#### **Emerging Ideas**

#### Relating EVM to "Real" Schedules Wayne Abba

# Dekker, Lfd.

## **Old Concepts - New Ideas**

#### Schedule variance

- What it is
  - Strengths
  - Weaknesses (misunderstandings?)
- Unleashing the power of schedule information
  - Reconciling earned value schedule and "real" schedule
- Cost variance
- Risk management
- Management reporting and presentation

#### **Schedule Variance**

• Definition

CARE

- Earned Value (BCWP) minus Planned Value (BCWS)
- Positive (+) variance indicates volume of work performed ahead of plan
- Negative (-) variance indicates volume of work performed behind plan

#### **Schedule Variance Example**

- Planned value: 50
- Earned value: 40
- Actual cost: 35
  - Schedule variance = 40 50 = (10)
  - Schedule variance percent = 10/50 = 20%
  - Schedule performance index = 40/50 = .8
- What does this tell us?
  - Behind schedule?
  - What? By how much?

© 2000 Dekker, Ltd.

#### **The Maligned Metric**

#### • "Schedule" Variance

- Doesn't measure time
- Doesn't reveal if the right work was done
- A positive variance is not necessarily good
- A negative variance is not necessarily bad
- What good is it?
- Sound and fury...

Jekker

#### Discussion

- Issue
  - Doesn't measure time

- Doesn't identify work
- "+" may be bad

"-" may be good

- Reason
  - Measures value of work completed vs. planned on same basis (\$, hrs.)
  - Requires 'drill down' analysis
  - Work done not on critical path; offsetting variances masked
  - Float

### **Schedule Variance: Strengths**

- Provides reliable early warning
  - When large, early and unfavorable
  - Observations on 100's of DoD contracts
- Reflects cost/schedule integration

Jekker,

- Work breakdown structure
- Performance measurement baseline

# Schedule Variance: Misunderstandings

- Earned value technique was developed for cost measurement, not scheduling
  - Three basic elements
    - Planned value
    - Earned value
    - Actual cost

Data needed to obtain

Objective cost measurement

- Earned value measures work accomplished
  - Better term "accomplishment variance?"
  - Must be used with other schedule information

# The Time is Right for Change

Jeak

- Better environment
  - Earned value redefined from reporting to management
- Better tools
  - Relational data bases
  - True cost/schedule integration - earned value & critical path
  - Timely data (weekly earned value becoming common)

#### **Unleashing the Power**

- By itself, schedule variance reveals no intelligence about critical path
  - How are cost and schedule integrated?
    - Planned value at early start creates earliest possible variance information
    - But also creates "meaningless" schedule variance
      - Later integration creates less negative variance and correspondingly less management information
  - There is no industry standard

IC

DEKKER TRAKKER<sup>™</sup> uses early start date

## **Unleashing the Power**

#### Solution

CRIR

- Take advantage of earliest practical information
  - BCWS at early start
  - A later date cannot optimize management information
- Use data base engine capabilities
  - Integrate schedule and earned value information
  - Part of management process
  - "Report up," not "drill down"
- Create new schedule variance subcategories

### **Schedule Variance Categories**

- "Problem"
  - Critical tasks that did not start early
- "Late with Float"
  - Tasks that did not start early but are not critical
- "Purposely Delayed"
  - Tasks delayed due to work-around (user flag)
- "Early"
  - Tasks begun ahead of early start
- "Anomalies/Errors" (user flag)

Dekker, I

#### **Schedule Variance Example**

• Schedule variance 40 - 50 = (10)

Problem- 2 \*Late with float- 6 \*Purposely delayed- 4Early+ 2 \*- 10

\*tracked automatically

© 2000 Dekker, Ltd.

#### **Cost Variance**

• Definition

CRI

- Earned Value (BCWP) minus Actual Cost (ACWP)
- Positive (+) variance indicates underrun for work completed to date and work in process
- Negative (-) variance indicates overrun for work completed to date and work in process

### **Cost Variance Categories**

- Similar to Schedule Variance
  - Understood & accepted
- Subcategories
  - "Positive"
  - "Negative"

Dekker, l

- "Anomalies/Errors"
- Avoid "washout" of lower level variances

Dekker, Lird.

#### **Cost Variance Example**

• Cost variance 40 - 35 = 5

| Negative | - 5*          |
|----------|---------------|
| Positive | <u>+ 10 *</u> |
|          | 5             |

\*tracked automatically

# **Risk Management**

- Better risk identification work in process
- "Watch List"
  - Prospective analysis to identify tasks that will affect critical path if not begun on schedule
    - 30/60/90 day
    - Relate to risk management
- Management vs. reporting
  - Data base engine is key
  - Extract intelligence from data to create meaningful management outputs

#### **Management Presentation**

- Customer understanding
  - Integrated Baseline Review
  - External customers
- Customer reports

Dekke

- Categorize variances
- Management charts
  - Lines/colors
  - Web delivery
- Problem notification by e-mail

Cause

Dekker, l

#### Cost Variance Categories Positive Negative

#### **Management Charts**

Jekke

- Refine current designs
  - Cost/schedule variance trends
    - More than one schedule variance line
- New types
  - Pie chart
- Web-based presentation
- Automatic e-mail notices

## **Coming Attractions**

- Display overtarget baselines clearly
- Display relationship between cost variance and financial status (for example, share lines)

Dekker.

# Summary

- State of the art in cost/schedule integration
  - Made possible by state of the art software
- Better integration of earned value and risk management
- Powerful management information outputs
- Raising the bar for integrated project management tools
