IMPROVED ANALYTIC LONGITUDINAL RESPONSE ANALYSIS FOR AXISYMMETRIC LAUNCH VEHICLES

VOLUME II - COMPUTER PROGRAM DESCRIPTION

by C. P. Rubin and T. T. Wang

Prepared under Contract No. NAS 1-4351 *by*
TRW SPACE TECHNOLOGY LABORATORIES
Redondo Beach, Calif.
for Langley Research Center

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION • WASHINGTON, D. C. • DECEMBER 1965

I. PROBLEM DESCRIPTION

This program uses an improved linear analytical model for the calculation of launch vehicle steady-state response to applied sinusoidal loads acting in the longitudinal direction. The present approach utilizes a finite element technique to construct the total launch vehicle stiffness [K] and mass [M] characteristics by subdividing the prototype structure into a consistent set of (1) axisymmetric shell components a_i to represent as separate units the fairing, interstage structure, bulkhead, tank walls and engine thrust structure; (2) fluid components b_i and (3) mass-spring components c_i to provide the inertial and stiffness characteristics of the equipment and engines and vehicle supporting structure.

The total vehicle characteristics are obtained by superposition of the stiffness and inertial characteristics of the individual shell, fluid and mass-spring components which are computed using a generalized coordinate approach. Fluid force and inertial coupling between all structural components is accomplished by assuming fluid motions consistent with the shell component distortions. The superposition technique automatically assures displacement compatibility and satisfies force equilibrium at the joints between components. After the complete system matrix has been formulated, displacement boundary conditions are introduced by removing appropriate rows and columns of matrix coefficients corresponding to points on the vehicle and its supports which are rigidly restrained from motion.

The coupled system natural frequencies and mode shapes are obtained from the eigenvalue equation constructed with the total stiffness and mass matrices

$$[K]\{\alpha\} - p^2 [M]\{\alpha\} = 0$$

in which p is the circular frequency of the system and $\{\alpha\}$ is the natural mode vector whose components are the longitudinal, radial and rotational displacements at discrete points on the vehicle. The steady-state response due to simple harmonic loads is determined using a standard modal response procedure which expresses the total displacement, velocity, acceleration and stress responses as the linear superposition of the individual modal responses based on an assumed modal damping.

II. PROGRAMMING ASPECTS

This section contains the following programming information:

1. Routine description
2. Tape format
3. Overlay program structure
4. Overlay core storage allocation
5. Deck set-up
6. Flow charts

ROUTINE DESCRIPTION

Name	Description
MAINF	Main program to generate program constants and to control the subprograms.
MATC	Matrix construction - Move B matrix into A matrix starting at $(i + 1)^{th}$ column and $(j + 1)^{th}$ row.
MATIV	Matrix inverse control - initialize and set up matrix for computing inverse.
MATO	Matrix clear - store zeros in matrix elements.
MAT1	Matrix transpose - $C = A^T$
MAT2	Matrix multiplication - $C = AB$
MAT3	Matrix addition - $C = A+B$
MAT5	Matrix multiplication - $C = AD$ where D is a diagonal matrix stored as a column.
MAT6	Matrix multiplication - $C = ADA^T$ where D is a diagonal matrix stored as a column.
MAT7	Matrix multiplication - $C = ADB$ where D is a diagonal matrix stored as a column.
MAT8	Matrix multiplication - $C = ADB^T$ where D is a diagonal matrix stored as a column.
MAT9	Matrix inverse - $C = A^{-1}$
MATP	Matrix print - print a rectangular matrix or the lower triangular portion of a symmetric matrix.
UNO9	Tape specification - generate FILE card for tape UNIT09.
UNO1	Tape specification - generate FILE card for tape UNIT01.
UNO2	Tape specification - generate FILE card for tape UNIT02.
BLDATA	Block data - generate $[\xi^n_{16}]$
BLDAT1	Block data - generate $[\dot{D}]$, $[W_G]$, $[\bar{\bar{W}}]$, and $[W]$
BLDAT2	Block data - generate $[\bar{W}]$
PRØC	Control program for reading input data and processing tables.

Name	Description
DASYS	Read system input data and save polynomial matrices on Tape 1.
DASH	Read shell input data and generate shell component tables.
DAFL	Read fluid component input data and store as a column in CØMMØN/DAS4/
DASM	Read spring-mass input data and save stiffness matrix $[K]_c$, mass matrix $[M]_c$, and identification vector on tape 2.
TABLE	Generate shell component tables which are functions of ξ at 16 points and compute initial stresses. Save processed data and geometry data on Tape 3 and Tape 4, respectively.
FUN2	Function subprogram to compute a part of initial stress.
FINP	Input subroutine. See separate write-up for further description.
SCNTL	Control program for generating stiffness matrix $[K]_a$ and mass matrix $[M]_a$ for shell components. These matrices are saved, along with the I.D. vector, on Tape 2. Transformation matrix $[T]$ is saved on Tape 9.
CØMPK	Compute 13 diagonal matrices which are functions of ξ and store results in CØMMØN/WØRK/
GENKM	Generate stiffness matrix $[K]_a$ and mass matrix $[M]_a$ for a shell component.
GENUV	Compute matrix $[UV]$
FCNTL	Control program for generating mass matrix for fluid components. These matrices are saved, along with the I.D. vector, on Tape 2.
GENXI	Generate matrices $[\xi]_{a1}$, $[\xi]_{a2}$, $[\xi]_{a3}$, $[\bar{\xi}]_{a2}$ or $[\bar{\bar{\xi}}]_{a2}$; $[\xi_{10} - \xi_{11}]$, $(\xi_{20} - \xi_{21})$, $(\xi_{30} - \xi_{31})$; γ_1, γ_2 and γ_3.
TABL1	Generate tables that are evaluated at 21 points of ξ.
DIAGM	Compute 35 diagonal matrices that are used in generating matrices $[\bar{M}_1]$ and $[\bar{M}_2]$.
GENFM	Generate matrix $[\bar{M}]$ for a fluid component.
VVV	Subroutine to compute $[\bar{V}_k^1]$, $[\bar{V}_k^2]$, $[\bar{V}_k^3]$, $[\bar{\bar{V}}_k^1]$, or $[\bar{\bar{V}}_k^3]$

Name	Description
WWW	Compute the sum of three terms in matrix $[\bar{M}_2]$ for case 2 or case 3.
YYY	Compute the sum of two terms in matrix $[\bar{M}_1]$ and $[\bar{M}_2]$
GENMB	Compute mass matrix $[M]_b$ for a fluid component.
TØTKM	Control program to generate total stiffness matrix [K] and total mass matrix [M] from component matrices. [K] and [M] are saved on Tape 4 and Tape 3, respectively.
BUILD	Subroutine to build a part of a total matrix from a component matrix and I.D. vector.
EGCNT	Control program to compute natural frequencies and mode shapes. The system data required for response computation is saved on Tape 1.
FREQ	Compute and print natural frequencies, mode shapes, velocities, and accelerations. Natural frequencies and mode shapes are saved on Tape 1.
EG2FM	Subroutine to compute eigenvalues and corresponding eigenvectors. See separate write-up for further description.
RCNTL	Control program to compute steady-state response. Data is taken from Tape 1 and Tape 2.
RESP1	Compute and print response amplitudes and phase angles.
STRES	Compute and print component force amplitudes and phase angles.

Identification

RW FINP - Decimal, Octal, BCD, Variable Data Input

Purpose

To read a set of Hollerith punched data and/or header cards into core with one CALL statement.

To convert the data fields to binary and store in core according to their associated conversion codes.

Restrictions

This routine uses FRWD to accomplish the BCD card image read and write. *

This routine uses FXEM error code 60 in case of errors such as non-Hollerith characters, data out of range, illegal format, subscripts too large for the array previously defined, etc. Upon detection of any error, control is sent to FXEM after the end-of-case is encountered. *

Method

Decimal numbers are converted to binary integers and then scaled to the indicated power of ten.

Octal numbers are converted to binary integers.

Hollerith words are stored directly.

Range: Decimal to floating binary conversion $10^{\pm 38}$
Decimal to fixed binary; 1 to 9 digits**
Decimal integer to binary integer; 0 to $2^{35} - 1$
Octal integer to binary integer; 0 to $2^{35} - 1$

Card images are optionally listed as encountered. If cards are listed, a page is ejected before listing the first card image. *

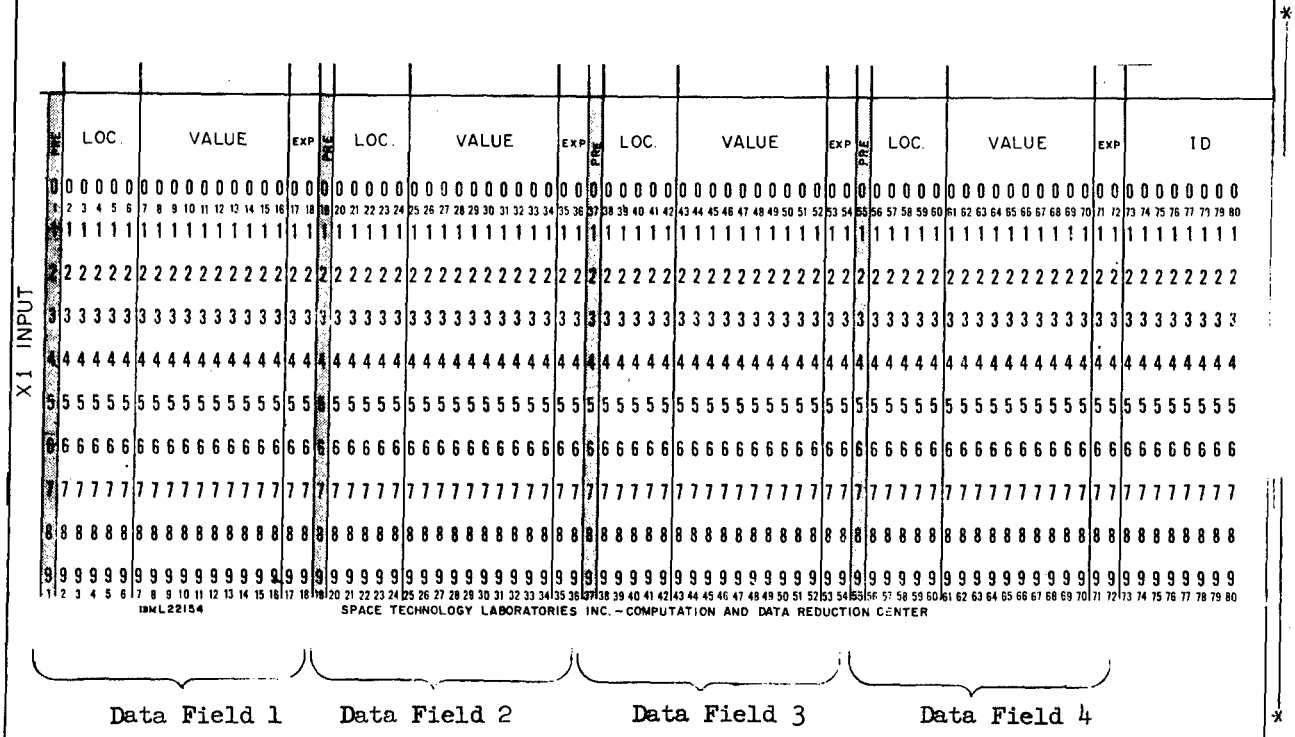
**The magnitude of the number depends upon the location of the decimal point.

Usage:

Format:

1. The data card format, available on keypunch form X1, X2, or X3, consists of four subfields containing the conversion code, location, number and exponent respectively.

	Card Columns			
	Data Field	Data Field	Data Field	Data Field
Sub field	1	2	3	4
Conversion code	1	19	37	55
Location	2-6	20-24	38-42	56-60
Value	7-16	25-34	43-52	61-70
Exponent	17-18	35-36	53-54	71-72



where conversion code is one of the alphabetic characters defined below which specifies the type of conversion to be used on the value field, the location specifies the cell into which the converted value field is to be stored, the value subfield contains the data to be converted, and the exponent contains the power of ten by which floating data is to be scaled, or the location of the binary point of fixed point data.

2. The header card format consists of a conversion code in column 1, a sequence number or symbolic location in columns 2-6 and any Hollerith information in columns 7-72. *

Decimal Points:

Decimal points may be placed anywhere in the value field except that they may not occur in the same column as a minus sign (11 punch) since this results in a non-Hollerith character. If the decimal point would normally appear at the right of the number punched in the value field, then it is optional.

Minus Signs:

Minus signs are 11 punches over any digit of the field. If all of the available columns of the field are not used, minus signs may be punched as the left character of the field.

Values:

Values must always be written to the extreme left of a field. It is not necessary that the entire field be filled as the first blank denotes the end of value. Superfluous low order zeros should be omitted as they increase conversion error.

The only exception to partial fields is BCI data where the entire field, including blanks, is stored.

Location:

The location may be specified by either absolute octal, a variable or array name, or the element subscripts in a one or two dimensional array. If the locations contain five digits, it is interpreted as octal. All five columns must be punched for octal locations.

If the location contains at least one (1) non-numeric character, it is interpreted as a variable or array name which must appear exactly as given in the CALL statement (see Calling Sequence below). The contents of the number and exponent fields, if they are numeric data, are stored in the cell for the variable or the first cell for the array. This location then becomes the origin for all subscript locations following until another variable or array name is encountered. Caution must be taken to load an array name prior to subscript locations.

If the location contains four or fewer digits, it is interpreted as a subscript except for conversion code H explained below. Single dimension array subscripts must be left justified with leading zeros optional. Two dimension array subscripts must be denoted by two subfields containing i and j respectively. The i and j subfields must be separated by a comma. Each subfield may be 1 to 3 digits but the total field, including the comma, cannot exceed 5 characters.

If the location is left blank, then the location counter within the routine is increased by 1 and the associated number is stored in the cell immediately following the cell where the last number was stored. Thus, an entire array may be read in by specifying the initial location only.

Conversion Codes:

Blank: Floating decimal

The number in the value field times the power of ten in the exponent field is converted to floating binary. Checks are made for overflow and format errors.

F: Fixed decimal

The number in the value field is converted to fixed point binary and stored with the binary point located at the position specified by the number in the exponent field. An overflow error check is made.

I: Decimal integer

The number in the value field is converted to a fixed point binary integer with the binary point following position 35. The exponent field is ignored. A decimal point is considered an error.

B: Octal

The value plus exponent fields are converted as a logical octal word.

It is not necessary to include leading zeros but the first octal digit must always occupy the leftmost position of the field.

D: BCI Data

The contents of the value plus exponent fields are interpreted as two BCI words and stored in two consecutive cells whose origin is specified by the location field.

H: Heading card

A card with an H in column 1 is considered a BCI heading card. If the location field is blank, the card is ignored. If the location field contains a one to four digit positive decimal integer V, (octal, or negative values not permitted) columns 7-72 of the card are stored directly in 11 consecutive words beginning at the current origin +11 * (V-1). If the location field is symbolic it becomes the current origin and is equivalent to V=1.

The last variable or array named in the CALL statement is used to initialize the current origin so that symbols are not required on headers which are first in the deck. Each card may be used as one record of output using FØRMAT option A with column 7 of the card providing the code for printer spacing.

A: Variable names as data

The value plus exponent fields are interpreted in a pseudo MAP instruction format AAAAA T DDDDD P where the fields to replace are address, tag, decrement and prefix respectively. The address and decrement fields are defined normally to be 5 characters and the tag and prefix as one octal numeric character each. Any field containing less than the normal number of characters must end with a comma while fields of normal length must not. Any address or decrement field containing less than 5 numeric characters is converted as decimal while those of all 5 numeric characters are converted as octal. Any address or decrement field containing at least one non-numeric character is interpreted as a variable or array name. Variable addresses cause the entire word from the compiler generated calling sequence to be loaded into the location word (i.e., the PZE X is stored in the location specified if X is the variable appearing in the address field). Variable decrements cause the right-most 18 bits from the compiler generated calling sequence to be loaded into the prefix and decrement of the location word. Numeric tags and prefixes are loaded directly into the corresponding parts of the location words. Null fields are not loaded. The first blank indicates the end of the loading; the address only, the address-tag, the address-tag-decrement, or the entire word may be loaded as desired.

G: Temporary Origin

The value in the first location field on the card is used as a temporary origin for tables. The location is saved and if data cards follow with blank location fields the corresponding data is stored consecutively beginning with the cell specified in the location in the G card. Columns 7-72 are ignored and may be used to identify the table.

The first non-blank location starts a new origin. If this non-blank location is a subscript, it references the last variable or array named, which may or may not have been on the G card.

J: Halt and Jump *

The location specified with this prefix must be an octal address and is the only part of the data field that is interpreted. The subroutine causes a transfer to the octal location specified and does not interpret the remaining fields on the card.

L: Two dimension array i_{max}, j_{max} definition

The location field contains the name of the array to be loaded. The value field is defined to consist of 2 subfields, separated by a comma, containing the decimal integers for i_{max} and j_{max} respectively where i_{max} and j_{max} generally appear in a DIMENSION statement. Until redefined the i_{max} and j_{max} values are retained to compute the successive subscripted locations. Blank address fields may follow this array definition if successive elements of the array are to be loaded.

M: Two dimension array i_{max}, j_{max} definition

Conversion is identical to L except the entire array is preset to zero.

E: End case

This defines an end-of-case and control is returned to the FORTRAN object program. The rest of this field and the remaining fields on the card are ignored.

K: Omit loading the next N cells

The integer N in the value field is used to increment the next storage location by N.

C: Preserve the location of the next storage cell.

The location of the next available sequential storage cell is stored into the TABLE of symbolic information in the address of the word in the calling sequence corresponding to the word which contains the BCI representation of the symbol in the value field.

R: Retain base location

The location of the symbol in the value field is saved as a base location for relative addressing. The base is initialized to the last variable or array in the calling sequence.

N: Preserve the relative location of the next storage cell.

In addition to the function of the C code being performed the location of the next available sequential storage cell relative to the symbol defined by the last R code will be stored according to the next table entry. The next symbol in the TABLE will be checked for being null (all blanks). If it is, the relative location (index value) will be stored in the associated location. If the symbol is not null an error is noted.

Calling Sequence:

The following two types of CALL statements may be used:

I. CALL FINP (± n,X,Y,ZETA,...,mHX (5) Y (5) ZETA (2)...) where *

A. n is the number of variables and/or arrays in the list, excluding n itself. If n is negative, a card image listing is produced and if n is positive, no listing is provided.

B. X, Y, ZETA,... are the names of variables and/or arrays restricted to at most 5 characters each, one character of which is non-numeric.

C. m is 6 times n. Hence, mH allows for 6n Hollerith characters to follow.

D. X (5) Y (5) ZETA (2)... is a list of the items previously named in exactly the same order with (i) indicating the number, i, of blanks necessary to provide six Hollerith characters for each item. Since each item name is restricted to 5 characters, the minimum value of of (i) is (1).

II. CALL FINP (0) where the number of items is given as zero. This CALL statement must be used only after a CALL statement of type I has been executed. When the subroutine encounters a zero for the number of items, it immediately refers to the last executed CALL FINP with a

non-zero number of items for the names of the items to be loaded.

Space Requirements

776 cells

Identification

RW EG2F Eigenvalues & Eigenvectors of $Ax = \lambda Bx$

Purpose

To compute in single precision floating point all the eigenvalues and eigenvectors of the (real) system $Ax = \lambda Bx$, where A and B are symmetric, and B is positive definite. The computation of the eigenvectors is optional.

Restrictions

No internal checks are made for overflow or underflow. The eigenvectors are not normalized. The matrices A and B are destroyed by the subroutine. The size of the system is limited only by the amount of core storage available.

Method

A lower triangular matrix M^{-T} is found such that $B = M^{T}M$. The equation $Ax = \lambda Bx$ is then equivalent to $M^{-T}AM^{-1}Mx = \lambda Mx$. We form the symmetric matrix $F = M^{-T}AM,^{-1}$ and let $y = Mx$. Now we solve the standard eigenvalue problem $Fy = \lambda y$ using the Jacobi method routine NYEVV, which gives us the desired eigenvalues. The eigenvectors are found by forming $x = M^{-1}y$. Details of the decomposition, $B = M^{T}M$, are given in Appendix A of routine RW MI2F.

Usage

Calling Sequence:

Loc.	Oper.	Add, Tag, Decr..
α	TSX	EG2F, 4
$\alpha + 1$	PZE MZE	A, 0, B
$\alpha + 2$	PZE	V, 0, N
$\alpha + 3$	Error Return	
$\alpha + 4$	Normal Return	

Where:

Operation of $\alpha + 1$ is $\begin{pmatrix}\text{PZE}\\ \text{MZE}\end{pmatrix}$, if eigenvectors $\begin{pmatrix}\text{are}\\ \text{are not}\end{pmatrix}$ desired.

A is the first location of N^2 cells which contain the full A matrix upon entrance. The eigenvalues will be stored along the main diagonal upon exit.

B is the first location of $(N^2 + N)/2$ cells containing the lower triangular portion of the B matrix. That is, $C(B) = b_{11}$, $C(B+1) = b_{21}$, $C(B+2) = b_{22}$, $C(B+3) = b_{31}$, etc.

Usage (continued)

V is the first location of N^2 cells which will contain the eigenvectors stored row-wise upon exit. The ith row of this matrix is the eigenvector corresponding to the ith eigenvalue along the main diagonal of the matrix which has replaced the A matrix.

If eigenvectors are not desired, V is the first location of N^2 cells used for temporary storage.

N is the order of the system.

Error return may be reached from two sources:

a) If C(ACC) = 0, the matrix B is not positive definite.

b) If C(ACC) $\neq$ 0, the matrix F is ill-conditioned under the criterion described in NYEVV as "restriction 1".

Coding Information

A square root routine (RWSQ2F) begins at EG2F + 345.
A Jacobi method routine (NYEVV) begins at EG2F + 370.
M^{-T} was formed by RWMI2F which begins at EG2F + 216.

Space Requirements

Program - 706 cells
CØMMØN - (14+N) cells

Timing

Approximately $.005N^3$ seconds, if eigenvectors are desired, or $.0035N^3$ seconds, if eigenvectors are not desired.

TAPE FORMAT

Five tapes are used to store intermediate results, to transmit data between program links, and to save information for computing steady-state response. The following is a general description of the contents of each tape:

Tape #1

This tape is used as a scratch tape in subprogram DASYS to store the polynomial matrices $[A]_k$ and $[B]_k$ which will be used in subprograms SCNTL and FCNTL to compute the component stiffness matrix and mass matrix. It contains $2 \times N_P$ number of records as shown:

$\bar{U}_k$, $\bar{V}_k$	$[A]_k$ $[B]_k$	$k = 1,2,3, \ldots, N_P$

Subprograms EGCNT and FREQ regenerate tape 1 to be saved for steady-state response computation. It contains four records:

Record No. 1 - Processed response data that are stored in CØMMØN/SYSO/:
HHEAD, P_i, C_i, η_k, N_{ET}, f_i, Δf_i, m_i

Record No. 2 - System input data that are stored in CØMMØN/SYS1/:
N_C, N_S, N_F, N_M, S, N_O, N_L, N_P, g, N_{EI}

N_W, opt_1, opt_2, opt_3, and opt_4.

Record No. 3 - Natural frequencies p_k in radians per second.

Record No. 4 - Mode shapes $\{\alpha_{ik}\}$

Tape #2

This tape contains the stiffness and mass matrices of all the individual components for constructing the total stiffness matrix and mass matrix and for computing steady-state response. It is generated by subprograms DASM, SCNTL and FCNTL in the following order:

1. Spring-mass I.D. number, matrix dimension, I.D. vector, stiffness matrix and mass matrix (2 x N_M records):

c_i, n_i	$(IDC)_i$, $[K_c]_i$, $[M_c]_i$	$i = 1,2,3, \ldots, N_M$

2. Shell component I.D. number, matrix dimension, I.D. vector, stiffness matrix and mass matrix (2 x N_S records):

a_i, $(\bar{U}+\bar{V})_i$	$(ID)_i$ $[K_a]_i$, $[M_a]_i$	$i = 1,2,3, \ldots, N_S$

3. Fluid component I.D. number, matrix dimension, I.D. vector, and mass matrix (2 x N_F records):

b_i, $\Sigma(\bar{U}+\bar{V})_i$	$(ID_{a1})_i$, $(ID_{a2})_i$, $(ID_{a3})_i$, $[M_b]_i$	$i = 1,2,3,\ldots, N_F$

Tape #3

This tape is used to transmit the processed shell data from subprogram TABLE in link 1 to subprogram SCNTL in link 2. It contains 3 x N_S number of records:

a_i, $ITEM_i$	$(DAS1)_i$	$(DAS2)_i$	$i = 1,2,3, \ldots, N_S$

Record No. 1 - a is the shell I.D. number and ITEM, equal to seven, is the number of tables in record no. 2.

Record No. 2 - Seven processed shell tables and three computed constants that are stored in CØMMØN/DAS1/:
ϕ, r, r_2, r, N_ϕ, t, and D
k, d_1 and d_2

Record No. 3 - Processed tables of shell orthotropic constants that are stored in CØMMØN/DAS2/:
C11, C12, C22, C33, C34 and C44.

Tape 3 is utilized again in subprogram TØTKM to store the dimension $N_C - N_O$ and the total mass matrix [M] as record no. 1 and record no. 2, respectively. The total mass matrix is saved for the computation of natural frequencies in subprogram EGCNT.

Tape #4

This tape is used to save the shell input data generated in subprogram TABLE to be used in subprogram SCNTL. Each record contains shell input data that is stored in CØMMØN/DAS0/. The table contains a total of N_S records.

Tape 4 is utilized again in subprogram TØTKM to store the dimension $N_C - N_O$ and the total stiffness matrix [K] as record no. 1 and record no. 2, respectively. The total stiffness matrix is saved for the computation of natural frequencies is subprogram EGCNT.

Tape #9

Tape 9 is used to store the shell component transformation matrices which are generated in subprogram GENKM and to be used in subprogram FCNTL. It contains two records per shell component as shown:

a_i, $(\bar{U}+\bar{V})_i$	$[T]_i$	i = 1,2,3, ..., N_S

where a is the shell component I.D. number
$\bar{U}+\bar{V}$ is the dimension of matrix [T]
[T] is the transformation matrix.

III. OPERATING INSTRUCTIONS

A. HARDWARE REQUIREMENTS

1. IBM 7090 or 7094 computer with 32K core.
2. Data channels and tape units for the software.
3. No on-line printer and punch.
4. Peripheral equipment for card-to-tape, tape-to-printer, and tape-to-punch as required by standard IBM system.
5. It is assumed that standard keypunch and verifier machines, card readers, and printers are used; therefore, these have not been specified.

B. SOFTWARE REQUIREMENTS

1. IBSYS Operating System Tape Version 9

   a. Basic Monitor (IBSYS) Version 4
   b. Processor (IBJØB) Version 3
   c. Assembly Language (MAP) Version 3
   d. Assembly Language (FTC) Version 3
   e. Loader (IBLDR) Version 3

2. The Fortran IV I/O Library Subroutines

C. TAPE USAGE

The standard Fortran input/output configuration, as described in IBM 7090/7094 IBSYS Operating System: IBJOB Processor, Form C28-6275, is used for the logical tape unit designation and the file specifications are as follows:

```
UNIT01 FILE ,A(1), HOLD,    INOUT, BLK = 256, BIN
UNIT02 FILE ,B(1), HOLD,    INOUT, BLK = 256, BIN

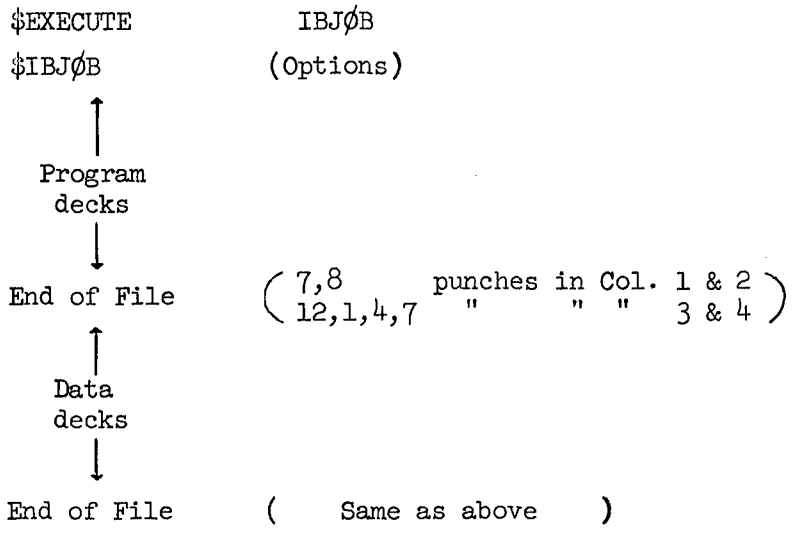
```

The logical tape unit 5 and 6 are used as input and output, respectively. The logical tape unit 1, 2, 3, 4, and 9 are used by this program as intermediate storage tapes and tape SYSLB2 is assigned to overlay.

D. DECK SET-UP

1. Installation control cards (e.g. $DATE card).

2.



For a description of these control cards see:

(IBM 7090/7094 Operation Systems Basic Monitor (IBSYS), Form C28-6248)

(IBM 7090/7094 IBSYS Operating System IBJØB Processor, Form C28-6275)

3. Installation control cards (e.g. $ENDFILE)

E. TIMING

The computer time for each case depends upon the number of individual components, the total number of system coordinates selected for the vehicle, and the number of forcing frequencies for the response. A typical case of twenty-one shells, four fluids, eight spring-mass components, and seventy-eight system coordinates took approximately six minutes to compute the natural frequencies ($S < 0$). For the same case, it took approximately six minutes to compute the response ($S = 2$, $opt_4 = 1$) for fifty forcing frequencies.

F. MULTIPLE CASES

The cases may be stacked for one computer run if any one of the following conditions are met:

1. All the cases have the same steady-state response option.

2. Each case has the steady-state response option of either $S < 0$ or $S = 0$. The necessary data for the steady-state computation is saved on tape 1 and tape 2 for the last case only.

3. Each case has the steady-state response option of either $S = 1$ or $S = 2$. All cases must be using the same set of data on tape 1 and tape 2 for the steady-state computation.

IV. INPUT DESCRIPTION

The input data is read in with symbolic data input subroutine FINP. See the FINP subroutine write-up for further details.

The following is a general description of the input data. The data consists of four logical blocks and must be set up in the same order that is given on the program input sheet. The symbols used in this description are the same as those stated in the left-hand column of the program input sheet.

A. THE SYSTEM INPUT DATA

1. Heading

HHEAD — is one line of BCD characters which will be printed as the title of the printed output. The number of BCD words (6 characters per word) must not exceed 11.

2. Input Parameters

N_C — is the total number of system coordinates which include the fixed coordinates N_O. $N_C - N_O$ must not exceed 80.

N_S — is the total number of shell components. N_S cannot be zero and must not exceed 40.

N_F — is the total number of fluid components. N_F must not exceed 6.

N_M — is the total number of spring-mass components. N_M must not exceed 30.

N_O — is the total number of fixed coordinates. $N_C - N_O$ must not exceed 80.

3. Applied Loads and Forcing Frequencies

N_L — is the total number of discrete applied loads. N_L must not exceed 80.

C_i — is the applied load coordinates $C_1, C_2, C_3, \ldots, C_{N_L}$.

P_i is the discrete applied loads $P_1, P_2, P_3, \ldots, P_{N_L}$.

N_W is the number of sets of forcing function frequencies.

$f_i, \Delta f_i, m_i$ f is the frequency of the forcing function in cycles per second. This program will compute the steady-state response for the frequencies $f_i, f_i + \Delta f_i, f_i + 2\Delta f_i, \ldots, f_i + (m_i - 1)\Delta f_i$, $i = 1, 2, \ldots, N_W$.

4. Modal Damping Factors

N_{ET} is the number of input η. Program will generate a complete table of η by setting $\eta_{(N_{ET}+1)}, \eta_{(N_{ET}+2)}, \cdots, \eta_{(N_C-N_O)}$ equal to $\eta_{N_{ET}}$.

η_k is the ratio of the assumed damping to the critical damping in mode k $\eta_1, \eta_2, \eta_3, \ldots \eta_{N_{ET}}$.

5. Ratio of Accelerations

g is the ratio of the vehicle acceleration to the acceleration of gravity.

6. Steady-State Response Option

S is a fixed point word which controls the option of computing steady-state response.

S<0 indicates that the computation of the steady-state response is not included. The necessary data for the steady-state computation is saved on Tape 1 and 2.

S=0 indicates that the computation of the steady-state response is included.

S>0 is the option to compute the steady-state response only. The necessary data should be available on Tape 1 and 2.

S=1, Heading (Item A.1.), Input Parameters (Item A.2.), and Modal Damping Factors (Item A.4.) are supplied as input.

S=2, Heading (Item A.1.), Input Parameters (Item A.2.), Applied Loads and Forcing Frequencies (Item A.3.), Modal Damping Factors (Item A.4.), and the option word opt_4 are supplied as input.

7. Print Options

opt_1 is a option word which controls the output of stiffness matrix and mass matrix of the shell and the fluid components.

opt_1 = 1, print the component matrices

opt_1 = 0, suppress the printing of component matrices.

opt_2 is a option word which controls the printing of total stiffness matrix and total mass matrix.

opt_2 = 1, print the total stiffness and mass matrices.

opt_2 = 0, suppress the printing of total stiffness and mass matrices.

opt_3 is a option word which sets the rigid body frequency to zero for computing the response.

opt_3 = 1, set the first frequency to zero.

opt_3 = 0, do not set the first frequency to zero.

opt_4 is a option word which controls the computation and printing of forces for the steady-state response.

$opt_4 = 1$, compute and print the forces.

$opt_4 = 0$, do not compute and print the forces.

N_{EI} is the number of frequencies, mode shapes, velocities and accelerations that will be printed as the final output.

8. Polynomial Matrices

N_P is the total number of polynomial matrices.

$\bar{U}_k$ is the number of rows of polynomial matrix $[A]_{\bar{U}_k} \times 11$.

$\bar{V}_k$ is the number of rows of polynomial matrix $[B]_{\bar{V}_k} \times 11$.

$[A]_k$ is $\bar{U}_k \times 11$ polynomial matrix.

$[B]_k$ is $\bar{V}_k \times 11$ polynomial matrix.

$k = 1, 2, 3, \ldots, N_P$

The input sequence of the polynomial matrices establishes the identification number k which is referred by the shell components. The subscript k is used as the polynomial matrix identification number by the shell components.

B. THE SHELL COMPONENT INPUT DATA

1. I.D. Number

a is the identification number for shell component a where $0 < a \leq N_S$

+ a indicates a conical shell component

- a indicates an ellipsoidal shell component

2. Coordinates

U, V	are the total number of system coordinates.
$\bar{U}$, $\bar{V}$	are the total number of local coordinates $\bar{U}$, $\bar{V}$ must not exceed 11.

3. Coordinate I.D. Vector

$(ID)_i$	is the identification vector which is used to position the elements for building total stiffness and mass matrices. The length of the vector must be equal to $\bar{U} + \bar{V}$ and the number must not be greater than N_C.

4. Polynomial Matrix Identification Number

k	is the polynomial matrix identification number which refers to polynomial matrices $[A]_k$ and $[B]_k$ in the system input data.

5. Shell Geometric Data

ϕ_o	is the meridional angle for conical shell and is the edge meridional angle for ellipsoidal shell. ϕ_o is input in degrees.
L	is the height of conical shell + L indicates converging upward - L indicates converging downward L = 0 for ellipsoidal shell input
R_2	is the lower radius of conical shell R_2 = 0 for ellipsoidal shell input
$\bar{b}$	is the height of ellipsoidal shell + $\bar{b}$ indicates convex upward - $\bar{b}$ indicates convex downward $\bar{b}$ = 0 for conical shell input
$\bar{a}$	is the radius of the base of ellipsoidal shell. $\bar{a}$ = 0 for conical shell input.

6. Orthotropic Shell Constants and Thickness

$(C_{11})_p$
$(C_{12})_p$
$(C_{22})_p$ — are orthotropic shell constants at two points $p = 1,2$.

$(C_{33})_p$
$(C_{34})_p$
$(C_{44})_p$ — are orthotropic shell constants at four points $p = 1,2,3,4$.

$(t)_p$ — are shell thickness at two points $p = 1,2$.

7. Mass Density and Total Mass

γ_a — is the mass density of the shell component.

M_a — is the total mass of the shell component.

$M_a \neq 0$, the ratio of the total mass M_a to the computed mass $\bar{M}_a$ will be used as the scaling factor for the mass matrix. When $opt_1 = 1$, the scaling factor will be printed as the mass check of the mass matrix.

$M_a = 0$, no scaling factor will be used for the mass matrix. When $opt_1 = 1$, the computed mass will be printed.

8. Initial Stress Data

H_i — is the depth of interior fluid.

w_i — is the weight density of interior fluid

P_i — is the uniform interior pressure.

H_e — is the depth of exterior fluid.

w_e — is the weight density of exterior fluid.

P_e is the uniform exterior pressure

W is the reactive force at upper edge of conical shell.

+ W produces tensile stresses.
- W produces compressive stresses
W = 0 for ellipsoidal shells.

C. THE FLUID COMPONENT INPUT DATA

1. I.D. Number

b is the identification number for fluid component b where $0 < b \leq N_F$.

2. Associated Shell Components

a_1, a_2, and a_3 are the identification numbers of the associated shell components

3. Fluid Data

H is the depth of fluid component.

γ is the mass density of fluid component.

M is the mass of fluid component.
$M \neq 0$, the ratio of the total mass M to the computed mass $\bar{M}$ will be used as the scaling factor for the mass matrix. When $opt_1 = 1$, the scaling factor will be printed as the mass check of the mass matrix.

M = 0, no scaling factor will be used for the mass matrix. When $opt_1 = 1$, the computed mass will be printed.

D. THE SPRING-MASS COMPONENT INPUT DATA

1. I.D. Number

c is the identification number of spring-mass component c where $0 < c \leq N_M$.

2. Stiffness and Mass Matrices

n	is the order of the spring-mass component n must not exceed 10.
$[K]_c$	is n x n stiffness matrix of spring-mass component.
$[M]_c$	is n x n mass matrix of spring-mass component.

3. Coordinate I.D. Vector

IDC_i	is the identification vector which is used to position the elements for building the total stiffness and mass matrices. The length of the vector must be equal to n and the number must not be greater than N_C.

Note: Care must be taken so that the units of the input data are consistent.

V. OUTPUT DESCRIPTION

The output of this program consists of four parts. The following is a general description:

A. INDIVIDUAL MATRICES

When $opt_1 = 1$, the following component matrices will be printed:

1. Stiffness matrix of shell component with equilibrium check.
2. Mass matrix of shell component with mass check.
3. Mass matrix of fluid component with mass check.

B. TOTAL MATRICES

When $opt_2 = 1$, the following total matrices will be printed:

1. Total stiffness matrix.
2. Total mass matrix.

C. MODAL SUMMARY DATA

The following modal summary data are printed. The number of modes printed depends on the input parameter N_{EI}.

1. Natural frequencies in cycles per second.
2. Mode shapes by columns.
3. Mode velocities by columns.
4. Mode accelerations by columns.

D. RESPONSE SUMMARY DATA

The following data are printed for the modal response expression $\{R_i\} = \{\bar{R}_i\} \sin (\omega t - \{\bar{\delta}_i\})$

1. Amplitudes $\{\bar{R}_i\}$
2. Phase angles $\{\bar{\delta}_i\}$
3. Modal velocities $\{R_i\}\omega$
4. Modal accelerations $-\{R_i\}\omega^2$

When $opt_4 = 1$, the following data are printed for the component force expression: $\{S_i\} = \{\bar{S}_i\} \sin (\omega t - \{\bar{\bar{\delta}}_i\})$

5. Amplitudes $\{\bar{S}_i\}$
6. Phase angles $\{\bar{\bar{\delta}}_i\}$

VI. TEST CASE

A one-stage launch vehicle is used as a test case to illustrate the input data requirements and to present the results in the final output format.

In this example the vehicle is represented by eleven shell components, two fluid components and four spring-mass components.

The input sheets and the computer output sheets are included in this section.
