Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

The First Record of *Canaraedes* from Hong Kong and aNew Distribution of *Aedes* (*Can.*) *penghuensis*(Diptera: Culicidae)¹John F. Reinert² and Gar-wai Chau³

ABSTRACT. The subgenus *Canaraedes* of the genus *Aedes* is reported for the first time from Hong Kong. The distribution of *Ae. penghuensis* is extended from Taiwan to Hong Kong. Collection and ecological information for this species are given.

The following report of *Canaraedes* Edwards represents the first for this subgenus of *Aedes* Meigen from Hong Kong. The subgenus occupies a distribution primarily in the coastal areas of land masses between 25° N to 10° S latitude and 75° E to 127° E longitude in the Oriental zoogeographical region. The usual immature habitat of species of the subgenus is brackish water in crabholes. This is also the first record of *Ae. (Can.) penghuensis* Lien outside of Taiwan.

Aedes penghuensis was first collected from Hong Kong as adults resting on the inside walls of crabholes during May 1981, and later (September 1981) as fourth stage larvae from water in crabholes. Some of these larvae were reared to adults. Adults were also observed feeding on the collector. These specimens and their collection data are as follows: HONG KONG, Lantau Island, Yam O Bay, May 1981, Gar-wai Chau collector, resting on inside of crabholes, 7 ♀; same data except date, 21 September 1981, and from water in crabholes, 9 ♂ pl, 25 ♀ pl, 45 L.

Yam O Bay is an isolated area on the northern tip of the 56 km long Lantau Island. The crabholes were approximately 5.0-7.5 cm in diameter and 45 cm deep, situated just above the highest tidal mark on a flat sandy beach beyond

the mangroves and just before the first line of shady terrestrial plants. Water in the holes was brackish and the holes were made by crabs probably of *Uca* species. All collections of *Ae. penghuensis* were made during the rainy season; collection attempts during the dry season were negative. Lien (1968:97) reported that in Taiwan, *Ae. penghuensis* larvae bred exclusively in crabholes and females fed on man viciously during the daytime in shade.

ACKNOWLEDGMENTS

Appreciation is expressed to Bruce A. Harrison and Ronald A. Ward, Walter Reed Army Institute of Research, Washington, D. C., for reading and commenting on the manuscript, and to Mollie Reinert for typing the manuscript drafts.
