Summary

Problem

Conventional U.S. Air Force medical assets have been undergoing analysis with Naval Health Research Center (NHRC) methods for modeling clinical requirements since 2005. Currently the Air Force has tasked NHRC to study Unit Type Codes (UTCs) and how they relate to each other. The UTCs are being studied as a system so that capability enhancements can be identified. The initial phase of this medical modeling effort evaluated the Small Portable Expeditionary Aeromedical Rapid Response (SPEARR) system, which is composed of the advanced echelon teams Mobile Field Surgical Team, Expeditionary Critical Care Team, and Preventive and Aerospace Medicine. The follow-on effort evaluated, the Expeditionary Medical Support (EMEDS) Basic, which studied the clinical requirements for the Air Force's deployable platforms providing first responder and forward resuscitative capability. This report details the clinical, medical materiel, and staffing requirements to support an operational EMEDS+10 UTC.

Objective

The objective of this study was to provide recommendations on Allowance Standard (AS) configurations for EMEDS+10 based on operational and clinical requirements. In modeling EMEDS+10, a complex deployable U.S. Air Force medical system, the advantages of medical modeling and simulation are demonstrated.

Approach

NHRC's methods for modeling clinical requirements to determine and validate UTC capability include the use of clinician and logistian input acquired during a Force Development Evaluation (FDE), conducted in February, 2008 at Langley Air Force Base, Virginia. Subject matter experts' input allowed NHRC to generate a valid patient stream using NHRC's Patient Condition Occurrence Frequency tool. This patient stream guides a simulation that is consistent with the operational requirements of EMEDS+10 configurations. With a developed scenario in place, NHRC's Estimating Supplies Program was used to determine the initial materiel requirements for each clinical functional area (FA). The result was a line list that is operationally based and patient driven.

Results

The models, primarily constructed with data collected at the FDE, have identified the capability, operational requirements, and materiel solutions of the EMEDS+10 UTC. During the process, issues of modernization, clinical requirement, standardization, and redundancy were addressed. Noteworthy enhancements were made in the Operating Room, Ward, and Laboratory FAs to contribute to the mission and clinical requirements of EMEDS+10.

In addition, materiel requirements provided by the Pharmacy and Logistics FAs were identified in Anesthesia, Operating Room, Ward, Emergency Room, and Flight Medicine FAs. There are a limited number of medications that are organic to functional areas' AS; all requirements for medications were satisfied by the Pharmacy or residual supplies and equipment from the EMEDS Basic and SPEARR.

Conclusion

Modeling and simulation of the complex EMEDS+10 medical system provides the Air Force with a range of valid materiel solutions for this UTC. This effective AS review focused on mission, operational requirements, and capability, and will support improvements to the Air Force's agile, deployable medical resources.

Background

The Naval Health Research Center (NHRC) has modeled clinical requirements to create and update U.S. Marine Corps medical capabilities and Authorized Medical Allowance Lists (AMALs) since the mid-1990s. Like the Marine Corps, Air Force medical units must remain light, small, and flexible. In 2004, the Air Force Medical Logistics Division, Office of the Surgeon General, Medical Operations Agency tasked NHRC to conduct a proof-of-concept study to assess the feasibility of using its medical modeling tool for U.S. Air Force clinical requirement Allowance Standard (AS) development and management. Following the success of that proof-of-concept study, NHRC was tasked by the Air Force to model elements of its expeditionary medical capabilities which include surgical subspecialty Unit Type Codes (UTCs) Oral Surgery Augmentation Team¹, Ear, Nose and Throat Augmentation Team,² and Gynecological Treatment Team.³ Having successfully completed these studies, the Air Force has since tasked NHRC to conduct further studies that demonstrate the benefit of modeling medical supply requirements for Expeditionary Medical Support (EMEDS). To date, the EMEDS modeled and reported are Small Portable Expeditionary Aeromedical Rapid-Response (SPEARR) system and EMEDS Basic.^{4, 5} This report lays out the results of the EMEDS+10 study. Following this study will be a modeling of EMEDS+25.

The U.S. Air Force Medical Service responds to a wide range of potential scenarios, from providing forward resuscitative care to warfighters to humanitarian assistance to civilian populations.⁶ The Air Force organizes its EMEDS in ways that have proved effective across missions; planners have adhered to the Joint Vision 2010 and provided medical resources that are highly mobile, impose a minimal logistic footprint, and do not compromise on capability.⁷ Looking forward, the guidance provided in the Joint Vision 2020 calls for a more scientific approach, one that leverages and enhances existing information technologies. These are key enablers that support modern operational capability.⁸ Emphasis on mobility and capability has resulted in a modular approach to EMEDS that is reflected in current planning, preparation, and deployment.⁹

EMEDS+10 provides medical capability similar to the EMEDS Basic in terms of clinical tasks. These UTCs are light, agile, and rapidly deployable and provide Forward Resuscitative Care in the Joint Taxonomy Continuum of Health Care Capabilities.¹⁰ EMEDS Basic provides acute intervention and primary care services to support a population at risk (PAR) of 1500–3000 deployed personnel. EMEDS+10 provides a modestly enhanced capability beyond what the EMEDS Basic possesses. EMEDS+10 can provide care for a population at risk of 3000–5000. Enhancements at the EMEDS+10 are more than an increased throughput. The orthopedic surgery capability was enhanced, going beyond the “life and limb saving” techniques, which now include open reduction and internal fixation of long bone fractures and the establishment of a ward with longer patient holding times than in the SPEARR. The ASs from the SPEARR and EMEDS Basic configurations are augmented by adding the EMEDS+10 AS components. Figure 1 depicts the deployment of EMEDS from SPEARR to EMEDS+25.

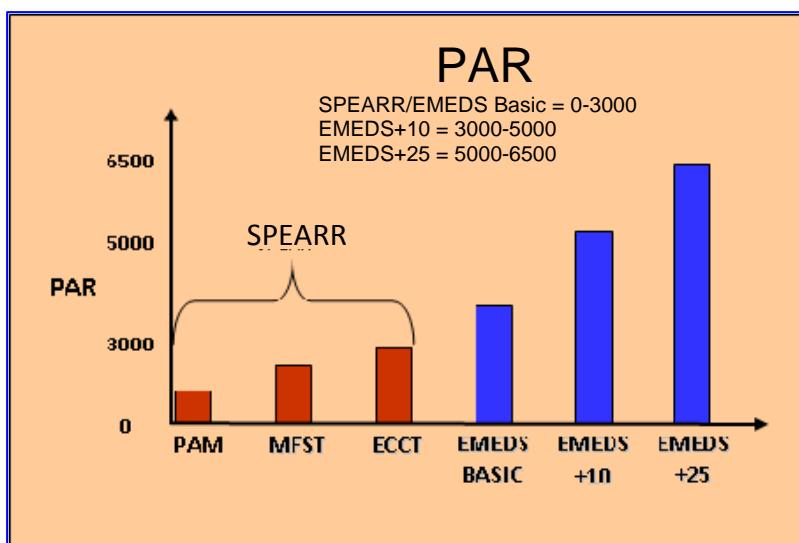

Figure 1. EMEDS deployment from SPEARR to EMEDS+25.

With the studies of the SPEARR and EMEDS Basic completed, this effort is the third volume of EMEDS study titled “Volume Three: EMEDS+10.” It is the third of four volumes documenting the modeling and simulation effort for EMEDS. The next and final report in this series will report the clinical and operational capability of the EMEDS + 25.

EMEDS Force Development Evaluation

The Air Combat Command, Manpower, and Equipment Force Packaging system manager coordinated a Force Development Evaluation (FDE) for the EMEDS SPEARR through +10, at Langley Air Force Base, Virginia, in February 2008. During the FDE, data were captured to refine the model of the surgical capability and to build new models for functional areas (FAs) not yet studied. The data collection effort included interviews with pilot unit members and observation of clinical intervention during the scenarios. Also for the FDE, NHRC researchers developed patient-driven scenarios to make sure the complete range of clinical tasks required to be performed at an FA were called for in the scenario.

Methodology

The NHRC method of modeling medical supply requirements was developed to establish and/or review AMALs for various levels of care in the Navy and the Marine Corps. Its aim is to give clinicians in the field or the fleet the materiel they need to provide the best care possible, while still maintaining as small a logistical footprint as possible, in concert with current Navy and Marine Corps doctrine. It involves a process that begins with the identification of the likely International Classification of Diseases, Ninth Revision (ICD-9) coded patient types to be encountered by a particular type of medical treatment asset, including combat wounds, nonbattle injuries, and illnesses.

The injuries and illnesses are then linked to clinical tasks. Those tasks are, in turn, linked to each supply item needed to complete the task. A patient stream, drawn from historical combat data, is created using a number of casualty estimation programs, including the Patient Condition Occurrence Frequency (PCOF) tool,¹¹ and the Ground Forces Casualty Forecasting System (FORECAS).¹² The required type and quantity of equipment and consumable supplies can then

be calculated based on the probability of those injuries and illnesses occurring in a patient stream. Figure 2 provides a basic representation of the NHRC modeling process.

ICD-9 Code	Capability of Care	Functional Area	Task	% of Pt	Supplies
850.2	1 st Responder	Operating Room	Triage	100	Sponge Surgical Cellulose, Cotton, Gauze 4X4 Pad ABD 7.5X8 White 3 Layers Sterile 240S Dressing Pressure Cotton 7.5X8 Sterile latex-free Dressing Pressure Cotton 11X11 Sterile latex-free Tape Adhesive Surgical 198X2 White
850.5	Forward Resuscitative	Emergency Room	Assess Patient	100	
-			O2 Set-Up	100	
-			O2 Admin	100	
866.1	Theater Hospitalization	Flight Medicine	Needle Thoracostomy	25	
867.1	Definitive Care	Ward	Emergency Control of Hemorrhage	100	
		Pharmacy			
		X-Ray			

Figure 2. Example of NHRC's clinical requirements model: open wound to the kidney.

In this model, the ICD-9-coded patient has an open wound to the kidney and is being treated by the Emergency Room FA at EMEDS+10, a forward resuscitative care clinical capability (formerly Level 2). The task profile shows the likely clinical tasks to be performed for this type of patient in that FA, and the percentage of those patients expected to receive each task. The "Supplies" column identifies the items needed to complete the Emergency Control of Hemorrhage task at that level of capability. Not shown in this figure are additional data fields used to calculate supply quantities, including the amount of each supply needed to complete the task, how often the task will be repeated in the first 24 hours of treatment, how often the task will be repeated in each subsequent 24-hour period, and the average length of stay at that facility.

Patient Stream

A critical component for determinations of accurate initial requirements for supplies and equipment in a scenario is the development of a correct patient stream. The patient stream is the range and types of patients to be seen and treated at a deployed military treatment facility. To provide a patient stream that was both comprehensive in the range of patient types and the frequency they present, the PCOF tool was used. The PCOF tool estimates illnesses and injuries from a range of operations that include Vietnam, the Battle of Mogadishu, and Operation Iraqi Freedom (OIF). The illnesses and injuries are then characterized by patient condition types and probabilities, which are used to generate the required patient stream.

Using the PCOF tool ensured the development of a patient stream reflected the illness and injury distributions evidenced from OIF. Typically, medical threat implications dictate that more than 80% of the hospital admissions during contingency operations are for disease and noncombat-injured patients. Less than 20% are admissions due to combat-related trauma.⁹ However, for this scenario disease, nonbattle injuries were weighted at 90% and the combat-related trauma at 10%.

After the distribution of the patient types is determined the frequency rate of occurrence of these patients are then modeled. A simple approach is to multiply each occurrence rate by the number of patients expected to present for care. For example, if the rate of pneumonia is 1.5% and the expected number of casualties is 200, then 3 patients from this stream would present with pneumonia. A stochastic method for modeling constant rate of occurrence can be modeled using the Poisson process—resulting in 5 or even 0 cases of pneumonia. The Poisson process is the stochastic process in which the events occur continuously and independent of previous occurrences and is used in the development of this patient scenario.

The patient occurrences from PCOF and selecting an average throughput of 200 patients generates the medical supplies for the EMEDS+10. For this capability, 200 patients were selected to be treated for a 7-day period for a PAR of 3000–5000. Because the process is random in nature, producing an identical patient stream is unlikely. Also, the number of the randomly selected patient types is seldom the number of patients in the resulting scenario. In this case, 200 patients were estimated—resulting in a patient stream of 201. The patient stream was modeled using a Poisson distribution based on the rate of occurrence provided from PCOF. The scenario is provided in Appendix A.

ESP Capability

The Estimating Supplies Program (ESP) has three core capabilities: it generates the supplies needed to treat a user-defined patient distribution, it compares an AS with the supplies required by a particular patient stream or with the supplies that should be in the supply blocks, and it reports the clinical readiness of an inventory. These capabilities provide results relative to the FA at a given band of care. As a result, it provides the weight, cube, and cost requirements for a range of medical supplies and equipment, all of which are linked to a clinical requirement.¹³

Findings

Emergency Room

A model of the Air Force Emergency Room equipment package, EMEDS+10 Emergency Room 937 BA, was updated and refined based on clinical input during the EMEDS SPEARR through EMEDS+10 FDE held in February 2008 at Langley Air Force Base in Virginia.

Capability

This UTC provides personnel and equipment for 24 hour operations, to include complex medical/surgical nursing care for non-life-threatening situations, emergency medical system response, and Advanced Cardiac Life Support, Advanced Trauma Life Support procedures, and minor surgical stabilization procedures. Staffing consists of an emergency services physician, clinical nurse, and 2 aerospace medicine technicians and is supplemented as needed by a family physician (044F3) or flight medicine physician (048R3) and 2 aerospace medicine technicians (4N051/4N071). Table 1 shows the required staffing.

Table 1. EMEDS+10 ER Staffing

AFSC Description	AFSC	Quantity
Emergency services physician	044E3	1
Clinical nurse (Emergency)	046N3	1
Aerospace medicine technician craftsman	4N051/4N071	2

Quantity Differences

Most of the changes are in the consumables. The notable changes in consumables consist of a decrease in exam gloves from 30 packages of 100 to 2 packages of 100. The total number of exam gloves for sizes medium and large is now a total of 5 packages of 100. An additional decrease is found in surgical detergent 4% 32 oz, which went from 12 bottles to 1 bottle. There are five medication line items in the AS consisting of a bronchial dilator, Povidone-iodine Topical Solution, Ringer's Inj. Lactated, Sodium Chloride Inj. 0.9% 100 ml, and Sodium Chloride Inj. 1000 ml. Based on the simulation, an increase of the bronchial dilator by 4 packages for a total of 7 and a decrease of both Ringer's Inj. Lactated and Sodium Chloride Inj. 1000 ml from 3 packages to 1 package of each is recommended. There are three recommended additions to the 937 BA, Emergency Room AS: Tape Measuring Linen 0.5 X 72 in., surgical prep razor, and skin markers. These line items are recommended for addition based on clinical requirements for an EMEDS+10 emergency room.

Two items were not modeled. These were Sexual Assault Determination Kit Fingerstick (used for investigative purposes and not part of the clinical requirements) and Condom Lubricated, used as a preventive medicine measure.

Clinical requirements called for line items from other FAs within the EMEDS+10 937 B, such as medicines from 937 BE, Pharmacy, and consumables from 937 BK. Logistics were also modeled and will be included in the overall EMEDS+10 model. Quantities called for from these other FAs will be aggregated in a separate line-item list.

Recommended changes to the EMEDS+10 emergency room AS is based on clinical requirements. The model created resulted in a 19% decrease in overall weight, a decrease in cube of 39%, and a cost decrease of 2.5%, or \$1,491.22, when compared with the pre-FDE AS. Modeled cost for EMEDS+10 emergency room is \$58,936.85. Table 2 is an overview of the changes by category. A detailed listing of AS recommended changes is provided in Appendix B.

Table 2. Weight, Cube, and Cost Analysis of the EMEDS+10 Emergency Room

Category	Weight	Cube	Cost

Percent change	-19.03	-38.95	-2.47

Operating Room, Anesthesia, and Central Sterile Supply

The surgical capability for EMEDS+10 was subject of an FDE in February 2008. During the FDE modernization, standardization and capability enhancements were discussed and provider-directed revisions were made to the three FAs that make up the surgical capability within EMED+10; those FAs are the Operating Room, Anesthesia, and Central Sterile Supply.

During the FDE, researchers from NHRC interviewed the clinical providers in an effort to refine existing surgical data in ESP. From the collected data, product research, and literature reviews a model was built of the surgical FA. A simulation was completed representing the kind of patients and range of those patients who may likely present for care. To develop the simulation, the PCOF tool was used to derive patient occurrence data from OIF. The data were then weighted based on sustained operations providing forward resuscitative care capability consistent with the mission and the scope of care operating environment of an EMEDS+10 military treatment facility. The patient stream for the surgical capability is a subset of the scenario used to model the EMEDS+10 and is listed in Table 3.

Table 3. Patient Stream for Surgical Capability

Number of Pts	ICD-9 Code

2	540.00, Acute Appendicitis with Peritonitis
2	685.00, Pilonidal Cyst with Abscess
10	Total

Capability

EMEDS+10 surgical capability is an enhancement of the EMEDS Basic system and can accommodate 10 surgical or 20 nonsurgical resuscitative patients. While no additional throughput is provided at the treatment facility, there is a significant difference in the environment where care is provided. There is an increase of 100 sq ft in the operating room and additional surgical instrumentation, primarily in orthopedics. Also provided in this FA are supplies and equipment for cleaning and sterilizing larger volumes of surgical instruments and medical materiel. This FA has no increase in the staffing and is fielded with Mobile Field Surgical Team personnel who include a general surgeon, an orthopedic surgeon, an emergency services physician, an anesthesiologist, and an operating room nurse.

Change Justification

Changes to the AS are categorized as Modernization, Clinical Requirement, Standardization, and/or Redundancy. There were a total of 27 items deleted and 17 new items added to the AS, totaling 44 individual line-item changes. Some items fell into two or more justification categories; in this study there were 60 justifications for change. Figure 3 depicts the justification for change occurrences in the AS.

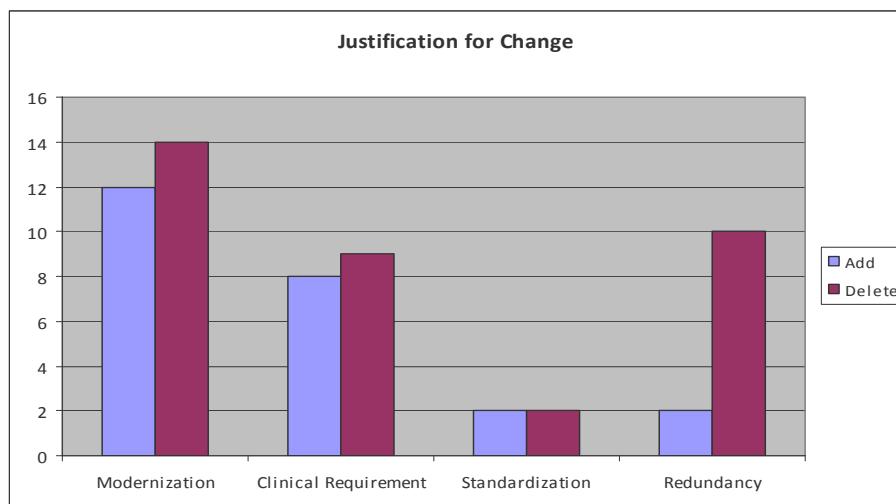

Figure 3. Surgical Capability AS content change justifications.

Quantity Differences

In the equipment category, increases in weight, cube, and cost were realized. In these FAs, equipment items are the largest segment of the inventories. Of the 365 items studied, 262 are equipment. This increase was due, for the most part, to the addition of the Sterilizer Water Recovery System 10 Gal Kit, which costs \$20,886.75. There were numerous items deleted from this category, but none off-set the dollar value of this single line item.

Consumable items decreased in weight, cube, and cost. External fixation capability was enhanced during the FDE. One set was deleted and the enhancements added and the level called for by the scenario was 3 while 5 were on hand. The majority of the changes were a decrease in packages. Consumables in this setting are provided in the units of issue and frequently the scenario called for much less than what was on hand. For instance, there are two types of surgical 4 X 8 Sponges, both provided for the packages of 200. One of the sponges is provided

for in the AS to a quantity of 4 packages of 200 and the scenario called for 1 package. The total requirement for both types of sponges was 600 sponges accounting for the recommended decrease of this item. Table 4 lists the supply categories and pre- and post-FDE recommended quantities. A detailed list of each line item in the Operating Room, Anesthesia and Central Sterile Supply is provided in Appendices C, D, and E respectively.

Table 4. Weight, Cube, and Cost Analysis of the Operating Room, Anesthesia, and Central Sterile Supply FAs

Category	Weight	Cube	Cost
Pre-FDE equipment	2108.373	308.949	\$231,225.61
Post-FDE equipment	2111.643	332.964	\$244,599.93

Percent change	-2.573	-1.885	4.359

Ward

A model of the EMEDS+10 Ward was built with input from clinical subject matter experts. The core AS (937 BS) was augmented using supplies and equipment from primarily the Logistics and Pharmacy FAs within EMEDS+10. For this scenario, a robust patient stream was developed using the PCOF tool and patient occurrence data from OIF.

Capability

The Ward at the +10 configuration provides 10 inpatient beds and a more complex patient care capability than at EMEDS Basic. Additional capabilities include patient monitoring supplies and equipment and the availability of a defibrillator, which is organic to the Ward and not relied on in other FAs. This level of inpatient care is provided for a 7-day period without resupply. The ward is staffed with 3 clinical nurses, 8 aerospace medicine journeymen and 2 aerospace medicine craftsmen.

The ward is heavily reliant on the presence and availability of medical supplies and materiel from other FAs within EMEDS+10 to provide care, most notably from the Logistics and Pharmacy FAs. The requirements drawn from these FAs provide the necessary additional medication and medical materiel typically required of the ward FA for a 7-day period.

The patient stream contains patients who represent the scope and range of patients appropriate for this level of care. The scenario is in keeping with the tactics, techniques, and procedures for EMEDS+10, and assumes that medical evacuation of patients is readily available and that hold times are minimal. In the patient stream there are 88 patients representing a broad range of ICD-9 codes encountered in this scenario. Battle injuries are more frequently poly-traumas. In this scenario four of the patients have multiple ICD-9 codes from battle injuries. Table 5 is a list of the ICD-9-coded patients derived for this simulation.

Table 5. EMEDS+10 Ward Patient Stream

Change Justification

As a result of the FDE, significant enhancements were made to inpatient capability. Revisions of the AS are categorized as Modernization, Clinical Requirement, Standardization, and/or Redundancy. There were a total of 10 items deleted and 20 items added to the AS. Those 30 line item changes resulted in 41 justifications for changes. Frequently a line item falls into more than one change justification category. For instance, sequential compression devices (SCDs) were added to the AS to mitigate the potential of a bed-ridden patient suffering pulmonary emboli. These devices fell into two categories; Modernization and Clinical Requirement. Figure 4 depicts the rationale for change by category.

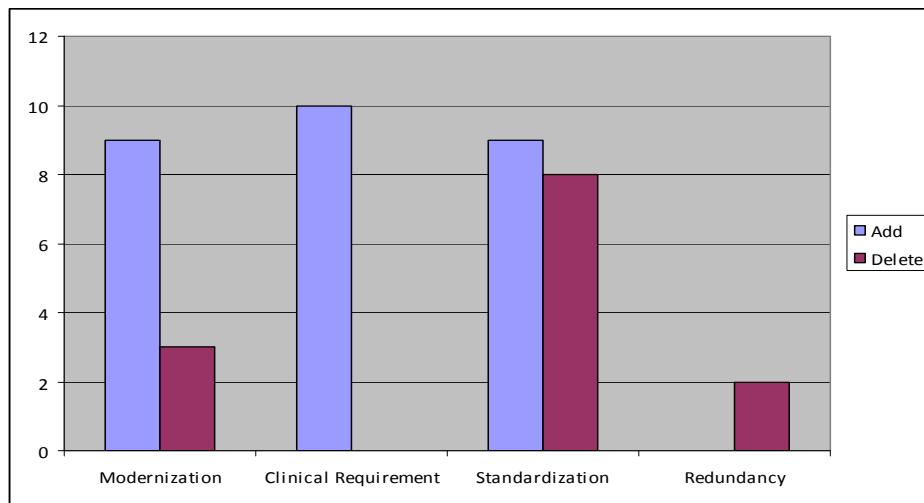

Figure 4. Ward AS content change justifications.

Quantity Differences

Two new capabilities added and accounted for most of the cost increase in the AS: SCDs and wound vacuum-assisted dressings. Currently one wound vacuum-assisted dressing system is being recommended for the AS. The rationale here is the EMEDS+10 Ward AS is added to the existing inpatient capability from EMEDS Basic where there are three at that level of care, for a total of four wound vacuum-assisted dressing systems. Also, the wound systems are a patient movement item and will be replaced when a patient is medically evacuated. This one item costs \$22,500.00, contributing significantly to the overall increased cost of the AS. The addition of the SCD capability resulted in the addition of seven line items for this task, totaling \$4,600.00.

In this AS, medications consist of intravenous fluids only and no changes in quantities available are recommended. There are other medications required of this scenario; those items are found in the Pharmacy FA. Consumables in this scenario exceeded the on-hand amounts in the ward. Like the medication section, there are items drawn from the Logistics FA. The weight, cube, and cost differences across the categories are found in Table 6. Appendix F provides a detailed listing of each line item that was subject to the FDE and reports the status and recommended quantities based on the scenario.

Table 6. Weight, Cube and Cost of the EMEDS+10 Ward

Category	Weight	Cube	Cost
Pre-FDE equipment	1,839.06	196.369	\$88,136.86

Critical Care Unit

A model of the Air Force critical care supplies and equipment package for EMEDS+10 was based on clinical input during the EMEDS SPEARR through +10 FDE. The patient stream was used to simulate the materiel requirements for the range of presurgical cases and injuries and illnesses that would typically be seen and treated by an EMEDS+10 Critical Care Unit in a 7-day period.

Capability

This UTC provides personnel and equipment for a critical care surge capability that may hold as many as three patients for up to 12 hours prior to aeromedical evacuation. This platform provides critical care for intensive and postanesthesia care for a variety of trauma, surgical, and medical patients. Critical care capability includes cardiovascular monitoring, ventilation/oxygenation support, hemodynamic monitoring, fluid/medication/electrolyte management, and advanced ACLS. This FA is staffed with one internal medicine physician, one critical care nurse and one cardiopulmonary technician.

Quantity Differences

There were no changes in equipment and consumables. The one change in durables was AA batteries. There are no medication line items in the 937 BC AS. Clinical requirements called for line items from other FAs within the EMEDS+10 937 B, such as medicines from 937 BE, Pharmacy, and consumables from 937 BK. Logistics were also modeled and will be included in the overall EMEDS+10 model. Quantities called for from these other FAs will be aggregated in a separate line item list. There are no recommended changes to EMEDS+10 Critical Care Unit ASs. Table 7 is an overview of the changes by category. A detailed listing of the 937 BC ASs is provided in Appendix G.

Table 7. Weight, Cube, and Cost Analysis of the Critical Care Unit

Category	Weight	Cube	Cost

Laboratory

A model of the EMEDS+10 Laboratory capability was built. This effort should be considered a baseline since there was no opportunity to discuss mission, capability, or deployment of the Laboratory FA with the subject matter expert from the pilot unit.

Capability

The EMEDS+10 Clinical Lab capability is an enhancement to the EMEDS Basic UTC. The core EMEDS+10 Laboratory AS is added to the EMEDS Basic capability, which is limited to point-of-care testing. EMEDS+10 capability significantly broadens the scope of care provided both in terms of supplies and equipment and in personnel. The enhancements organic to EMEDS+10 Laboratory enable blood analysis for hematology and serology. While EMEDS Basic does provide a walking blood bank, EMEDS+10 has the capability to type and cross match and store 30 units of fresh frozen plasma. This capability is staffed by one laboratory technician.

A patient stream was developed to capture the clinical capability of EMEDS+10. While the patient stream for EMEDS+10 is very robust, not all patients require laboratory studies to assist in diagnosis and treatment. A total of 96 patients did require laboratory studies in this scenario and are listed in the Table 8.

Total		96

Change Justification

Modeling and simulation provides visibility on justifications for change. Change justifications in an AS are typically placed into four different categories: Modernization, Clinical Requirement, Standardization, and Redundancy. Categorizing these changes make sure when modifications are made they are purposeful and within the context of the unit's tactics, techniques, and procedures, and in keeping with the mission of the FA being studied.

In this study there were a total of 19 line-item changes in the AS with a total of 38 change justifications. There are three justifications for change in this study they are Modernization, Clinical Requirement, and Standardization. Changes in this study frequently fell into more than one category accounting for more justifications than actual changes. For instance, a dry heat incubator was removed and was replaced by another because the original incubator is to be removed from the National Stock Table and another was added. While it cannot be considered Modernization, it does satisfy the Clinical Requirement because the incubator is necessary to perform a needed task and the replacement is considered a standard solution because it is found in the Universal Data Repository.

Across all categories more items were added than removed. These additions significantly enhanced the organic capability to perform blood gases and chemistry studies of urine. While there are urine dip sticks that can be used from the EMEDS Basic lab FA, the urine analyzer at the EMEDS+10 provides a greater throughput, it can perform multiple studies simultaneously, is easy to use, and alleviates human error in interpretation of results. Figure 5 depicts the numbers and justifications for change.

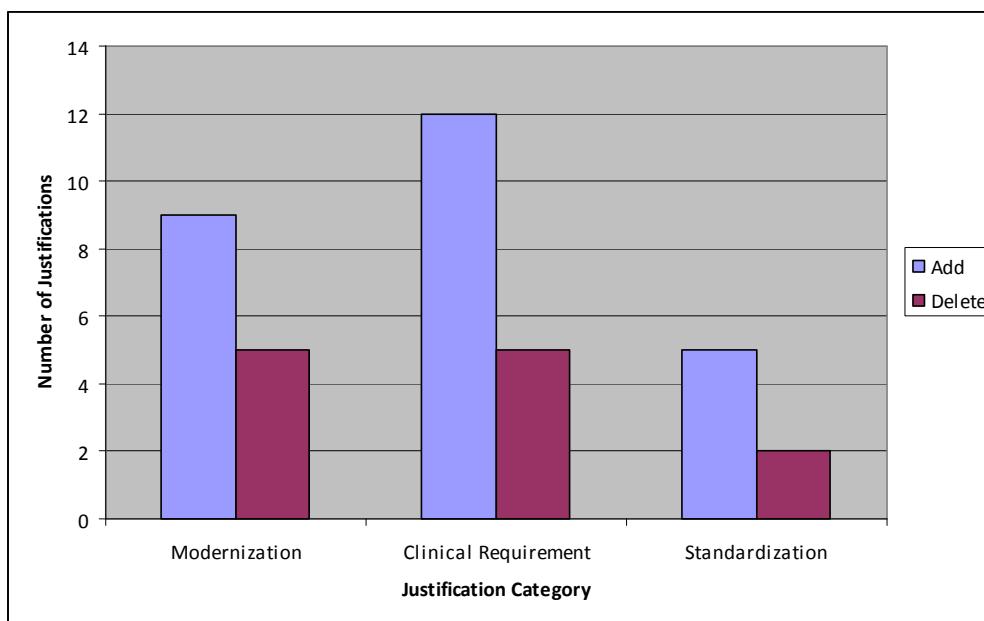

Figure 5. EMEDS+10 Laboratory justifications for change.

Quantity Differences

Changes in the EMEDS+10 Laboratory configuration resulted in a noteworthy increase in total cost and a modest increase in cube. Laboratory capability at this level of care is supported heavily by technology; technology, particularly in health care, tends to be expensive. Four items added to the AS are responsible for a nearly \$40,000 increase: the handheld gas analyzer (\$11,690.67), the urine analyzer (\$13,690.15), the coagulation timer unit (\$7,076.03), and the optical microscope (\$6,585.86). The total cost of these items was not offset by the deletion of equally expensive items from the AS. Table 9 provides the weight, cube, and cost analysis of the changes in AS. A detailed line list is provided in Appendix H.

Table 9. Weight, Cube, and Cost of the EMEDS+10 Laboratory

Category	Weight	Cube	Cost
Pre-FDE equipment	868.36	93.07	\$60,032.52
Post-FDE equipment	875.39	97.47	\$97,804.84
Difference	7.03	4.41	\$37,772.32
Percent change	0.81	4.73	62.92
Pre-FDE consumables	195.23	54.27	\$7,289.68
Post-FDE consumables	181.79	66.83	\$8,955.28
Difference	-13.44	12.56	\$1,665.60
Percent change	-6.88	23.14	22.85

Difference	-6.42	16.79	\$39,428.14
Percent change	-0.60	11.33	58.25

Radiology

Capability

Radiology at EMDS+10 provides enhanced capability to include spinal, chest, pelvic, and abdominal imaging. As with EMEDS Basic image development is digital. A radiology technician is assigned, providing a wider range of services. The AS augments the capability found at EMEDS Basic and has equipment like the floor-mounted cassette holder needed for upright imaging of the chest and abdomen. Also included are calipers used to calculate the appropriate penetration for views based on the size of the patient.

Quantity Changes

The recommended Radiology AS has 14 line items, 12 of which are equipment. The equipment items were provided in quantities appropriate for the level of care and throughput. As with EMEDS Basic, there were no change recommendations for equipment. One consumable item was recommended for removal: the Envelope, Photo Negative. All images are digital, negating the need to provide envelopes from developed radiographic images. Iohexal Injection was a recommended addition. Iohexal Injection is a contracting agent used in myelography, which provides examination of the spinal cord, spinal column, and nerve roots. A weight, cube, and cost analysis of the changes in the AS and a line list are provided Appendix I.

Pharmacy

Capability

The Pharmacy FA at EMEDS+10 provides greater infrastructure and materiel support to the clinical FAs than the Pharmacy at EMEDS Basic. The pharmacy at EMEDS+10 is capable of storing and dispensing medications, enough for a 10-day period, and is staffed with a pharmacist. The pharmacist is responsible for maintaining and accounting all medications.

Quantity Differences

There were significant changes recommended based on the clinical requirements of the patient stream. Each clinical FA has a requirement for medications to be administered, so the Pharmacy materiel requirements were aggregated across the clinical FAs within EMEDS+10. The patient stream was robust and having a broad spectrum of patient types, many were seen in more than one FA and seen in numbers appropriate for the EMEDS+10. There were 212 medications in this study. Of the 212 medications, 46 items were recommended to be increased—while 89 were recommended to be decreased. The operational requirement for 12 medications did not exist and have been recommended for deletion without replacement. The medications' total cost was nearly \$3,900. The medications' recommended include five medications used for tobacco cessation, which is not considered an operational requirement in the EMEDS+10 tactics, techniques, and procedures. Also removed were two medications used as prophylaxis against HIV transmission due to occupational exposure to blood. Aspirin 325 mg is recommended as a deletion because of the complications in coagulation in the critically injured. Aspirin 81 mg for use in CPR is a recommended addition. Table 10 provides a weight, cube, and cost analysis of the Pharmacy FA. A detailed line list is in Appendix J.

Table 10. Weight, Cube, and Cost of the EMEDS+10 Pharmacy

Category	Weight	Cube	Cost
Pre-FDE equipment	703.46	39.75	\$7,138.68

Post-FDE total	1459.34	161.06	\$38,486.89
Difference	-553.84	-92.22	-\$19,927.58
Percent change	27.51	36.41	34.11

Logistics

Capability

The Logistics component of EMEDS+10 provides a segregated, environmentally controlled storage area for medical materiel and augments the resupply capability of EMEDS Basic. This capability is also responsible for the maintenance and repair of the medical equipment organic to EMEDS+10. The biomedical repair equipment personnel are included in the manning and are materially supported in EMEDS Basic; most of the tools used in biomedical repair are maintained and carried by the technicians and not part of the ASs within the EMEDS systems.

The Logistics FA is also staffed with personnel responsible for maintaining the reconstitution of clinical areas in EMEDS.

Quantity Differences

There were noteworthy changes in the Logistics AS based on the resupply and materiel needs of the supported FAs. The total resupply requirement was based on the aggregated materiel needs of all the clinical FAs within EMEDS+10. As with EMEDS Basic, if the materiel requirements of line items exceeded the amounts available in the clinical FAs, these items were called from Logistics. Unlike EMEDS Basic, items like pajamas, robes, or bedding were not increased because laundry facilities are either organic to EMEDS+10 or obtained on a contractual basis. Medications and intravenous fluids found in logistics were recommended to be moved to the pharmacy. Also recommended for removal was the Envelope, Photo Negative. This item is used to store radiology films. Currently the Radiology Department uses digital technology to process x-rays, negating the need for the envelopes. Table 11 is a summary of the weight, cube, and cost analysis. A detailed listing of the logistics AS is provided in Appendix K.

Table 11. Weight, Cube, and Cost of the EMEDS+10 Logistics

Percent change	47.84	11.33	58.25

Discussion and Conclusion

The SPEARR through EMEDS+10 was the subject of an FDE performed February 2008. During the FDE, data were collected from FA SMEs ensuring accuracy in the modeling and simulation effort.

A modeling and simulation study was conducted on the clinical components of the EMEDS+10, composed of the Emergency Room, Operating Room, Ward, Laboratory, and Radiology FAs. The clinical FAs have capabilities that range from routine sick call to the life- and limb-saving forward resuscitative care. Patient streams were developed that represent the type and frequency of patients likely to be seen at an EMEDS+10.

Using ESP, a simulation provided a comparison of the pre-FDE and post-FDE AS, resulting in the changes categorized as Modernization, Clinical Requirement, Standardization, and Redundancy. Also detailed were quantity differences in the AS. These quantity differences were a result of the effect of the patient stream during the scenarios and provide greater visibility of the weight, cube, and cost requirements of the patient stream.

Standardization activities are enhanced because ESP can identify common materiel solutions in a range of FAs. This standardization is critical in maintaining continuity of care, particularly for a critically injured patient who moves quickly from point of injury to definitive care. Figure 6 is a screenshot displaying common supplies and equipment solutions in a range of Air Force FAs. The figure also indentifies areas for potential standardization. For instance, there are two different nasopharyngeal airways, seemingly possessing the same characteristics and are seemingly interchangeable. Airway standardization across FAs can be examined more closely during future AS reviews using ESP.

Figure 6. Standardized materiel solutions in Air Force FAs.

ESP is an invaluable tool when building a new AS or reviewing an existing one. ESP is instrumental in configuration management because the planner is able to see the effect of deleting an item across the spectrum of tasks performed in a given FA. Moreover, SMEs can review task profiles to determine if a task is considered critical, and if not, it can be removed from the task profile. Figure 7 is a task profile for a Full Arm Amputation patient in the Ward FA for EMEDS+10. The same concept holds true for supplies: if a supply item is not considered essential to perform a task, it can be removed from the task.

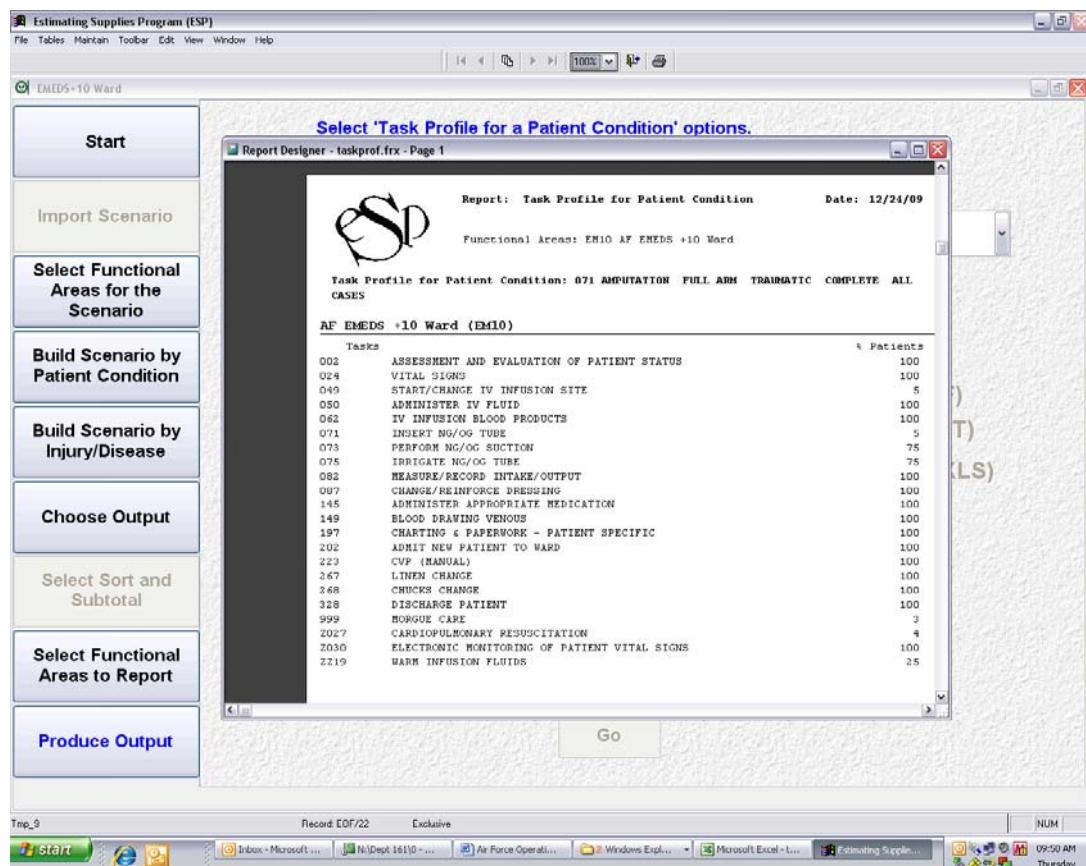

Figure 7. Task profile for a full-arm amputation patient admitted to the Ward at EMEDS+10.

Finally, ESP creates an audit trail establishing clinical requirements for supply items in medical system inventories that enable logisticians, medical planners, and manpower and equipment force packaging members to validate current inventories and perform analyses of projected changes to future ones.

Acknowledgments

We would like to express our appreciation to General Dynamics, Information Technology of Fairfax, VA, and Expeditionary Medical Modeling Consultants of Oceanside, CA, for their support in this effort.

The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB Control number. **PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.**

1. REPORT DATE (DD MM YY) 12 01 10	2. REPORT TYPE Technical Document	3. DATES COVERED (from – to) Feb 2008–Nov 2009		
4. TITLE Air Force Operational Medicine: Using the Estimating Supplies Program to Develop Materiel Solutions for the Operational Clinical Requirements of the Expeditionary Medical Support (EMEDS) System. Volume Three: EMEDS+10		5a. Contract Number: GS-09K-99BHD 5b. Grant Number: 5c. Program Element Number: 5d. Project Number: 5e. Task Number: 9T7SDGIS006 5f. Work Unit Number: 60334		
6. AUTHORS Nix, RE; Hopkins, CC; Konoske, P; Pang, G; Jackson, C				
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES) Commanding Officer Naval Health Research Center 140 Sylvester Rd San Diego, CA 92106-3521		8. PERFORMING ORGANIZATION REPORT NUMBER Tech Doc 10-2B		
8. SPONSORING/MONITORING AGENCY NAMES(S) AND ADDRESS(ES) Commanding Officer Naval Medical Research Center 503 Robert Grant Ave Silver Spring, MD 20910-7500		10. SPONSOR/MONITOR'S ACRONYM(S) NMRC/NMSC 11. SPONSOR/MONITOR'S REPORT NUMBER(s)		
9. DISTRIBUTION/AVAILABILITY STATEMENT Approved for public release; distribution is unlimited.				
10. SUPPLEMENTARY NOTES				
11. ABSTRACT <p>A modeling and simulation effort was completed on the Air Force Expeditionary Medical Support (EMEDS)+10 system using current Naval Health Research Center methodology and the Estimating Supplies Program (ESP). The clinical functional areas modeled were the Emergency Room, Operating Room, Anesthesia, Central Sterile Supply, Critical Care Unit, and Ward. Ancillary functional areas modeled were Radiology, Laboratory, and Pharmacy. The Logistics functional area, while not a clinical component of EMEDS+10, does provide materiel support and was modeled. EMEDS+10 is the follow-on echelon of the EMEDS Basic, and is an element of the more robust EMEDS deployable medical system and provides emergent life- and limb-saving resuscitative surgical care as well as limited outpatient services in austere environments. EMEDS was the subject of a Force Development Evaluation (FDE) where the system was set up as in a deployable setting and patient streams were presented and treated in the various functional areas. As part of the FDE, significant modernization of the Allowance Standard was performed. During the FDE, data were collected and used to construct the models used in the simulation. The simulation was a patient stream derived from Operation Iraqi Freedom I and was representative of the kind of patients and their occurrence frequency this system was developed to support. The study of the Allowance Standards resulted in modernization of the three functional areas, most notably the Operating Room. The surgical capability enhancements included hemorrhage control, negative-pressure dressing supplies and equipment, and the application of compression boots.</p>				
12. SUBJECT TERMS EMEDS Basic, medical modeling
