INSTRUCTIONS FOR COMPLETING SF 298

1. REPORT DATE. Full publication date, including day, month, if available. Must cite at least the year and be Year 2000 compliant, e.g. 30-06-1998; xx-06-1998; xx-1998.

2. REPORT TYPE. State the type of report, such as final, technical, interim, memorandum, master's thesis, progress, quarterly, research, special, group study, etc.

3. DATES COVERED. Indicate the time during which the work was performed and the report was written, e.g., Jun 1997 - Jun 1998; 1-10 Jun 1996; May - Nov 1998; Nov 1998.

4. TITLE. Enter title and subtitle with volume number and part number, if applicable. On classified documents, enter the title classification in parentheses.

5a. CONTRACT NUMBER. Enter all contract numbers as they appear in the report, e.g. F33615-86-C-5169.

5b. GRANT NUMBER. Enter all grant numbers as they appear in the report, e.g. AFOSR-82-1234.

5c. PROGRAM ELEMENT NUMBER. Enter all program element numbers as they appear in the report, e.g. 61101A.

5d. PROJECT NUMBER. Enter all project numbers as they appear in the report, e.g. 1F665702D1257; ILIR.

5e. TASK NUMBER. Enter all task numbers as they appear in the report, e.g. 05; RF0330201; T4112.

5f. WORK UNIT NUMBER. Enter all work unit numbers as they appear in the report, e.g. 001; AFAPL30480105.

6. AUTHOR(S). Enter name(s) of person(s) responsible for writing the report, performing the research, or credited with the content of the report. The form of entry is the last name, first name, middle initial, and additional qualifiers separated by commas, e.g. Smith, Richard, J, Jr.

7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES). Self-explanatory.

8. **PERFORMING ORGANIZATION REPORT NUMBER.** Enter all unique alphanumeric report numbers assigned by the performing organization, e.g. BRL-1234; AFWL-TR-85-4017-Vol-21-PT-2.

9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES). Enter the name and address of the organization(s) financially responsible for and monitoring the work.

10. SPONSOR/MONITOR'S ACRONYM(S). Enter, if available, e.g. BRL, ARDEC, NADC.

11. SPONSOR/MONITOR'S REPORT NUMBER(S). Enter report number as assigned by the sponsoring/ monitoring agency, if available, e.g. BRL-TR-829; -215.

12. DISTRIBUTION/AVAILABILITY STATEMENT. Use agency-mandated availability statements to indicate the public availability or distribution limitations of the report. If additional limitations/ restrictions or special markings are indicated, follow agency authorization procedures, e.g. RD/FRD, PROPIN, ITAR, etc. Include copyright information.

13. SUPPLEMENTARY NOTES. Enter information not included elsewhere such as: prepared in cooperation with; translation of; report supersedes; old edition number, etc.

14. ABSTRACT. A brief (approximately 200 words) factual summary of the most significant information.

15. SUBJECT TERMS. Key words or phrases identifying major concepts in the report.

16. SECURITY CLASSIFICATION. Enter security classification in accordance with security classification regulations, e.g. U, C, S, etc. If this form contains classified information, stamp classification level on the top and bottom of this page.

17. LIMITATION OF ABSTRACT. This block must be completed to assign a distribution limitation to the abstract. Enter UU (Unclassified Unlimited) or SAR (Same as Report). An entry in this block is necessary if the abstract is to be limited.

Introduction

This was a preliminary study needed to develop a shipboard chronic disease condition prevalence study. The purpose of this study was to describe the percent congruence between the personnel records identified by SNAP (Shipboard Non-Tactical ADP Program) Automated Medical System (SAMS) and Composite Health Care System (CHCS). The reliability of CHCS to link ship board personnel to their proper command unit identification code (UIC) is needed to conduct epidemilogical research and disease management interventions. Population health data systems in the Navy require the ability to identify individuals who have disease risk factors and facilitate connecting those at risk with health care providers. Informal interviews with health care providers has highlighted a potential incongruence between the sailors listed on a ship's roster in the SAMS database and clinical data in CHCS. The accuracy of clinical data systems needed to be determined in order to identify potential data sources for further research.

Population health and disease management strategies have been identified as critical components of Navy Medicines total force protection initiatives ("BUMED Strategic Plan Update", 2004). Disease management initiatives for high volume chronic health conditions are considered essential for improving patient health and reducing health care costs within the Navy and Department of Defense ("FY 2005 BUMED Business Plan", 2004). Consequently, the provision of disease management is mandated by military leaders through formal directives and expected of health care organizations responsible for the health of populations (DODD 1010.10, 2003). Effective disease management programs have two critical components. The first is access to reliable and current clinical information and indicators of specific chronic health conditions such as diabetes, asthma, hypertension, and hyperlipidemia, cervical dysplasia, and depression. Second, is the ability to link identified high-risk patients with clinicians skilled in disease assessment, evidenced-based clinical practice, and patient/family education (DoD Tricare Management Activity, 2001).

Data systems needed for disease management interventions are different for shore based and shipboard sailors. The two critical data systems for this study were CHCS and SAMS. CHCS is the military's computerized provider order entry system supporting over 500 Military Treatment Facilities worldwide. It is one of the world's largest standardized health information systems and provides clinical data to other medical data systems. DoD has used CHCS for over ten years to order and document laboratory tests, radiology exams, perform prescription transactions, document outpatient appointments and other care administered to patients. Disease management screening indicators can be obtained through queries written for diagnostic test values or through proxy measures of medication classifications. CHCS provides real-time access to clinical data, however, this portal has limitations for shipboard medical departments. Discussions with shipboard clinicians identified limitations using CHCS data for case finding and clinical follow-up related to inaccurate UIC entries.

The second data system that has potential use for fleet disease management data is SAMS (Snap (Shipboard Non-Tactical ADP Program) Automated Medical System). SAMS is used for clinical and medical administrative purposes. There is no direct link between SAMS and CHCS. The quality of SAMS clinical data is completely dependent on manual data entry by shipboard personnel and the level of detail required for meeting minimal crew medical readiness standards. A strength of the SAMS data base is that it represents a gold standard for identifying every sailor currently assigned to that ship.

The lack of at least one reliable field that can link the medical data in the above databases severely limits Navy Medicine's goal of providing premium health care to operational forces. A disease management data source is needed that can be used to identify fleet sailors who need focused intervention to maintain combat readiness. Total force protection can not be achieved without the ability to identify and provide timely clinical services to highly mobile operational personnel. In particular, sailors with poorly managed or unmanaged chronic disease conditions become an unplanned loss from the ship during symptom exacerbations. The loss of one sailor with a critical job specialty can cause a ship with limited personnel resources to degrade its mission readiness (Westphal, 2004). This preliminary study was needed to test at least one critical data element for connecting clinical information to the source sailor and command in order to conduct epidemiological and disease management research and clinical interventions. This study addressed a gap in the literature by providing a statistical analysis of actual UIC congruence between SAMS and CHCS versus casual clinician observations.

Method

The minimum unit of observation is the individual listed on a roster and not the source (a ship) of the roster. A minimum sample of 522 observations were needed to describe congruence and to compare if the congruence rates differ between at least two sources. The rosters of at least three ships with crew sizes of 285 – 325 were used to achieve a minimum sample size and assess for potential SAMS list variation between at least two ships. A total of 1500 names were generated by the CHCS query for comparison. This study used a cross-sectional analysis of health care administrative data to describe the level of congruence on a key variable between two databases. A roster of beneficiaries in one data base was compared to a roster generated by the second database. There were no hypothesis tested. A convenience sample of three ships that normally use nurse practitioner services were the source for the three UIC lists. Human Subject Protection approval was obtained prior to data collection. This study was not representative of the fleet as a whole. It is representative of the level of UIC congruence between SAMS and CHCS for active duty shipboard sailors.

Results

A Chi-square test Likelihood Ratio was calculated comparing the result of unit identification code (UIC) rosters between SAMS and CHCS (n = 1500) (Table 1). A significant interaction was found (Likelihood Ratio (1) = 686.66, p<.001). Because one cell had less than 5 observations the Fisher's Exact Test was conducted and showed a significant difference (p<.001) as well. The CHCS generated UIC roster was able to correctly identify 44.9% of the sailors actually assigned to a ship. The overall congruence between the CHCS and SAMS generated rosters was 25.8%. The incongruence in the CHCS generated roster from the SAMS roster included 42.6% of listed sailors for the UIC who were not on a ship and omitted 31.6% of the sailors actually on a ship.

Table 1. SAMS and CHCS Crosstabulation

A post hoc analysis was conducted to evaluate potential differences between UIC codes for the SAMS and CHCS rosters. A Kruskal-Wallis Test was conducted to assess if there was a difference between generated rosters by UIC. There is a significant difference between the rosters for UIC 2 from UIC 1 (Chi-Square (2) = 225.71, P<.001) and UIC 3 (Chi-Square (2) = 224.33, P<.001). There were three UIC codes used in the sample. There was a significant interaction found for all three UIC's (UIC1: Likelihood Ratio (1) = 227.59, p<.001; UIC2: Likelihood Ratio (1) = 13.23, p<.001; UIC3: Likelihood Ratio (1) = 240.91, p<.001). There was wide variation between the three UICs for correctly identifying actual crewmembers (UIC1 50.6%, UIC2 26.0\%, UIC3 57.7%), overall congruence (UIC1 23.4\%, UIC2 25.6\%, UIC3 27.7%), listing sailors not on the ship (UIC1 53.7%, UIC2 1.7%, UIC3 51.9%), and omitting crewmembers (UIC1 22.9%, UIC2 72.7%, UIC3 20.4%) (Table 2). It is noteworthy that UIC2 represented a recently commissioned ship, which may have influenced the differences between the three UIC's.

Table 2. SAMS and CHCS Crosstabulation by Ship CHCS

Conclusion

This study was conducted to test the congruence of a critical data element (a sailor's UIC) between the dominant clinical database (CHCS) and a known list of actual crewmembers (SAMS). The overall congruence between the CHCS and SAMS generated rosters, however, was only 25.8%. The incongruence in the CHCS generated roster included 42.6% of listed sailors for the UIC who were not on a ship and omitted 31.6% of the sailors actually on a ship. CHCS generated UIC identifiers are not reliable for case finding or for clinical follow-up. The implication for this study is that the electronic medical record alone cannot provide accurate data for determining chronic disease prevalence rates of sailors in particular occupational settings.
