TITLE: A Novel Approach to the Development of Highly Specific Inhibitors of EFG, a Critical Transcription Factor in Prostate Cancer

PRINCIPAL INVESTIGATOR: John H. Bushweller, Ph.D.

CONTRACTING ORGANIZATION: University of Virginia Charlottesville, VA 22904

REPORT DATE: March 2008

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release; Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.

Introduction

More than 230,000 new cases of prostate cancer were diagnosed in the United States in 2006 and more than 27,000 deaths were attributed to prostate cancer, accounting for ~9% of cancer deaths in men. It is clear that there is a need for more effective highly targeted agents for the treatment of this pervasive cancer. Our goal is to explore a novel approach, namely inhibition of a specific protein, ERG, to treat this deadly disease.

We have proposed three steps to achieve our goal of finding compounds that can inhibit ERG function by stabilizing the inhibited form of the protein. First, we will make ERG in bacteria and identify which parts of the protein mediate the inhibition. Second, we will utilize nuclear magnetic resonance spectroscopy to determine the 3D structure of the inhibited form of ERG. This structural information makes it possible to use computational tools to identify molecules which may bind to ERG. Third, we will use these computational tools to identify potential lead compounds which can stabilize the inhibited form of ERG and inhibit its binding to DNA. Based on the computational results, we will test a selected panel of compounds for their ability to inhibit binding of ERG to DNA to identify compounds which are effective and can be developed further into a useful drug.

Our efforts can lay the foundation for development of drugs targeting ERG which is a novel and potentially therapeutically powerful approach for the treatment of prostate cancer.

Body

Aim 1: Delineation of auto-inhibitory domains of ERG.

Generation of constructs. Using PCR, we have generated 6 constructs in pHIS Parallel 2 thus far for expression of a series of fragments of ERG (see Table below).

ERG1	Expression of ERG residues 1-462 (full-length)
ERG2	Expression of ERG residues 211-462
ERG3	Expression of ERG residues 261-412
ERG4	Expression of ERG residues 290-412
ERG5	Expression of ERG residues 290-383
ERG6	Expression of ERG residues 290-377

Expression and purification. All six of these constructs have been expressed in *E. coli* using low temperature (10 °C) induction with IPTG. The resulting protein is expressed in a soluble form. Purification is effected using Ni-NTA affinity chromatography, rTEV cleavage of the His₆ tag, and a second Ni-NTA affinity chromatography step to obtain homogeneous protein.

Figure 11. SDS gel showing purification steps for ¹⁵**N-labeled ERG3.** Lane 1, markers; Lane 2, flow through from Ni-NTA column; Lane 3, insoluble fraction; Lanes 4-7, wash steps on Ni-NTA column; Lanes 8-12, elution from Ni-NTA column.

Fluorescence polarization (FP) assay for measuring ERG-DNA binding. For the measurement of K_d values for the binding of ERG fragments to DNA, we have developed a fluorescence polarization assay. Several functional DNA sequences identified from selected and amplified binding (SAAB) using the highly homologous Fli-1 protein (Mao et al., 1994) have been synthesized with a 3'-fluorescein label. Upon binding of the larger ERG protein, the fluorescence polarization is altered due to the decreased rotational correlation time of the complex, providing a simple, robust assay for these measurements (Rishi et al., 2005). A representative binding plot for binding of ERG3 to DNA is shown in Figure 2 below. We are also measuring the K_d values using isothermal titration calorimetry to provide an independent determination.

This assay has been used to measure K_d values for several constructs with one DNA element:

ERG1	$K_d = 426 \text{ nM}$
ERG3	$K_d = 280 nM$
ERG4	$K_{d} = 120 \text{ nM}$
ERG6	$K_{d} = 100 \text{ nM}$

The results of these measurements clearly that longer fragments of ERG (beyond the canonical Ets domain) do indeed show evidence of auto-inhibition, validating our original aim to explore this for ERG. The data also suggest that the ERG3 construct contains most, if not all of the regions of the protein necessary for auto-inhibition so we will focus our structural efforts on this ~150 amino acid fragment.

Aim 2: Determination of the structure of the auto-inhibited form of ERG (X-ray or NMR).

Preparation of ¹⁵N-labeled protein. ERG3 has been expressed in minimal media for labeling with ¹⁵N for preliminary NMR data collection. Good yields of labeled protein (~5 mg/L purified protein) have been obtained, establishing our ability to make the quantities of protein necessary for the NMR studies (see Figure 1 above).

Aim 3: Virtual screening of ERG structure to identify potential lead compounds.

We do not yet have a structure of the protein, so efforts on this aim have not yet begun.

Key Research Accomplishments

- Creation of a serried of constructs for expression of various fragments of ERG
- Development of expression and purification protocol for fragments of ERG
- Development of fluorescence polarization (FP) assay for measurement of ERG-DNA binding
- Analysis of ERG fragment DNA binding by FP

Reportable Outcomes

- We plan to use the preliminary data generated under the auspices of this grant to seek additional federal funding for this project through DOD or NIH.
- One student, Tomasz K. Kabzinski, has been supported by this grant.

Conclusion

We have confirmed that, like Ets-1, ERG shows evidence of auto-inhibition of DNA binding, laying the groundwork for our subsequent studies. Based on the results, we have focused our structural efforts on one ~150 amino acid fragment of ERG, ERG3.
