, DOD highlighted a number of key areas relative to the program. Government personnel reviewed more than 226 MP

agreements from FY94 to FY97 and found that SDBUs experienced an aggregate gain of 3,342 jobs; SDBUs experienced an aggregate increase in revenue of more than \$276 million; and prime contractors reported an additional \$295 million in subcontracting awards appropriated for future SDBU work.

PMPP Participation

The final approval authority for a prime contractor seeking to become a mentor remains with DOD. Specifically, the Office of Small and Disadvantaged Business Utilization has oversight responsibility. Eligibility to become a mentor is contingent on the prime contractor meeting three requirements: it must be eligible for award of government contracts; it must be a recipient of a DOD prime contract and subcontract awards, and the awards must either equal or exceed \$100 million in the fiscal year prior to the mentor entering into an agreement; and it must be a prime contractor with a minimum of one active plan negotiated under DFAR Subpart 19.7. Additional details outlining mentor requirements are specified in the *Defense Federal Acquisition Regulation Supplement 219.71* dated Oct. 1, 1991.

Potential protégé firms must also meet specific requirements prior to participating in the program. Primarily, the applicant must be classified as a small disadvantaged business. The definition of an SDBU consists of being either owned or controlled by one or more socially and economically disadvantaged individuals. Additionally, the potential protégé must meet the size standard outlined by the Small Business

Administration (SBA) under the appropriate Standard Industrial Classification Code. For example, the SBA uses total number of employees as a criterion for evaluating a potential protégé firm. Currently, the threshold is 500 employees; however, once accepted as a protégé, the SDBU may expand up to 2.5 times the size stipulated in the basic agreement.

Establishing the actual MP agreement is best described as a process that incorporates a systematic flow of events. The essence of the agreement requires that the needs of both parties be taken into consideration and clearly defined. Goals between the mentor and protégé must be continuously assessed and, if necessary, redefined throughout the various stages of the intervention. Good agreements make good business sense; therefore, trust and commitment are fundamental to a successful program.

The Bell Helicopter TEXTRON (BHTI) Model

The BHTI Pilot Mentor-Protégé Program provides an excellent example of how a partnership between a mentor and protégé firm is established. Moreover, it provides a model for other mentor and protégé firms to take into consideration. BHTI uses a systematic process to establish an MP agreement. Initially, BHTI conducts a comprehensive evaluation of an SDBU prior to its selection as a protégé. This includes an evaluation of whether or not the SDBU can achieve the right "fit" within the framework of BHTI's manufacturing process and organizational structure. In essence, the opportunity cost of BHTI's development effort must not exceed the benefit of the protégé's capability to add value to the product; therefore, the protégé must be able to provide a benefit that might otherwise be considered a burden to the manufacturing process.

The prime contractor is solely responsible for implementing the MP agreement. At BHTI, the Manager of Small Business Programs Louis D. Marks Jr. is implementing the program by combining a high-energy approach with aggressive implementation. BHTI pledges a firm commitment to achieving the goals of the agreement and, in return, it expects no less than the same type of commitment from the protégé.

Precise Industries Inc. is a protégé that benefited from a well-designed MP

The key to implementing a successful mentor-protégé agreement is commitment and trust between a mentor and protégé.

agreement. This Lufkin, TX, SDBU was originally built as a hydraulic repair facility. Its market consisted of servicing the operations of locally owned lumber, pulp, and paper mills. The company is owned (controlling interest) and operated by Neva Brown, a Native American. Initially, BHTI and Precise Industries entered into a dialogue with the help of congressional support from Texas Congressman Charles Wilson (D-Ret). Subsequently, the two organizations teamed, and a mentor-protégé relationship was established in November 1994.

The terms of the MP agreement required Precise Industries to compete as a vendor for machine parts and ground handling and support equipment. However, the company first needed to acquire the necessary knowledge, equipment, and technology to perform operations as a government contractor. Therefore, a significantly large cash outflow was needed to offset necessary capital expenditures on equipment and training. Ultimately, the expenditures were able to speed up the protégé's learning curve by incorporating sophisticated machinery, providing subject matter expertise, and developing a detailed training program. Cost reimbursement by DOD as well as hard work proved to be essential elements in accomplishing the goal.

In February 1997, Precise Industries earned the distinction of being qualified as a QPS-100 Class I Supplier. The protégé firm was now qualified to perform work on government equipment, and in March 1997, it was awarded a contract in excess of \$160,000. Terms of

the contract required Precise Industries to manufacture ground-handling wheels for 25 of the Army's Kiowa Warrior helicopters, and as a result of its demonstrated excellence, Precise Industries was awarded follow-on contracts that currently total more than \$400,000. Today, the company competes for subcontracts through the competitive bidding process and performs government work on a national level.

Conclusion

The PMPP is highly controversial and widely debated. Disadvantaged businesses have historically viewed such programs as a means of leveling a traditionally unfair playing field. Therefore, the program has received praise for its ability to create jobs and generate revenue, which benefit local economies. Nevertheless, other businessmen and politicians view the program as merely another attempt at implementing a government spending policy.

The mentor-protégé relationship between BHTI and Precise Industries is a testimonial to the commitment of reducing cost and increasing competition. Since becoming a protégé, Precise Industries has experienced significant growth. Purchase orders (end of FY97) now total more than \$572,000, and the company has increased its business base 62 percent. In particular, Precise Industries has expanded its scope of work beyond the boundary of BHTI. Today, it has a Repair of Repairables Agreement with Tinker Air Force Base and incorporates various subcontracting work with other DOD prime contractors.

An Army Acquisition Corps member, KaczmarSKI is now assigned to the Corps of Engineers in Kansas City, MO, as a Contracting Officer.

Introduction

Weapons technology advancements that eclipse the capabilities of our nation require a timely response. Operation Desert Storm revealed the gravity of this situation. The result of our encounter with the tactical ballistic missile (TBM) threat necessitated upgrades to current air defense systems and required the introduction of new systems. The U.S. Army responded to TBM proliferation by upgrading the Phased Array Tracking To Intercept Of Target (PATRIOT) missile and developing Theater High Altitude Area Defense (THAAD) to provide a near-leakproof, two-tier defense capability. THAAD ranks as one of the most technically complex systems ever developed by the U.S. Army. Stability of requirements can make or break this system. This article describes the methodology for achieving stable requirements through the use of vertical and horizontal integration to develop the THAAD requirements baseline.

Why Bother With Requirements?

Continuous evolution of the TBM threat, including unexpected technology advances, creates a dynamic aspect in defense system development. The warfighter must plan to counter a potential threat capability at the time the defense system is designed, built, tested, and fielded.

During system development, warfighters communicate their needs to the materiel developer, who works closely with the prime contractor to ensure the defense capability is robust enough to meet the warfighters' needs.

This buildup in defense capability is achieved through the use of a stable, well-defined requirements baseline. While it seems contradictory to assert that requirements can remain stable while responding to dynamic changes, the THAAD Program is succeeding in the area of requirements development. The key is vertical and horizontal requirements integration.

Requirements are the means used by warfighters to communicate their needs to the developers. But where do require-

REQUIREMENTS: WHO NEEDS 'EM?

MAJ(P) Bruce D. Lewis, James R. Pearson Jr.,
and Jeffrey D. Robinson

ments come from? In the THAAD Program, there are many stakeholders involved: The warfighter, materiel developer, prime contractor, subcontractors, suppliers, and testers all collectively contribute unique aspects to the body of requirements.

The warfighter originates a set of requirements that are conveyed to the materiel developer through an Operational Requirements Document (ORD) and a User Functionality Document (UFD). These documents establish the threshold performance and functional capabilities for joint interoperability of the THAAD System. The materiel developer further defines logistic considerations, describes the threat behavior and performance envelope (based on the System Threat Assessment Report), and defines operational environments. Jointly, the stakeholders develop the Concept of Operations (CONOPS) document. The successful integration of these diverse requirements from all stakeholders is achieved through vertical integration.

Vertical Integration

The key to requirements stability lies in the methodology used to decompose and allocate the requirements from top-level weapon system requirements to the specific, detailed requirements needed to design the segment components. The allocation and budgeting of the system functional performance, nonfunctional performance, and constraints to the physical architecture define the process called *vertical integration*.

In the vertical integration process,

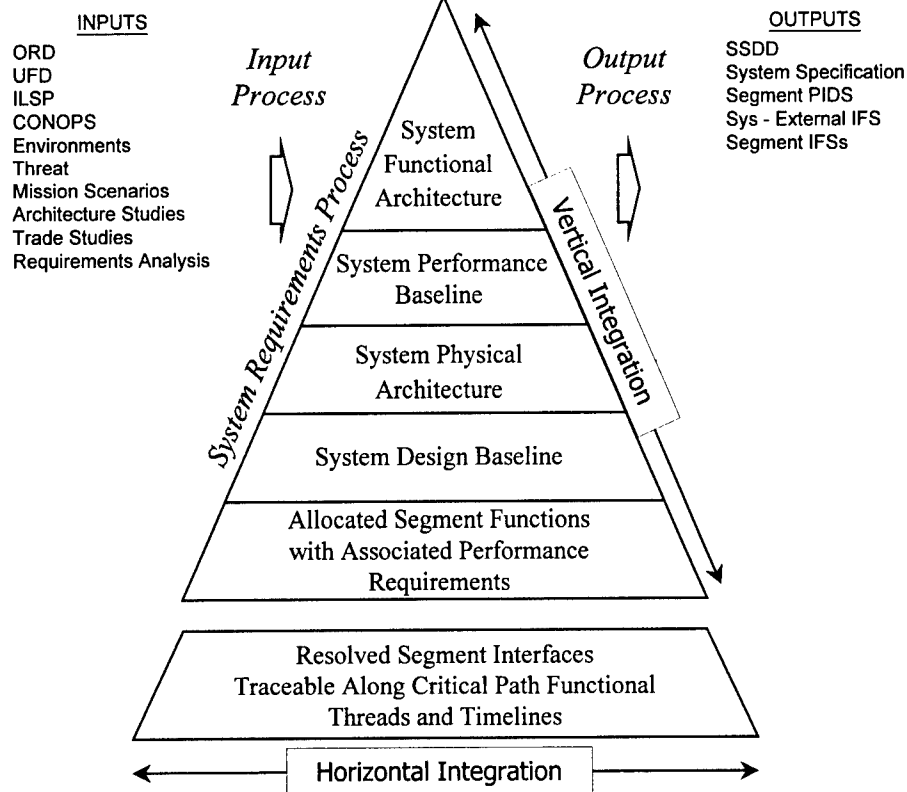

allocation determines where the requirement will flow while budgeting determines which applicable portion of the parent requirement is decomposed to the segment or component. Both functional and performance models are used to allocate and budget top-level requirements.

Before the vertical integration process can begin, the weapon system requirements baseline must be established. The system design must first be imposed on a physical architecture that defines roles and responsibilities of architecture components. This is necessary to guide decomposition of system requirements and their allocation to the physical architecture. The accompanying figure depicts these relationships.

THAAD System requirements are derived from several sources including CONOPS, ORD, UFD, scenarios, and environments. These requirements can be organized into three categories: functional performance, nonfunctional performance, and constraints. Functional performance defines a purposeful action (function), and how well and when the action must execute (performance). Nonfunctional performance (e.g., environments) and constraints (e.g., weight, dimensions) impose mutually inclusive conditions on functionally based performance.

The combination of all these requirements must allow the system to integrate within the warfighter's force structure and perform its primary mission. For THAAD, this functionality can be separately organized as force operations and engagement operations. It is essential that this functionality

Relationships of an Integrated Requirements Baseline

 UFD - User Functionality Document

provide a closed-loop response to the dynamic tactical environment. Vertical integration combines THAAD's system-level functions of planning, execution, monitoring, and assessment with appropriate feedback paths to provide necessary and sufficient closed-loop response.

The THAAD physical architecture consists of five integrated segments and their interfaces. The functional responsibilities are organized for centralized planning, distributed execution, joint monitoring, and assessment. System design makes assignments so that system functionality can be completely allocated

into the physical architecture.

With the system baseline completed, the decomposition of system functionality, performance, and constraints can proceed. At this point, it is important to put the baseline under change control to overcome allocation or flowdown inertia. This is the natural tendency of a preconceived or existing design to resist change. A stable baseline will allow complete and consistent allocations, whereas requirements not baselined can be overcome by requirements creep and flowdown inertia.

The decomposition of system

functions, performance, and constraints provides the building components for reconstructing the system in its allocated form. As the requirements are partitioned among different physical components of the system, interfaces between the components are identified and defined. Decomposition continues until the components can be uniquely allocated in a form appropriate to the next level of development. The system allocates to segments and interfaces, and a segment allocates to its software and hardware configuration items. In this manner, each layer of allocation can

contribute unique added value.

Following a prescribed formula in the decomposition and allocation of the system baseline to the physical architecture provides auditable proof of the integrity of requirements. The vertical integration process ensures a complete set of allocated and budgeted requirements. The horizontal integration process shows the objective demonstration that the allocations are complete, correct, and consistent.

Horizontal Integration

The purpose of *horizontal integration* is to demonstrate desired system behavior, dynamics, and performance in its allocated form. It further substantiates the vertical integration effort by showing that the allocated baseline is completely exercised in the primary mission.

A functional and performance approach is used to ensure horizontal integration of requirements. Threat characteristics and behavior, environments, CONOPS, and system design determine system behavior and performance. This same information influences the decomposition and allocation of the system baseline.

Functional modeling involves the determination of precedence and concurrence in function and interface sequencing. The system's closed-loop response to external and internal stimuli is programmed onto the function and interfaces.

Performance modeling is intended to determine the capabilities needed for the segments and their interfaces. Defended area coverage, for example, can be decomposed into a flight envelope for a missile; a planning envelope for battle management/command, control, communications, and intelligence; and a surveillance envelope for radar. The timeline would be distributed between segments and interfaces in accordance with the sequencing determined by the functional model.

A system balance point is sought that holds the margins given to segments and interfaces in a state of tension. When a segment or interface design threatens to fail its allocation, the system balance point can be adjusted with margin taken proportionately from the other segments and

interfaces. As segment designs mature, the basis of the performance model can shift from capabilities needed to capabilities provided. The cost to perform can also be taken into account in the adjustment of the system balance point.

Mission scenarios are needed to relate the space/time presentation of the threat and environment to the functional and performance models. They provide for segment correct viewing perspectives and time-synchronous geometry.

These scenarios are applied to the functional model to induce it to form a sequence of functions and interfaces termed a thread. A thread is the model's prediction of system behavior. These threads are evaluated for the correct response to deterministic and stochastic stimuli played out in a scenario. When the model has demonstrated itself to close on all scenarios, the system is horizontally integrated.

The mission-critical path and timeline is essential in identifying mission and nonmission-critical functionality to designers. The allocations in turn will identify the mission-critical components that also receive special fault and built-in test requirement flowdown. There is a great deal of parallel activity among all segments and interfaces during scenario time. If we chronologically interleave the latest completing functions and interface transfers, the desired mission-critical path and timeline are obtained.

When a function or interface is exercised on a thread, the occurrence is logged. When the system's closed-loop response has been traced in its allocated form for every scenario, this proves every function and interface has been exercised and horizontal integration is substantiated. A complex system may have several thousand requirements and each must be verified. It is cost prohibitive to verify each individually. Thread verification leverages the greatest number of mutually inclusive requirements and arguably can reduce the cost of verification.

Conclusion

The usefulness of a model-based, vertically and horizontally integrated requirements baseline is found in its service to all stakeholders involved with

development of a complex defense system. All stakeholders need stable requirements that are accountable to external factors, resistant to requirements creep, yet robust enough to respond to dynamic changes. By applying the horizontal and vertical integration process, THAAD will have a stable set of requirements that are objectively substantiated and completely relate the baseline between system, segment, interface, and software designs.

SYNCHRONIZING DEFENSE TRANSPORTATION SYSTEM REFERENCE TABLES

LTC Kenneth S. Wagner

Introduction

The proliferation of uncoordinated and nonsynchronized data reference tables is a significant challenge to fully integrating automated information systems (AISs) within the Defense transportation mission area. An AIS uses reference tables such as "Country Code" and "Aerial Port" to conduct business transactions. If the receiving AIS does not have matching reference table data, it often rejects that transaction as invalid. Human intervention may then be required, resulting in reduced efficiency throughout the entire transportation mission area—not to mention the impact on soldiers in a theater of operations.

With millions of transactions processed monthly, even a small percentage of data errors quickly results in the expenditure of tens of thousands of man-hours to analyze and fix the rejections. The amount of frustrated cargo (cargo that becomes undocumented, lost, and/or stranded) increases, unnecessary supply reorders increase, and customer satisfaction drops. When looking at these problems, one can easily appreciate the efficiencies that can be gained from synchronization of reference tables.

A Systematic Process

This article describes the process developed by a U.S. Transportation Command (USTRANSCOM) project team to synchronize transportation reference tables across 24 transportation-related AISs. The importance of reference table management is not unique to the transportation mission area; it is also an important element in mission areas such as logistics and finance. Though the mission area may be different, USTRANSCOM's

process may be applicable to any agency attempting to synchronize and manage its reference tables.

For the purpose of this article, the term "reference table" refers to data tables that are fairly static and do not change as a result of business transactions. Country Codes, Hazardous Materiel Codes, and DOD Activity Address Codes are examples of reference tables. This process does not address operational tables such as transportation or movement requests; these contain data values that differ with each transaction.

Critical Project Elements

USTRANSCOM has identified three critical project elements: Creation, Replication, Usage, Duplication (CRUD) analysis of reference tables; Concept of Operations (CONOPS); and Implementation Plan. Each is described below.

CRUD Analysis. CRUD analysis is the single most important part of developing a logical reference table management plan. USTRANSCOM's reference table management CONOPS is based entirely on the information derived from CRUD analysis. The project team used the following CRUD analysis steps:

- Identified all reference tables for each AIS supporting the mission area;
- Identified sources being used for each table;
- Identified existing AIS table update processes such as frequency and method;
- Obtained reference table printouts that contain actual data values from each AIS;
- Separated the data value printouts by

general category (i.e., "Bucketed the CRUD");

- Compared the printouts in each category side-by-side to identify duplicates;
- Researched source data to identify single, authoritative sources for each table;
- Analyzed all data to determine logical table stewards; and
- Analyzed all data to determine logical table management business rules.

As a result, the project team identified 1,162 reference tables used with 24 transportation-related systems. Of those 1,162 reference tables, 215 tables were duplicated between two or more systems and accounted for 656 of the total. In addition, 508 tables were unique to a single AIS or may have duplicate reference tables outside the 24 Defense Transportation System (DTS) AISs.

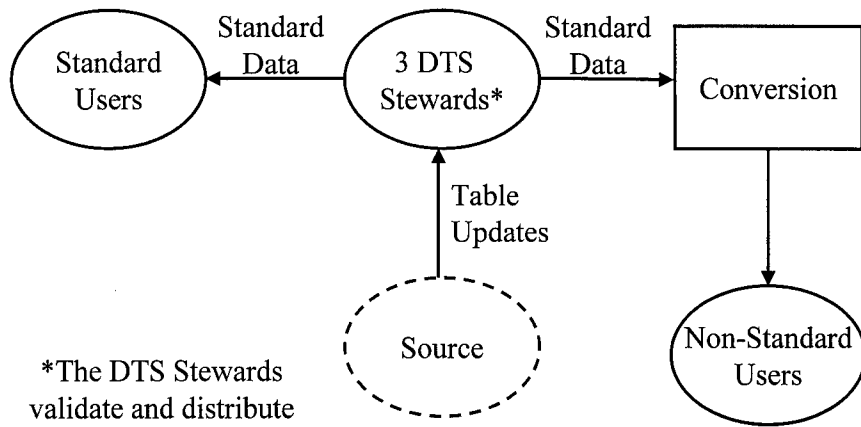

Concept Of Operations. The CONOPS includes the following information:

- A reference table management end-state process model (see accompanying figure);
- Assignment of roles and responsibilities;
- Identification and establishment of a single, authoritative source for each reference table;
- Identification of reference table stewards (managers and distributors of reference tables and updates);
- Establishment of business rules for the systematic control and distribution of new tables and/or table updates;
- A plan for implementing the above policies and procedures.

The Joint Reference Tables (JRT) Program Management Office (PMO), the DTS Stewards, and the DTS System PMOs are jointly responsible for implementing the CONOPS. The JRT PMO serves as USTRANSCOM's single manager for DTS reference tables, for developing policies, and for resolving all issues related to the processes and management of reference tables used by the DTS community. In addition, the JRT PMO serves as the focal point for identifying and resolving resource issues related to reference table control and management, and researches and analyzes all new reference tables used with transportation systems and identifies a single authoritative source. As needed, the JRT PMO assigns stewardship responsibility for any new reference tables to an appropriate DTS Steward.

USTRANSCOM's implementation plan identifies three DTS Stewards: Military Traffic Management Command, Washington, DC; the Transportation Coordinators Automated Information System II PMO, Washington, DC; and the Air Mobility Command, Scott AFB, IL. As the only

Reference Table End-State Model

*The DTS Stewards validate and distribute tables and table changes.

authorized distributor throughout the DTS community, DTS Stewards dispense all reference tables and reference table updates to the DTS community in a timely fashion to ensure that the DTS community is synchronized as much as possible with the entire DOD community. These tables and updates are provided to DTS System PMOs in whatever technical format specified by the System PMO. DTS Stewards establish procedures for obtaining reference tables and updates from each individual source and are responsible for resolving any reference table issues generated by system PMOs. In this role, DTS Stewards act as reference table validators, coordinating any "bad data" issues directly with the authorized sources. They may modify reference table data values as needed to meet operational requirements even if the authorized source does not recognize that data as valid.

DTS System PMOs ensure that their systems are capable of accepting reference table updates from the appropriate DTS Steward and promulgate those updates throughout the system in a timely manner. PMOs will forward any reference table data errors to the appropriate DTS Steward for resolution. PMOs will NOT directly coordinate data issues with authorized sources; that is the responsibility of the DTS Steward. PMOs will forward any operational data change requirements to the appropriate DTS Steward for processing.

Breakouts of single, authoritative sources for all DTS reference tables are attached as appendices to the CONOPS, as are breakouts of responsible stewards for each reference table (alphabetical by system or steward name and then reference table name).

The CONOPS establishes business rules for adding, deleting, and updating reference

tables. When a PMO creates a new table, he or she must coordinate the new table with the JRT PMO. The JRT PMO will research the new table to see if it is a duplicate of an existing table. If so, the JRT PMO will pass existing source and stewardship data to the system PMO. If the table is new, the JRT PMO will research and establish source and stewardship rules.

When a PMO deletes a table from his or her system, he or she must notify the JRT PMO, who will move the reference table management data from an active file to an inactive file as appropriate.

DTS Stewards will "push" reference table updates daily (and emergency reference table updates as needed) by whatever electronic means and in whatever data format is requested by the individual system PMO. System PMOs will design or modify their systems to ensure that the system can process the update changes and promulgate those changes to system users in a timely manner.

Implementation Plan. On average, a steward requires 1 full-time equivalent (FTE) to actively manage 5 to 10 reference tables. The largest DTS Steward, for example, will employ a combination of 18 functional and technical FTEs to manage about 150 tables.

PMOs must be allocated sufficient resources to enable their systems to automatically process the daily "pushes" from the stewards and update system reference tables in a timely manner.

To institute an implementation plan requires the establishment of stewards and the development of a steward relational database management system and communication links within the first 6 to 12 months. In addition, stewards must replicate authoritative source tables and obtain table update

format requirements from user PMOs.

Between the first and second year, PMOs develop scripts to automatically process update "pushes" from stewards. Stewards begin "pushing" baseline reference table values and updates to user PMOs.

Once the process is established, the cost of maintaining reference table synchronization can run several million dollars annually, most of which goes for stewardship operations. The cost is much higher the first 2 to 3 years as the stewards develop new interfaces with system PMOs and the PMOs modify their systems to process data pushes in a timely fashion.

Conclusion

Synchronizing reference table data values across functional area AISs is a daunting effort. Analyzing each system's tables is tedious and time consuming; coordinating with all of the stakeholders (PMOs, steward nominees, etc.) is complex. The process itself will be completely new to most people, and execution requires significant resources. But the potential payoff is enormous. How many hours are currently wasted by operators who must manually process rejected transactions? For the Defense transportation functional area, the cost of inefficiency is about 500,000 man-hours annually. For USTRANSCOM, it was too expensive NOT to address the problem.

LTC KENNETH S. WAGNER has served as Project Manager for USTRANSCOM's Defense Transportation Joint Reference Tables effort since October 1998. He is an Army Acquisition Corps officer with more than 19 years of service. LTC Wagner holds a B.S. from the U.S. Military Academy and is a graduate of the Advanced Program Management Course at the Defense Systems Management College, Fort Belvoir, VA.

IMPROVED MODULAR DECONTAMINATION EQUIPMENT

Introduction

As the Army moves into the 21st century, our troops face an increasing possibility that the enemy may use relatively inexpensive weapons of mass destruction. To counter the ever-increasing chemical and biological threat, our soldiers must receive early warnings, be protected in a manner that will allow them to continue engagements in a nuclear, biological and chemical (NBC) environment, and have at their disposal an effective means for decontamination. The doctrine for NBC weapons used by most threat nations is postulated to be attacks against forward troop concentrations and to targets reached by the depth of delivery systems. Because some NBC agents may still be effective several days after they are first used, U.S. forces must be able to decontaminate quickly and safely.

Modular Decontamination System

For equipment decontamination, the U.S. Soldier and Biological Chemical Command recently completed the development phase of the Modular Decontamination System (MDS). The MDS includes two separately powered diesel engine-driven modules mounted on a three-quarter-ton, high-mobility trailer. Combined, these items provide an improved capability for decontaminating equipment on the battlefield. A Milestone III In-Process Review held in December 1998 recommended Type Classification, Standard, for the MDS. The decision memorandum approved proceeding to the production stage of the program. Production contracts are planned leading to the initial fielding of the MDS in FY00.

The MDS consists of an M21 Decontaminant Pumper (DP) and two M22 High Pressure Washers (HPWs), which will replace the M12A1 Power Driven Decontamination Apparatus (PDDA) and the M17 Lightweight Decon System (LDS) in dual-purpose (smoke/decon) companies and in some heavy divisions. Neither the

Rinaldo J. Bucci

PDDA or the LDS optimize the use of water, a limited battlefield resource, and each lacks the capability to spray high-pressure water to thoroughly clean equipment. In addition, neither uses standard Army fuel.

Lessons learned during the Gulf War validated that existing decontamination equipment is labor intensive, requires extensive maintenance, and is very dependent on a large supply of water. Because of this, commercial items were procured to assist in decontaminating equipment prior to its return to the United States. Later, a requirements document was written incorporating the essential elements of these commercial items. Invitations were then extended to industry requesting comments about the Army's requirements. Once the requirements document was approved, a market investigation of industrial aqueous cleaning and decontamination systems was conducted. The market survey showed that, with some improvements to meet the extremes of military requirements, commercial items could be modified for high-pressure washing.

Manufacturers were then invited to provide an onsite demonstration of the items best suited to meet the Army's needs. There was no commercial equivalent that met the Army's need for a DP. Development contracts were awarded using the performance-based streamlined acquisition process.

Chemical smoke/decon companies will normally deploy with a division-size or larger Army force to provide NBC decontamination capability. Once in theater, chemical platoons may be attached or in direct support to brigade-size elements within the main battle area and rearward within the theater.

The dual-purpose smoke/decon squad

will transport the MDS in high-mobility trailers to conduct detailed equipment decontamination (DED). DED is conducted in five steps: primary wash, decontaminant application, wait/interior, rinse, and check. The MDS will be used to perform three of these steps—primary wash, decontaminant application, and rinse—as described in Army FM 3-5, *NBC Decontamination*.

The M21 DP is used to apply the decontaminant, and the M22 HPW is used before (primary wash) and after (rinse) the decontaminant is applied. The M22 HPW is used in the first step to remove gross contamination, such as mud and grease, so that the surface area of the equipment can be reached by the decontaminant. It is used again to rinse off the applied decontaminant. The powered equipment will be operated by the chemical squad members (military occupational specialty (MOS) 54B) who will, at the same time, supervise soldiers from the supported unit. These supported unit soldiers will operate the spray wands of the M22 HPW and the powered brushes of the M21 DP. The mobility and flexibility of the MDS will allow chemical companies to tailor load plans to best meet mission requirements.

The M21 DP pumps and sprays Decontamination Solution No. 2 and liquid field expedients such as bleach and diesel fuel. It uses a diaphragm-type chemical pump that is belt-driven by the diesel engine to pump the decontaminant through two spray wands. It will deliver decontaminants in all required temperatures and environmental conditions. The decontaminants are applied efficiently by the spray wands at rates between 1 and 4 gallons per minute (gpm) using both wands. The M21 DP can draw the decontaminant up to 6 feet below the pump and 15 feet from a container on the ground.

After the surface is sprayed, the operators use electric-powered brushes to mix the decontaminant with the agent to

The M22 High Pressure Washer on the left and the M21 Decontaminant Pumper on the right

accelerate the removal or neutralization process. The replaceable brush heads rotate at approximately 350 revolutions per minute (rpm) under load and are easily maneuvered and replaced by the operator. This system will replace the current procedure where an operator dips a mop into 5-gallon pails to apply the decontaminant and then uses a broom to accelerate the action of decontamination. The current method is extremely labor intensive, especially in Mission Oriented Protective Posture (MOPP) gear. Test results have shown a significant reduction in the amount of decontaminant needed, reducing costs and mitigating, to some extent, the adverse effect on the environment.

The M21 DP cases provide for all of the needed hoses and hose reels, nozzles, spray guns, extensions, the components for two hand-held power brush assemblies, a North Atlantic Treaty Organization (NATO)-compliant electrical connector, powered brush heads with two spares, and 75-foot power cords. Extensions for the spray wands and powered brush assemblies are provided to ensure that most surfaces of large combat equipment may be reached without the need for mounting the equipment.

The M22 HPW is capable of delivering hot or cold water at up to 3,000-pounds-per-square-inch (psi) using two spray wands at a rate of 5 gpm. The water pressure and temperature are adjusted by the operator. The heated water or wet steam is produced using the M22 HPW's built-in boiler. Hot water and steam are used on sensitive

surfaces of aircraft, rubber, and field gear. The M22 HPW is also equipped with a liquid injector system useful for adding a deicing agent or a liquid detergent. Water may be drawn from an urban fire hydrant, natural sources (streams or lakes), or from a 3,000-gallon water bladder provided with the system.

The M22 HPW can also deliver up to 40 gpm of ambient water through its high-volume pump. This feature is used to accelerate the decontamination process when water is not a scarce commodity. In addition, the M22 HPW can be adapted for use with the standard Army 125-gpm diesel-powered water pump to draw water into the water bladder or for application through the high-volume hose and nozzle.

The M22 HPW, like the M21 DP, is trailer-mounted and also includes accessory cases for hose reels, hoses, suction strainer spray wands, adapters, and nozzles. An extendible wand is included to reach surfaces up to 10 feet high, and a shower bar with a hot and cold mixing valve assembly is included to provide heated showers for up to 8 people.

The MDS will contain a limited warranty from the producer and will be supported initially by the production contractor to expedite the fielding process. Savings in replenishment parts and maintaining extensive inventories is planned by improving reliability and minimizing the number of maintenance tasks scheduled at the unit level. Maintenance manpower requirements will

be significantly less than those required to support existing systems. In addition, the MDS will not require any special tools or test and measurement equipment, nor will it require any new MOS or unique system training devices.

The MDS will be fielded with additional standard Army items. These associated support items of equipment include the three-quarter-ton trailer, a 125-gpm diesel-driven water pump, and the 3,000-gallon fabric water tank. Even with this new capability, the MDS is not a panacea to the decontamination challenge—it is for exterior surfaces of equipment and not for large ground areas, interior surfaces, or for sensitive electronic equipment.

Conclusion

The M21 DP and the M22 HPW, together, complement the doctrine outlined in Army FM 3-5. The MDS becomes a neutralizing force for quickly returning equipment to the battlefield. The Modular Decontamination System provides our forces a more effective system, one with greater mobility and reliability. In addition, it will relieve the soldier of some of the logistical burden and labor intensiveness associated with the current decontamination process.

RINALDO J. BUCCI is the Team Leader/System Manager for the Modular Decontamination System Program at the U.S. Soldier and Biological Chemical Command. He is a graduate of the University of Maryland. His awards include membership in the Department of the Army's Honor Roll for Acquisition Streamlining Excellence and the prestigious Henry Knox Award.

SIMULATIONS DURING OPERATIONS

MAJ John R. Surdu
and Dr. Udo W. Pooch

their staffs to focus on important information and screen out the unimportant data. Ultimately, this assists commanders in maintaining a decision cycle that is faster than their enemy's decision cycle.

The conduct of military operations generally consists of planning, rehearsal, execution, and after-action review. While these are not definitive phases, for purposes of discussion, it is helpful to treat each as a distinct and separate phase. Simulation technology can be applied in each of these phases.

• **Planning.** During the planning phase, staffs develop COAs. The current method, as outlined in *Techniques and Procedures for Tactical Decisionmaking* (CGSC ST 100-9), is an *ad hoc* process that involves staff members discussing the various COAs. Each phase of the operation is analyzed according to an *action-reaction-counteraction* paradigm. This method, however, has numerous problems.

The effectiveness of the wargaming process is highly dependent on the skill of planning staff members. It is doubtful that a large percentage of planning staff members have the feel of the battlefield that Clausewitz described. There are many time and space relationships that must be considered when going through the *action-reaction-counteraction* drill, and there are no tools to help staff members do this well.

The effectiveness of an *action-reaction-counteraction* analysis of COAs is also dependent on the interactions among planning staff members. The reality of current personnel management policies is that a staff rarely has time to coalesce. Except for *lock-ins* and *ramp-ups* for deployments to large-scale training exercises, personnel rotations ensure that a fair portion of a planning staff will be new to the group.

Finally, the same officers who develop the COAs are the ones who analyze and determine the criteria to evaluate them. Despite best intentions, planning staff members carry personal biases as to which plan is better. Given a bias toward one COA, a person can easily manipulate the criteria, weights on the various criteria, and resultant decision support matrix of the preordained "best" COA. This bias may manifest consciously or unconsciously, but it is clearly a risk associated with the current wargaming procedure.

Introduction

A large number of tasks performed by commanders and their staffs during operations can be facilitated by applying simulation technologies. Traditionally, the focus of simulation in DOD has been on analysis and training. The military community has developed a large number of these simulations, such as Corps Battle Simulation, Brigade/Battalion Simulation, Janus (a two-sided combat model), and Modular Semi-automated Forces. While many of these simulations are excellent products, most are unsuitable for use during operations because of the amount of pre-exercise preparation involved, specialized hardware, and the large number of participants and workstations required.

Currently, there are no *operationally focused* simulations specifically intended for use during operations. Simulations designed to further course of action (COA) development and analysis, rehearsal, and operations monitoring will enhance the effectiveness of commanders and their staffs.

In his book, *On War*, Carl Von Clausewitz discusses the "feel of the battlefield" and how great commanders have the ability to see through the fog of war. He also notes that this feel of the battlefield only comes with experience. With severely constrained budgets and 100-hour wars, the Army has limited means to identify those officers who have this feel of the battlefield. The use of an

operationally focused simulation would augment the ability of commanders and their staffs to feel the battle.

This article discusses the use of simulation for COA development and analysis, rehearsals, and operations monitoring. The authors have previously published several technical articles in computer science publications that propose a methodology to make this use of simulation viable. *This* article also argues the usefulness of simulation during operations to motivate research, development, and acquisition efforts.

Why Operational Simulations Are Important

Operationally focused simulations leverage simulation technology to improve situational awareness, prevent information overload, and help the commander stay inside the enemy's decision cycle. An operationally focused simulation provides more than just a view of the battle; it facilitates real-time analysis of the implications of friendly and enemy decisions. Like a computer chess analyzer, it simulates COAs into the future and provides timely information to commanders and their staffs.

Additionally, use of operationally focused simulation helps with situational awareness by preventing information overload and by drawing the commander's attention to aspects of the current operation that could lead to failure. This allows commanders and

Operationally focused simulations provide powerful new tools to the planning process. As part of this process, the staff can enter enemy and friendly COAs and simulate them to assess their effectiveness. The results of these simulations can then be used as criterion in evaluating courses of action. This provides better feedback with higher granularity than do current procedures. It highlights problems, especially synchronization issues, within the proposed COAs. The end result is a more timely, accurate, and rigorous assessment of COAs than is provided by the current manual process.

There is still the problem of "straw-man" plans. The planning staff often proposes two valid COAs and one "throwaway." Therefore, the staff typically only considers two viable COAs because there is usually insufficient time to adequately analyze three. A staff armed with a valid simulation can adequately analyze more viable COAs—and do a better job—than they can using the current method. While the manual method was appropriate for an industrial-age Army, it is no longer appropriate for an information-age Army needing to stay inside the enemy's decision cycle.

The planning staff usually explores possible branches and sequels to the plan. Simulation of the plan makes it easier for the commander and planning staff to explore more branches and sequels in greater detail and with greater fidelity. Because of time constraints, typically only the most likely and the most dangerous branches and sequels can be explored—and that analysis is often superficial.

Having the operationally focused simulation at multiple echelons also speeds the planning cycle. Once division headquarters personnel have completed the plan, they transmit the plan electronically to each of the subordinate brigades. The brigade planning staff then deletes entities that do not apply to them, disaggregates entities that do apply to them, and builds a brigade plan. Once again, this aids our forces in staying inside the enemy's decision cycle. If less time is needed by lower level headquarters to recopy overlays and redraw plans created at higher headquarters, they will have more time to conduct mission and COA analysis.

• **Rehearsal.** Once a COA is chosen, it is developed into a full plan and rehearsed. The simulation will facilitate this detailed rehearsal. Certain rehearsals (e.g., fire support; close air support; nuclear, biological, and chemical; and mobility, countermobility, and survivability) are difficult to conduct over sand tables and maps. Clearly, simulation is an asset for these types of rehearsals, in addition to the traditional, maneuver-centric rehearsal. Rehearsals identify synchronization issues and ensure that everyone fully understands the plan. A simulation that can be halted by any means could facilitate a rehearsal, just as large sand tables and map boards do today.

A significant advantage of a simulation-based rehearsal is that it can potentially be distributed geographically. With a number of distributed graphical interfaces to the same simulation, the commander and operations officer can control the plan's playback while subordinate commanders and other staff members watch from remote locations. The rehearsal can be conducted without all the key players being within grenade-burst radius of each other.

• **Execution.** Once the operation commences, operationally focused simulations monitor the progress of the simulated plan and the real operation. Intelligent software agents, referred to as operations monitors (OMs), compare the progress of the real plan against its simulation. When significant deviations from the plan occur, the OMs launch tools that explore the impact of these deviations. Finally, the commander is advised if the OMs determine that the plan's success is in jeopardy.

• **After-Action Review.** After-action reviews are important, even during a war. The course of the real operation can be recorded and archived for later review. The operation can then be "played back" for the key leaders. This allows commanders and their staffs to identify synchronization problems or other errors in the operation. During training exercises, there are often impartial observer/controllers (O/Cs) to watch the planning and operations and provide feedback. O/Cs are unlikely to be available during real operations. The use of an operationally focused simulation helps fill this void.

Summary

Operationally focused simulations are an important technology for an information-age Army. These simulations improve situational awareness, prevent information overload, and help the commander stay inside the enemy's decision cycle. An operationally focused simulation provides more than just a view of the battle; it facilitates real-time analysis of the implications of both friendly and enemy decisions. An operationally focused simulation of COAs into the future provides timely information to commanders and their staffs. This information helps commanders make the right decisions at the right time and stay inside the enemy's decision cycle.

AUTOMATED ENVIRONMENTAL MANAGEMENT, MONITORING, AND CONTROL SYSTEMS

Shelley J. Barker, Nelson Colon, Daniel Dauenhauer,
Fred Mulkey, and Thomas J. Wildoner Jr.

Introduction

To ensure real-time compliance with environmental regulations and monitoring facilities and operations, an automated system is mandated. Two programs—the Facility Environmental Management and Monitoring System (FEMMS) Program at Tobyhanna Army Depot and the Radford Environmental Development and Management Program (REDMAP) at Radford Army Ammunition Plant—are enhancing air, water, and solid waste and hazardous materials management. Additionally, these programs improve the overall environmental posture of both these facilities.

Each program has two technical components. First, Web-based supervisory control and data acquisition (SCADA) applications are being implemented for environmental process control and response. Second, pollution prevention and treatment technology, training, and ISO 14001 projects are underway. ISO 14001 is an international standard for environmental management systems consisting of 17 requirements to assess and manage the environmental impacts of a facility's activities, products, and services.

Started in 1995, the FEMMS-Tobyhanna Program was fully implemented in July 1999, while the REDMAP will be in its first year of operation. Responsibilities for imple-

menting the two programs are assigned to an integrated product team (IPT) consisting of members of the contracting team (Concurrent Technologies Corp. and Electronic Warfare Associates Inc.), Tobyhanna and Radford stakeholders, and employees of the U.S. Army Industrial Ecology Center at Picatinny Arsenal.

Challenges

Facility managers face continuing environmental challenges to monitor and control industrial processes to comply with expanding regulations, minimize pollution, and maintain competitiveness. To maintain environmental compliance and a competitive advantage, managers now require near real-time data monitoring and automated control systems to replace time-consuming, labor-intensive data collection and laboratory testing. Near real-time data improve environmental compliance through data accuracy and timeliness, enhance safety, reduce damage to the environment by early detection and prevention of incidents, and help to avoid nonpermissible discharges. Consequently, regulatory fines are reduced and operational efficiency is improved.

Environmental SCADA Applications

In response to these challenges, the U.S. Army implemented the FEMMS

Program, a unique approach using online monitoring, process- and field-level sensors and controls, and the latest computer and communication technologies. The FEMMS emphasizes off-the-shelf, nondevelopmental items giving managers and plant personnel local; central; and remote monitoring, control, and response capabilities.

The unifying factor in the FEMMS architectural approach is the Environmental Information System, which integrates each phase of the environmental and industrial process—referred to as the FEMMS modules—into a unified, whole system. Functional categories include process monitoring and event status, process control, modeling and simulation, information management, and facility management (mission support, policy, and planning). Modules are linked via a dedicated Web site, relational database, customized and intuitive human-machine interfaces, programmable logic controllers, and document management systems. The system collects, stores, and processes data into usable information for analysis, reporting, display, and dissemination over a FEMMS intranet.

FEMMS-Tobyhanna

The FEMMS-Tobyhanna was implemented in modules, with the Environmental Information System

Environmental Technology Projects Of The FEMMS Program		
Project	Problem	Results
Replace/reduce chlorine for wastewater disinfection	Lower discharge limits for chlorine were imminent.	Turnkey ultraviolet system installed that consistently maintains bacteria level and eliminates chlorine.
Reduce nitrates/nitrites	Newer permits require monthly nitrate discharge levels below original sewage system capability.	Biological denitrification towers operating under anoxic conditions selected and implemented.
Recycling of rain room water	Rain room packaging test water formerly went to drain.	System designed and installed, recycling more than 1 million gallons of water annually.

installed early to support future module establishment. The first demo module was completed in 1996, the last in 1998. The module functional areas for this communications-electronics maintenance depot are process monitoring and event status, process control, information management, and facility management. The FEMMS architecture allows each module to serve in a stand-alone capacity and as part of the whole system, with data funneling to the Environmental Information System. Radio, local area network, fiber-optic cable, telephone, and Web-based technologies are used for the information transfer and communications architecture. A centralized environmental control center within the facility's environmental management office is the hub of the FEMMS. The FEMMS architecture is also expandable to incorporate newly identified processes. For example, a review is now underway to incorporate Tobyhanna's new industrial operations facility.

Tobyhanna Benefits

The FEMMS has provided environmental and process control benefits for Tobyhanna, including the following:

- Detecting four electroplating shop leaks, automatically notifying personnel, and permitting immediate repairs preventing an environmental hazard;
- Automatically notifying personnel of equipment failures and power outages and self-diagnosing system failures;
- Remotely accessing (out-of-office and off-facility) Environmental Information System data, which saves time and labor, and providing continuous visibility of environmental status (presently not employed for security purposes);

- Continuously providing real-time, local weather data for use by security, environmental, emergency response, and contracting personnel; and

- Replacing, reducing, and eliminating labor-intensive process control, data collection, storage, and reporting tasks.

REDMAP-FEMMS

REDMAP entails the implementation of the FEMMS modules at Radford. The REDMAP-FEMMS, while following a similar implementation approach and philosophy as the FEMMS-Tobyhanna, largely emphasizes the modeling and simulation module functional area arising from its chemical manufacturing and ammunition plant operational mission. Its concept design was completed in November 1998, and the first modules will be completed by March 2000. It will also have an Environmental Information System hub with a relational database management system, Web server, REDMAP intranet, and human-machine interface capability.

The REDMAP-FEMMS, providing the latest technologies in automated environmental management, will integrate sensors, meters, monitors, analyzers, controllers, recording devices, and alarms into a single real-time system with state-of-the-art data acquisition and communications.

REDMAP Benefits

The FEMMS will allow Radford personnel to manage chemical leaks from its nitric acid, oleum, ammonia, and ethyl-ether tank farms; monitor outfalls for environmental violations; monitor its wastewater system to ensure proper operation; and track (from accumulation to disposal) waste propellants and explosives. The REDMAP-FEMMS is specifically designed to provide the following benefits to the Radford Army Ammunition Plant:

- Strengthen environmental and safety regulatory compliance,
- Reduce the likelihood of environmental contamination and improve process efficiency,
- Enhance commercial appeal as an armament retooling and manufacturing support initiative site, and
- Improve the ability to respond to hazardous materials emergency response situations.

Environmental Projects

In addition to the environmental SCADA systems being deployed, the FEMMS Program and REDMAP contain many supporting projects to enhance each facility's environmental posture and environmental stewardship.

Environmental Technology Projects Of REDMAP		
Project	Problem	Results
Reduce/replace caustic soda used to remove energetic materials	Caustic soda is a high-volume waste stream and is treated offsite. No acceptable chemical/process substitutes identified.	Low-risk, cost-effective option of aqueous spray wand prewash identified and being demonstrated.
Reduce sulfates in nitrated products stream	Sulfates cause upsets at the bioplant. The need is to remove or beneficially reuse the sulfates.	Six process improvement areas under investigation.
Improve pan liners for open burning ground	Regular field clay is used but sloughs off, adding to hazardous waste volume as well as needs periodic replacement.	Improved pans using a castable refractory lining material in demonstration.
Training to properly segregate "suspect" contaminated waste	Army and Radford-specific regulations must be followed to ensure only proper materials are transferred to the burning ground.	A train-the-trainer educational program accompanied by reinforcement visuals and a trainee validation system are underway.

Both Tobyhanna and Radford participate in DOD's ISO 14000 Pilot Program. The FEMMS Program and REDMAP are assisting each facility's ISO pilot efforts as follows:

- Analyzing gaps in the present Environmental Management System versus the ISO 14001 standard;
- Executing ISO implementation plans, training plant personnel, and providing audit assistance; and
- Providing technical support to help meet the requirements and milestones of DOD's ISO Pilot Program.

Additionally, the FEMMS Program and REDMAP entail implementation of several multidisciplined projects based on the highest priority needs of the stakeholder. Factors such as payback, environmental compliance, cost avoidance of fines, and hazard reductions and implementation risk will be considered in the prioritization process.

Conclusion

The FEMMS Program and REDMAP significantly impact the way key environmental management operations are performed while meeting the monitoring and control response needs of two very different facilities. Manual methods are being replaced with automated technologies. Enhanced decisionmaking and facility management opportunities are occurring through rapid correlation and dissemination of detailed, current data that permit development, analysis, and comparison of multiple alternatives.

The FEMMS-Tobyhanna will be a proven and tested system providing real-time visibility into environmental status, operations, and processes that have substantially reduced both the chances for regulatory violations and the likelihood of an environmental disaster through early-warning and automated-control applications.

The FEMMS architecture now being applied at Radford represents the current technological edge in integrated environmental monitoring, management, and control systems and applies to all other military industrial facilities. Additional efforts in pollution prevention, treatment, education, and ISO 14001 enhance the overall benefit of the programs to the Tobyhanna and Radford

The FEMMS Program and REDMAP significantly impact the way key environmental management operations are performed while meeting the monitoring and control response needs of two very different facilities.

facilities and apply the full capabilities of the IPT.

She holds a master's degree in environmental science and engineering and a bachelor's degree in biology from the Virginia Polytechnic Institute. She has 15 years experience in her field.

NELSON COLON is a Program Management Engineer at the Industrial Ecology Center, U.S. Army Tank-automotive and Armaments Command's Armament Research, Development and Engineering Center. He is also the IPT Leader for the FEMMS Program and REDMAP. He holds a bachelor's degree in electrical engineering from the New Jersey Institute of Technology and is pursuing an M.S. in engineering

management. He has 10 years experience in program management.

DANIEL DAUENHAUER is the Director of Environmental Technologies at Electronic Warfare Associates Inc., where he is the Program Manager for both the FEMMS Program and REDMAP. He holds a bachelor's degree in administration and has 15 years experience in program management of information, instrumentation, and control systems integration.

FRED MULKEY is the Manager of Process and Materials Characterization at Concurrent Technologies Corp., where he is the Program Manager for both the FEMMS Program and REDMAP. He holds a bachelor's degree in chemistry from Dickinson College and a master's degree in chemistry from Indiana University of Pennsylvania. A Registered Environmental Manager, Mulkey has 13 years experience in environmental project management and laboratory management.

THOMAS J. WILDONER JR. is an Environmental Protection Specialist at Tobyhanna Army Depot and is the Tobyhanna-FEMMS Technical Monitor. He holds a bachelor's degree in earth and space science from East Stroudsburg University. He has 15 years experience, including 4 years active duty with the U.S. Army Chemical Corps.

THAAD CITIS

Freida Garrison

Introduction

How do you transition from mountains of paper to a "paperless" integrated digital environment (IDE)? This is a daunting prospect for many DOD organizations. In its effort to evolve to a successful IDE, the Theater High Altitude Area Defense (THAAD) Project Office (TPO), an acquisition category (ACAT) ID program, is taking steps to digitize all documents, acquisition business processes, and technical processes. The centerpiece of the TPO IDE is a prototype Contractor Integrated Technical Information Service (CITIS).

Strategy

The THAAD CITIS is being developed, tested, and implemented by the project's prime contractor, Lockheed Martin Missiles and Space (LMMS). When fully implemented, it will provide the entire THAAD team—the TPO and its business partners at diverse geographic locations—with instant online access to essential technical and programmatic data along with key collaborative capabilities. To meet the challenge of providing quick, low-cost access to critical program information, the TPO will require the CITIS to provide government and contractor personnel access to contractor data. This includes data from key subcontractors and government-furnished information. The TPO government concept of operations and MIL-STD-974 define core and other functional requirements for the CITIS.

The CITIS is conceptualized as a comprehensive information service enabled by an electronic vault providing the capability for online storage, notification, access, viewing, and approval of specific THAAD program data. This system will provide the TPO and its business partners the opportunity to re-engineer their infrastructure to improve their core business processes.

Current Status

Because the THAAD CITIS is Web-based, it is platform independent, provides better scalability, and allows for global data sharing. The CITIS can be accessed via desktop computers at all the prime contractor facilities and within the TPO. It can be accessed by TPO employees, the Systems Engineering Technical Assistance contractor, and other TPO support contractors. In addition, it can be accessed at the major subcontractor's facility.

The THAAD CITIS prototype incorporates an Electronic Data Management System that combines a data vault using the latest information management software and a Web-based indexing and search tool. It provides online access to key program data and databases that will ultimately replace most, if not all, deliveries of paper information. The THAAD CITIS applies FORMTEK client-server information management technologies with an electronic capability to search, view, comment on, disperse, and acknowledge information. In addition, version control is provided to maintain control of a document throughout its life cycle.

One immediate, tangible benefit of the CITIS is an improved engineering design review process. Because the FORMTEK design review system was built around workstations, networks, and electronic documents, it supports concurrent online employee review. Transitioning from a hard-copy review process to an online, concurrent review process has greatly reduced review cycle time.

Future efforts will focus on improving and expanding the design review process via the Web to facilitate the integrated product team (IPT) approach taken by the THAAD Program. This is absolutely essential because the IPT philosophy calls for multicorporate teaming involving large, geographically dispersed teams.

The THAAD CITIS prototype development team has taken advantage of advances in information technology to facilitate the government's access to contractor-generated information. Improved network capabilities allow contractors and the government to use a single-server concept and permit real-time collaboration via access to contractor databases. One example of this is the action item database, an easy-to-use, automated system for assigning, updating, and reviewing action items. This database streamlines activity reporting, enhances collaborative interaction, and is accessible via the Web, making it potentially available to any THAAD CITIS user. Other data currently accessible through the CITIS include the weapon system engineering, integration, and test (WSEIT) issues database; financial data warehouse; engineering drawings; security; and technical and administrative data.

In addition to data population, the prime contractor is conducting business process analyses and exploring database integration and migration requirements to facilitate collaboration between the TPO, LMMS, Raytheon Co. (the major subcontractor), and other THAAD business partners. As described above, the capability already exists to access various databases via CITIS.

The CITIS is linked to the Lockheed Martin financial data warehouse for viewing current weekly labor actuals and other financial data; access to this database is consistent with the current THAAD contract, risk mitigation II work breakdown structure, and charge number structure.

The action item database is expected to reach functional maturity by the Engineering and Manufacturing Development (EMD) Phase of the THAAD Program. In addition to the interactive access to the WSEIT issues database and the other information

**Because the
THAAD CITIS
is Web-based,

independent,
provides better
scalability, and
allows for
global data
sharing.**

sources described on page 39, CITIS users have Web access to prime contractor directives and recent contract modifications.

Future Plans

The THAAD Intranet is envisioned to be a secure system for e-mail and CITIS access. Future plans include expanding the THAAD Intranet to other TPO business partners. A "need to know" and cost and benefit analysis will determine which THAAD business partners will be connected. Participating organizations will be linked via T-1 lines, frame relay, ISDN, remote dial-up, or other systems (depending on projected usage and cost and benefit analysis). Metrics will be monitored so that communication methods may be modified to ensure optimal efficiency and availability at the lowest possible cost.

The prime contractor will continue to conduct requirements analysis, populate the CITIS with relevant data provided by THAAD business partners, migrate legacy databases to CITIS, and incorporate collaboration tools. The IPT's requirements for online information and specialized tools will be addressed to maximize its effectiveness and the use of shared data. The THAAD CITIS is expected to reach functional maturity by the EMD Phase of the THAAD Program.

Advantages

The THAAD CITIS will provide the TPO with many advantages. However, the primary reasons for implementing the CITIS include substantial reduction

in the amount of data delivered and stored in paper format; improved accuracy and timeliness of data; improved management and tracking of review status; reduction in review cycle time; improved comment collection and correlation; consistency of data used; and a readily accessible repository of program data. The ultimate goals of the THAAD CITIS are to reduce lead times and costs for weapon system design, manufacturing, and support processes; and ensure technical information accuracy and timeliness.

Other Benefits

Although a prototype, the THAAD CITIS already supports at least four major DOD initiatives to reduce acquisition costs. The first of these is the mandate for all ACAT I and II Programs to establish an IDE. Two other relevant initiatives are the electronic data interchange (EDI) initiative and the continuous acquisition and life-cycle support (CALC) strategy, both of which seek to increase the generation, exchange, management, and use of digital data in support of Defense systems. The fourth major initiative is the requirement to operate in an IPT environment.

The THAAD CITIS will provide the IPTs with online data and integrated databases. Moreover, it is envisioned that the CITIS, when fully implemented, will enable "virtual" IPT meetings via secure desktop video, white-board markup collaboration tools, and other team-linking tools. In addition to these Defense-wide initiatives, the availability of online access to essential program data will enhance TPO's capability to respond to requests from others and to meet various program milestones.

Conclusion

A successful IDE is dependent on business partners in diverse geographic locations having the capability to create information only once, and then sharing it. They must be able to share all data and databases with their other business partners in a secure environment. The TPO and its business partners will have instant online access to all THAAD Program data via the THAAD CITIS.

Other benefits include enhanced acquisition business processes and technical processes and a real-time collaboration capability. While assuring technical information accuracy and

timeliness, the CITIS will ultimately help reduce lead times and costs for weapon systems design, manufacturing, and support processes.

The CITIS will also support DOD initiatives such as the requirement to operate in an IPT environment and establish EDI, CALS, and IDE strategies. The Army of the 21st century will leverage information on the battlefield in command and control operations and in the weapon systems development arena. Through its investment in projects such as the THAAD CITIS, the TPO has been, and continues to be, one of the leaders in this field.

FREIDA GARRISON is a Senior Program Analyst in the Army's Theater High Altitude Area Defense Project Office, Program Executive Office for Air and Missile Defense, Huntsville, AL. She received B.S. and M.A. degrees in business education from the University of North Alabama.

AN INTEGRATED APPROACH TO PRODUCTION BASE PLANNING

Lawrence R. Laibson and Charles T. Osiecki

Introduction

Shrinking budgets. Competition for scarce dollars. Reduced procurements. Large overhead costs associated with retention of facilities for replenishment. Increased demands for innovative technologies that are rapidly changing. Policy shifts toward commercialization of the production base. These are just a few of the new challenges of production base planning today. A new approach to planning is needed to effectively deal with these challenges.

The Ammunition Production Base

The existing production base was designed for the type of large-scale production needed for a conflict with a major superpower such as the now defunct Soviet Union. Shaped by the needs of the times in which it was constructed, the base is large and highly specialized. It is also expensive to maintain and lacks the flexibility required to quickly meet changing technological needs.

In the past, production base planning was installation oriented and focused on individual items that were either already in production or soon to go into production. Given the challenges mentioned above, plans for the future must become broader in scope. Planners must look at life-cycle aspects of emerging requirements and technologies along with their long-range demands on both commercial and government production capabilities.

Technology And Development

Government technology objectives currently look 10 to 15 years into the future, as do industry objectives. However, government development cycles tend to be much longer than those of industry because of the government's unique requirements. This can be problematic, especially in areas such as electronics where product improvements are both rapid and routine. For example, in the cellular phone industry, the time from design to consumer is less than 1 year. For the military planner, the issue of technological obsolescence is a serious one. Technological and process changes that are not anticipated and planned for early in the developmental cycle can have significant long-range cost and schedule impacts.

As Army and commercial production bases continue to merge, it is critical that assessments of new technologies and their impact on the production base be carried out in an integrated and forward-looking fashion.

A New Approach

In place of the old "stovepipe" method of identifying needs and programs, planners today must consider the following:

- Look across families of weapon systems throughout their acquisition life cycles to identify both short- and long-range needs for development, production, fielding, replenishment, and demilitarization and disposal;
- Be aware of emerging technology

drivers in both industry and government;

- Identify current and future government and commercial production base capabilities; and
- Consider "bundling" production base planning and technology requirements where appropriate.

Production base planning must emphasize "design for future capabilities" rather than design for obsolete or rapidly decaying technologies. In addition, the following questions must be addressed:

- What are the Army's future needs considering short- and long-term objectives and peacetime and replenishment requirements?
- Are there existing technologies to meet these needs?
- If the necessary technologies exist, can these needs be met by the commercial market or is investment in the organic base required?
- If investment in the organic base is required, what form will that investment take?

A comprehensive and realistic base plan for the future must be founded on the answers to these questions.

Implementing The Approach

In June 1998, the Assistant Secretary of the Army for Research, Development and Acquisition (now the Assistant Secretary of the Army for Acquisition, Logistics and Technology) issued *Industrial Base Policy Letter 98-1*. In response to this letter, the Army Materiel Command Deputy Chief of Staff for Ammunition requested that an

Generic Area	Area	Artillery	Tank	Mortar	Small Caliber	Mines, Countermines, Demolition	Bomb/Bomblets	Missile/Rocket	Issues	More Details	Program	Prior (\$M)	FY98 (\$M)	FY07 (\$M)	FY08 (\$M)
Ammunition	All	X	X	X	X	X			Enhanced Integrated Munitions Manufacturing Technology Insertion	Identify additional applications and industrial/academia consortia for incorporating Totally Integrated Munitions Enterprise technology	PBRS			//	
Electronics	Smart Munitions	X	X	X	X	X			Rapidly changing commercial technology for military use	Assess technology directions, best strategy and choices for design nonobsolescence with commercial base, COTS; gun hardening	PBRS			//	
Energetics	All	X	X	X	X	X	X	X	Long-range energetic production base planning	Assess base requirements/capabilities and technology needed for propellants, explosives and their associated ingredients, and loading	PBRS			//	
Load, Assemble, Pack	Tri-Service Future Munitions	X	X	X		X	X		Base assessment of producing future munitions	Evaluate items and explosives for ability to load	PBRS			//	
Micro-electrical Mechanical System	All Smart Munitions	X	X	X	X	X	X	X	Micromachine components for munitions	Assess technology for process for production and assembly fuzes and other munitions	PBRS			//	

Sample integrated plan grid

“Integrated 10-Year Ammunition Production Base Plan” be prepared to address production base requirements for the 21st century.

Completed in late 1998, this plan integrates needs identified by program managers (PMs) with current and emerging technology needs, trends, and programs.

The integrated plan builds on PM life-cycle acquisition plans and strategies that focus on ammunition “families” and that cover the entire life cycle, including research, development, procurement (both peacetime and replenishment), operations and support, demilitarization, and disposal.

Formulation of the integrated plan began with an examination of PM plans and strategies to identify common areas of concern needing to be addressed in

technology or production base programs. Such programs can answer needs relating to common technology or production thrust areas that may be too costly for any one PM or contractor.

Examples of areas of concern identified in the integrated plan include smart munition electronics, composites, and energetic materials. Some of these areas were specific to a family of items; others spanned several families.

For each of the areas identified, the integrated plan provides discussion of related developments in industry. For instance, in the area of electronics, many of the systems used in smart munitions (such as global positioning systems) are produced by industry for the commercial market. Military applications for electronic components constitute only 0.3 percent of the market, and this is

reflected in high costs to the government. Driven by consumer demand and market forces, industry is rapidly improving its technologies. Military planners must be in touch with these developments. Instead of using unique military specification parts, DOD must maximize use of commercial off-the-shelf products (COTS). This will not only impact immediate costs, but also the replenishable life span of our future ammunition.

Integrated Plan Grid

The integrated plan displays, in grid format, technology efforts underway to address identified concerns. The accompanying chart is a sample of the grid’s contents. Technology efforts are grouped in the following categories:

Science and Technology Objectives (STOs). Based on the "Army Science and Technology Master Plan," these are Army objectives relating to needs for both Army XXI and the Army After Next. STOs are specific, measurable technological advancements to be achieved by a specific fiscal year. Supporting research (basic—6.1 funding, applied—6.2 funding, and advanced technology development—6.3 funding) is performed at various levels.

The U.S. Army Tank-automotive and Armaments Command's Armament Research, Development and Engineering Center (TACOM-ARDEC) Technology Base Program. This is a research program that covers the entire spectrum of Army weaponry except missiles and rockets. Within this program, eight technology thrust areas have been identified that address improved life-cycle capabilities, performance and costs (including advanced materials such as composites or energetics), new warhead designs, improved sensors, ammunition survivability, and pollution prevention. When mature, the new technologies will be incorporated into the base of the future.

Production Base Readiness Support (PBRs). This involves efforts that address the abilities of the production base (both government and commercial) to produce quality goods cost effectively and on schedule. The focus is on items currently being developed, and the objective is to identify production base capabilities and technology gaps, if any.

Manufacturing Technology (MANTECH). This entails programs that deal with the technology gaps identified by PBRs efforts. MANTECH develops and demonstrates new or improved technologies that enable or enhance cost-effective production of end items or systems. The MANTECH Program deals with developing or improving manufacturing technology, engineering, processes, capability, and inspection, and it addresses other producibility and cost issues.

For each area of concern, the integrated plan grid identifies the family or groups of families affected, the particular items involved, the program or programs addressing the concern, and

funding levels during the next 10 years. The grid is a detailed overview of practical needs and programs ranging from the technology base to MANTECH that are responding to those needs. It not only provides a unified picture, but serves as a working tool for planning, budgeting, and scheduling.

Conclusion

The Integrated 10-Year Ammunition Production Base Plan links together in one document PM life-cycle plans and associated technology programs. By identifying common concerns across PM families, discussing new trends in technology, and highlighting pertinent short- and long-range research and development, technology, production base, and MANTECH efforts, it provides a methodology and a framework for formulating an integrated master plan for the future munitions production base.

In the past, planning has often been conducted from the top down and been dictated by the needs of the Army's organic base. Additionally, planning has often been constrained by processes intrinsic to specific sites or by infrastructure and sunk-cost considerations. In contrast, this Integrated 10-Year Ammunition Production Base Plan

provides a way of building from the bottom up, matching the Army's future needs with a broader production base capability in which these needs—not workloading a specific plant—are the significant drivers.

The integrated plan is a living document that will be periodically updated. Updates will reflect changing Army production requirements as well as the latest technology challenges in industry and will include an evaluation of the technology and infrastructure investments that must be made to meet emerging Army requirements. Consideration will also be given to reassessment of retaining portions of the Army's organic base.

Future iterations of the integrated plan will be shaped by a PM's changing needs and will, in turn, help shape those needs. By providing decisionmakers with an overarching picture of long-range needs across families and related ongoing or planned technology efforts, integrated planning will facilitate transitioning to the industrial production base of the 21st century.

LAWRENCE R. LAIBSON is a Manufacturing and Environment Team Leader in the TACOM-ARDEC Systems Readiness Center. He has a B.S. in chemical engineering from the University of Maryland and an M.S. from Stevens Institute of Technology. He has more than 35 years experience in various phases of the ammunition acquisition life cycle.

CHARLES T. OSIECKI is a Readiness and Technology Team Leader in the TACOM-ARDEC Systems Readiness Center. He has a B.S. in mathematics and a master's of engineering from Stevens Institute of Technology. He has more than 33 years experience in various phases of the ammunition acquisition life cycle.

Technological and process changes that are not anticipated and planned for early in the developmental cycle can have significant long-range cost and schedule impacts.

ARMY HIGH PERFORMANCE COMPUTING RESEARCH CENTER: A UNIQUE RESOURCE FOR DEFENSE BASIC RESEARCH AND EDUCATION

Dr. Walter B. Sturek, Dr. Tayfun E. Tezduyar,
and Paul Muzio

Introduction

The mission of the Army High Performance Computing Research Center (AHPCRC) is to advance high-performance computing (HPC) and its application to critical Army technology issues through university-industry-Army collaborative research programs.

The AHPCRC is one of the premier HPC research and development facilities in the United States. It has a proven track record in basic and applied research and in HPC educational programs.

The AHPCRC draws on the resources of its seven outstanding research universities (Clark Atlanta University (CAU), Florida A&M University (FAMU), Howard University (HU), Jackson State University (JSU), Northwestern University, Rice University, and the University of Minnesota) to support an aggressive program in HPC basic research, applications development, and technology transfer effected through collaborations with Army laboratories. CAU, FAMU, HU, and JSU are histor-

ically black colleges and universities. Currently, more than 40 faculty members and 100 research assistants and graduate and postdoctoral fellows are involved in the AHPCRC's research activities.

The AHPCRC works with its partner institutions to strengthen HPC education and encourage minorities and women to pursue careers in computational science. The center also maintains exchange programs with Army laboratories and an internship program with the U.S. Military Academy, West Point, NY. (See Web site at www.mems.rice.edu/TAFSM/ARDA99/1.)

Technology Areas

The AHPCRC's research program is divided into five major technology areas: simulation and modeling, computational structural mechanics, environmental sciences, materials science, and enabling technologies. In the first three areas, the research program is focused on development of new, unique, and advanced HPC

techniques to address critical technology needs. The research program for enabling technology is directed at development of the underlying computational and computer science technology required to facilitate and enable the application technology areas.

The center's research program in the application of HPC and the development of application software is benefiting projects through production of new artillery systems, improved airdrop systems, improved vehicle stability, and better environmental quality.

The development of computational techniques for the modeling of airdrop systems is a collaborative effort with the U.S. Army Natick Soldier Center. This work is recognized both nationally and internationally as leading in the development and application of simulation techniques to complex issues related to airdrop technology. Two examples, modeling of large ram-air parachutes and aircraft-paratrooper separation, are described in the following paragraphs.

Large Ram-Air Parachutes. The Army is engaged in the development of a new class of ram-air parachutes capable of delivering to a target area, with pinpoint accuracy, 21 tons of cargo dropped from 25,000 feet. These parachutes are flexible structures deformed by the airflow around them in addition to the shape and weight of the cargo they are carrying. In turn, the deformation of the shape of the parachute modifies the aerodynamic properties and flight envelope of the parachute.

Structural stresses on parachute fabric must be calculated to provide for appropriate fabric selection and fabric layout. This is a complex fluid-structure interaction problem which, because of the flexible nature of the parachute, is not amenable to wind tunnel testing. Cut-and-try approaches, without a priori design data, can be time consuming and costly.

Improved simulation tools, such as those being developed by the AHPCRC Team for Advanced Flow Simulation and Modeling (TAFSM), are expected to result in significant reductions in design time and in the actual number of flight tests required during parachute development and test and evaluation phases. (See Web site at www.mems.rice.edu/TAFSM/ARDA99/2.)

Paratrooper Crossing the Wake of Transport Aircraft (Aircraft-Paratrooper Separation). The modeling of paratroopers crossing the turbulent wake of large transport aircraft flying in formation is a problem of great interest to the Army. It is also an extremely complicated problem because it requires a 3-D simulation of the fluid flow around a secondary object in the far downstream, unsteady wake flow of a primary object that is usually much larger.

For example, if a group of transport aircraft are flying in formation, paratroopers deployed from the second aircraft would be subject to the unsteady wake flow of the first aircraft. This problem has an analogy in commercial aviation where small aircraft must maintain a 5-mile separation behind

aircraft as large, or larger, than a Boeing 757. A military transport aircraft is considerably larger than a Boeing 757 and, of course, a paratrooper is considerably smaller than an aircraft and is not self-propelled.

The AHPCRC TAFSM is currently developing a multidomain parallel computational method to carry out this kind of simulation. With this method, the TAFSM can simulate the unsteady flow past the primary object, the unsteady wake flow in the long region between the two objects, and the influence of this wake flow on the secondary object. (See Web site at

www.mems.rice.edu/TAFSM/ARDA99/3.) The base method is a numerical formulation applicable to flow problems with complex-shaped objects and is capable of yielding accurate results. The multidomain computation approach is based on dividing the entire simulation domain into an ordered sequence of overlapping subdomains.

With simulation involving objects in tandem, such as with the transport aircraft and paratroopers, the first subdomain and the third subdomain would be used for computing the unsteady flow around the aircraft and the paratrooper, respectively. The second subdomain would be used for computing the unsteady flow in the long wake region between the aircraft and the paratrooper.

By developing these techniques and eventually using them to simulate flight formations and conditions, the Army hopes to improve paratrooper safety. These examples show that simulation and modeling using advanced computational modeling techniques and using advanced computer and networking hardware can impact the test and evaluation community.

Conclusion

The Federated Laboratory concept brings together university and Army researchers in a creative environment that facilitates the advancement of simulation and modeling and the technology to produce affordable weapon systems.

From the university perspective, students gain experience working on challenging and relevant problems, taking pride in writing theses on the pioneering work they have done in solving these problems. In turn, the Army benefits by being able to apply leading-edge computational technology in the development of new weapon systems.

We believe this partnership works and that it is the right way to do business now and in the future.

DR. WALTER B. STUREK is a Senior Scientist in the High Performance Computing Division, Corporate Information and Computing Center, Army Research Laboratory; and Contracting Officer's Representative for the AHPCRC. He has a B.S. in mechanical engineering from Oklahoma State University, an S.M. in mechanical engineering from Massachusetts Institute of Technology, and a Ph.D. in applied science from the University of Delaware.

DR. TAYFUN E. TEZDUYAR is the James F. Barbour Professor in Engineering and Chairman of Mechanical Engineering and Materials Science at Rice University. He has both an M.S. and Ph.D. in mechanical engineering from California Institute of Technology. The former Director of the AHPCRC, he now leads the AHPCRC Research Team at Rice University.

PAUL MUZIO is Vice President for Government Programs at Network Computing Services Inc. He has a B.S. degree in management science and a master's degree in operations research.

Smoke Generator IPT Gets Hammer Award

MG John Doesburg, Commander of the Soldier and Biological Chemical Command, presented the Vice President's Hammer Award to the M157A2 Smoke Generator System Integrated Product Team during a ceremony on July 1, 1999, at Edgewood Arsenal, MD. The M157A2 team was recognized for eliminating the need to use motor gasoline in operating the smoke generator in compliance with DOD Directive 4140.43 on fuel standardization. In addition, the team is credited with eliminating the need to rely on sole sources for more than 142 parts and for efficiently addressing significant safety and operational deficiencies. The M157A2 team achieved a life-cycle cost reduction of more than \$10 million with an investment of less than \$400,000 by employing acquisition reform strategies such as performance specifications, best value contracting, modernization through spares, teaming and partnering, and technology insertion. Points of contact for this article are Cindy Peterman at (309) 782-4634, DSN 793-4634; and Janice Nordin at (410) 436-2838, DSN 584-2838.

Small Business Receives USASMDC Contract

Late last year, the U.S. Army Space and Missile Defense Command (USASMDC) awarded a small business firm a contract to provide services previously performed at a higher cost by a larger company. TRESKO Inc., located in Las Cruces, NM, will provide building maintenance, procurement and warehousing services, inventory control, and other tasks for USASMDC's High Energy Laser Systems Test Facility (HELSTF) at White Sands Missile Range in New Mexico. The contract

also includes occupational medical support, electrical and plumbing upgrades, and computer network services.

TRESKO, which operates a vocational rehabilitation center, a child and infant development school, and maintains New Mexico state highway rest areas, is a small business and meets the criteria of the Javits-Wagner-O'Day Act.

In awarding the 5-year contract to TRESKO Inc. for \$1.5 million per year, USASMDC and HELSTF accomplish the following:

- The command will gainfully employ the handicapped. (TRESKO's workforce at HELSTF is 65-percent handicapped.)
- The command achieves an estimated cost savings of \$150,000 per year (\$750,000 savings over the 5-year contract) as a result of TRESKO's lower overhead rates and nonprofit status.
- The command can use the International Merchants Purchase Authorization Card (IMPAC) to pay TRESKO, thus streamlining payroll procedures.

The point of contact for this article is Al Longhi, USASMDC, DSN 645-5901.

Alpha Contracting Used For AMCOM Grounds Maintenance Services

In late February 1999, the Base Operations Division of the U.S. Army Aviation and Missile Command's (AMCOM's) Acquisition Center needed to quickly contract out grounds maintenance services as a result of problems encountered by customers in obtaining approvals on the Performance Work Statement (PWS). The previous grounds maintenance contract expired Dec. 31, 1998, but had been extended through March 31, 1999.

Because of the short period remaining on the expiring contract, the Alpha contracting approach was used to negotiate both the contractual requirements as well as the associated costs. This involved an in-depth study of the services actually provided under the previous contract, as well as the new services, the frequency of the new services, and the

ACQUISITION REFORM

standards of performance required under the upcoming contract.

On March 23, 1999, following submission and approval of a PWS, a series of negotiations between the government and the contractor, and a site visit by the contractor, a contract was awarded to Chugach Management Services, an Alaskan Native Corporation in Anchorage, AK. The total of the contract with all options was \$32.9 million over 10 years.

This cooperative effort between the contractor and government resulted in a timely award in fewer than 30 days, no lapse in contract performance between the outgoing and incoming contractors, and a base year negotiated amount of \$3.2 million, which was within budget constraints. Additionally, the negotiated agreement obtains more services with more stringent performance standards than the previous contract.

The government team consisted of Gary Poolos (Contracting Officer), Kathy Wiggins and Theresa Weigartz (Contract Specialists), and Paul Hernandez (Technical Specialist).

The point of contact for this article is Kathy Wiggins at (256) 876-1231.

Army Doctrine For Contracting Support On The Battlefield

MG Daniel G. Brown, Commanding General of the U.S. Army Combined Arms Support Command (CASCOM) at Fort Lee, VA, as the U.S. Army Training and Doctrine Command (TRADOC) proponent, approved publication of Field Manual (FM) 100-10-2, *Contracting Support on the Battlefield*, on April 28, 1999. Thus, the Army is now the first military Service to publish contingency contracting doctrine.

The Deputy Assistant Secretary of the Army for Procurement (DASAP) incorporated comments and lessons learned from more than 120 Joint Staff, DOD and Army headquarters and staff agencies, plus Marine, Air Force, and British Army contracting personnel, while staffing drafts of FM 100-10-2. This teamwork, coupled with mentoring from CASCOM's Directorate of Combat Developments, allowed

the DASAP to develop FM 100-10-2 within 19 months; CASCOM cites 36 to 48 months as the normal time required to develop new doctrine. The DASAP's staffing and briefing of emerging Army doctrine also served as a catalyst for discussions about joint contracting doctrine with the Joint Staff, Marine Corps Headquarters and the Air Staff.

FM 100-10-2 empowers the Army's warfighting Principal Assistants Responsible for Contracting (PARCs) and contracting chiefs at each level of command. The manual requires mission commanders to include a contracting support plan, authored by their PARC or mission contracting chief, as an appendix to the logistics annex of their operational plans and orders. This contracting support plan governs all Army contracting within the theater or mission area of responsibility (AOR), eliminating the competition for resources between agencies, Services, and Army units that marked earlier missions. When the Army is designated lead Service for contracting for a joint force, this contracting support plan likewise governs contracting by all deployed military Services and agencies within that theater or AOR.

The Army Training Support Center (ATSC) at Fort Eustis, VA, publishes doctrinal field manuals for TRADOC. During their publication process, Army personnel can access and download FM 100-10-2 at CASCOM's Web site at http://www.cascom.lee.army.mil/multi/Field_Manuals/FM_100-10_Series/, and the Office of the DASAP Web site at <http://acqnet.sarda.army.mil/acqinfo/zpcntert.htm>. LTC(P) Scott Risser, Action Officer for FM 100-10-2 in the Office of the DASAP, can also forward the manual via electronic mail upon request. He can be reached at DSN 761-7556, (703) 681-7556, or e-mail rissers@sarda.army.mil.

For additional information on acquisition reform, contact Monti Jagers in the Acquisition Reform Office at (703) 681-7571.

David Packard Excellence In Acquisition Award

The U.S. Army Joint Program Office for Biological Defense Portal Shield Team was selected as a David Packard Excellence in Acquisition Award winner by Dr. Jacques Gansler, Under Secretary of Defense for Acquisition and Technology. The 27-member integrated product team was recognized for using modular design and a commercial off-the-shelf approach to improve system supportability and reduce ownership costs. The team was nominated by BG Eddie Cain, PM, Joint Program Office for Biological Defense, and honored at a Pentagon ceremony during Acquisition and Logistics Reform Week. The highest acquisition award given by DOD, the David Packard Award recognizes teams that have made highly significant contributions that demonstrate exemplary innovation and best acquisition practices.

Besson Awards Recognize Procurement Excellence

In separate ceremonies at their respective duty locations, Michael P. Anthony, Frank A. Ruzicka, and MAJ Brad L. Westergren were recently presented the U.S. Army Materiel Command (AMC) Frank S. Besson Award for Procurement Excellence. GEN John G. Coburn, AMC Commanding General, presented the prestigious award to Anthony. MG Roy E. Beauchamp, Commanding General, U.S. Army Tank-automotive and Armaments Command (TACOM), Warren, MI, presented the award to Ruzicka and Westergren.

The Besson Award was established in honor of GEN Frank S. Besson, the first AMC Commander, and his lifelong achievements in acquisition. The award recognizes individual excellence in the AMC contracting workforce. Selection is based on demonstrated technical expertise and development, and implementation of innovative ideas, methods, or processes related to contracting in support of AMC's mission. Awards are made annually for exceptional achievements by an intern, by a civilian careerist, and by a military officer within AMC.

Contract Specialist Michael Anthony, who works for the U.S. Army Communications-Electronics Command (CECOM), Fort Monmouth, NJ, is the intern recipient of the 1998 Besson Award. Anthony was recognized for his foreign military sales contracting skills, critical participation in a billion dollar source selection evaluation, and unique database development efforts. His effective management of a variety of Web site information and other automation tools was also highlighted. Anthony is a Vice President in the Fort Monmouth Area Chapter of the National Contract Management Association, and he has authored a number of acquisition-related articles for the *Fort Monmouth Message*. In addition, he is Level II certified in contracting and is pursuing an M.B.A.

Frank Ruzicka is a Team Leader and Contracting Officer at TACOM-Warren. Ruzicka was honored for his use of special pricing techniques and Alpha contracting procedures in awarding a creative, flexible "family" (i.e., product line) contract. He was also recognized for his innovative perspectives, ability to streamline

processes, and attention to customer service. Ruzicka's ability to guide and motivate his team was instrumental in enabling them to accept, without additional resources, contracting responsibility for many new, unfamiliar systems transferred to TACOM as a result of base realignment and closure actions. Ruzicka has 18 years of government service and has been a contracting officer for 13 years. He holds a B.A. degree and is Level III certified in contracting.

MAJ Brad Westergren has served as a Contract Specialist, Team Leader, Contracting Officer, Acting Group Leader and, most recently, as Deputy Executive for Contracting at the U.S. Army Armament and Chemical Acquisition and Logistics Agency (ACALA), Rock Island, IL. Westergren's initiative and persistence was critical to the effective use of Alternative Dispute Resolution (ADR) procedures in resolving a long-standing contract pricing case. His positive perspective, perseverance, and diplomacy in facilitating government team "buy-in" to the ADR process enabled the parties to reach agreement on this extremely contentious and complex matter. Westergren completed a Training With Industry assignment at Lockheed Martin Vought Systems and has received numerous military decorations and awards. He holds an M.B.A. and is Level II certified in contracting and program management.

In October 1999, AMC will request nominations for the 1999 AMC Besson Award. Procedural guidance for the award is contained in AMC Regulation 672-10 and can be accessed at <http://www.amc.army.mil/amc/rda/rda-ac.html>. For additional information, please contact Scott Crosson at (703) 617-0544 or scrosson@hqamc.army.mil.

Vollmecke Gets Hite Award

MAJ Kirk F. Vollmecke received the LTG Ronald V. Hite Award at a ceremony held June 2, 1999, at Fort Leavenworth, KS. Established in March 1999 by LTG Paul J. Kern, Director, Army Acquisition Corps (AAC), the award recognizes the outstanding AAC graduate of the regular Command and General Staff Officer Course (CGSOC). Hite, also a former AAC Director who is now retired, presented the award.

Vollmecke received a plaque, an AAC coin, and a congratulatory note from Kern. Additionally, Vollmecke's name was inscribed on a plaque that is permanently displayed at the U.S. Army Command and General Staff College (CGSC). MAJ Vollmecke is now assigned to the U.S. Army Program Analysis and Evaluation Directorate, Headquarters, Department of the Army.

Vollmecke was selected for the award from 58 AAC students attending the 1998 to 1999 regular CGSOC. All AAC officers attending the regular CGSOC are eligible for the honor. Selection is based on a student's grade point average, contribution to group work, leadership skills, written and oral communications, research ability, recommendation by academic counselor or evaluator, and consensus of the acquisition faculty.

Hite was responsible for establishing the Acquisition Education and Training Program (AETP) at the CGSC. The AETP offers a distinct AAC concentration within CGSOC and a fully funded Acquisition Graduate Degree Program leading to a master of arts degree that is offered in conjunction with the CGSOC. An article on the AETP was published in the July-August 1998 issue of *Army RD&A*.

Leading Change

By John Kotter
Harvard Business School Press, 1996

Reviewed by LTC Kenneth H. Rose (USA, Ret.), a Project Manager with Waste Policy Institute in San Antonio, TX, and a former member of the Army Acquisition Corps.

There are two kinds of people in the world: those who think the era of transformation and change has peaked and that we are now moving toward a time of tranquility and stability, and those who know better. John Kotter is one of the latter. His recent book, *Leading Change*, provides direct, relevant guidance for those who would prosper in turbulent times.

Kotter, the Konosuke Matsushita Professor of Leadership at the Harvard Business School, has written a unique, insightful book that is at once concise and accessible. At 185 pages, it is an easy evening read. But it should not be, for it is densely packed with wisdom to be carefully considered, even savored, by the thoughtful reader. What makes it most accessible is its tone. Deliberately lacking even a single citation, the book is more like a conversation with a learned friend than an academic text.

In the first 30 pages, Kotter describes common problems encountered by organizations facing change. He prescribes an eight-step method for successful transformation and focuses on leadership as the essential element, while recognizing management as necessary but not sufficient.

Consistent with Kurt Lewin's change model of unfreezing-movement-refreezing, Kotter describes the first four steps of his model as critical to "defrost a hardened status quo." These steps are establishing a sense of urgency, creating the guiding coalition, developing a vision and strategy, and communicating the change vision.

The next three steps are the actions of a transformation effort: empowering broad-based action, generating short-term wins, and consolidating gains and producing more change. Kotter warns that a typical error is to leap immediately to actions in a rush for results. Such an approach, without the foundation of the first four steps, condemns the most well-intentioned actions to probable failure.

The last step, anchoring new approaches in the culture, cements the new ways in the organization and prevents the backsliding that can otherwise occur.

Kotter discusses each of the eight steps in separate chapters, providing illuminating examples and vignettes that give life to ideas and relevance to concepts. He closes with a view of the organization of the future that is necessarily vigorous, team oriented, visionary, lean, and adaptive.

Leading Change will probably change the way you lead. It provides a paradigm for prosperity, not just survival, which applies to any level of an organization. Standing above the class of competing solutions, it provides a method of universal use and worth.

Leading Change is available from Harvard Business School Press at <http://www.hbsp.harvard.edu>.

Leadership Skills for Project Managers

Edited by Jeffrey K. Pinto and Jeffrey W. Trailer
Project Management Institute, 1998

Reviewed by LTC Kenneth H. Rose (USA, Ret.), a Project Manager with the Waste Policy Institute in San Antonio, TX, and a former member of the Army Acquisition Corps.

Leadership Skills for Project Managers, edited by Jeffrey K. Pinto and Jeffrey W. Trailer, is the first of a new Editor's Choice series of books that present best-of-class reprints from *Project Management Journal* and *PM Network*.

This volume includes 10 articles. The first four address the interaction of leader attributes and situational characteristics. "Project Leadership: Understanding and Consciously Choosing Your Style," by Dennis P. Slevin and Jeffrey K. Pinto offers a model that relates information input to decision authority as a medium for understanding style and a guide for making choices. The authors include a list of specific situations and briefly describe how the model defines a basis for appropriate leadership style.

The next three articles deal with improving project leadership. In "Developing Project Management Skills," Hans J. Thamhain offers straightforward advice on necessary skills and how to get them. Nicholas DiMarco, Jane R. Goodson, and Henry F. Houser present a tool for assessing individual ability in 19 essential skill areas in "Situational Leadership in a Project/Matrix Environment." The authors' quantitative approach provides a path to understanding the complexities inherent in matrix organizations, which are typical of project environments.

Lawrence Todryk's article, "The Project Manager as Team Builder: Creating an Effective Team," is a succinct summary of the elements of successful teams and the changes that occur as project groups mature toward that goal.

In "Organization Culture and Project Leader Effectiveness," Michael Elmes and David Wilemon discuss an important issue for project managers who often work in matrix environments that bring together disparate elements with dissimilar cultures. The authors provide a foundation for understanding culture and how it is communicated. They present a two-dimensional model that relates information gathering and decisionmaking to define four general culture types and provide examples of each type. Though not explicitly stated, the similarity to the Myers-Briggs Type Indicator will be apparent to many readers. The authors then suggest ways of identifying cultures and managing cultures on the job, including consideration of team cultures and countercultures, such as "skunkworks."

Leadership Skills for Project Managers is a collection of discrete pieces that offers a unique resource to both developing and experienced project managers. It is a briefcase book for selective consumption as time permits or interest demands.

Sacred Cows Make the Best Burgers

By Robert Kriegel and David Brandt,
Warner Books, New York, 1996.

Reviewed by LTC John Lesko (U.S. Army Reserve), a member of the Army Acquisition Corps and frequent contributor to Army RD&A. He works for ANSER, a public service research institute, and provides consultative services for several joint programs within the DOD acquisition community.

If you like your management axioms, truisms, and buzzwords served up in fast-food fashion, pick up a copy of *Sacred Cows Make the Best Burgers*. This book is delivered in 22 neatly wrapped burger-sized bites. Each chapter can be consumed and digested in about 20 minutes. (I read this book in a little less than 2 weeks' time while commuting to and from work via the Virginia Rail Express. Each day's round trip allowed me to finish two to three chapters per leg of the trip.) Unfortunately, the authors have cooked their burgers a little on the overdone side.

Kriegel and Brandt attempt to be clever by presenting each management lesson using cute cow-related anecdotes and chapter titles. A sampling of the chapters from the first half of the book include: "The Expert Cow," "The Cash Cow," "The Low Price Cow," "The Downsizing Cow," "The Technocow," "The Team Cow," and "Cow Hunting." This reviewer suggests the following alternative chapter headings: Cow Prodigies, Filet Mignon, Tripe and Other Cheap Cuts of Meat, Lean Beef, The Bell Works but the Horns Don't, Herd Mentality, and Cattle Roundup.

The most useful parts of this book are Chapters 17 through 22. Here, Kriegel and Brandt forget about the bovine species and focus on change management. From these chapters, the acquisition professional will find useful information and guidance for preparing for the future. Titles of these chapters are "Building the Change-Ready Environment," "Turning Resistance into Readiness," "Motivating People to Change," "Developing Change-Ready Traits," "The Change-Ready Zone," and a "Change-Ready Review."

Another shortcoming of this book is that it offers little that is original, well documented, or scientifically researched. The serious reader will find more scholarly and useful works regarding managing organizational change by Rosabeth Moss Kanter (see her seminal work *The Change Masters*) and Tom Peters (see *In Search of Excellence* and *In Pursuit of Wow!*).

In conclusion, if you enjoy a quick bite and fast food, then *Sacred Cows Make the Best Burgers* may be for you. However, this reviewer was left asking, "Where's the beef?" This book is

more sizzle than steak. The acquisition professional would be better served reading something from the recommended reading list published in a recent issue of *Army RD&A* magazine.

NEWS BRIEFS

Army Produces Own Researchers for The New Millennium

At an awards ceremony held at Claflin College, Orangeburg, SC, in April 1999, the U.S. Army Research Laboratory (ARL) presented the third of five \$100,000 scholarships awarded to Historically Black Colleges and Universities (HBCUs) under ARL's 3-year-old Science and Technology Recognition System (STARS) Program. To date, STARS contributions committed to HBCUs total \$1.2 million.

"Through STARS, we [ARL] are basically growing our own minorities with graduate degrees in research areas where there is a shortage projected for the next century. So while we're rewarding highly accomplished and sought-after students, we are also enhancing our own portfolio," said Betty Irby, Program Manager for ARL's HBCU/Minority Institutions (MI) Enhancement Program and originator of the STARS Program.

By adopting Irby's STARS Program and other HBCU/MI initiatives, ARL is taking a proactive approach to address the projected scientist and engineer shortage now. Irby says the STARS concept is based on a National Research Council National Academy of Science model and is designed to strengthen the infrastructure of HBCUs and MIs and assist them in educating scientists and engineers for the future.

STARS is a 3-year program that pays tuition and expenses up to \$20,000 for the senior year of undergraduate study and up to \$30,000 per year for the first 2 years of graduate study. The scholarship award also includes summer salaries, special mentoring, and conferences. Students have the opportunity to perform research at ARL during school breaks and agree to join the ARL workforce after receiving their graduate degrees.

STARS began in 1997 with three top-ranked students. Today, there are 12 in the program. In addition to the awards they receive from ARL, each student is honored with numerous awards from their schools in areas such as leadership, scholarship, and community service. Many are first- and second-ranked graduates, and all graduate magna or summa cum laude. As Irby stated, "They are all scholars in their own right."

The public presentation of HBCU STARS awards began last year at the Honors and Awards Convocation at Xavier University in New Orleans, LA. The public acknowledgement was so well received that Irby adopted this approach to advertise the program and attract more applicants.

Students must apply for acceptance into the STARS Program. A panel of six, chaired by ARL Deputy Director Dr. Joseph Rocchio, closely scrutinizes the applications. The panel consists of three ARL senior researchers and three researchers from academia and industry.

Allan Goldberg, ARL Materials Engineer and STARS Program mentor, made the recent HBCU STARS scholarship presentation at Claflin College. He described the response: "I called our STARS student up on the stage and described the program. There was noticeable response from the audience. ... There was outright applause when I told them she would have a guaranteed position at ARL. But that was nothing compared to the excitement, cheers, and standing ovation that occurred when I held up the oversized check. Clearly, the school feels honored that its student was selected and recognized by the Army. ..."

In May, a student from Morgan State University in Baltimore, MD, was presented an HBCU STARS scholarship at Morgan's Honors and Awards Ceremony.

"We truly are growing our own," Irby said, "because once they're part of the workforce, we're sure they will have a vested interest in the research and will stay. We also have a program that sends select employees on for their Ph.D."

The STARS Program is corporately funded; however, because it has proven so successful, some of the directorates are funding their own STARS students. This year, three ARL directorates have their own STARS students in addition to those funded corporately.

Dr. Norman Francis, President of Xavier University, described STARS as an excellent motivational and inspirational initiative for many students who have the capability and who aspire to serve the Armed Services in professional and leadership capacities.

Francis stated, "Private industry offers incentives all the time to attract talented people. I commend the Army for having the foresight to use very productive strategies that capture the talent that resides in our HBCU community from students who have excelled and gone on to provide leadership in corporate business and government service," he added.

ARL's HBCU/MI involvement is multifaceted. In April, Dr. James Gantt, Director of ARL's Information Science and Technology (IS&T) Directorate, was the keynote speaker at the 13th Annual Industrial Engineering Awards Banquet at North Carolina Agricultural and Technical State University (NCA&T) in Greensboro, NC. Three ARL employees received awards at the ceremony for their work at NCA&T.

Dr. Grayson Cucklock-Knopp, an Engineering Psychologist with ARL's Human Research and Engineering Directorate (HRED), received her award for coordinating the team that developed and taught an Advanced Topics in Human Factors class for two semesters.

Thomas Davis, an HRED General Engineer (human factors), was recognized for his work as president of Alpha Pi Mu Honor Society. Davis is on long-term training at NCA&T.

Robert Harder, a Computer Scientist with ARL's IS&T Directorate, received the Campus Leadership Award for Graduate Students. Harder recently completed a master's degree at NCA&T.

The establishment of the STARS Program was a result of Irby's desire to create a program in the name of the ARL Director that would serve as a legacy for the organization. Through Irby's steadfast commitment to young minds and the HBCU/MI Enhancement Program, she accomplished that and much more.

Irby retired in June with 32 years of federal service. However, Dr. Robert W. Whalin, ARL Director, is committed to continuing STARS as a recruitment and development program.

The preceding article was written by Angie Levrone, a Public Affairs Specialist at the U.S. Army Research Laboratory, Adelphi, MD.

48th Defense Working Group On NDT Schedules Meeting

The meeting of the 48th Defense Working Group (DWG) on Nondestructive Testing (NDT) will be held Nov. 1-4, 1999, at the Holiday Inn Hotel and Suites, Historic District, Alexandria, VA. The Naval Surface Warfare Center, Indian Head Division, Indian Head, MD, will host the meeting.

This is an annual meeting of engineers, scientists, technicians, and managers from all military and other U.S. government activities having the responsibility for development or application of NDT methods in research, engineering, maintenance, and quality assurance. Hosted alternately by the Army, Navy, Air Force, and Defense Logistics Agency, the meeting has served as an excellent vehicle for the technical exchange of information for problem solving and as a cost-effective way to avoid duplication of effort. Attendance meets DOD standards for training.

Although nongovernment organizations may provide presentations, attendance at the DWG meeting is restricted to government personnel. Nongovernment representatives may attend only that portion of the meeting during which their organization is making a presentation.

To register for the 48th DWG meeting, please visit our Web site at <http://members.aol.com/dodndt/> (click on [dodndt.html](#)), or contact Don Burtchette at Naval Surface Warfare Center, Indian Head Division, 101 Strauss Ave., Code 310, Indian Head, MD 20640; by phone at (301) 743-4152; by fax at (301) 743-4153; or by e-mail at BurtchetteDE@ih.navy.mil.

ATC/APG Team To Support FCT Program

On Jan. 7, 1999, the International Cooperative Programs Activity (ICPA), Aberdeen Proving Ground (APG), MD, hosted a visit by LTG Michael S. Davison Jr., Director of the Defense Security Cooperation Agency (DSCA), Office of the Secretary of Defense (OSD). The purpose of Davison's visit was to become acquainted with the Foreign Comparative Test (FCT) Program, which is being transitioned from OSD's Test Systems Engineering and Evaluation Directorate to DSCA.

"The FCT Program was set up by Congress to encourage project managers to evaluate the suitability of allied equipment meeting Army requirements," said Tom Buonaugurio, an ICPA employee who briefed Davison on the current status of the FCT Program.

The Aberdeen Test Center (ATC) played a major role in making this visit successful. ATC provided the bulk of the equipment and facilities for the exhibit, which included a 20-piece display of foreign equipment already fielded and currently under evaluation; well-known items such as the Fox Nuclear, Biological, Chemical and Reconnaissance Vehicle (Germany); and the M119 105mm Howitzer (United Kingdom). The Fox is used to detect and mark areas of contamination, and the M119 is used by the 82nd Airborne Division and other Army units for artillery support.

The FCT Program is funded separately by Congress. The Army typically receives \$10 million to \$12 million per year for new and continuing projects. The FCT Program allowed for evolution of 135

Defense systems, of which 42 were bought and fielded. Davison's visit provided first-hand knowledge of the program's positive impact on the Army.

During lunch, Davison thanked all participants and described his visit to ATC as "outstanding." He stated that APG has a valuable and unique role in Army Defense equipment development and that

it is remarkable that such a quality installation is easily accessible to the decisionmakers in Washington, DC.

The preceding article was written by Lena Goodman, Public Affairs Specialist at the U.S. Army Aberdeen Test Center, Aberdeen Proving Ground, MD.

LETTERS

Dear Sir:

Thank you for your recent interview with Mr. Hoepfer [Assistant Secretary of the Army for Acquisition, Logistics and Technology], in which he reaffirmed he likes to supply the soldiers with what they need "to get to the fight quickly, win decisively, and come back alive." This is the same objective as the honorable Secretary of the Army wrote to the WSJ [*Wall Street Journal*] on 3/24/99, "To meet future threats, the Army is transforming itself into a lighter, more agile, more lethal force that exploits information age technology to give soldiers the ability to dominate the battlespace in the world with a lightning fast flow of forces." Mr. Hoepfer then mentioned: Warren Buffett became America's greatest investor by consistently getting a little bit better return than everyone else. I think we need to look at Buffett differently.

It is true Buffett Partnership, Ltd. consistently outperformed the Dow Jones Industry Average since 1957. Many people forget that Buffett decided to invest 40 percent of his Partnership's assets in one company, American Express, in 1963. In the next 2 years, the share price tripled. At present, Buffett is still not investing in any Internet or technology stocks. Buffett always focuses on a limited number of companies in his portfolio. He knows the value of that business, the management, and stays with them in good times or bad for the long haul. MTS [Modernization Through Spares] and VEC [Value Engineering Change Proposals] will not change the Army's reliance on M1 tanks. I think the Army needs to invest 40 percent of the Army budget in a New Infantry Fighting Vehicle [NIFV] Program now. NIFV is basically a Bradley with design improvements to help the soldiers fight and win.

NIFVs can perform 95 percent if not all the ground combat missions now shared by the M1 tanks, MLRS [Multiple Launch Rocket System], Self Propelled Artillery and Apaches. The priority of NIFV is Deployability and Self Sustainability first, followed by Mobility, Fire Power and Survivability. NIFVs will have: 1. Side Firing Port Weapon systems as the original Bradley to fight through city blocks at 30 to 40 mph speed. (Tanks without foot soldiers' escort suffered at Mogadishu, Somalia.) 2. NIFVs can fire the hand held Stinger missiles from a gunner riding at the back of a partially opened rear ramp. This

gunner can see 360 degrees and hear the enemy helicopters before they pop out from behind a hill. NIFV retains the TOW [Tube-launched, Optically tracked, Wire-guided missile], thus it is better than the Linebacker. 3. NIFVs will add a central air conditioning unit to reduce the heat stress on the crew. 4. NIFVs will allow firing the 25 mm as a defen-sive mode while reloading the TOW and vice versa, a huge survivability improvement with practically no cost increase compared to the Bradley A2 program that took away the SFPWs [Side Firing Port Weapon System] in favor of the armor protection, a bad trade off. Army got more money, soldiers lost the system they liked. 5. NIFVs can also carry an extra quiet motorcycle and discharge two soldiers to survey the grounds before the commander decides when and where to attack.

Satellite pictures or high mast antenna from C2V [digital Command and Control Vehicle] cannot tell the commander what it looks like from a corner of a river bend or a small hill just a mile away. If we cannot deploy our troops quickly, then no amount of Digitization is going to help the Army. Tanks are just too heavy for Bosnia or Kosovo. Crews need air conditioning to manage the current equipment. Digitization increases the workload on soldiers. It can cause them to make more mistakes or even fault the equipment. Soldiers are not fully trained today. For example, there is no training device today to really simulate the potency of the Bradley TOW system and allow soldiers to score the tank killing win in an NTC [National Training Center] exercise. Digitization will only give the Armored Generals another excuse to keep supporting the outmoded tanks.

Let's build and field the NIFV now even if it means stopping the whole Digitization program. This the Army alone can decide through Simulation or common sense decision making. It is a moral issue more important than strategic or doctrine. We owe our future foot soldiers, and the innocent civilians in a far away land, the NIFV. NIFVs will complement the junior officer demanded restructure of the 10 division Army to 25 Mobile Combat Groups nicely. The heavy armored division is just too heavy to bring it to the front line, like Kosovo. I am sure the Army is not happy to be only peace keepers after the cruise missile and the bombers finish the combat missions.

Thank you for your time.

Respectively yours,
William H.K. Chu

FROM THE DIRECTOR ACQUISITION CAREER MANAGEMENT OFFICE

For those who have not heard, COL Ed Cerutti has moved on to become the Senior Military Assistant to the Defense Acquisition Executive, Jacques Gansler. Ed leaves behind a series of solid accomplishments as the ACMO Director. In his new position, COL Cerutti serves the Army in an office that is critical to our mission to equip and support the soldiers of the next century. I am sure all of you join me in wishing Ed continued success in this most challenging assignment.

On July 5, I assumed duties as your Director of the Acquisition Career Management Office. I served previously as the Project Manager for Close Combat Anti-Armor Weapon Systems within the PEO for Tactical Missiles. Many of you may remember me from my earlier days as the Military Acquisition Management Branch Chief at PERSCOM. As a recent PM, I am aware of the concerns and challenges that face our Acquisition Workforce, both civilian and military. It is my intent to be your advocate for progress on personnel policy issues and in strengthening the morale and cohesiveness of our "young" corps.

I say young corps because we will shortly celebrate only our 10th anniversary. Certainly, by Army standards, we are still in our infancy. We have experienced some growing pains, but our professional growth is evident to everyone. Since the corps was formed, there has been a significant expansion in our development opportunities. These include both educational and assignment opportunities. I saw the results in my last assignment. Our current civilian and military members clearly stand toe-to-toe with their industry counterparts. That's my perspective and my starting point.

While we can show some successes, enormous challenges must be addressed if we are to continue to grow as a corps. My top concerns are our aging civilian workforce, with a vast majority eligible for retirement in 2005, and a military workforce with a recent reduction in promotion rates and initial accessions. We're good now, but if we don't act to develop the next generation, we won't be ready to meet the Army's future modernization requirements. I view these as the key ACMO challenges.

We can't do it alone. We need the support of our leadership and our workforce. And relative to our leadership, I strongly encourage you to read the very informative interview with Deputy Director for Acquisition Career Management Keith Charles on Page 2 of this magazine. As we finish our 10th year, we have already begun the process of surveying our population to solicit their opinions. Our general officers began the process last year through mentoring sessions, with feedback to the DACM, LTG Kern. The ACMO has started surveying our exiting officers and will expand its efforts to include reviewing commander's end-of-tour reports, field surveys, and sensing surveys on specific topics. We need to

know we are targeting the right issues. Help us by getting involved and letting us know your concerns.

I look forward to meeting you at upcoming Roadshows (now called Army Acquisition Workforce 2000 briefings). Please contact us if we can be of assistance. Our phone numbers can be found on the Army Acquisition Corps home page at <http://dacm.sarda.army.mil/contacts>.

COL Roger Carter
Director,
Acquisition Career Management Office

Naval Postgraduate School Offers M.S. In Program Management

The Army Acquisition Corps (AAC) is sponsoring a new and exciting graduate degree program for the Army Acquisition Workforce. The Master of Science in Program Management (MSPM 836), conducted by the Naval Postgraduate School (NPS), is a regional pilot program presently underway at Warren, MI, and at Edgewood Arsenal, Aberdeen Proving Ground, MD. Recently, this program was also established at Fort Monmouth, NJ, and at Huntsville, AL. Picatinny Arsenal and the National Capital Region (NCR) are being considered as possible future locations. If a regional program is established in the NCR, participating students may represent each of the Armed Services. Once a decision is made, opportunities for these two additional locations will be announced in an updated edition of the *Acquisition Education, Training and Experience Catalog*.

MSPM 836 is a 27-month distance learning program leading to a master's degree in program management. The program consists of 9 (12-week) quarters. Students attend courses during duty and nonduty hours (average 50-percent duty hours). During the first eight quarters, the program is conducted at the pilot sites via video teleconferencing (VTC), in which the pilot sites are linked to the NPS classroom. The final quarter is an accelerated full-time 8-week session held in residence at NPS in Monterey, CA.

Command and supervisor commitment is essential for the success of this program. Commands and organizations make a substantive investment of resources in terms of facilities, administrative support, and student participation. Unlike normal "after-hours" courses where the educational institution and the student's command have little interaction, the MSPM Program depends largely on a close relationship among the NPS, the student, and the student's organization.

The benefits of MSPM 836 include the following:

- The program satisfies training requirements for Level III certification in the program management and acquisition logistics career fields.
- The program satisfies training requirements for Level II certification in the manufacturing, production, and quality assurance; systems planning research, development, and engineering; and test and evaluation career fields.
- The program satisfies Defense Acquisition Workforce

CAREER DEVELOPMENT UPDATE

Improvement Act (DAWIA) statutory requirements for the 24 or 12 semester hours of business disciplines, as applicable.

Expenses for this program, including travel and per diem costs for the 8-week resident session, course work, and books, are paid for by the AAC. The participating command is responsible for funding individual salaries and VTC classroom facilities.

For additional information on MSPM 836, contact Jim Welsh at the Acquisition Career Management Office at (703) 604-7116, DSN 664-7116. For additional information on the program, visit the NPS Web site at http://www.sm.nps.navy.mil/curric/program_management.

Acquisition Education, Training And Experience Board Results

The Acquisition Career Management Office is pleased to announce results from the Acquisition Education, Training and Experience Board, which met June 22-23, 1999, to review applicants for training and educational opportunities. Listed below are the personnel selected by the board. Note that Naval Postgraduate School (NPS) instruction will be conducted by video teleconferencing. SOC denotes school of choice.

Name	Organization	Selected For	Training Site
Roberts, Glen S.	AMCOM	NPS	Huntsville
Ryan, Michael F.	PEO, IEW&S	NPS	Fort Monmouth
Martin, Jose F.	PEO, Tac Msl	NPS	Huntsville
McGee, Michael E.	AMCOM	NPS	Huntsville
Balla, Robert J.	SMDC	NPS	Huntsville
Brown, Richard H.	SMDC	NPS	Huntsville
Lawrence, Mike C.	PEO, Tac Msl	NPS	Huntsville
Maples, Henrietta H.	AMCOM	NPS	Huntsville
Hoyt, Sidney F.	AMCOM	NPS	Huntsville
Beck, Daniel S.	AMCOM	NPS	Huntsville
Cooper, Alvin L.	AMCOM	NPS	Huntsville
Barton, Dean M.	PEO, Aviation	NPS	Huntsville

Leonard, Kathleen	AMCOM	NPS	Huntsville
DeNicolantonio, Gail	PERSCOM	SOC	George Mason University
De La Cruz, Denice	WSMR	SOC	University of Arizona
Brennan, Craig R.	SMDC	SOC	Auburn University
Smith, Kim M.	PEO, AMD	SOC	Florida Institute of Technology
McHale, Mary E.	ACMO	SOC	George Washington University

Easterwood, Larry	PEO, AMD	Weapon Sys. Mgmt. Course	Germany
Jasinski, Frank	CECOM	Operational Experience	Fort Bragg
Tilghman, John	SBCCOM	Operational Experience	Fort Bragg

CAREER DEVELOPMENT UPDATE

Regional And Annual Army Acquisition Workshops Scheduled

Mark your calendars now. The dates, locations, and coordinators for the FY00 Regional and Annual Army Acquisition Workshops and Executive Sessions have been approved by the Military Deputy to the Assistant Secretary of the Army for Acquisition, Logistics and Technology and the Deputy Commanding General, Army Materiel Command (AMC). Three regional workshops are planned, culminating with the annual workshop in August 2000. Program Executive

Officers, Deputies for Systems Acquisition, and other acquisition general officers and Senior Executive Service members are invited to attend all workshops and executive sessions. Program, project, and product managers are invited to attend their regional workshop as well as the annual workshop. Workshop coordinators, as shown in the accompanying chart, are from AMC and the Army Acquisition Executive Support Agency (AAESA). Please note that the U.S. Army Test and Evaluation Command, site of the first regional workshop, will be renamed the Army Developmental Test Command on Oct. 1, 1999.

Date	Location	Workshop Coordinator
Regional Workshop Nov. 3-4, 1999	U.S. Army Test and Evaluation Command, Aberdeen, MD	COL Lee Parker, HQ AMC (703) 617-9196 DSN 767-9196
Regional Workshop Feb. 16-17, 2000	U.S. Army Armament Research, Development and Engineering Center, Picatinny Arsenal, NJ	Janet Jones, AAESA Structures Division (703) 805-4363 DSN 655-4363
Regional Workshop May 17-18, 2000	Army Simulation, Training, and Instrumentation Command, Orlando, FL	COL Lee Parker, HQ AMC (703) 617-9196 DSN 767-9196
Annual Workshop Aug. 22-24, 2000	U.S. Army Tank-automotive and Armaments Command, Warren, MI	Janet Jones, AAESA Structures Division (703) 805-4363 DSN 655-4363

AAC Officers Get M.A. Degrees

Thirteen Active Army Acquisition Corps (AAC) officers and one Reserve AAC officer received acquisition-related master of arts (M.A.) degrees at a commencement ceremony held June 2, 1999, at Fort Leavenworth, KS. Webster University awarded the degrees as part of its Acquisition Graduate Degree Program (AGDP).

AAC officers who received M.A. degrees in procurement and acquisition management were MAJ Charlotte Alvarenga, MAJ Francisco Espailat, MAJ Jeffrey Hendren, MAJ Steven Kihara, MAJ Anthony Nieto, MAJ Samuel Parrish, and MAJ Christian Rush.

Recipients of M.A. degrees in computer resources and information management were MAJ Gerrie Gage, MAJ Ralph Hay, MAJ Anthony Jimenez, MAJ Daniel Justis Jr., MAJ Gregory Kilby, MAJ James Ramskill, and MAJ Craig Schaefer.

Dr. David Harpool, Webster University Acting Dean of the School of Business and Technology and Associate Vice President of Graduate Studies, delivered the commencement address.

The AGDP is a fully funded program that permits selected AAC officers to complete an acquisition-related advanced degree while concurrently attending the regular Command and General Staff Officer Course (CGSOC).

AAC officers selected for the regular CGSOC and who are interested in the AGDP should contact the Chief, Acquisition

Education and Training Program, U.S. Army Command and General Staff College, Fort Leavenworth, KS, at (913) 684-5330/5329 or DSN 552-5330/5329.

Happy 10th Anniversary Army Acquisition Corps!

The U.S. Army Acquisition Corps (AAC) will celebrate its 10th anniversary beginning Oct. 10, 1999, and throughout the week of the 1999 Association of the United States Army (AUSA) Annual Meeting.

Event Highlights

A series of special events will highlight the AAC and the contributions it has made in acquisition and in the development of future Army leaders.

An AAC exhibit commemorating the 10th anniversary will be on display at the AUSA meeting. In addition, career development guidance and counseling will be provided by the Acquisition Career Management Office staff in an adjacent suite.

AAC teams will also participate in the Army Ten-Miler on Oct. 10.

Association Inauguration

The 10th anniversary commemoration will also inaugurate the establishment of an association of acquisition professionals. The headquarters of the association will be in

Washington, DC. An important part of the association's role will be to publicize and reinforce Army acquisition goals and ensure that the lessons of history and the proud traditions of the Army Acquisition Workforce (AAW) are remembered by future generations.

AAC Ball

Anniversary activities will also include the AAC Ball on Oct. 10 in the main ballroom of the Crystal Gateway Marriott, Crystal City, VA. Dinner and entertainment will be provided. Special award presentations, as well as recognition of charter memberships and chapter presentations, are also planned for the evening.

To obtain additional information on any of the celebratory events, contact Mary McHale at (703) 604-7105, DSN 664-7105, e-mail: mchalem@sarda.army.mil.

A special Web site has been created for the AAC's 10th anniversary. Log on to the AAC home page at <http://dacm.sarda.army.mil> to access this new Web site (click on News). This link provides information on the anniversary events and the new acquisition professional association. The link also provides the AAW with online registration for the AAC Ball.

Deputy Project/Product Manager Process Action Team Established

A process action team has been established to provide recommendations on the centralized management of deputy project/product manager (DPM) positions. The primary purpose of this initiative is to provide interested individuals the opportunity to gain the requisite experience to successfully compete for PM positions.

To make this happen, the Acquisition Career Management Office (ACMO) and the Army Acquisition Executive Support Agency (AAESA) will provide authorizations and high-grade authority to support selected positions to receive a DPM. PM offices will be recommended for a DPM position through an order of merit list compiled by the annual PM/Acquisition Command General Officer Steering Committee. The ACMO is developing a central referral process to identify individuals for selection into DPM positions. The selection authority for each DPM position will reside at the Senior Executive Service or general officer level of the hiring organization. Following completion of the DPM's rotation, the assigned authorization will revert back to AAESA for reassignment.

For additional information, contact Paul Richard at AAESA, (703) 805-1059, DSN 655-1059, e-mail: richardp@aaesa.belvoir.army.mil.

PERSCOM Notes . . .

FY99 Lieutenant Colonel Promotion Board Results

The FY99 Lieutenant Colonel Promotion Board results were released in July 1999. The selection rate for Army Acquisition Corps (AAC) officers in the primary zone was 55.7 percent, while the selection rate for the Army competitive category was 68.8 percent.

The primary zone selection percentage for AAC officers does not correlate to substandard performance by year group (YG)83 AAC officers. An analysis of the number of officers selected versus the minimum Army requirements for AAC critical skills indicates otherwise. There were 147 officers in the primary zone population for the FY99 Lieutenant Colonel Promotion Board. The selection board was given the requirement to select a minimum of 40 fully qualified AAC officers for promotion. The overall file quality of AAC officers in the primary zone resulted in the board selecting approximately 200 percent of the minimum requirements.

Overall AAC Results

The FY99 Lieutenant Colonel Selection Board reviewed the files of 147 AAC officers in the primary zone. From this population, 82 were selected for promotion to lieutenant colonel. Additionally, the board selected one AAC officer from below the zone (0.6 percent), and seven AAC officers (5.4 percent) from above the zone.

Statistics For Selected Officers

Functional Area	Primary Zone Considered	Primary Zone Selected	Primary Zone Percent
51	90	46	51.1%
53	24	11	45.8%
97	33	25	75.7%
TOTAL	147	82	55.7%

Promotion Trends

A review of those officers selected for promotion by the FY99 Lieutenant Colonel Board validated the following historical trends:

- LTC = Army Command and General Staff College*
- + Above Center of Mass (ACOM) Command*
- + Consistent COM(+) performance*
- + Job progression and diversity*

Army Command and General Staff College (CGSC)

Sixty-eight of 82 (82.9 percent) AAC officers selected in the primary zone attended resident CGSC. Fourteen of 82 (17 percent) AAC officers selected in the primary zone completed

CAREER DEVELOPMENT UPDATE

CGSC through nonresident studies. In contrast, 6.8 percent of the officers in the primary zone did not complete CGSC (either resident or nonresident), and none of these officers were selected for promotion regardless of their overall performance.

Command

Company command reports appeared to be extremely important to board members. The majority of AAC officers selected for promotion received at least one ACOM Officer Evaluation Report (OER) as company commanders. These reports generally had either clear ACOM senior rater profiles and/or strong senior rater comments on potential. AAC officers with more than one center of mass command OER were usually not selected.

Consistent COM(+) Performance

Another important trend was consistent COM(+) performance throughout the officer's career. AAC officers selected for promotion generally had consistent COM(+)/ACOM OERs. Senior captains or majors with below center of mass evaluations were generally not selected for promotion.

Job Progression

The last important trend was clear evidence of increased responsibility from one assignment to the next. OERs on those officers selected clearly showed increasing levels of responsibility from one assignment to the next as well as acquisition diversity in assignments.

The New OER (DA Form 67-9)

Statistics were not gathered on the new OER. There was not a sufficient number of DA Forms 67-9 to conduct an analysis or draw any conclusions on the impact of the new OER. However, the majority of the officers considered for promotion had at least one DA Form 67-9. Initial results indicate officers who receive COM OERs are competitive for promotion.

Listed below are the AAC officers selected for promotion to lieutenant colonel above the zone, in the primary zone, and below the zone:

ADAMS DAN LEON JR
ALTAVILLA PETER ANTHONY
AZEMAR JACQUES ANDRE
BARISANO GREGG ANTHONY
BASHAM CHARLES SHERMAN JR

CAREER DEVELOPMENT UPDATE

Electronic Processing For Command

This year, the U.S. Total Army Personnel Command (PERSCOM) will electronically process all command decision paperwork for officers in the zone of consideration for command assignments. Under this plan, the Acquisition Management Branch will mail a letter to officers indicating they are in the zone of consideration. The letter will contain the individual officer's electronic account name and password. All officers in the zone of consideration will be requested to log on to the Web site identified in the letter and indicate if they desire to compete for a command assignment. Those officers who elect to compete will be directed to another screen to number the FY01 Products, Projects, Acquisition Commands in preferential order. Officers will be considered for all positions for which they meet the basic eligibility, as well as for any unanticipated vacancies. This information will be downloaded at PERSCOM and used in both the board preparation process and the command slating process.

The acquisition command Web site will not be activated until after the FY01-FY03 General Officer Steering Committee adjourns. Additional information will be included in the above-mentioned letter.

FY00 Colonel/GS-15 PM/Acquisition Command Slate

The U.S. Army Total Personnel Command's Acquisition Management Branch recently announced the following personnel for FY00 project manager/acquisition command assignments:

Project Manager

Rank	Name	Career Branch	Field	Acquisition Command
COL	Asada, Michael K.	AR	51	PM, COMBAT MOB SYS
LTC(P)	Birmingham, Robert P.	AV	51	PM, AVIATION SYSTEMS

COL	Thomas, Dwight E.	OD	97	CDR, DCMC DALLAS

Officer Preparation For The PM/Acquisition Command Board

A Department of the Army (DA) selection board will convene in November 1999 to consider eligible lieutenant colonels and promotable majors for both projected and unanticipated Product Manager (PM) and Acquisition Command vacancies in FY01. The DA message announcing this board can be found at the following Web address: <http://www-perscom.army.mil/default.htm>. After accessing this site, go to "What's New," to "MILPER Message Index (1999)," and to message number 99-190. The initial site provides critical information concerning deadlines associated with Officer Evaluation Reports (OERs) and other documents that need to be sent to the U.S. Total Army Personnel Command (PERSCOM).

Your board file consists of three items: your photo, your Officer Record Brief (ORB), and your microfiche. The information below details some helpful advice to prepare for this significant event in your career.

- *Photo.* Update your photo if it is more than 5 years old or you have changed rank, earned badges, or received awards since your last one. The standard is to have a three-quarter-length digital color photo with your basic branch shown in the information summary that is electronically overlaid in the upper left-hand corner of the photo. In general, board members consider an updated photo as "initiative" from those officers who care about their file.

- *ORB.* Visit your local personnel administrative center to ensure all entries are accurate. The ORB is a "snapshot" of the officer that gives board members an initial impression of overall assignment histories and qualifications.

- *Microfiche.* Document all awards and badges on your microfiche. With the exception of nonrated time or TDY schools, there should be an OER or Academic Evaluation Report to account for all active federal commissioned service.

CAREER DEVELOPMENT UPDATE

Officers may decline PM and/or Acquisition Command consideration without prejudice prior to the convening of the board. However, declining does not guarantee that you will not permanently change stations (PCS) prior to the next board a year later.

Copies of award certificates (with social security number and full name clearly printed in block letters) should be mailed with photos to U.S. Total Army Personnel Command, ATTN: TAPC-OPB-E, 200 Stovall St., Alexandria, VA 22332-0411.

For additional information, contact the following assignment officers in the Acquisition Management Branch at PERSCOM: Functional Area (FA) 51 LTCs, MAJ John Masterson, (703) 325-3129, DSN 221-/FAX -9001, e-mail: mastersj@hoffman.army.mil; FA53 LTCs, MAJ Steve Decato, (703) 325-3124, DSN 221-/FAX -9001, e-mail: decatos@hoffman.army.mil; FA97 LTCs, MAJ Jay Norris, (703) 325-5479, DSN 221-/FAX -9001, e-mail: norrisj@hoffman.army.mil.

FY00 ACQUISITION POSITION LISTS

This supplement to *Army RD&A* magazine provides a listing of acquisition positions validated by the FY00 Acquisition Position List Boards. The military acquisition position list (MAPL) is provided, as well as a list of all GS-14 and above (or broadband level equivalent) critical civilian acquisition positions (CAPs). The provisions of the Defense Acquisition Workforce Improvement Act (DAWIA) and DOD Instruction 5000.58 require each Service to annually publish a list of critical acquisition positions. The following lists of FY00 acquisition positions were briefed to LTG Paul J. Kern, Director, Acquisition Career Management, on July 30, 1999. These positions are recognized as valid requirements for the assignment of military and civilian acquisition personnel.

These lists do not reflect vacancies. Instead, these lists represent board-validated acquisition positions. Each position includes the assigned acquisition position list number for tracking and reporting, the acquisition position category (APC) or functional area (FA) that identifies the position's acquisition career field, the grade or rank, and other information. CAP information is sorted by acquisition organization, APC, and grade. The pay plan (PP) has been added this year to clarify grades for those organizations that are participating in the Acquisition Workforce Personnel Demonstration. Additional position information on these lists is available at <http://dacm.sarda.army.mil/workforce>.
