## **NOTICES**

When US Government drawings, specifications, or other data are used for any purpose other than a definitely related Government procurement operation, the Government thereby incurs no responsibility nor any obligation whatsoever, and the fact that the Government may have formulated, furnished, or in any way supplied the said drawings, specifications, or other data, is not to be regarded by implication or otherwise, as in any manner licensing the holder or any other person or corporation, or conveying any rights or permission to manufacture, use, or sell any patented invention that may in any way be related thereto.

Please do not request copies of this report from the Air Force Research Laboratory. Additional copies may be purchased from:

National Technical Information Service  
5285 Port Royal Road  
Springfield, Virginia 22161

Federal Government agencies and their contractors registered with the Defense Technical Information Center should direct requests for copies of this report to:

Defense Technical Information Center  
8725 John J. Kingman Road, Suite 0944  
Ft. Belvoir, Virginia 22060-6218

### **DISCLAIMER**

This Technical Report is published as received and has not been edited by the Air Force Research Laboratory, Human Effectiveness Directorate.

### **TECHNICAL REVIEW AND APPROVAL**

AFRL-HE-WP-TR-2003-0015

This report has been reviewed by the Office of Public Affairs (PA) and is releasable to the National Technical Information Service (NTIS). At NTIS, it will be available to the general public.

This technical report has been reviewed and is approved for publication.

### **FOR THE COMMANDER**

  
BRIAN P. DONNELLY, Lt Col, USAF  
Deputy Chief, Crew System Interface Division

13. ABSTRACT (Maximum 200 words)  This document is a compilation of spectral transmissivity data measured from numerous aircraft transparencies. The spectral transmissivity of each part was measured from wavelengths of 450 nm through 950 nm. Some parts were also measured at several different angles relative to the optical axis of the spectroradiometric instrument. The measurements yielded both visible light and near infrared (NIR) spectra. The NIR data were used to calculate night vision goggle-weighted transmissivity (TNVG) values (Pinkus and Task, 1997). TNVG is a measure of a transparency's compatibility when it is used in conjunction with night vision goggles (NVGs). NVGs utilize the NIR portion (600 nm through 950 nm) of the night sky ambient illumination. Generally speaking, the higher the TNVG coefficient, the higher the NVG visual performance (Pinkus & Task, 1998a; Pinkus & Task, 1997).

 APPENDIX A The Effects of Aircraft Transparencies on Night Vision Goggle-Mediated Visual Acuity (Pinkus and Task, 1997) .....	355

**THIS PAGE INTENTIONALLY LEFT BLANK**

## INTRODUCTION

The Visual Image Evaluation of Windscreens (VIEW) facility at Wright-Patterson AFB, Ohio, has been evaluating the optical characteristics of aircraft transparencies (Merkel & Task 1989; Muick, 1978) for over twenty-five years. During this time period, numerous types of aircraft transparencies from different sources have been measured for a multitude of optical characteristics. Some of these optical characteristics include angular deviation, multiple imaging, distortion, haze, and transmissivity. Though continuous in nature, transmissivity characteristics can be divided into two spectral ranges: visible and near infrared (NIR). Unaided human vision is sensitive to light from about 400 nm (blue) to 700 nm (red) with peak sensitivity occurring at about 555 nm (green). In comparison to human vision, the night vision goggles (NVGs) that are used in aircraft cockpits are sensitive to and amplify light in the red and NIR region of the spectrum from about 600 nm to 950 nm. This data compilation provides detailed information on the visible and NIR transmissivity characteristics of transparent plastics. These data allow human factors engineers and vision scientists to assess the relative visual impact that different types of transparencies may have on both unaided and NVG-supplemented aircrew out-of-the-cockpit visual performance. The NIR data also can be used to resolve NVG/transparency integration issues.

The American Society for Testing and Materials (ASTM) has published several standardized test methods (ASTM D 1003-97; ASTM F 1316-90) for measuring the transmissivity of transparent parts in the visible region. ASTM D 1003-97 is utilized when measuring thin, flat parts perpendicular to the optical axis whereas ASTM F 1316-90 is applied when measuring large, curved or installed parts. These standard test methods include precision statements for reproducibility (between-laboratory variability) and repeatability (within-laboratory variability) (ASTM E 691-99).

Transparencies can have high transmissivity in the visible region but attenuate NIR. The result is a transparency exhibiting good out-of-the-cockpit visibility for the unaided eye but marginal or poor NVG-aided visual performance. Thus, an analytical method was devised to measure a transparency's NVG-weighted transmissivity or  $T_{NVG}$  (Pinkus and Task, 1997).  $T_{NVG}$  is an indicator of a given transparency's compatibility with NVGs. ASTM has also published a standardized test method (ASTM F 1863-98) for the determination of  $T_{NVG}$  of a transparent part. This standard test method also includes reproducibility and repeatability precision statements (ASTM E 691-99).

## DOCUMENT STRUCTURE

This document is sub-divided into different sections containing transmissivity data for: USAF bombers, cargo aircraft, fighters, trainers, some Navy aircraft, prototype transparencies,

plastic coupons and samples. Each sub-section contains an aircraft transparency profile, a transmissivity graph and its associated tabular data. Some parts were measured at both normal and installed (design eye) angles. Also included in this reference is a reprint of a paper by Pinkus and Task (1997), which provides the theoretical basis of the  $T_{NVG}$  calculation that is used throughout this reference.

### Aircraft Transparency Profile

The aircraft transparency profile page contains the following information: aircraft type, part name, date of manufacture, serial number, material type, construction and coating. Some profiles are incomplete because the information was not available at the time of the measurement.

### Transmissivity Graph

This graphic shows the transmissivity coefficient plotted as a function of wavelength from 450 nm to 950 nm as measured using an EG&G Gamma Scientific Radoma Model GS-1252-01 spectroradiometer. The graph is labeled with information including aircraft type, material, serial number, measurement geometry (normal means perpendicular to the surface of the transparency) and the  $T_{NVG}$  coefficient. For visible light, the transmissivity of a transparency is often expressed as a simple percentage (Fischer and Tadic-Galeb, 2000). The graph plots the transmission coefficient (or simply transmissivity) as a function of wavelength, where a transmission coefficient of 1.0 equals 100% transmission.

### Tabular Data

This section contains the tabular data used to plot the transmissivity graph and calculate the  $T_{NVG}$  coefficient (Pinkus and Task, 1997 & 1998b). The tabular data are included to facilitate additional analyses by the reader.

# **F-16**

**Aircraft:** F-16

**Part Name:** Canopy, Left Side, A/C, TEXSTARS

**Manufactured:** 11/92

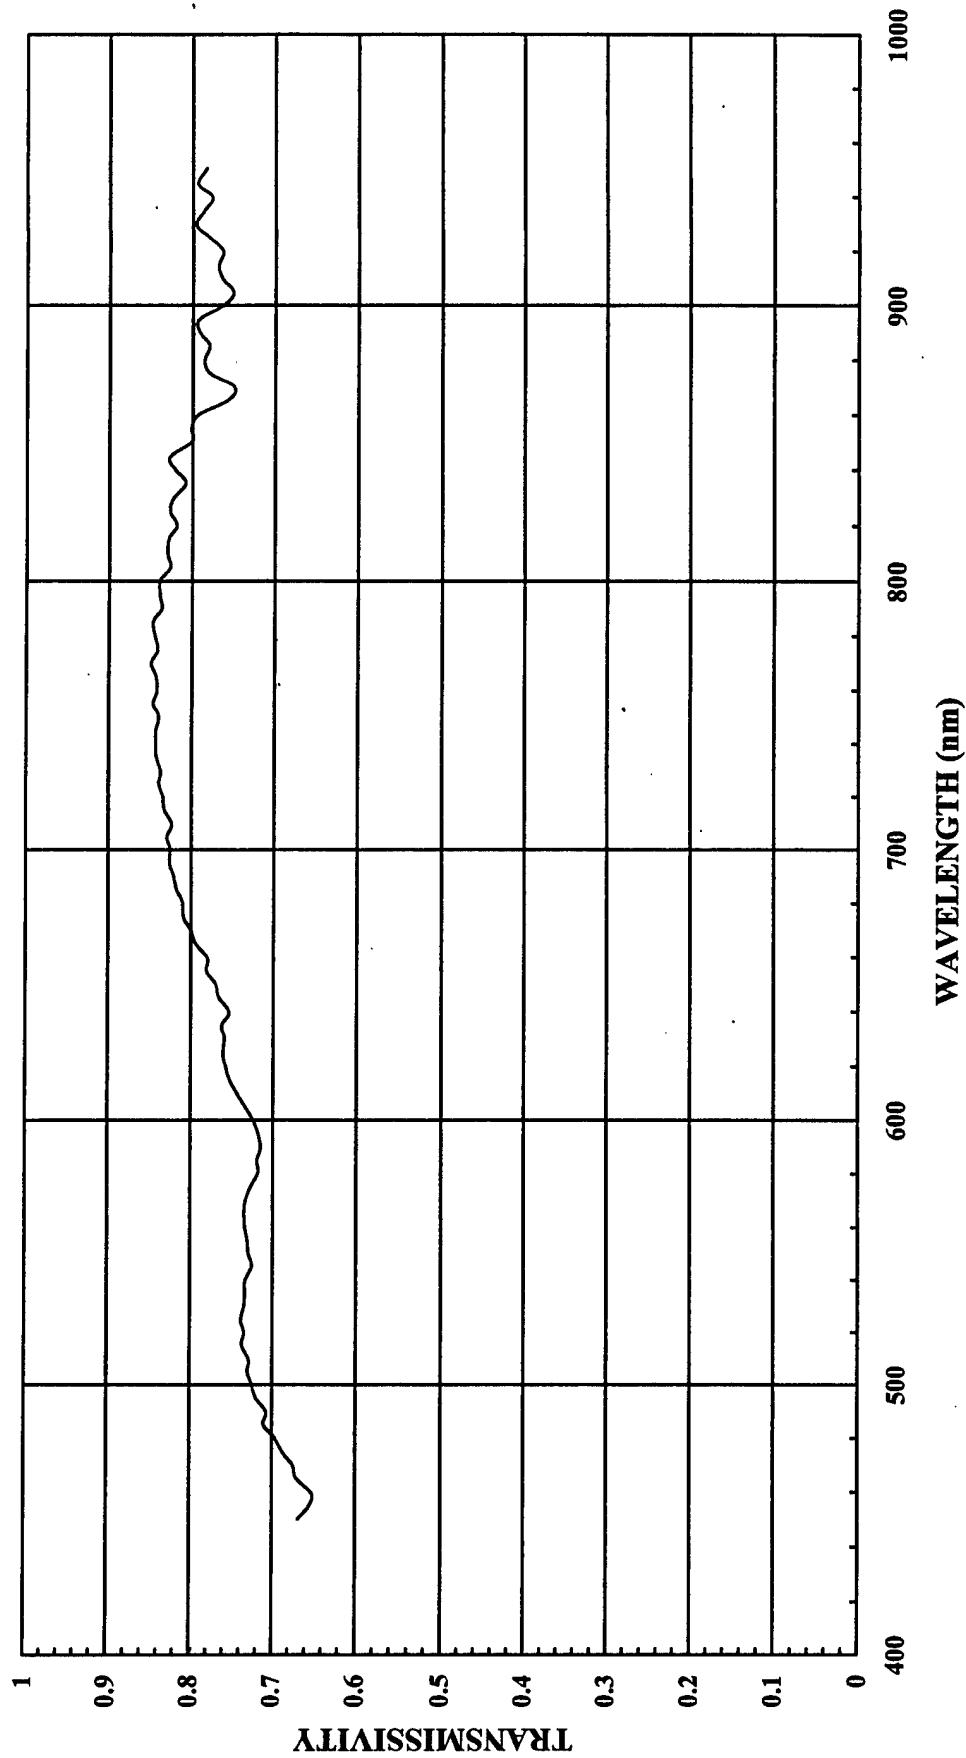

**S/N#** 010

**Material Type:** 2-3 Ply, Polycarbonate

**Construction:** N/A

**Coating:** Gold Coat

F-16 CANOPY (TEXSTARS, A/C, GOLD COAT, LEFT SIDE, 2-3 PLY  
POLYCARBONATE, S/N# 010) @ NORMAL

# **F-16**

**Aircraft:** F-16

**Part Name:** Canopy, A/D, CFWD, TEXSTARS

**Manufactured:** N/A

**S/N#** 3818

**Material Type:** N/A

**Construction:** N/A

**Coating:** Solar

## **NAVY FIGHTER**

# **F-18**

**Aircraft:** F-18

**Part Name:** Windscreen, SIERRACIN

**Manufactured:** N/A

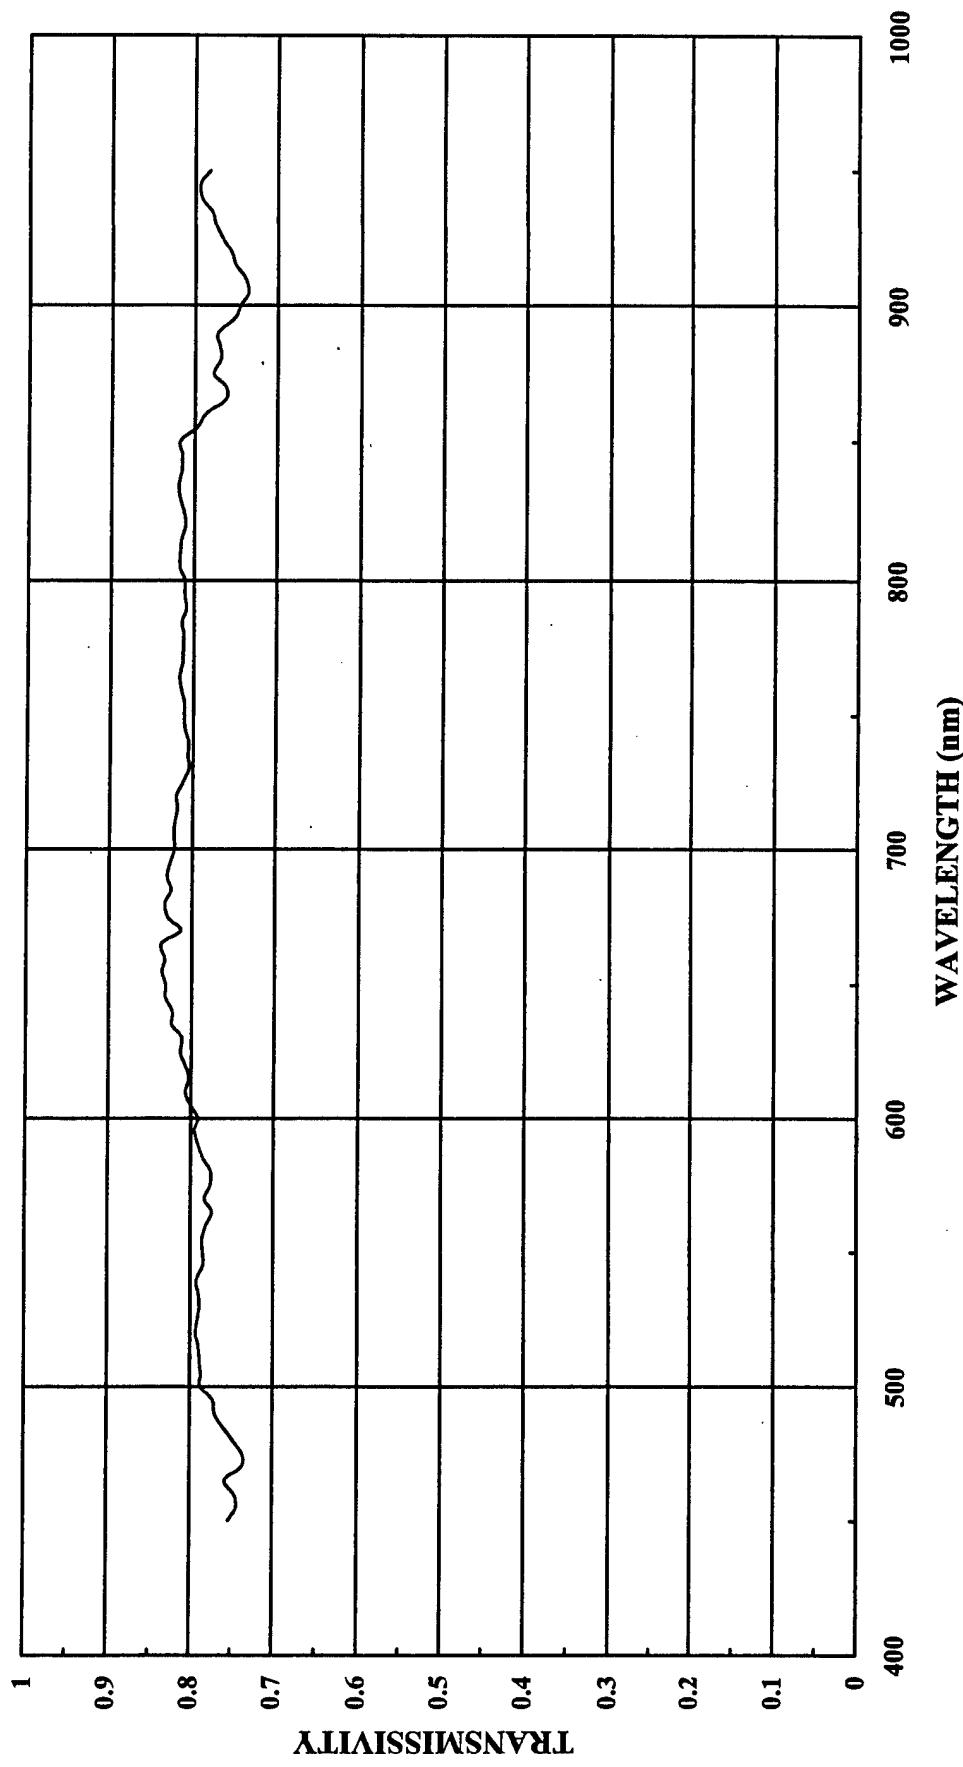

**S/N#** 168

**Material Type:** N/A

**Construction:** N/A

**Coating:** ITO S243 Process Coating

F-18 WINDSCREEN (SIERRACIN, ITO, S243 PROCESS COATING, S/N# 168)  
@ NORMAL  
 $T_{avg} = 81\%$

## **F-18**

**Aircraft:** F-18

**Part Name:** Windscreen, SIERRACIN

**Manufactured:** N/A

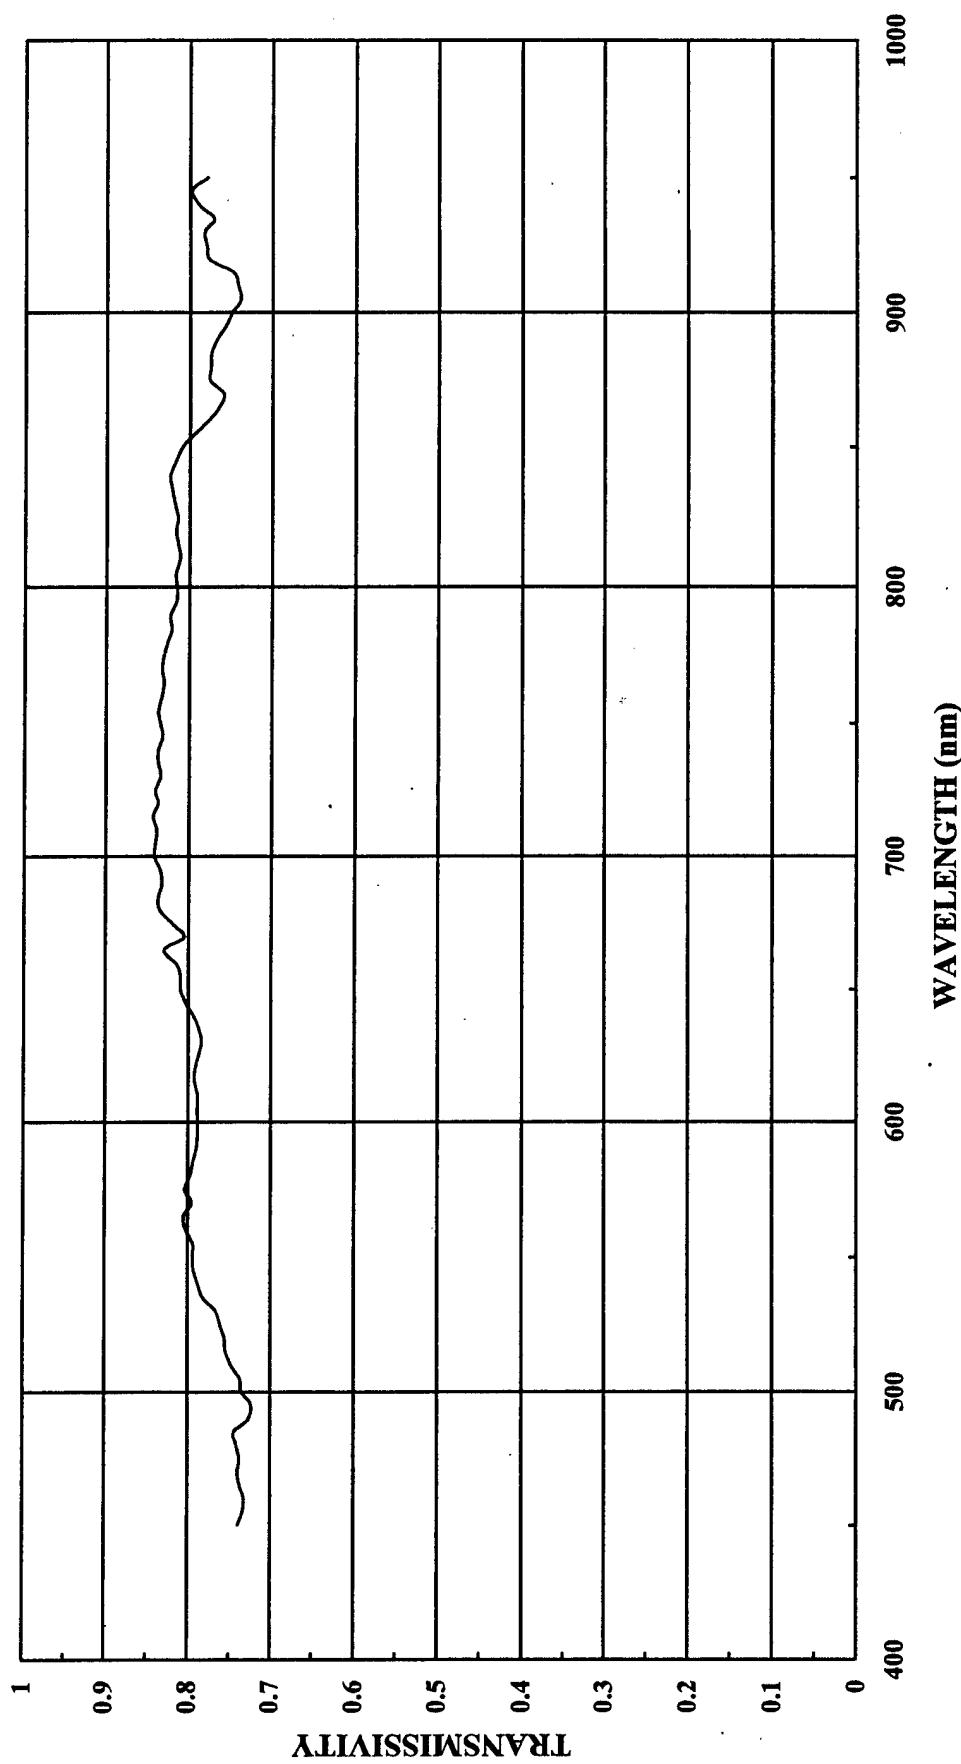

**S/N#** 307

**Material Type:** N/A

**Construction:** N/A

**Coating:** ITO S243 Process Coating

F-18 WINDSCREEN (SIERRACIN, ITO, S243 PROCESS COATING, S/N#307)  
@ NORMAL

# **F-18**

**Aircraft:** F-18

**Part Name:** Windscreen, SWEDLOW

**Manufactured:** N/A

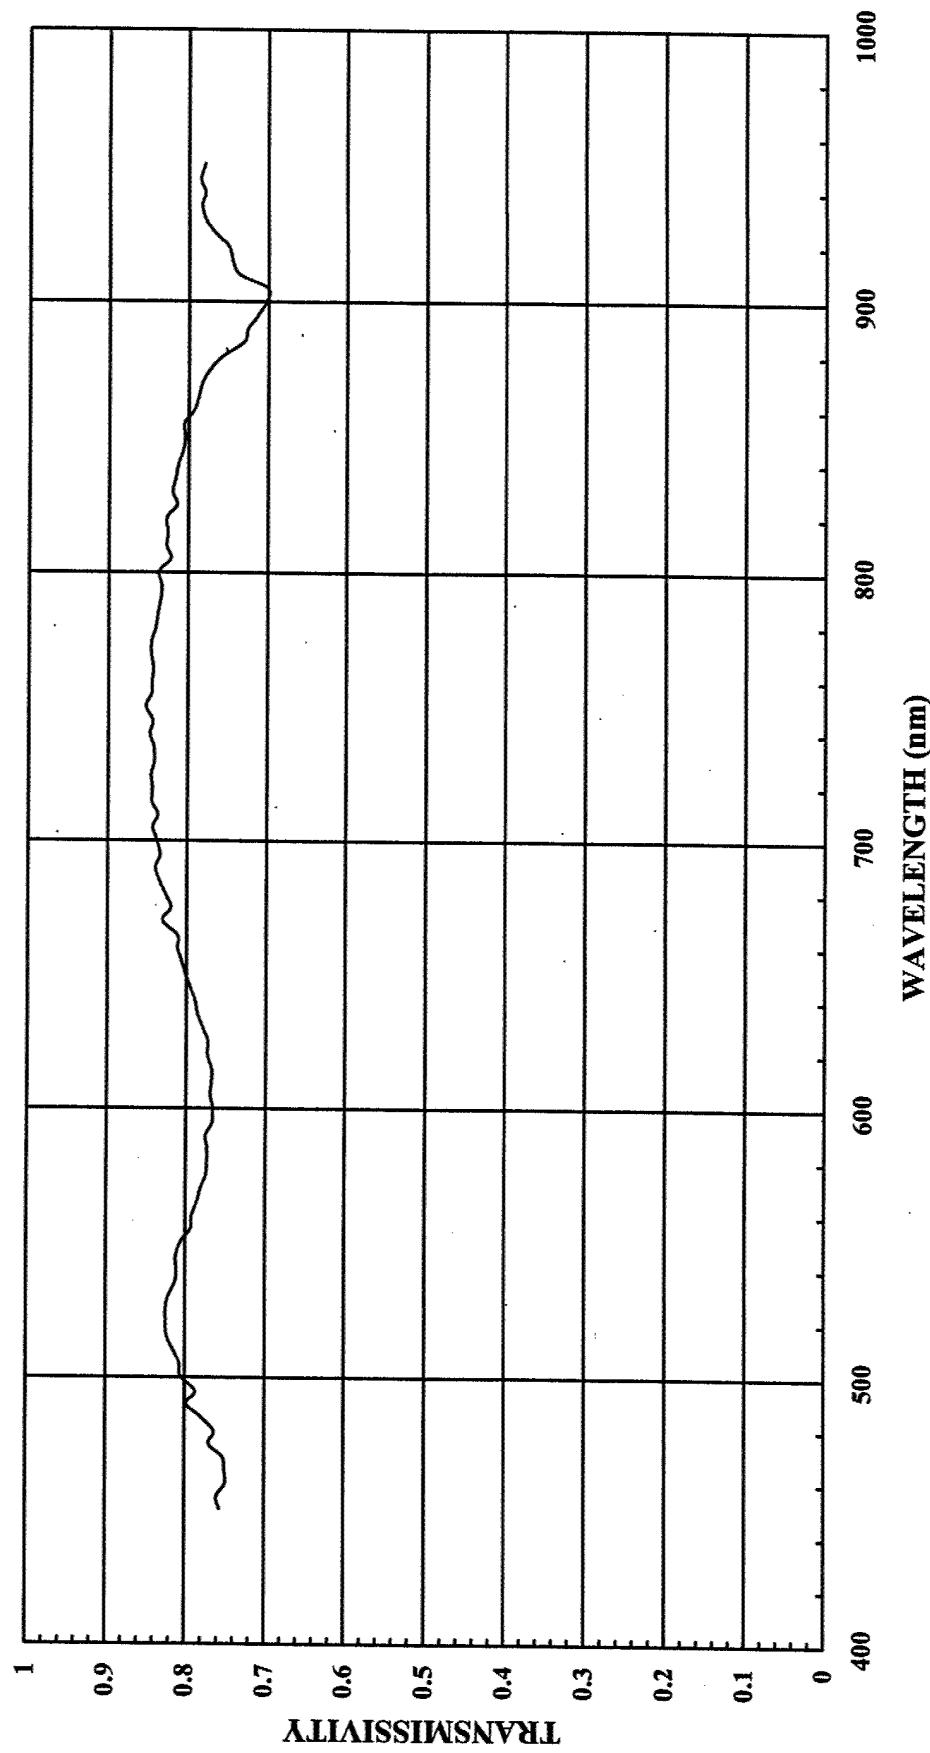

**S/N#** 126

**Material Type:** N/A

**Construction:** N/A

**Coating:** Night Attack Acrylic

F-18 WINDSCREEN (SWEDLOW, NIGHT ATTACK ACRYLIC, S/N# 126)  
@ NORMAL  
 $T_{avg} = 82\%$

# **F-18**

**Aircraft:** F-18

**Part Name:** Windscreen, SWEDLOW

**Manufactured:** N/A

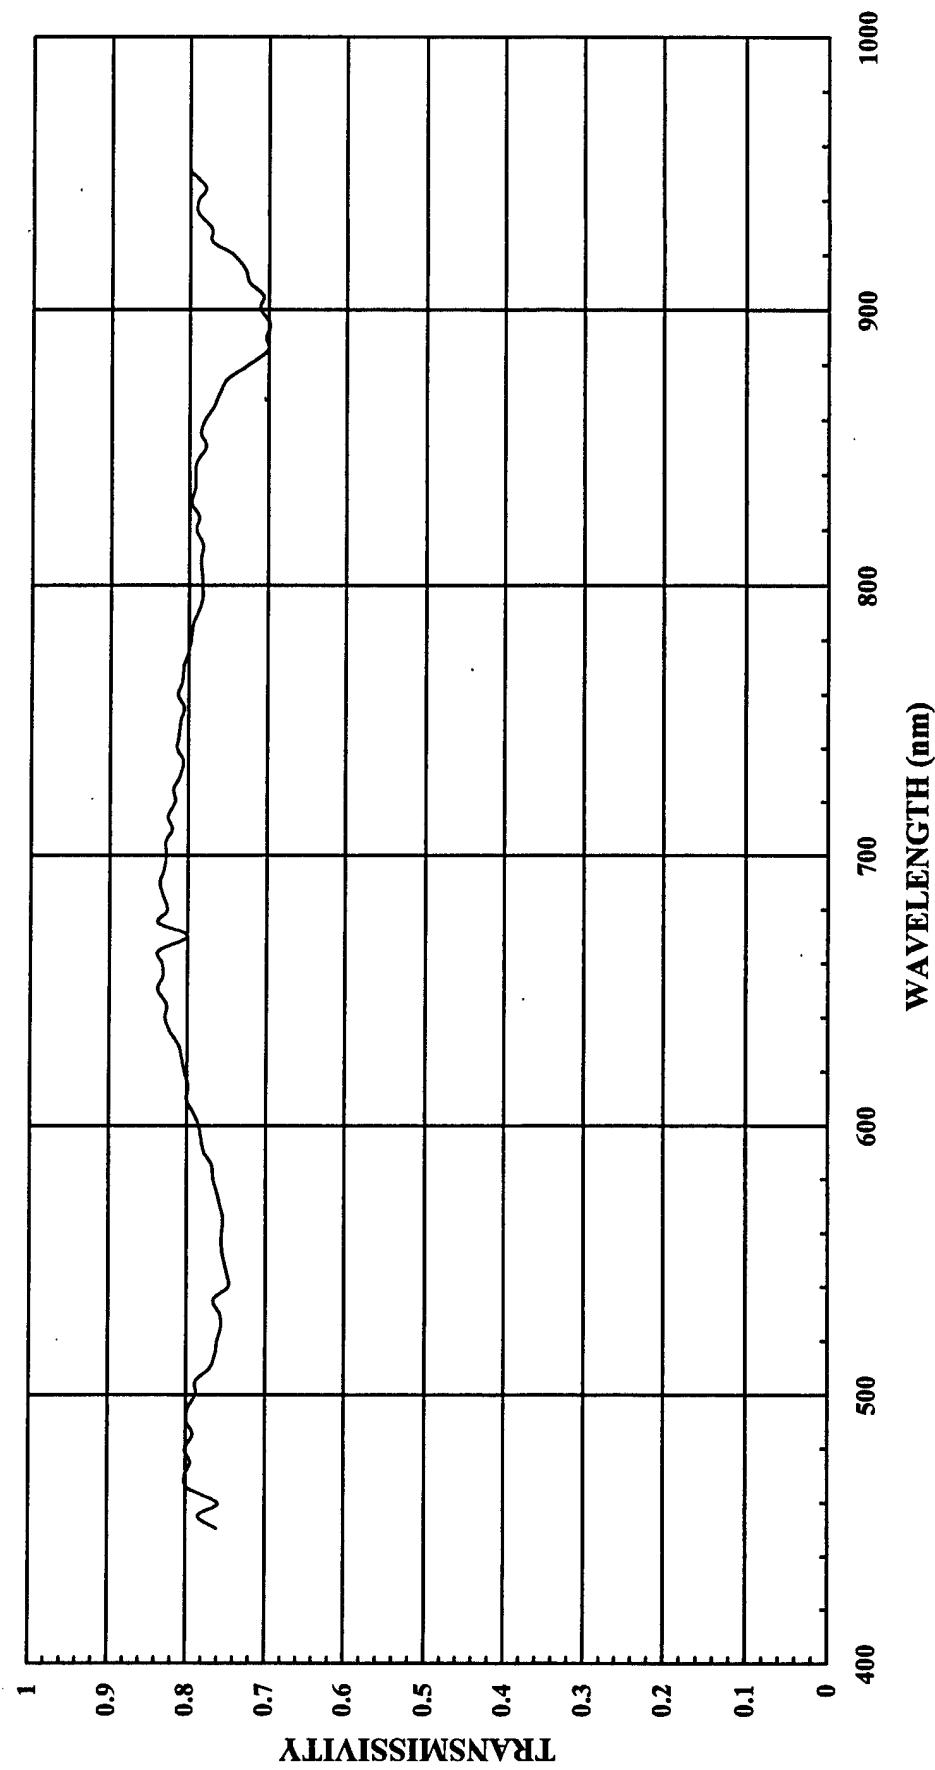

**S/N#** 077

**Material Type:** N/A

**Construction:** N/A

**Coating:** Night Attack Acrylic

F-18 WINDSCREEN (SWEDLOW, NIGHT ATTACK ACRYLIC, S/N#077)

### ABSTRACT

*Night vision goggles (NVGs) are currently used in a wide variety of military aircraft that were not originally designed for NVGs. Likewise, the windscreens and canopies on these aircraft were not designed with NVGs in mind. Present day windscreens and canopies typically have one or more specialized coatings applied to them. These may be reasonably transparent for visible wavelengths but not so transparent for near infrared light to which the NVGs are sensitive. It was hypothesized that the major mechanism by which aircraft transparencies affect the operation of NVGs is through reduced light levels. This would mean that the key characteristic of interest for determining the effect of an aircraft transparency on the operation of the NVGs would be its transmission coefficient calculated using the spectral sensitivity of the NVGs. This hypothesis was tested by investigating visual acuity performance of trained observers viewing through NVGs for three levels of ambient illumination (1, 2 and 5 times starlight) and three levels of NVG-weighted windscreen transmissivities (58, 76 and 100%). In addition, two levels of contrast were included in the study (20*

*and 70% modulation contrast). Three trained observers determined the orientation of a Landolt C using a two-alternative, forced-choice step paradigm. A luminance-based model was developed to smoothly combine the effects of illumination level and transmission level for each contrast thus supporting the hypothesis. In addition, the results demonstrate the significant difference between individual observer's performance level and the increased difficulty (higher variability) of performance at lower contrast levels.*

### INTRODUCTION AND BACKGROUND

Night vision goggles provide observers with the ability to see very dimly illuminated nighttime scenes by amplifying ambient light from the red and near infrared spectral energy region (600 through 950 nm; see Fig. 1). Anything that reduces the light level getting to the NVGs will tend to reduce the output luminance while at the same time decreasing the signal-to-noise ratio. This, in turn, tends to reduce the visual acuity of observers using the NVGs. These effects are most apparent at very low ambient light levels such as starlight illumination

conditions. The basic hypothesis of this study is that it should not matter whether the light level is reduced by lowering the illumination level on the target area or by attenuating the light level getting to the NVGs by viewing through a transparency. This leads to the concept of equivalent illumination. For purposes of this study, equivalent illumination is the product of the actual illumination level and the transmission coefficient of the transparency through which one is viewing. As a specific example, the equivalent illumination for 2

times starlight actual illumination viewing through a 50% transmitting windscreens would be 1.0 starlight (2 times 0.5). This is the same equivalent illumination obtained for an actual illumination of 1 times starlight viewing through the NVGs with no intervening transparency (1 times 1.0). If the hypothesis were correct one would expect the visual acuity for these two conditions to be essentially the same (within the variability expected for human observations).

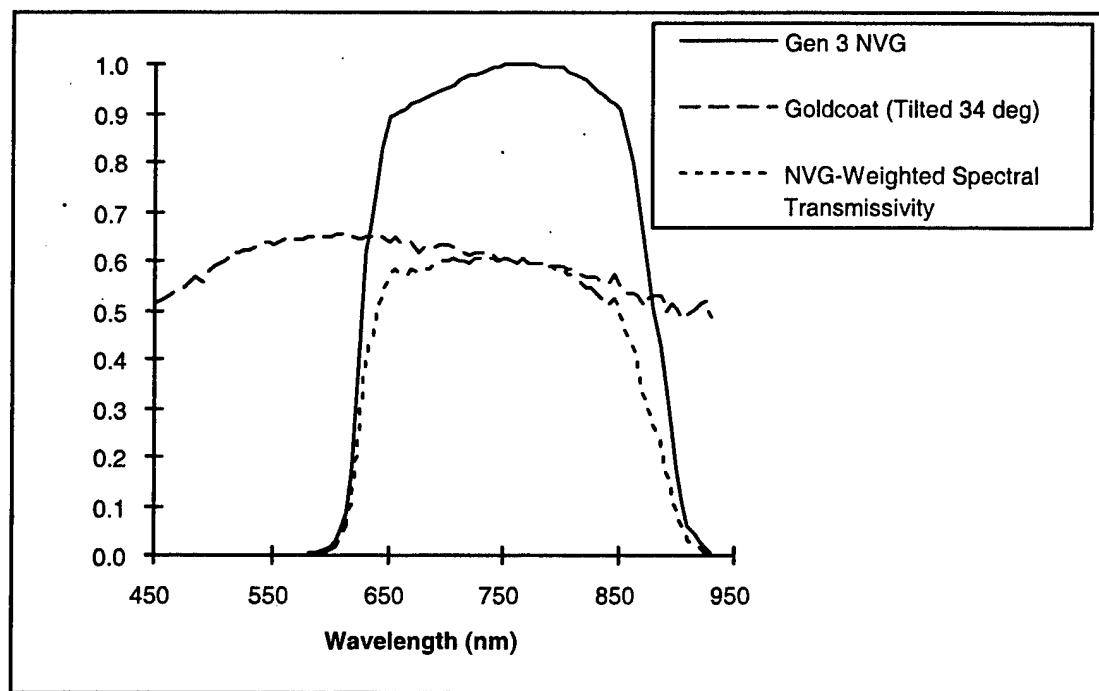

Figure 1. The relative value of a third-generation NVG, a gold-coated transparent sample (34 deg tilt) and its corresponding NVG-weighted spectral transmissivity plotted as a function of wavelength.

In order to determine how much an aircraft windscreens or canopy will reduce the light level by, it is necessary to measure or

calculate the NVG-weighted transmission coefficient ( $T_{NVG}$ ). This is done by using the spectral sensitivity of a given NVG<sup>1,2,3</sup>.

Equation 1 describes the calculation for NVG-weighted transmissivity.  $T_{NVG}$  equals the integral with respect to wavelength, of the transparent part's spectral transmissivity [ $P(\lambda)$ ] times the spectral energy distribution of the light source [ $S(\lambda)$ ] times the NVG spectral sensitivity [ $G(\lambda)$ ] divided by the integral with respect to wavelength, of the spectral energy distribution of the light source times the NVG spectral sensitivity. Since the specific spectral energy distribution of the light source in Equation 1 is typically not known for operational conditions (it depends on the spectral energy distribution of the illumination source on the scene and the spectral reflectivity of the various objects in the scene) the NVG-weighted transmission coefficient was calculated using  $S(\lambda) = 1$  for all wavelengths. This simplifies the equation and typically does not significantly affect the results for the vast majority of broadband reflectance distributions normally encountered. Figure 1 shows the spectral transmissivity curve for one of the gold-coated samples used in this study. The third-generation NVG sensitivity curve is plotted for reference.

$$T_{NVG} = \frac{\int_{450 nm}^{950 nm} P(\lambda) S(\lambda) G(\lambda) d\lambda}{\int_{450 nm}^{950 nm} S(\lambda) G(\lambda) d\lambda} \quad (1)$$

where:

- $T_{NVG}$  = NVG-weighted transmissivity
- $P(\lambda)$  = spectra radiometric scan through the transparent part
- $S(\lambda)$  = spectral energy distribution of the light source (equal to 1 for our calculations)

$G(\lambda)$  = spectral sensitivity of the night vision goggle

Undocumented reports from some aircrew in different aircraft indicated that some transparencies, such as gold-coated F-16 canopies, might cause a reduction in NVG visual acuity compared to uncoated transparencies. Investigation into the NVG-weighted transmission level of currently fielded F-16 canopies revealed that there are at least three different gold coatings and two different indium-tin-oxide coatings in use. It was therefore the objective of this study to investigate the effect of coated transparent parts that included the full range of NVG-weighted transmission coefficients that might be found in the field. Since we could not obtain samples of all of the different types of coated windscreens it was decided to use what samples we did have in such a way as to provide a fairly wide range of transmissivities. Two gold-coated sections of transparencies were available: one with a fairly light coating and one with a relatively heavy coating. In order to expand the range even further, viewing through the heavily coated sample was done at a tilted angle, which made the transmission coefficient even smaller.

## METHOD

### Participants

The three participants in this study were not naive subjects in the traditional sense but highly trained psychophysical observers, two males and one female, ranging in ages from 35 to 46 years.

### Apparatus and Stimuli

The tests utilized a new set of ITT Model F4949D (serial #3873) NVGs<sup>4</sup> that had P-43 phosphor image intensifier tubes and a measured gain<sup>5</sup> of about 6000. With the room lights off and the NVGs on, the observer first adjusted the interpupillary distance of the goggles. Then they adjusted the eyepiece lenses by looking at the dark ceiling with the goggles and focusing until the scintillation looked sharp. Objective lenses were focused by viewing a one-half moon illuminated, NVG resolution chart composed of square-wave gratings<sup>6</sup>.

All observations were made in a light tight room. The observer sat in a chair behind a table with their eyes 9.14 m (30 ft) from the stimulus easel. On the table was a fixture that held an aircraft transparency sample and a foam board visual field mask, which had a 15 cm high by 18 cm wide (6 by 7 in.) aperture. The observer held the NVGs but could rest his or her elbows on the table while looking through the hole and transparency at the stimulus. The goggles were powered using a regulated external power supply.

The stimuli were Landolt C's<sup>7</sup> printed using a high-resolution photo-grade laser printer. All of the C's (in each set) were consecutively numbered 1 through n for ease of use with the computer program (see *Procedure* section) during the study. After the study, the observers' data were converted to Snellen equivalents. The high contrast (70% Michelson) set consisted of 69 C's ranging from 20/19.1 to 20/200.5 Snellen acuity for the 9.14 m viewing distance. C's 1 through 48 increased by about 2 minutes-of-arc (MOA) per step and

C's 49 through 69 increased in about 2 to 4 MOA steps in order to insure a high upper range. The low contrast (20% Michelson) set consisted of 107 C's ranging from 20/19.1 to 20/236.8 Snellen acuity. For this set, C's 1 through 92 increased by about 2 MOA per step and C's 93 through 107 increased in about 2 to 4 MOA steps. The first stimulus presentation, as determined by the program, was always from the center of the set's range and all subsequent thresholds were found to be below this value.

The C's were mounted on 18 x 18 cm (7 x 7 in.) foam board. The letter and background were different gray levels, varied to achieve the two desired contrasts but maintain the same average reflectance. For presentation, the C was placed onto a larger surround board 61 x 61 cm (24 x 24 in.) that matched either the high or low contrast Landolt C background reflectance as appropriate. The background board was held on an easel and had a small ledge that held the letter C in the center. The ledge was invisible when viewed through NVGs. The C was then easily placed onto the ledge with the gap oriented either up or down.

The experimenter's station was to the side of the stimulus easel. The computer's electroluminescent, backlit liquid-crystal display was filtered and shrouded to eliminate any stray light from falling on the target pattern.

Three, precalibrated, 2856K incandescent lamps<sup>8</sup> were used to easily change to the different illumination levels. Apertures varied their intensity without affecting the color temperature. Illumination levels used

were: 1x starlight =  $3.4 \times 10^{-4}$  lx ( $3.2 \times 10^{-5}$  fc)<sup>9</sup>; 2x starlight =  $6.7 \times 10^{-4}$  lx ( $6.2 \times 10^{-5}$  fc); 5x starlight =  $1.8 \times 10^{-3}$  lx ( $1.7 \times 10^{-4}$  fc). A fourth lamp, set to about one-half moon illumination  $1.3 \times 10^{-1}$  lx ( $1.2 \times 10^{-2}$  fc) was used to illuminate an NVG resolution target<sup>6</sup> during pretest goggle focusing.

Three transmission conditions were included in this study: a tilted heavily gold-coated sample, a non-tilted lightly coated sample, and no intervening transparency (100% transmission, hereafter termed baseline or high  $T_{NVG}$ ). The  $T_{NVG}$  for the heavily gold-coated sample tilted to a 34 deg orientation was 58% (hereafter termed low  $T_{NVG}$ ). The untitled (normal) lightly gold-coated sample had 76% transmissivity (hereafter termed medium  $T_{NVG}$ ). This study used three different combinations of stimulus illumination, with three different levels of  $T_{NVG}$  coefficient to achieve nine total levels

of equivalent illumination. Table 1 summarizes the nine equivalent illumination levels derived from the different illumination and  $T_{NVG}$  coefficient combinations.

Testing was conducted within randomized blocks of the lighting conditions because the observer had to adapt to that level before the test. First, an illumination source was randomly selected. Within that lighting level, the observer was tested with a randomized order of stimulus contrasts and transparency samples. Two levels of contrast (20 and 70%), three levels of illumination and three levels of  $T_{NVG}$  yielded nine experimental conditions for high contrast letters and nine experimental conditions for low contrast. The visual acuity through the NVGs for trained observers was measured as a function of these nine equivalent illumination levels.

Table 1. The nine different equivalent illumination levels produced by all combinations of the three levels of stimulus illumination and three levels of transparency  $T_{NVG}$  coefficients.

MULTIPLES OF STARLIGHT	LOW $T_{NVG}$ coefficient $T_{NVG} = 58\%$	MEDIUM $T_{NVG}$ coefficient $T_{NVG} = 76\%$	HIGH $T_{NVG}$ coefficient $T_{NVG} = 100\%$
1x	0.58	0.76	1
2x	1.16	1.52	2
5x	2.9	3.8	5

#### Procedure

A portable computer executed a two-alternative, forced-choice Step Program adapted from Simpson<sup>10</sup>. The experimenter started the Step Program which asked for the

initial setup parameters: Landolt C upper and lower stimulus identification numbers (1 through 69 for high contrast or 1 through 107 for low contrast), confidence level (95%), number to criterion (5), maximum

total number of trials (50) and a data file name. Using a conservative 95% confidence level caused the program to require a few more trials before converging to threshold.

The proper stimulus surround was placed onto the easel, a 1x, 2x or 5x starlight lamp was energized and the transparency sample placed into the fixture. The observer then partially dark-adapted to the goggle output luminance for about 10 minutes. The Step Program instructed the experimenter to place a given numbered (size) Landolt C in an up or down, randomized position. The stimulus was blocked from the observer's view by the experimenter during placement onto the easel. The experimenter asked the observer if he or she was ready, unblocked the stimulus for about 4 seconds, and then blocked it again. The observer had to respond either "up" or "down". No feedback was ever given to the observer. The experimenter then removed the stimulus and entered the observer's response into the Step Program. Based on the response, the Step Program determined the next stimulus size and randomized its orientation. The procedure was repeated until criterion was reached or the maximum numbers of trials were met. All observers converged before reaching the maximum number of trials. This procedure averaged about 10 minutes

per experimental condition with five minute rests after each condition and additional rest after completion of each lighting condition.

## RESULTS

The study presented a total of 1015 stimuli to the three observers. Threshold criterion (5 correct responses at smallest, reliably seen gap size) was reached in 19 trials on the average, 10 being the fastest and 38 the slowest (see Fig. 2 for an example). Snellen acuity, which served as the dependent variable, was calculated from the viewing distance and the gap size of the Landolt C with the standard conversion that 20/20 Snellen acuity corresponds to a gap size of one minute of arc. Table 2 is a summary of the results for the high contrast Landolt C condition listing the Snellen acuity for each illumination/transparency combination for each trained observer and the average across observers. The equivalent illumination column is the fraction of starlight that was available to illuminate the target pattern after accounting for the transmission coefficient of the transparency. This value was calculated by multiplying the illumination level (1, 2, or 5 times starlight) by the transmission coefficient (0.58, 0.76, or 1.00) for each condition. Table 3 is a summary of the results for the low contrast condition.

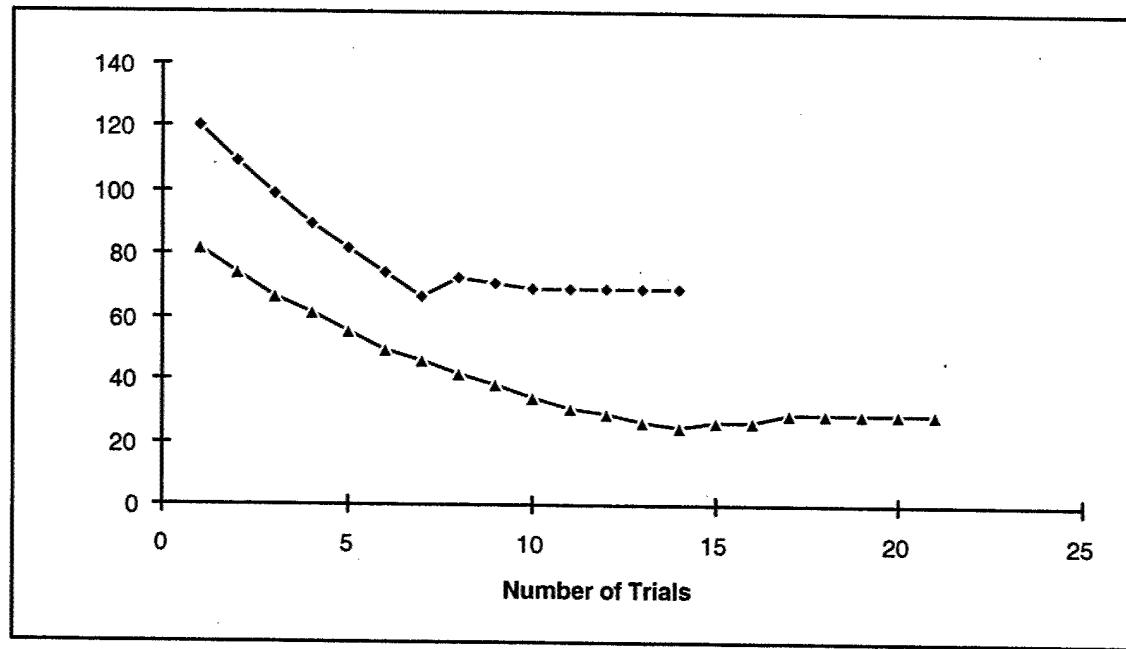

Figure 2. Typical Landolt C presentation sequences using the computer-based Step Program.  
Table 2. Summary of high contrast (70%) stimuli data. All data are Snellen acuities (20/xx).

ILLUMINATION (X STARLIGHT)	$T_{NVG}$ COEFFICIENT	EQUIV ILLUM	OBSERVER 1	OBSERVER 2	OBSERVER 3	MEAN

5x	HIGH	5	36.3	32.5	34.4	34.4

Table 3. Summary of low contrast (20%) stimuli data. All data are Snellen acuities (20/xx).

ILLUMINATION (X STARLIGHT)	$T_{NVG}$ COEFFICIENT	EQUIV ILLUM	OBSERVER 1	OBSERVER 2	OBSERVER 3	MEAN
1x	LOW	0.58	114.6	103.1	149.0	122.2
1x	MEDIUM	0.76	128.0	105.0	126.1	119.7
1x	HIGH	1	108.9	99.3	107.0	105.1
2x	LOW	1.16	114.6	84.0	122.2	106.9
2x	MEDIUM	1.52	112.7	108.9	82.1	101.2
2x	HIGH	2	105.0	99.3	70.7	91.7
5x	LOW	2.9	101.2	93.6	74.5	89.8
5x	MEDIUM	3.8	68.8	87.9	68.8	75.2
5x	HIGH	5	47.7	74.5	61.1	61.1

## DISCUSSION

Although none of the combination of conditions (illumination and transmission coefficient) permitted a direct test of the equivalent illumination hypothesis, it was possible to graph the Snellen acuity results against the equivalent illumination to see if it would produce a reasonably smooth, monotonically decreasing curve. This is the type of curve that would be expected since; in general, visual acuity improves (Snellen acuity value is smaller) as light level to the eye increases<sup>11</sup>. Figures 3 and 4 show these graphs for the high contrast and low contrast conditions, respectively.

The graphs of Figures 3 and 4 include all of the individual observer data in addition to a dashed line that corresponds to the average for the three observers for each equivalent illumination condition. The high contrast graph of Figure 3 demonstrates a very clear pattern, although it is apparent that there is a certain amount of observer variability and differences between observers. Based on visual inspection of the graph in Figure 3, a

curve fit was applied using a simple reciprocal model. The general form of the model equation was:

$$S = K + \frac{M}{E} \quad (2)$$

where:

$S$  = Snellen acuity (20/xx)

$K$  = constant (empirically determined by least squares fit)

$M$  = proportionality constant (empirically determined)

$E$  = equivalent illumination

Table 4 is a summary of the model fit (Equation 2) for both the high contrast and low contrast Landolt C. The model is shown in Figures 3 and 4 as a solid line. The model fits reasonably well for the high contrast condition ( $r = 0.981$ ) and not too badly for the low contrast condition ( $r = 0.912$ ) given that human observations are involved. It should be noted that this fit was done for a relatively small range of illuminations (0.58 to 5.0 times starlight) and

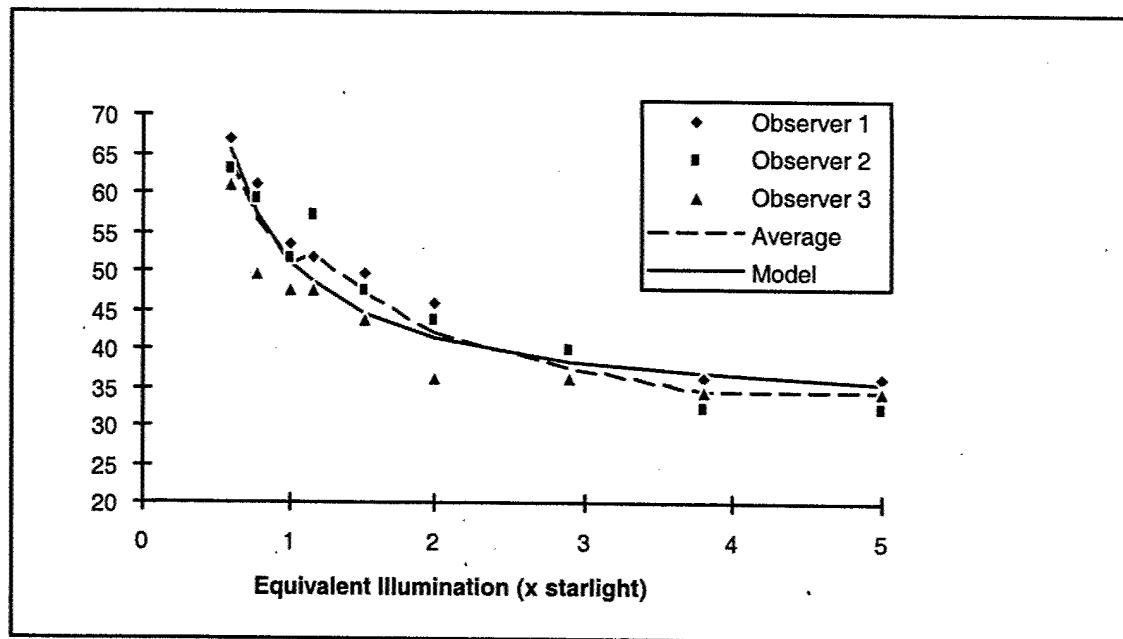

Figure 3. Plot of Snellen acuity as a function of starlight illumination for high contrast Landolt C stimuli (data from Table 2).

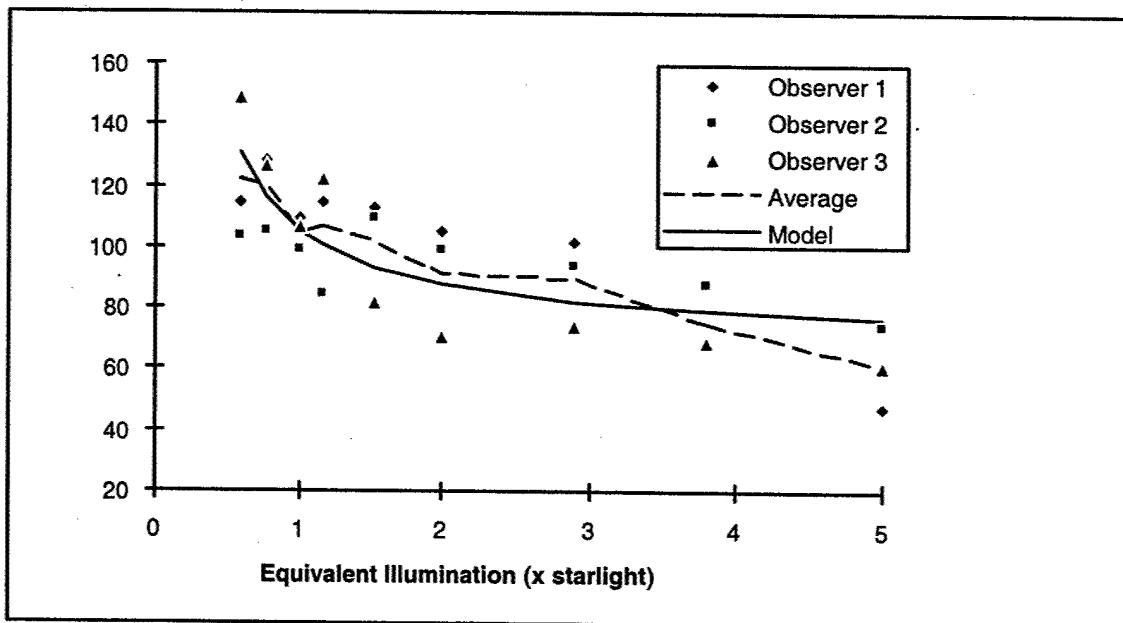

Figure 4. Plot of Snellen acuity as a function of starlight illumination for low contrast Landolt C stimuli (data from Table 3).

is therefore only valid for this range. It is possible the basic model (Equation 2) may still hold up for a greater range of illuminations but that has not yet been tested.

Table 4. Summary of model fit to data.

CONDITION	K	M	CORR ( <i>r</i> )
70% CONTRAST	31.6	19.6	0.981
20% CONTRAST	70.0	35.3	0.912

The results shown in Figures 3 and 4 and the correlations in Table 4 support the validity of the hypothesis regarding using equivalent illumination and the  $T_{NVG}$  as a means of assessing the quality of aircraft transparencies with respect to NVGs. It is possible to use Equation 2 with the appropriate coefficients from Table 4 to reasonably predict the impact on visual acuity of a specific windscreens or canopy if its  $T_{NVG}$  value is known.

There is, however, an implicit assumption that must be addressed before applying the model presented herein. These results and the model presented assume the transparency has a very low haze value<sup>12</sup>. Haze is a phenomenon caused by light scattering from materials within the transparency or from micro-scratches on the surface of the transparency (usually due to repeated cleaning). The effect of haze is to lower the contrast of objects viewed through the transparency, which, in turn, would reduce visual performance (Snellen acuity). The implicit assumption was that the transparencies employed in this study had very little or no haze. The two transparencies used in this study were measured<sup>13</sup> and were found to have fairly low values of haze; 1.7% for the medium transmission and 2.4% for the low transmission transparency samples. If haze is present, then the model needs to be modified to include the loss in visual acuity due to contrast reduction. If haze is not present, then the contrast of objects viewed through a transparency remains the same no matter what the transmission coefficient is; only the apparent luminance of the object is affected. Future work in this area will address the haze issue.

## ACKNOWLEDGMENTS

The authors gratefully acknowledge the help of Sharon A. Dixon and David W. Sivert of Logicon Technical Services, Inc. Sharon skillfully collected the observer data and helped prepare the manuscript. David was responsible for the experimental setup and equipment calibration.

## BIOGRAPHIES

*Alan Pinkus* has been an Air Force psychologist since 1982. As a human factors engineer, he has worked on major systems including Royal Saudi Air Force KE-3 tanker, Gunship 2, LANTIRN, Air Force One and Joint-Stars. As a researcher, he has worked in the areas of image display metrics, night vision goggles, apparent motion, aircraft lighting, transparency analysis, vision from space, workload assessment and has lectured for NATO in Europe several times. Alan has a B.S. Degree (Wright State, 1974), an

M.A. (University of Dayton, 1980) and a Ph.D. (Miami University, 1992), all in Experimental Psychology. He holds seven patents (or pending) in the area of night vision goggle ancillary devices and has over 20 publications. He is a member of SAFE, Association of Aviation Psychologists and is active in the American Society for Testing and Materials Subcommittee F 7.08 on Aerospace Transparencies.

*H. Lee Task* has been employed as a research scientist for the US Air Force since 1971. He has served as chief scientist for the Armstrong Aerospace Medical Research Laboratory (prior to its reorganization and disestablishment in 1991) and is presently a senior scientist at the Visual Display Systems Branch of the Human Engineering Division, in the Armstrong Laboratory's Crew Systems Directorate, at Wright-Patterson AFB, Ohio. He is currently involved in research and development in the areas of helmet-mounted displays, vision through night vision goggles, and optical characteristics of aircraft windscreens, vision, and display systems. He has a B.S. Degree in Physics (Ohio University), M.S. degrees in Solid State Physics (Purdue, 1971), Optical Sciences (University of Arizona, 1978), and Management of Technology (MIT, 1985) and a Ph.D. in Optical Sciences from the University of Arizona Optical Sciences Center (1978). During his career he has earned 36 patents and has published more than 75 journal articles, proceedings papers, technical reports, and other technical publications. He is a member of the Human Factors and Ergonomics Society (HFES), the American Society for Testing and Materials (where he is chairman of Committees F 7 and F 7.08 on Aerospace Transparencies and is a Fellow of the Society), the Association of Aviation Psychologists, SAFE association, the Society for Information Display (SID), and SPIE (the optical engineering society). He has served as reviewer for papers in SAFE, SID, and HFES.
