ABSTRACT

Field velocity measurements were taken four times at fifteen stream gaging sites within the Iowa River and Des Moines River basins during 3 September 2002 and 18 April 2003. Using the historical data available and the data collected in this study, log-linear stage-discharge relationships, as well as a rating table, were developed for each station.

ACKNOWLEDGMENTS

The field investigation reported herein was conducted for and sponsored by the U.S. Army Corps of Engineers, Rock Island District (USACE-MVR) through Missman Stanley & Associates, P.C. (MSAPC). The author thanks James Stiman and Thomas Knox of the USACE-MVR and Mike McCaw of MSAPC for their unfailing cooperation throughout the course of this study. The author is also indebted to Doug Houser and Troy Lyon of the IIHR – Hydroscience & Engineering, and Justin Krohn and Kenny Bodeen of MSAPC for collecting the field data.

STREAM-FLOW MEASUREMENTS AT SELECTED GAGING STATIONS IN THE IOWA AND DES MOINES RIVER BASINS AND DEVELOPMENT OF STAGE-DISCHARGE RELATIONSHIPS

Sampling Period: 3 September 2002 - 18 April 2003

I. INTRODUCTION

Establishment of field-data based, reliable, stage-discharge relationships for any stream is indispensable in predicting discharges at different river stages. The U.S. Army Corps of Engineers, Rock Island District (USACE-MVR) maintains and operates many stream-gaging stations along the Iowa River and Des Moines River basins and routinely collects stream-stage information through the GEOS satellite system. IIHR – Hydroscience & Engineering, The University of Iowa, received a subcontract from the USACE-MVR through Missman Stanley & Associates, P.C., in Rock Island, IL to collect four sets of velocity data at fifteen different gaging stations and to establish the best stage-discharge relationship for each station.

The field stream-flow measurements were conducted at six gaging stations for the Iowa River basin and nine stations for the Des Moines River basin, including the following stations:

Iowa River basin:

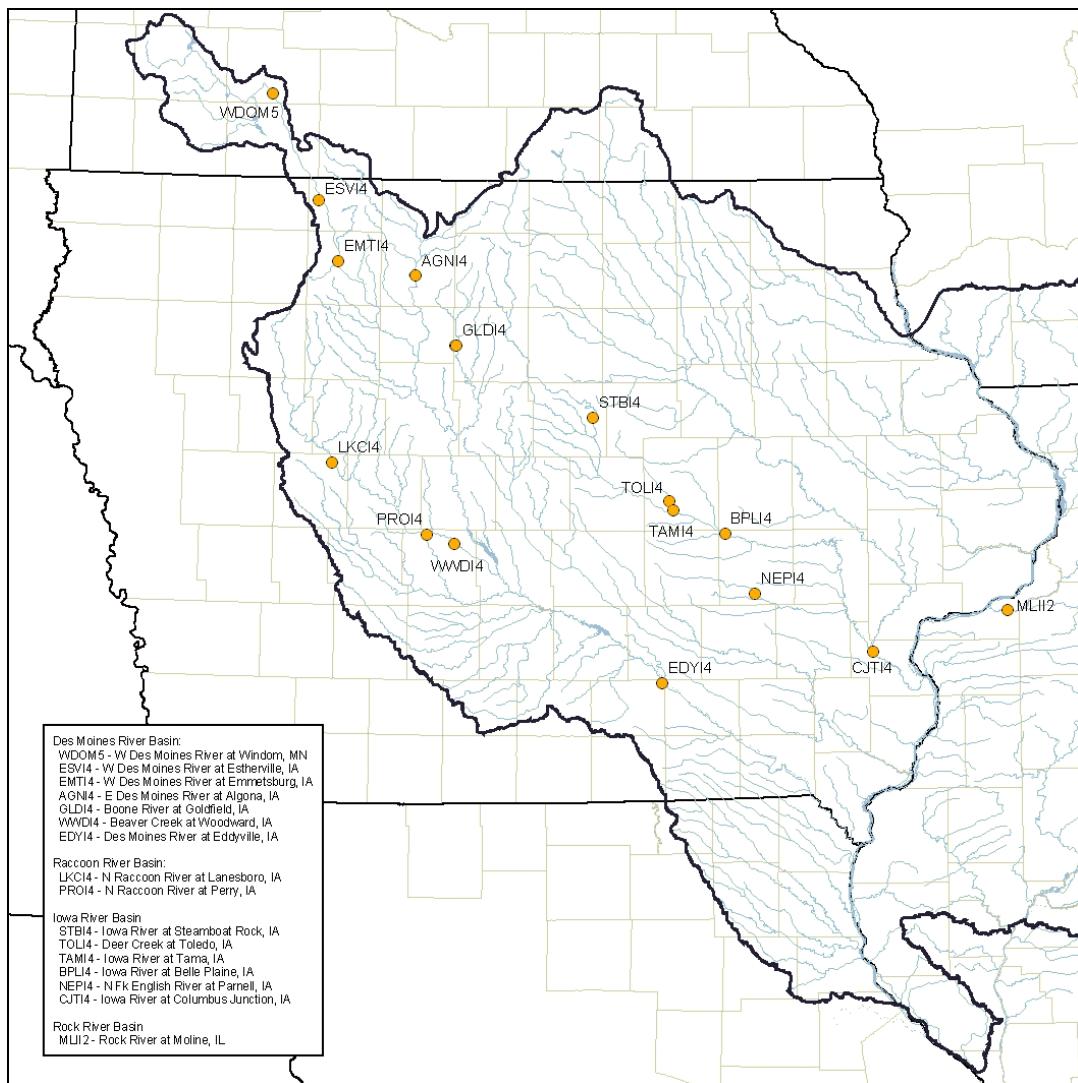

1. Iowa River at Steamboat Rock, Iowa (STBI4);
2. Deer Creek Near Toledo, Iowa (TOLI4);
3. Iowa River at Tama, Iowa (TAMI4);
4. Iowa River near Belle Plaine, Iowa (BPLI4);
5. North Fork English River near Parnell, Iowa (NEPI4); and
6. Iowa River at Columbus Junction, Iowa (CJTI4)

Des Moines River basin:

1. West Fork Des Moines River near Windom, Minnesota (WDOM5);
2. Des Moines River at Estherville, Iowa (ESVI4);
3. Des Moines River at Emmetsburg, Iowa (EMTI4);
4. East Fork Des Moines River at Algona, Iowa (AGNI4);
5. Boone River near Goldfield, Iowa (GLDI4);
6. Beaver Creek near Woodward, Iowa (WWDI4);
7. North Raccoon River near Lanesboro, Iowa (LKCI4);

8. North Raccoon River near Perry, Iowa (PROI4); and
9. Des Moines River near Eddyville, Iowa (EDYI4)

Each gaging station is identified with the station ID and their locations are shown in figure 1. In order to make the index search easier, station descriptions are given in alphabetical order of the station ID in this report instead of the river basins. At each station, four separate measurements were taken during the period from 3 September 2002 to 18 April 2003.

**Figure 1 Location map identifying fifteen stream-flow gaging stations
(Note: MLII2 on the Rock River in Illinois was not included)**

All the raw velocity data collected were stored in the spreadsheet and total discharges were computed using MS Excel 2000, as exemplified in table 1. Appendix I lists all the spreadsheets generated for each velocity measurement campaign. Tables 2(a) through 2(c) list the date and the time of measurements, information on gage height (GH), the width of the stream flow, the total flow area, and the calculated discharge (Q).

Table 2(c) Summary of field data collected at Stations STBI4, TAMI4, TOLI4, WDOM5, and WWDI4 in the Iowa River and the Des Moines River Basins between September 2002 and April 2003

II. DEVELOPMENT OF STAGE-DISCHARGE RELATIONSHIPS

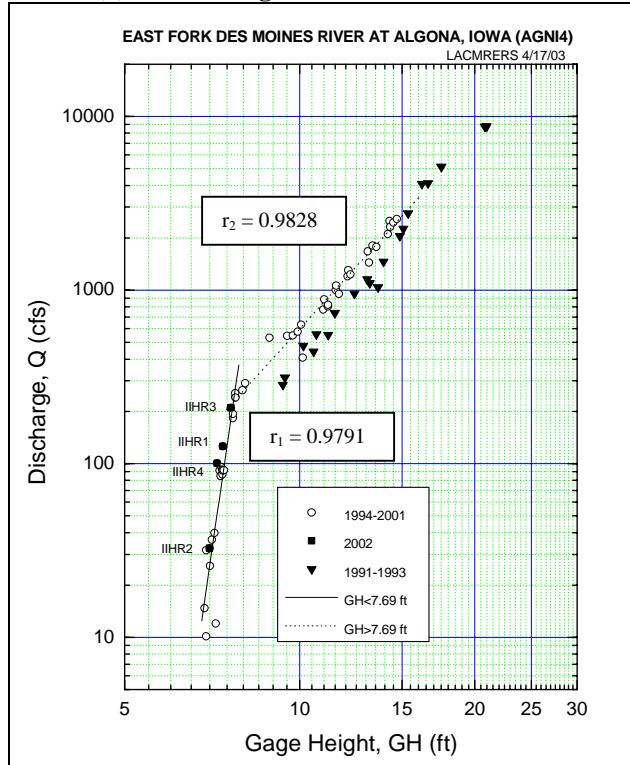

In order to establish the best stage-discharge relationships for each gaging station, historical data provided by the USACE-MVR, as well as four new data sets collected in this study, were first plotted on a log-log graph using ORIGIN graphics software (Origin Pro Version 7). Segment-wise log-linear relationships (power-law relationships) were then sought. An intersecting boundary value between two log-linear lines was first determined by manually reviewing the plot. The best-fit lines were then determined by correlation coefficients. The correlation coefficient of the log-linear regression equation, r , for each data set was determined using the following relationship:

$$r = \frac{n \sum [\{\log(GH)\} * \{\log(Q)\}] - \{\sum \log(GH)\} * \{\sum \log(Q)\}}{\sqrt{[n \sum \{\log(GH)\}^2 - \{\sum \log(GH)\}] * [n \sum \{\log(Q)\}^2 - \{\sum \log(Q)\}]}} \quad (1)$$

where n = number of data points; GH = gage height (ft); and Q = discharge (cfs). For each station, correlation coefficients were carefully reviewed to further improve the stage-discharge relationships. For example, at AGNI4, the entire data set available was plotted, as shown in figure 2(a). The correlation coefficients for the lower and upper gage heights were found to be 0.8283 and 0.9153, respectively. In order to find the effect of the Great Flood of '93, the existing data from 1991 to 1993 were isolated and excluded in the analysis, as shown in figure 2(b). The correlation coefficients were significantly improved to 0.9791 and 0.9828 from 0.8283 and 0.9153. As can be seen in figure 2(b), the discharge data for approximately $GH = 9$ ft ~15 ft for the period between 1991 and 1993 can clearly be isolated in improving the correlation coefficients. A similar investigation on the Great Flood of '93 was conducted for the other stations. However, no such effects were found in any other stations.

(a) All existing data for 1991-2002 included

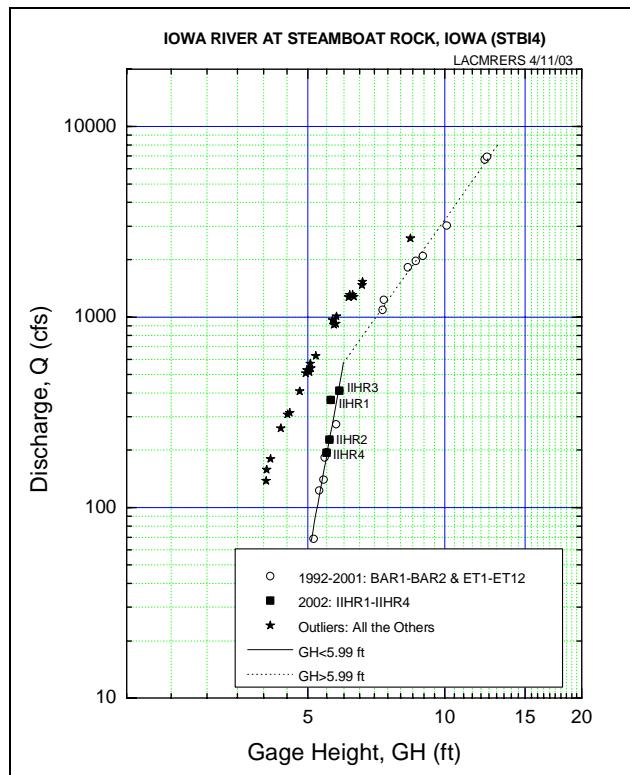

(b) Data for 1991-1993 isolated

Figure 2 Comparison of two log-linear stage-discharge relationships developed for two different sets of data for AGNI4

During the regression analysis, apparent outliers were identified and excluded from the analysis. Outliers were found at three stations (BPLI4, GLDI4, and STBI4). In particular, at STBI4 a significant number of the data that were collected from 1992 to 1995 was found to be outliers, as can be seen in figure 3. All the outliers identified in the present study were marked in red in the spreadsheets so that they would not be used in the future analyses. It should be noted that all the spreadsheets generated for the historical raw data, discharges calculated, and the rating table were submitted to the USACE-MVR.

The best-fit power-law relationships that were developed for each station in the present study are shown in tables 3(a) and 3(b). Correlation coefficients in these tables are seen to be very high, ranging from $r = 0.8628$ at NEPI4 for the lower flow regime in which $GH < 14.66$ ft to $r = 0.9976$ for the higher flow regime in which $GH \geq 12.39$ ft.

III. DESCRIPTION OF INDIVIDUAL STREAM-GAGING STATIONS AND PRESENTATION OF PROPOSED RATING TABLES

In this chapter, a general description of each station that was downloaded from the USACE-MVR web site (<http://www.mvr.usace.army.mil/>), a few site photos, the stage-discharge plot, and the rating table developed are presented for each gaging station.

1. EAST FORK DES MOINES RIVER NEAR ALGONA, IA (AGNI4)

- Gage Description - AGNI4 - E. Des Moines River near Algona, IA
- Stream = East Fork Des Moines River
- Gage Zero = 1098.74 feet NGVD (1929)
- Flood Stage = 14.00 feet
- Record Stage = 22.65 feet date 04-01-93
- Lat $43^{\circ}04'44''$ - Long $94^{\circ}14'10''$
- Drainage Area = 884.0 sq. mi.
- River Mile = 374.4
- Location of Gage = on left bank at downstream side of bridge on US Highway 169, at north edge of Algona, and 5.5 miles downstream from Black Cat Creek.

4. DES MOINES RIVER NEAR EDDYVILLE, IA (EDYI4)

- Gage Description - EDYI4 - Des Moines River near Eddyville, IA
- Stream = Des Moines River
- Gage Zero = 600.00 feet NGVD (1929)
- Flood Stage = N/A
- Record Stage = N/A
- Lat 41°08'59" - Long 92°38'04"
- Drainage Area = 13,130 sq. mi.
- River Mile =
- Location of Gage = on downstream guard rail of bridge on State Highway 137, at south edge of Eddyville, 0.35 mi upstream from Miller Creek, and 1.5 mi downstream from Grays Creek.

15. BEAVER CREEK NEAR WOODWARD, IA (WWDI4)

- Gage Description - WWDI4 - Beaver Creek near Woodward, IA
- Stream = Beaver Creek
- Gage Zero = N/A feet NGVD (1929)
- Flood Stage = N/A
- Record Stage = N/A
- Lat $41^{\circ}47'31''$ - Long $93^{\circ}57'20''$
- Drainage Area = 280 sq. mi.
- River Mile = N/A
- Location of Gage = 15 ft downstream from bridge on county highway, 3.5 miles downstream from Little Beaver Creek, and 3.5 miles south of Woodward, IA.

River-Stage Gaging Station
