<b>13. ABSTRACT (maximum 200 words)</b>		
The results of analyses of hydrographic, nutrient, and biological data collected in coastal ocean waters off Central California in June 2008 aboard the <i>R/V Point Sur</i> are presented in both tabular and graphical form. The cruise departed from and returned to Monterey, California. Because the cruise encountered unusually (for the time of year) heavy weather, scientific operations could only be completed along CalCOFI line 67 from Monterey to station 75, a total of 11 sites. Three more hydrographic stations were completed along the California coast between Monterey and San Francisco, California. Marine mammal observations taken during the cruise are also included.

## Introduction

Following in a long tradition of hydrographic studies of the California Current system-- see, for example, Steger *et al.* (2000) and Collins *et al.* (2003)-- the data in this report were collected during the 23-27 June 2008 cruise of the Pacific Coast Ocean Observing System (PaCOOS) program aboard the *R/V Point Sur*. The PaCOOS program was organized in 2003/2004 as the NOAA west coast contribution to the national Integrated Ocean Observing System (IOOS), and is charged with “providing ocean information for the sustained use of the California Current Large Marine Ecosystem under a changing climate.”<sup>1</sup> PaCOOS cruises generally subsample the standard California Cooperative Oceanic Fisheries Investigations (CalCOFI) grid of hydrographic stations (Figure 1). This cruise was scheduled to do exactly that by sampling along CalCOFI lines 60 and 67 between stations 90 and the mainland shore. However, because of weather unusually heavy for the time of year, this cruise struggled to sample along CalCOFI line 67 to station 75 (Figure 2). Since it has been normal procedure for these cruises to sample not only at standard CalCOFI stations but also halfway between those standard stations along CalCOFI line 67 (Rago *et al.*, 2006, 2007a, 2007b, 2007c, 2008), this resulted in 11 hydrographic stations (CTDs 1-11) completed, as well as 7 net tows at the standard CalCOFI stations. An additional three hydrographic stations were completed along the California coast after it became evident that nothing more could be accomplished in the remaining time further offshore along CalCOFI line 67. This coastal work did serve to allow us to get very good marine mammal observations in an area known to teem with marine mammals. Participants on the cruise came from the Naval Postgraduate School (Physical Oceanography, Marine Mammal Observations), the Monterey Bay Aquarium Research Institute (Nutrient Analysis and Primary Productivity), the University of California at Santa Cruz (Zooplankton and Nutrient Analyses), and the Marine Advanced Technology Education (MATE) Internship Program<sup>2</sup>.

## Standard Procedures

### *CTD/Rosette Data:*

At each site a Seabird Electronics, Inc., Conductivity-Temperature-Depth (CTD) instrument fitted with a 12-place rosette was deployed. The rosette was equipped with 12 10-liter PVC Niskin bottles for collection of water samples. The CTD was lowered to 1000 meters or the bottom (whichever came first). Where primary productivity sampling was performed, water samples were taken at depths designed to maximize resolution of the variables sampled throughout the thermocline. Where only nutrient sampling was performed<sup>3</sup>, water samples were more or less evenly spaced throughout the water column. A water sample was always obtained at or near the bottom of each CTD cast for later conductivity/salinity calibration of the CTD conductivity sensors.

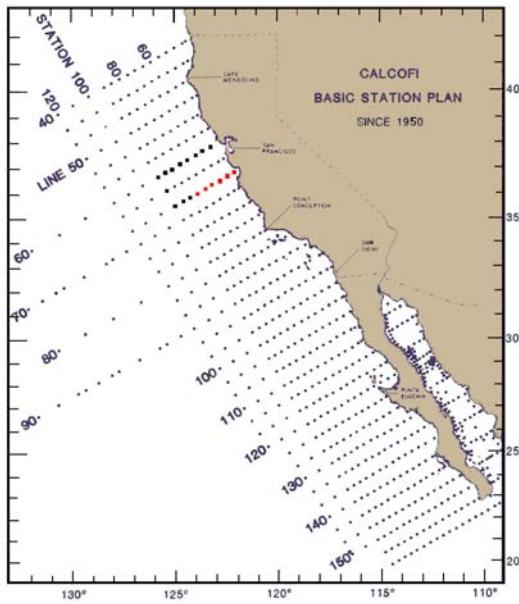

Besides temperature (dual sensors), conductivity (dual sensors), and pressure, the CTD also measured fluorescence, transmissivity, dissolved oxygen content, and photosynthetically available radiation (PAR) in the water column. Except for PAR and the secondary of the dual sensors, all these parameters are reported here.

---

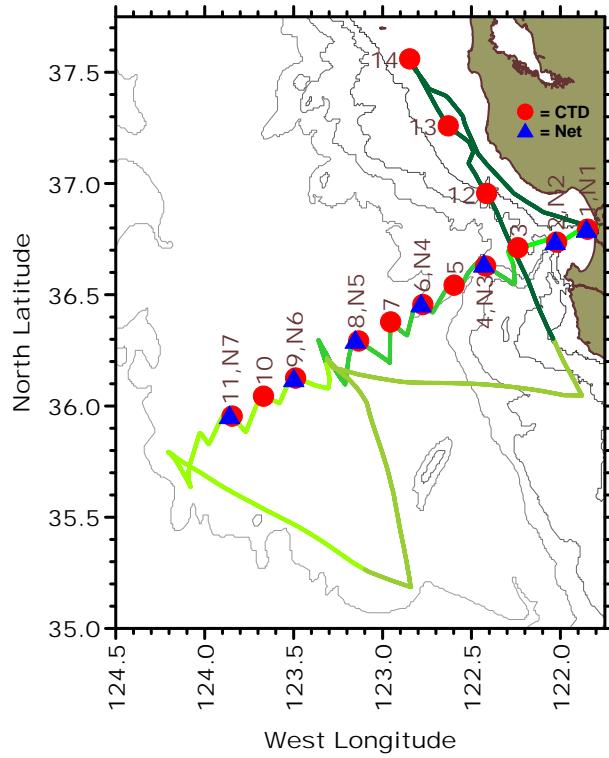

<sup>1</sup> <http://www.pacoos.org>

<sup>2</sup> <http://www.marinetech.org>

<sup>3</sup> CTD stations 3, 5, 7, and 10.

**Figure 1:** Full CalCOFI hydrographic station grid. Stations occupied during the PaCOOS cruise of June 2008 are highlighted in red.

**Figure 2:** Hydrographic stations occupied during the PaCOOS cruise of June 2008. 200, 1000, 2000, 3000, and 4000 m isobaths are shown. The ship's erratic (due to heavy weather) track is shown in green, where different shades represent different days. Net tows were completed at the sites marked by blue triangles.

Generally, a minimum of two salinity samples (including the bottom-of-cast sample) were collected from each CTD cast. These samples were analyzed after the cruise at the Naval Postgraduate School (NPS) using a Guildline model 8400B Autosal salinometer. A regression between the salinometer results and the conductivities measured by the CTD at the times the Niskin bottles were tripped was made, from which a correction to the CTD salinities was determined and then applied. The salinometer was standardized using IAPSO Standard Seawater (batch P147) before and after each set of water samples was analyzed. Salinity values were calculated using the algorithms for the Practical Salinity Scale, 1978 (UNESCO, 1981).

Dissolved oxygen (Winkler) samples were collected at CTD stations 3, 10, 12, 13, and 14. These were analyzed after the cruise at the Monterey Bay Aquarium Research Institute (MBARI). The CTD for this cruise was outfitted with a Sea-Bird Electronics, Inc., SBE 43 oxygen sensor. This sensor is a polarographic membrane that outputs a voltage proportional to the temperature-compensated current flow occurring when oxygen is reacted inside the membrane. Dissolved oxygen concentration is then calculated from a modified version of the algorithm by Owens and Millard (1985). The results of the analysis of the Winkler oxygen samples were compared to the corresponding oxygen values recorded by the CTD. Using the method described in SBE Application Note #64-2<sup>4</sup>, we calculated new SBE 43 sensor coefficients. Corrected CTD oxygen values were then recalculated with the modified version of the Owens and Millard (1985) algorithm using the new sensor coefficients.

For this cruise, the CTD was fitted with a Seatech<sup>5</sup> 25-cm. transmissometer. This instrument is designed to measure beam transmission over a 25 centimeter water path using a modulated Light Emitting Diode (660 nm, in this case) and a synchronous detector. The temperature compensated transmissometer is not sensitive to ambient light. (For further details concerning the Seatech transmissometer, the introduction from its operating manual is reprinted in Appendix C.)

Nutrient samples were collected in 45-ml polypropylene screw-capped containers which were rinsed three times prior to filling. Samples were frozen and returned to MBARI for later analysis on an AlpChem autoanalyzer, as in Sakamoto *et al.* (1990).

Chlorophyll-*a* and phaeopigments were collected in 280-ml polyethylene bottles and filtered onto 25-mm Whatmann GF/F filters. Chlorophyll-*a* was assayed with the standard fluorometric procedure of Holm-Hansen *et al.* (1965), modified such that phaeopigments are extracted in acetone in a freezer over at least 24 hours (Venrick and Hayward, 1984; Chavez *et al.*, 1991). Analysis was performed as possible during the cruise or at MBARI immediately following the cruise.

Primary productivity was estimated for the 100, 50, 15, 5, 1, and 0.1% light penetration depths as determined by secchi, and followed the general method of Parsons *et al.* (1984). Water samples from the appropriate depths were collected in 280-ml polycarbonate bottles, spiked with <sup>14</sup>C, and incubated on deck for 24 hours under running seawater in plexiglass tubes wrapped with nickel-cadmium screens of differing pore size. (See Pennington and Chavez, 2000, for methodology details.)

---

<sup>4</sup>See Application notes under the Support tab at <http://www.seabird.com>.

<sup>5</sup> Seatech, Inc. was acquired by Wet Labs, Inc. in late 1998.

### *Zooplankton Net Tows:*

Seven stations<sup>6</sup> (Figure 2 and Table1) were sampled for zooplankton during the cruise. All sampling was conducted with 0.7-m diameter paired bongo nets fitted with 505-mm mesh, which were towed obliquely to a depth of 210 m (or within 10 m of the bottom, whichever came first). Samples were preserved at sea according to standard protocols (Kramer *et al.*, 1972). Upon return to the University of California at Santa Cruz (UCSC), all samples were initially measured for total biovolume and subsequently processed for krill species composition and abundance.

### *Zooplankton Displacement Volume:*

Zooplankton displacement volumes for 2008 were comparable to those observed in June 2007. Mean zooplankton displacement for the inshore portion of the June 2007 cruise (199.87 ml/1000m<sup>3</sup>) was not significantly different than that collected during the June 2008 cruise (182.76 ml/1000m<sup>3</sup>). However, the distribution of biomass demonstrated a slightly offshore shift in 2008 relative to 2007 (Figure 3), due most likely to stronger levels of coastal upwelling and corresponding offshore Ekman transport in 2008 versus 2007.

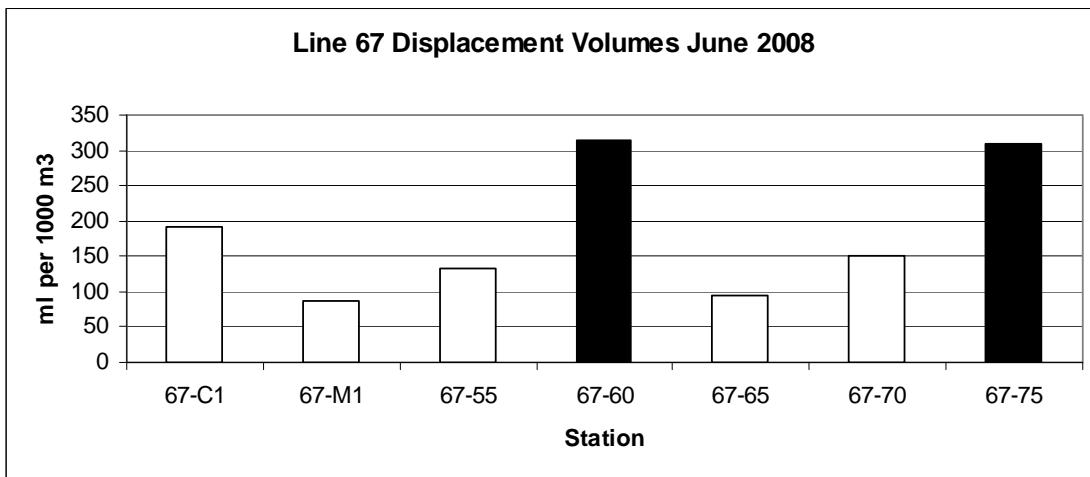

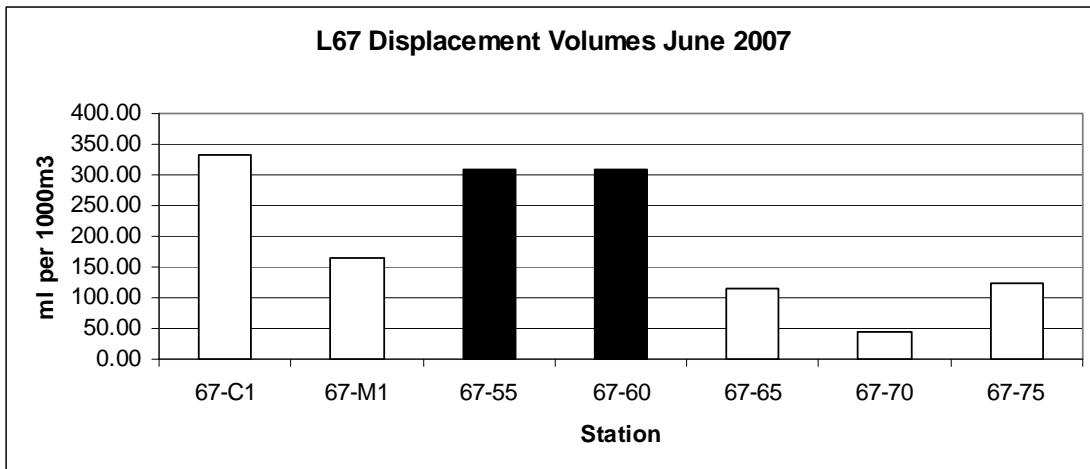

### *Krill:*

A total of 5 species of krill were collected in net samples from CalCOFI line 67, although two species, *Euphausia pacifica* and *Nematoscelis difficilis*, constituted 99% of all krill collected. This was comparable to the June 2007 cruise, which had a total of 4 species collected within the comparable region. Relative abundances were not significantly different between the 2007 and 2008 samples for both *E. pacifica* and *N. difficilis*. Onshore/offshore distributions for *E. pacifica* were similar for both 2007 and 2008 (Figure 4), while *N. difficilis* had a slightly more inshore maximum in 2008 compared to that in 2007 (Figure 5).

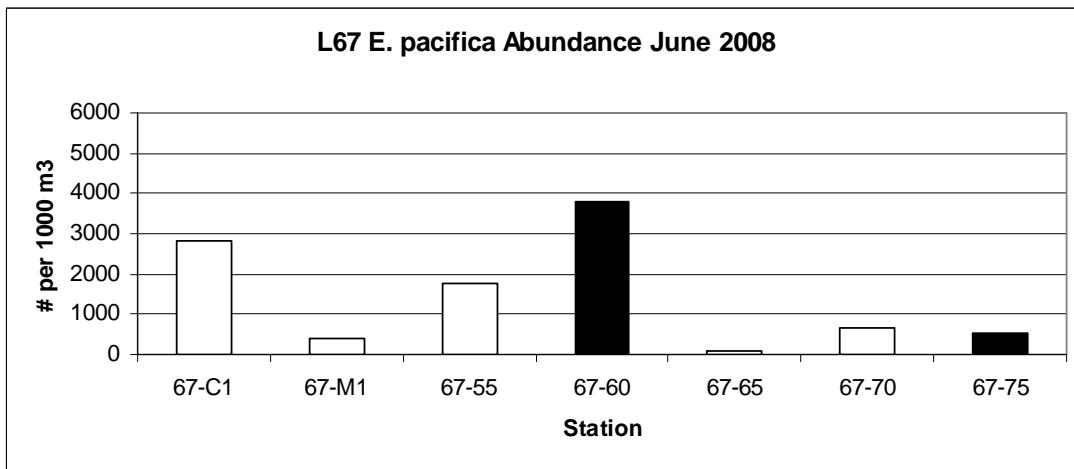

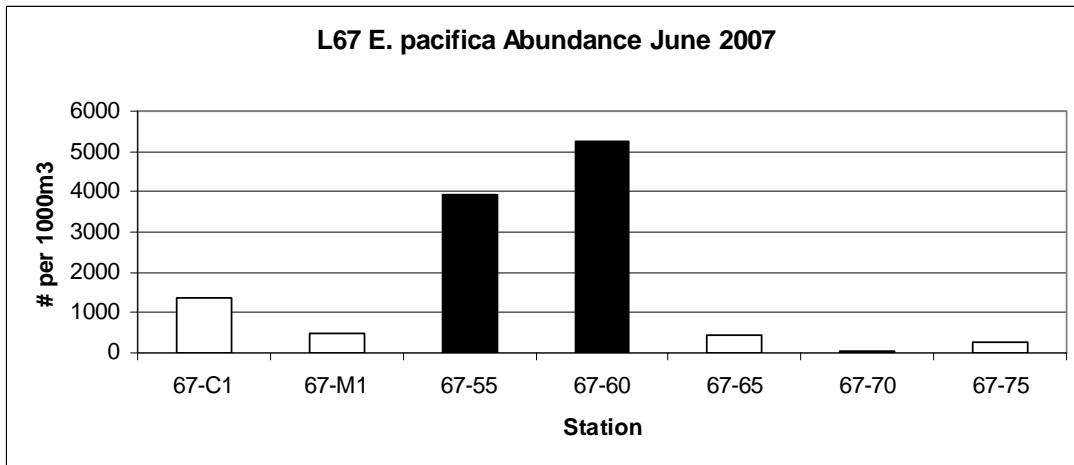

**Table 1:** Zooplankton data. This table lists the total biovolume (displacement) abundance, as well as the mean abundances of the three dominant euphausiid species (*Euphausia pacifica*, *Thysanoessa spinifera*, and *Nematoscelis difficilis*), measured at the seven hydrographic stations sampled by bongo net tows along CalCOFI line 67 during the PaCOOS cruise of June 2008. The data are listed onshore to offshore.

Station <i>(CalCOFI)</i> Number	Zooplankton Biovolume (ml/1000m <sup>3</sup> )	<i>E. pacifica</i> Abundance (no./1000m <sup>3</sup> )	<i>T. spinifera</i> Abundance (no./1000m <sup>3</sup> )	<i>N. difficilis</i> Abundance (no./1000m <sup>3</sup> )
1 (67-C1)	191	2840	0	863
2 (67-M1/H3)	86	397	0	15
4 (67-55)	134	1766	0	241
6 (67-60)	315	3800	0	309
8 (67-65)	95	70	0	6
9 (67-70)	150	681	0	13
11 (67-75)	309	539	0	366

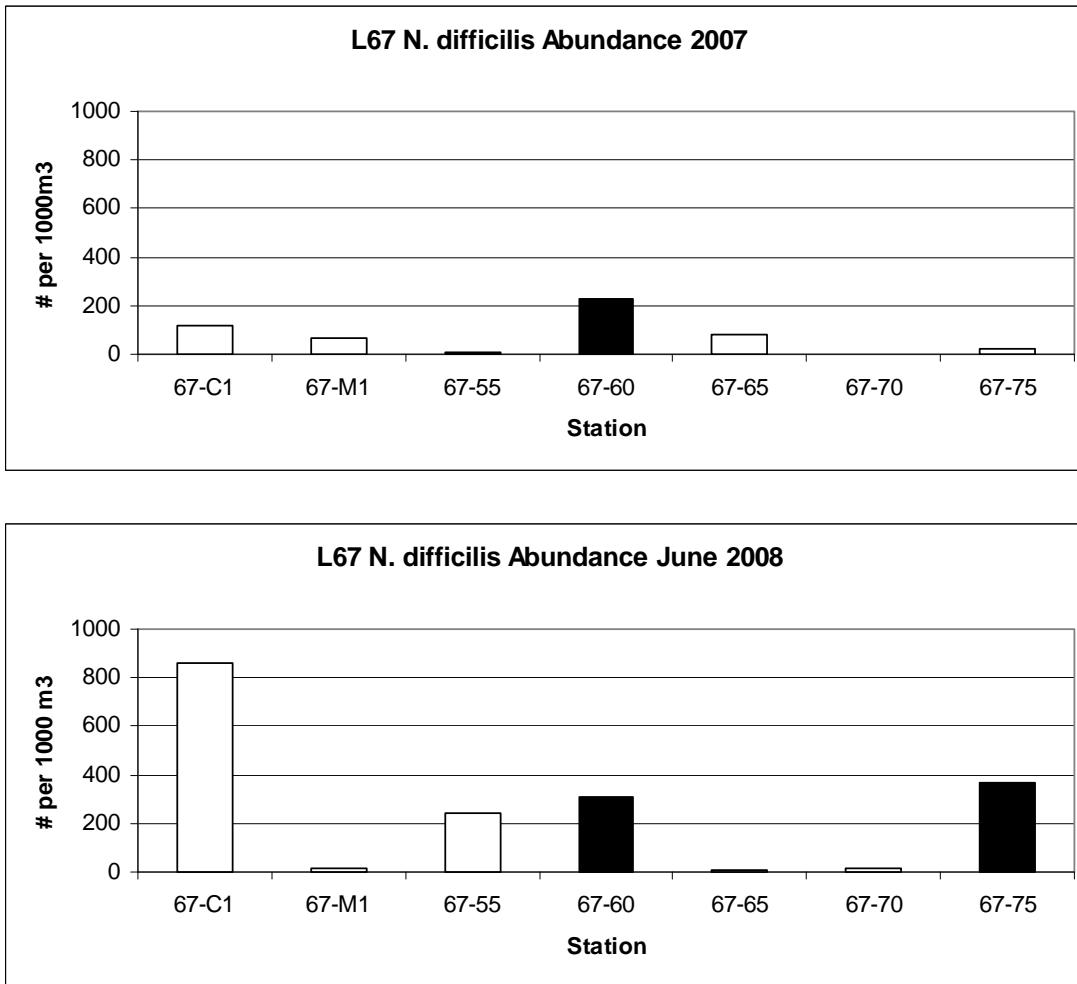

<sup>6</sup> CTD stations 1, 2, 4, 6, 8, 9, and 11.

**Figure 3:** Zooplankton volume displacements for CalCOFI line 67 during the PaCOOS cruises of June 2007 (top) and June 2008 (bottom). Samples are arranged onshore (67-C1) to offshore (67-75), with nighttime sampling shown by black bars.

**Figure 4:** *Euphausia pacifica abundance for CalCOFI line 67 during the PaCOOS cruises of June 2007 (top) and June 2008 (bottom). Samples are arranged onshore (67-C1) to offshore (67-75), with nighttime sampling shown by black bars.*

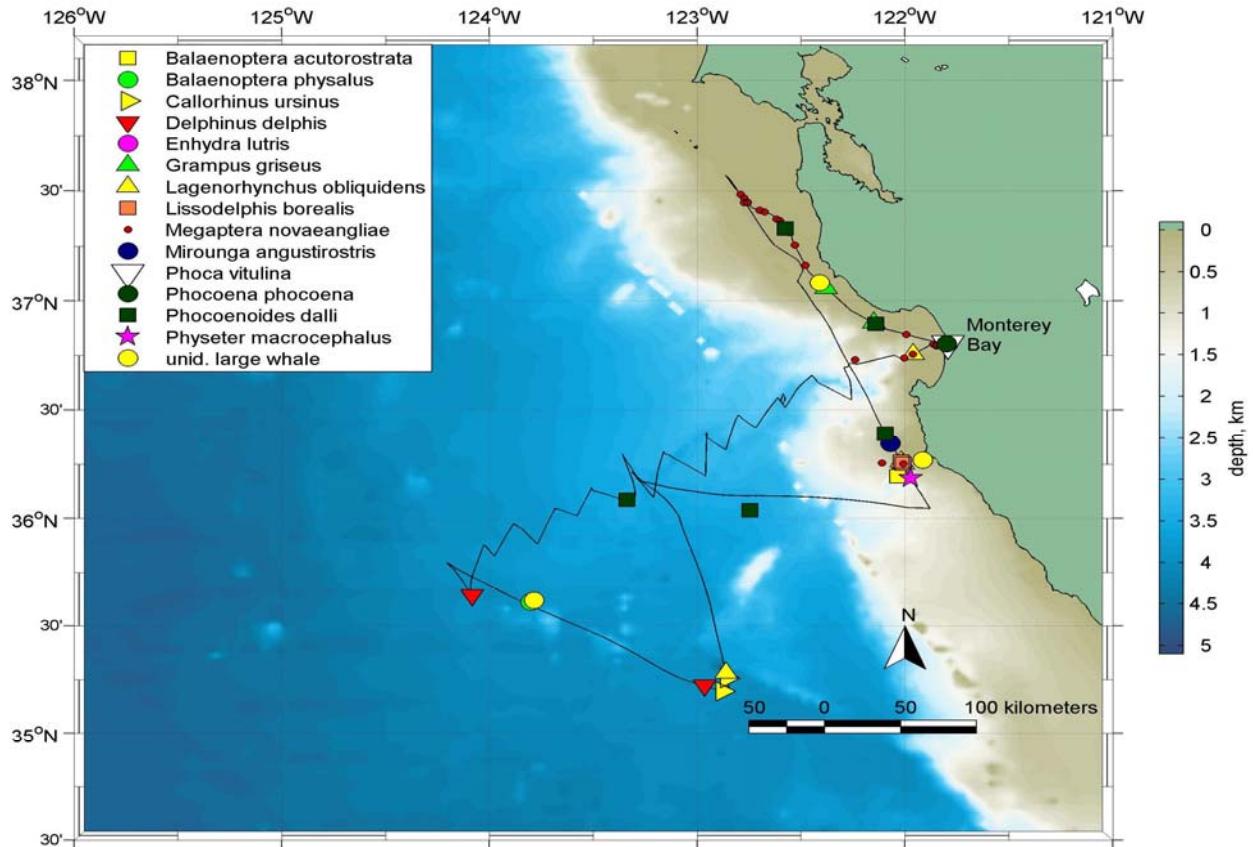

**Figure 5:** *Nematoscelis difficile abundance for CalCOFI line 67 during the PaCOOS cruises of June 2007 (top) and June 2008 (bottom). Samples are arranged onshore (67-C1) to offshore (67-75), with nighttime sampling shown by black bars.*

#### *Marine Mammal Observations:*

Observations of marine mammals (Figure 6, Tables A4 and A5) were made by a single observer during daylight hours (approximately 1300 to 0300 Coordinated Universal Time [UT]) throughout the cruise, conditions permitting (e.g., clear or high clouds, Beaufort state less than 4, etc.). Observations were made from the 02-deck (outside the Bridge), where eye height was approximately 20 meters above the sea surface, using handheld Fujinon 7 x 50 binoculars with compass for bearing and reticle for distance. Observations were recorded on a laptop computer using the marine mammal and bird mapping program *Seebird* (developed at the Southwest Fisheries Science Center). This program interfaces with handheld global positioning system (GPS) devices, and allows the generation of observation logs containing the observations of the mammals themselves with matching ship's velocities and positions, observational conditions, etc. Generally, intensive "on effort" observations were made during the last half of each half-hour period, with the other half of the half-hour period devoted to less intensive "off effort" observations. Depending on

the situation, the observer would take short breaks from the observations approximately every two hours.

During this cruise, conditions were often far less than ideal. High winds (see Table A1) gusting as high as 60 knots offshore caused Beaufort states above 7. Although the winds were much tamer close to shore, visibility nevertheless was severely restricted there due to smoke and ash from the hundreds of wildfires that were burning out of control across central California. Despite these conditions, observations were attempted and were surprisingly often productive.<sup>7</sup>

**Figure 6.** Marine mammal sightings during the PaCOOS cruise of June 2008. The black line shows the track of the ship.

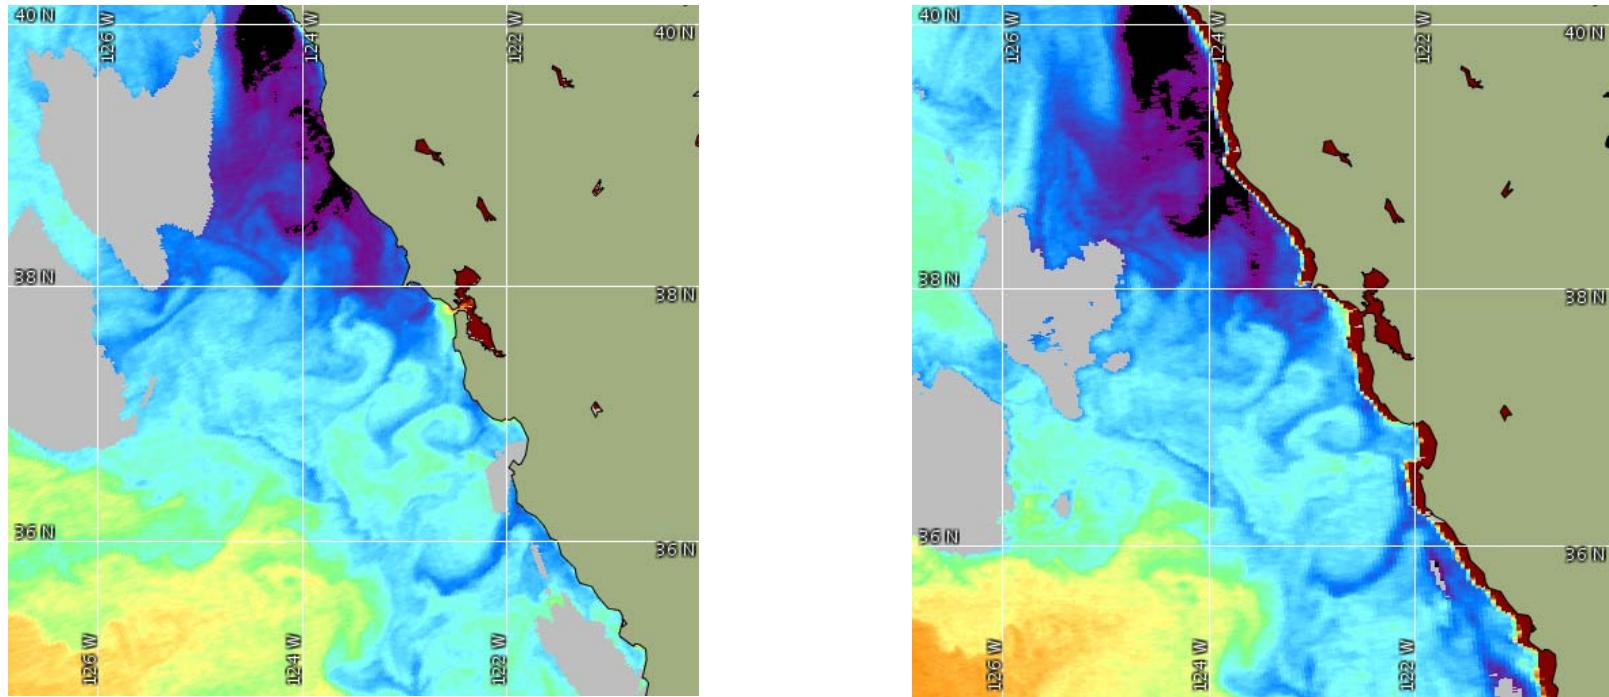

#### Ancillary Observations:

**Underway Data:** Near surface measurements of temperature and salinity were recorded throughout the cruise from water pumped through the ship's uncontaminated seawater system. These data, along with meteorological data (barometric pressure, wind, etc.) collected from various sensors mounted primarily on the ship's mast, were recorded at approximately 30-second intervals throughout the cruise. Table A1 lists these data at the start of each hydrographic station.

---

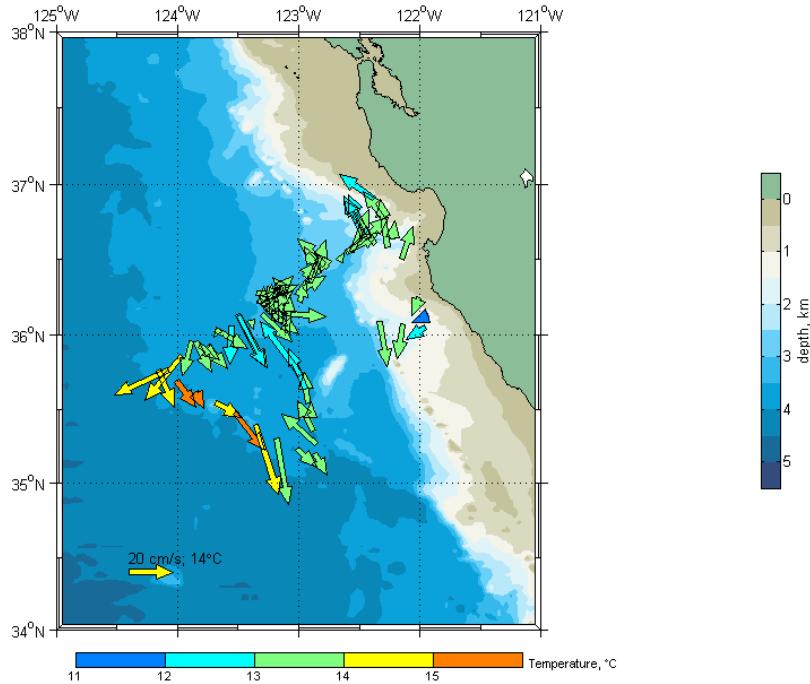

<sup>7</sup> An example of this was the fin whale and unknown large whale, likely another fin, sighted on 25 June during a Beaufort 7 sea state with winds gusting to 60 knots.

*Satellite Imagery:* Advanced Very High Resolution Radiometer (AVHRR) satellite imagery of sea surface temperature of the area of operation during the PaCOOS cruise is included as Figure 7.

**Figure 7.** Advanced Very High Resolution Radiometer (AVHRR) satellite imagery of sea surface temperature ( $^{\circ}\text{C}$ ) of the area of operation during the PaCOOS cruise of June 2008. These images were taken on 24 June 2008 at 2031 UT (left) and 2212 UT (right).

*ADCP:* Continuous ocean current measurements were made throughout the cruise using a vessel-mounted RD Instruments 75 kHz broadband Acoustic Doppler Current Profiler (ADCP). Some results from the ADCP are shown in Figure 8.

**Figure 8.** *ADCP results from the PaCOOS cruise of June 2008.* The arrows are current vectors for currents averaged between 50 and 100 m. The colors of the current vectors reflect the sea surface temperature as measured (nominally at 3 meters) by the ship's underway data acquisition system.

#### Tabulated Data (in Appendix A)

The following tables of data can be found in Appendix A:

1) Table A1: Meteorological and Sea Surface Data

This lists the meteorological and surface oceanographic conditions at the start of each hydrographic station as measured by the underway data acquisition system of the *R/V Point Sur*.

2) Table A2: Hydrographic Data

This is a chronological listing of the hydrographic data collected at each CTD station during the cruise. Data are given for standard pressures, except that the last line of data for each site is the deepest pressure for that CTD cast. The surface pressure, listed as 0 dbar, is actually 1 dbar. Salinities (oxygens) have been adjusted according to the conductivity/salinity (oxygen) calibration correction determined from the collected salinity (oxygen/Winkler) water samples. The time listed for

each station is the beginning (UT) of the CTD cast. Units of geopotential anomaly ( $\Delta\Phi$ ), potential density ( $\sigma_0$ ), and potential spiciness ( $\pi_0$ ) are  $\text{m}^2\text{s}^{-2}$ ,  $\text{kg m}^{-3}$ , and  $\text{kg m}^{-3}$ , respectively.

3) *Table A3: Nutrient and Primary Productivity Data*

This is a chronological listing of the results of the nutrient and primary productivity analyses of the water samples collected from the 12 Niskin bottles tripped at each hydrographic station. The time given is the start (UT) for each hydrographic station. Except where primary productivity analyses were not performed (see Introduction), the data for each hydrographic station are separated into two sections (“Physical and Chemical” and “Biological”).

The physical oceanographic properties listed in the first seven columns of the “Physical and Chemical” section of each station’s data are the uncorrected values measured by the CTD at the times each Niskin bottle was tripped. Because they are uncorrected, these values may differ slightly from those listed in Table A2. The last four columns of this section of each station’s data give the nitrate ( $\text{NO}_3$ ), nitrite ( $\text{NO}_2$ ), phosphate ( $\text{PO}_4$ ), and dissolved silicate ( $\text{SiO}_4$ ) concentrations (determined as described previously).

The “Biological” section of each station’s data gives the results of the primary productivity analyses. As stated above, primary productivity sampling was not undertaken at every hydrographic station.

4) *Table A4: Marine Mammal Data*

This table lists the results of the marine mammal observations made during the cruise. The data are listed alphabetically by species’ scientific name, then chronologically within each species.

5) *Table A5: Marine Mammal Data Summary*

This table summarizes the (more specific) results from Table A4 of the marine mammal observations made during the cruise. The data are listed alphabetically by species’ scientific name, except that pinnipeds/southern sea otters are listed last.

### **Figures of Results (in Appendix B)**

Graphical representations of the data collected during this cruise follow the tabulated data in Appendix A. Figure 9 is a series of four diagrams contouring (a) the temperature ( $^{\circ}\text{C}$ ), (b) the salinity, (c) the density anomaly ( $\text{kg m}^{-3}$ ), and (d) the oxygen ( $\mu\text{mol kg}^{-1}$ ) fields along the line of hydrographic stations from Moss Landing, California, to CalCOFI station 67-75.

Figure 10 contours the fluorescence and transmissivity in the upper 100 meters of the water column along the line of hydrographic stations from Moss Landing, California, to CalCOFI station 67-75.

Figure 11 is a series of four diagrams contouring (a) the nitrate ( $\mu\text{M}$ ), (b) nitrite ( $\mu\text{M}$ ), (c) phosphate ( $\mu\text{M}$ ), and (d) silicate ( $\mu\text{M}$ ) fields along the line of hydrographic stations from Moss Landing, California, to CalCOFI station 67-75.

## Appendix A

**Table A1:** Meteorological and sea surface data collected during the PaCOOS cruise of June 2008. Listed here are the meteorological and surface oceanographic conditions as measured by the underway data acquisition system (UDAS) of the *R/V Point Sur* at the beginning of each hydrographic station. Continuous measurements of the water being pumped through the ship's uncontaminated seawater system ("sea chest") from approximately 3 meters below the surface supplied the oceanographic data, while instrumentation mostly atop the ship's mast supplied the meteorological data.

Station	Year/day, 2008 (UTC)	Barometric Pressure (mb)	Wind Speed (kts)	Wind Direction (°T)	Air Temp. (°C)	SST (°C)	SSS
1	175.7257	1016.45	8.62	276.22	10.3	12.611	33.746
2	175.8118	1016.65	16.96	283.58	10.6	11.779	33.736
3	175.9243	1015.99	20.45	322.41	11.2	11.573	33.828

14	179.4333	1009.04	7.91	167.15	10.8	10.497	33.868

**Table A2:** List at standard pressures of hydrographic data collected during the PaCOOS cruise of June 2008. Stations are in chronological order. For each cast, the surface pressure (listed as 0 dbar) is actually 1 dbar, while the last pressure is the deepest pressure of the cast. Salinities and oxygens have been adjusted according to the calibration corrections determined from the collected salinity and oxygen water samples. The time listed for each station is the beginning (<mm/dd/yyyy, hhmm> UT) of the CTD cast. Units of geopotential anomaly ( $\Delta\Phi$ ), potential density ( $\sigma_0$ ), and potential spiciness ( $\pi_0$ ) are  $m^2 s^{-2}$ ,  $kg m^{-3}$ , and  $kg m^{-3}$ , respectively.

**Table A3:** Results of nutrient and primary productivity analyses of water samples collected at each hydrographic station during the PaCOOS cruise of June 2008. Stations are in chronological (and numerical) order. The time listed (<Mon. dd, yyyy hh:mm> UT) for each station is the beginning of the CTD cast. 12 Niskin bottles were tripped at each station, although some bottles sampled duplicate pressures. Except where primary productivity analyses were not performed (see Introduction), the data for each station are separated into two sections (“Physical and Chemical” and “Biological”).

The physical oceanographic properties listed in the first seven columns of the “Physical and Chemical” section of each station’s data are the uncorrected values measured by the CTD at the times each Niskin bottle was tripped. Because they are uncorrected, these values may differ slightly from those listed in Table A2. The last four columns of this section give the nitrate ( $\text{NO}_3$ ), nitrite ( $\text{NO}_2$ ), phosphate ( $\text{PO}_4$ ), and dissolved silicate ( $\text{SiO}_4$ ) concentrations.

The “Biological” section of each station’s data gives the results of the primary productivity analyses where such sampling was undertaken.

Date	Jun 23, 2008 17:27	Cruise:	<b>S308</b>	Latitude:	36.795	Year:	2008
Project:	CALCOFI	Station:	<b>C1</b>	Longitude:	-121.848	Work week:	26
Platform:	POINT SUR	Cast:	<b>1</b>	Secchi Depth:	---	Day of Year:	175

\*Note: Latitude and Longitude are reported in decimal degrees. '---' signifies no data.

## Appendix B

**Figure 9:** Contours of (a) temperature ( $^{\circ}\text{C}$ ), (b) salinity, (c) density anomaly ( $\text{kg m}^{-3}$ ), and (d) oxygen ( $\mu\text{mol kg}^{-1}$ ) fields along the line of hydrographic stations from Moss Landing, California (on the right), to CalCOFI station 67-75. Arrows along the top axes indicate the locations of the hydrographic stations. Contour intervals for panels a-d are 0.5 $^{\circ}\text{C}$ , 0.1, 0.2  $\text{kg m}^{-3}$ , and 20  $\mu\text{mol kg}^{-1}$ , respectively, except that the (nearly) oxygen minimum contour of 11  $\mu\text{mol kg}^{-1}$  is highlighted in red in panel d.

**Figure 10:** Contours of fluorescence (volts) [upper panel] and transmissivity (percentage) [lower panel] in the upper 100 dbars of the water column along the line of hydrographic stations from Moss Landing, California (on the right), to CalCOFI station 67-75. The arrows along the upper axis of the upper panel indicate the locations of the hydrographic stations. The contour intervals are 0.02 volts and 1 percent, respectively, for the upper and lower panels.

**Figure 11:** Contours of (a) nitrate ( $\mu\text{M}$ ), (b) nitrite ( $\mu\text{M}$ ), (c) phosphate ( $\mu\text{M}$ ), and (d) silicate ( $\mu\text{M}$ ) fields along the line of hydrographic stations from Moss Landing, California (on the right), to CalCOFI station 67-75. The dots indicate the water sample locations. Contour intervals for panels a-d are 5  $\mu\text{M}$ , 0.1  $\mu\text{M}$ , 0.2  $\mu\text{M}$ , and 4  $\mu\text{M}$ , respectively.

## Appendix C

The following is the introduction from the manual for the Seatech transmissometer that was mounted on the CTD during the PaCOOS cruise of June 2008.

The Sea Tech 25 cm pathlength transmissometer has been designed to provide accurate in situ measurements of beam transmission and the concentration of suspended matter in relatively clear waters.

The two basic processes that alter the underwater distribution of light are absorption and scattering. Absorption is a change of light energy into other forms of energy whereas scattering entails a change in direction of the light without loss of energy.

In a pure absorbing medium, the loss of light due to absorption in a well-collimated beam of monochromatic light will be given by  $I(z) = I(0)e^{-az}$ , where "a" is the absorption coefficient with units of  $m^{-1}$ . Similarly, in a pure scattering medium, the light redirected from a well-collimated beam of monochromatic light will be given by  $I(z) = I(0)e^{-bz}$ , where "b" is the volume scattering coefficient with units of  $m^{-1}$ . Since attenuation is defined as the sum of absorption and scattering, we get  $a + b = c$ , where "c" is the beam attenuation coefficient.

The light lost from a well-collimated monochromatic beam of light in a scattering and absorbing medium is thus given by  $I(z) = I(0)e^{-cz}$ . This can be rewritten as  $T(z) = I(z)/I(0) = e^{-cz}$ , where  $T(z)$  is the percent light transmitted over a distance, "z". It should be noted that transmission is always over a given distance, whereas the beam attenuation coefficient, "c", is independent of distance. "c" is computed by  $-\ln(T)/z$ , where  $z$  is the pathlength of the instrument.

The simple exponential relationship holds only if the light is monochromatic. The Sea Tech transmissometer employs a light emitting diode (LED) light source with a wavelength of 660 nm, which is in the red part of the spectrum. This LED is nearly monochromatic.

A beam attenuation coefficient, "c", can be divided into three parts: 1) That due to water,  $c_w$ ; 2) that due to suspended particulate matter,  $c_p$ ; and 3) that due to dissolved materials (mostly humic acids or "yellow matter"),  $c_y$ . Hence,  $c = c_w + c_p + c_y$ . Each of these components has distinct spectral characteristics. Yellow matter absorbs strongly in the blue part of the spectrum. This absorption decreases exponentially with increasing wavelengths. The beam attenuation coefficient for particulate matter is much less wavelength dependent. It varies approximately as  $\lambda^{-1}$ . The attenuation spectrum of natural waters is a composite of the three components, depending on the relative concentrations. The yellow matter is a by-product of organic decay and can be present in large amounts in lakes, reservoirs, and near-shore waters. At 660 nm, the attenuation of yellow matter is negligible, however, so that the attenuation is due to particulate matter and sea water only.
