Presented at the Armed Forces Radiobiology Research Institute Scientific Medical Effects of Ionizing Radiation Course July 28 through August 1, 2008 Bethesda, Maryland

Distributed via the AFRRI Web site

http://www.afrri.usuhs.mil

The Scientific Medical Effects of Ionizing Radiation Course, conducted once a year, focuses on the latest research about the medical effects of ionizing radiation to help clinicians, health physicists, and medical planners preserve troop health in the face of radiological/nuclear terrorism or warfare.

For additional information about AFRRI training opportunities, contact AFRRI Military Medical Operations at 301-295-9150 or press the "Request info about: MEIR courses" button on this web page. To view more AFRRI information products, go to this web page.

Fundamentals of Radiation Physics

Scientific MEIR

AFRRI - July 2008

Col. Mark S. Smyczynski

Objectives

- Define ionizing radiation
- Describe sources of ionizing radiation
- Describe interaction of ionizing radiation with matter at microscopic level
- Describe interaction of ionizing radiation with matter at macroscopic level

Categories of Ionizing Radiation

- Directly ionizing
 - Charged particles
 - e⁻ e⁺ p⁺ α⁺⁺ π⁻ heavy nuclei
 - $\alpha^{++} = {}^{4}\text{He}^{+2}$
- Indirectly ionizing
 - Photons
 - E = hv (Greek letter nu = frequency)
 - γ rays = photons of nuclear origin
 - Neutrons

Sources of Ionizing Radiation

- Electrically generated
 - Charged particle accelerators
 - Van de Graaff generator, cyclotron linear accelerator, synchrotron, betatron, microtron, rhodotron
- Radionuclides
 - Atom with an unstable nucleus
 - Naturally occurring
 - Man-made (induced)

Basic Nuclear Physics

- Nuclei have different energy states
 - Ground state
 - Metastable or isomeric nuclear states
 - Often $> 10^{-12}$ sec or on the order of hours
 - Excited nuclear states
 - Usually < 10⁻¹² sec
- Terminology
 - Isotopes: same Z (atomic number)
 - Isobars: same A (atomic mass)
 - Isotones: same N (number of neutrons)

Nuclear Processes

- β- decay
 - n → p⁺ + e⁻ + antineutrino + KE
- β⁻, γ decay
 - n → p⁺ + e⁻ + antineutrino + KE followed by γ release
- β⁺ decay
 - p⁺ → n + e⁺ + neutrino + KE
 followed by e⁺/e⁻ annihilation
- β⁺, γ decay
 - p⁺ → n + e⁺ + neutrino + KE
 followed by γ release and e⁺/e⁻ annihilation

MEIR

More Nuclear Processes

- Electron capture
 - p⁺ + e⁻ → n + neutrino + KE
 then characteristic x-rays or Auger electrons
- Electron capture, γ
 - p⁺ + e⁻ → n + neutrino + KE
 followed by γ release
 then characteristic x-rays or Auger electrons
- α decay
- α decay, γ
 followed by γ release

Basic Mathematical Formulation

- $-dN/dt = \lambda N (\lambda = decay constant)$
- $N(t)/N_0 = e^{-\lambda t}$
- $N(t) = N_0 e^{-\lambda t}$
- Activity is defined as -dN/dt
- $A(t) = A_0 e^{-\lambda t}$
- In 2 = $\lambda T_{\frac{1}{2}}(T_{\frac{1}{2}} = \text{half life})$
- $0.693 = \lambda T_{\frac{1}{2}}$
- $\lambda = 0.693/T_{\frac{1}{2}}$
- Often useful to use e^{-x} where $x = (0.693/T_{1/2})t$
- For small values of λt: e^{-λt} ≈ 1-λt
- Average lifetime: $\tau = 1/\lambda = 1.44T_{1/2}$

International System of Units (SI) and Radionuclide Activity & Decay

- SI unit of activity is becquerrel (Bq)
- $1 \text{ Bq} = 1 \text{ sec}^{-1}$
- Describes rate of decay as number/sec
- Thus 1 Bq = 1 "disintegration" per sec (dps)
- Another unit of activity is the Curie (non-SI)
- 1 Ci = $3.7 \times 10^{10} \text{ sec}^{-1} \text{ or } 3.7 \times 10^{10} \text{ Bq}$
- Therefore 1 Bq = 2.7 x 10⁻¹¹ Ci

Specific Activity

- Carrier: stable isotopes of same element in the sample are called <u>carriers</u>
- Specific activity defined as: radioisotope activity/total mass of element present
- Units of specific activity (non-SI): Ci/g
- m = activity/specific activity
- Highest possible specific activity is referred to as the <u>carrier free specific activity</u>

Production of Radionuclides

- Nuclear reactor
 - Neutron activation
 - Not carrier free; tend to decay by β- emission
- Particle accelerator
 - Cyclotron often used to add positive charge
 - Carrier free; tend to decay by β⁺ emission
- Photonuclear
 - Low yield
 - Not carrier free; tend to decay by β⁺ emission

MEIR

SI Units - Matter - Energy

- Fundamental units of nature (MKS-A) length mass time ampere meter kilogram second ampere
- Other supplementary units temperature (kelvin: K) amount of substance (mole: mol) luminous intensity (candela: cd)
- All other units are derived
 eg: electrical potential (volt)
 1 V = 1 m² kg s⁻³ A⁻¹

SI Units - Matter - Energy

- Matter: fundamental property in universe
- Energy: fundamental component of nature
- Energy = ability to do work
- Recall: work = force x distance (newton x meter)
- Energy can be expressed in several ways
- SI unit of energy is joule (J)
- $-1 J = 1 m^2 kg s^{-2}$
- Total energy = kinetic energy + potential energy
- Consider 1 e- accelerated across an electrical potential of 1 volt acquires a KE of 1 eV
- \blacksquare 1 eV = 1.6022 x 10⁻¹⁹ J

SI Units - Matter - Energy

- Matter represents a form of potential energy
- Mass increases as KE approaches speed of light
- An object at rest has its own rest mass energy

	m_0c^2	$\rm m_{e^-}$
e-	0.511 MeV	1
μ⁻	106 MeV	207
π-	140 MeV	273
p ⁺	938.26 MeV	1836
n	939.55 MeV	1839

Fundamental Quantities

Particle fluence

$$\Phi = dN/da$$

Energy fluence

$$\Psi = dE/da$$

Exposure (roentgen - R)

$$X = dQ/dm$$

where dQ is the sum of the electrical charges of one sign on all the ions produced in air when all the electrons liberated by photons in a volume of air of mass dm are completely stopped in air

$$1 R = 2.58 \times 10^{-4} C/kg$$

- Attenuation = reduction in the number of particles in a radiation beam as it passes through an absorber
- Can occur as a single event or series of events
- Energy loss by an extended series of energy transfer events predominates for charged particle beams
- The concept of range and path length mostly appropriate for charged particle beams
- Energy loss by indirectly ionizing radiation beams can occur in a single event or gradual degradation
- Mean free range & half value thickness of absorber more meaningful for indirectly ionizing radiation

More on Attenuation

- Involves the processes of absorption and scatter
- Based on the concept of a reaction cross section
- Cross section = probability per target per unit area
- Probabilities of independent processes additive
- Attenuation terminology different for charged particle and indirectly ionizing radiation beams
- Charged particle beams scatter elastically
- Energy loss related mostly to inelastic processes
- Linear attenuation coefficient best describes attenuation for indirectly ionizing radiation beams

Energy Loss by Charged Particles

- Predominantly occurs through inelastic collisions with atomic electrons and nuclei
- Involves coulomb force and strong force
- Energy loss per unit length called stopping power
- Depends on particle, its KE, and Z of medium
- KE often symbolized by T
- Stopping power: collisional and radiative
 dT/dx = dT/dx_C + dT/dx_R
- Mass stopping power
 dT/pdx = dT/pdx_C + dT/pdx_R

Photon Attenuation Processes

- Atomic photoelectric effect
 _aτ ↔ Z⁴/(hν)³ x-section/atom for hν ≤ 0.1 MeV
- Compton scattering
 _eσ ↔ Z x-sec/electron & _aσ = Z _eσ x-sec/atom
 Compton effect dependent on atomic e⁻ density
 Atomic e⁻ density mostly constant except for H
- Atomic pair production
 aκ ↔ Z² cross section/atom
- Rayleigh scattering
 _aσ_R ↔ (Z/hν)² cross section/atom

Photon Attenuation

Total linear attenuation coefficient

$$\mu = \tau + \sigma + \kappa + \sigma_R$$

Total mass attenuation coefficient

$$\mu/\rho = \tau/\rho + \sigma/\rho + \kappa/\rho + \sigma_R/\rho$$

- Under ideal narrow beam conditions
 - $N(x) = N_0 e^{-\mu x}$ (similar to radioactive decay eqn.)
- Under less ideal conditions (broad beam conditions)

$$N(x) = N_0 e^{-\mu'x}$$

where μ' = effective total linear attenuation coefficient

Photon Energy Transfer

- Photons transfer energy by generating secondary charged particles
- Almost all charged secondary particles are e⁻
- Total energy transfer coefficient

$$\mu_{tr} = \tau_{tr} + \sigma_{tr} + \kappa_{tr} + (\gamma, p^+)_{tr} + (\gamma, n)_{tr}$$

Total mass energy transfer coefficient

$$\mu_{tr}/\rho = \tau_{tr}/\rho + \sigma_{tr}/\rho + \kappa_{tr}/\rho + (\gamma, p^{+})_{tr}/\rho + (\gamma, n)_{tr}/\rho$$

Photon Energy Absorption

- Mass energy absorption coefficient
 μ_{en}/ρ = (μ_{tr}/ρ)(1 g)
 where g = fraction lost to radiative interactions
 g increases gradually with increasing Z or hv
- Energy absorbed per unit volume correlates the amount of radiation with the effects of radiation
- Energy deposited per unit length along the track of radiation important and correlates to effects
- Duration of time associated with the delivery of radiation especially important in living systems (Above subjects covered shortly or in next lecture)

Kerma and Exposure

- Kerma = kinetic energy released in matter (K)
- $K = K_C + K_R$
- Energy required to produce a unit charge in air (W/e)_{AIR} = 33.97 J/C
- Exposure (X) is ionization equivalent of K_C in air
- Equivalence valid only for photon energies < 3 MeV
- $(K_C)_{AIR} = X(W/e)_{AIR}$
- SI units: X(W/e)_{AIR} = (C/kg)(J/C) = J/kg
- Energy per unit mass → J/kg
- Roentgen: 1 R = 2.58 x 10⁻⁴ C/kg
- 1 C/kg = 3876 R

Kerma and Dose

- \bullet K = K_C + K_R
- $K = dE_{tr}/dm$
- $K = E_{tr}\Phi(\mu/\rho) = \Psi(\mu_{tr}/\rho)$
- $K_C = \Psi(\mu_{en}/\rho)$
- SI unit of dose (D) is the Gray (Gy)
- 1 Gy = 1 J/kg (1 rad = 1×10^{-2} J/kg = 100 cGy)
- D = K_C under conditions of CPE
- Charged particle equilibrium is an important and necessary condition for D at the macrocsopic level

Neutrons

 Characterized by their kinetic energy T Cold neutrons: $5 \times 10^{-5} \text{ eV} \leq T < 0.025 \text{ eV}$ Thermal neutrons: T = 0.025 eV at 293° K Epithermal neutrons: 0.025 eV ≤ T < 1 eV Slow neutrons: $1 \text{ eV} \leq T < 1 \text{ keV}$ Intermediate neutrons: 1 keV ≤ T < 0.5 MeV Fast neutrons: 0.5 MeV ≤ T < 10 MeV High energy neutrons: 10 MeV ≤ T

 Neutron beams essentially always occur as mixed photon/neutron beams

Neutrons

- Decay in free space with T_½ = 10.6 min according to n → p⁺ + e⁻ + antineutrino
- Reacts with other particles predominantly by the strong nuclear force at a range of 10⁻¹⁴ m
- Interactions produce elastic neutrons, γ photons inelastic neutrons, recoil atoms (nuclei), & fragments
- Neutron kerma $K = \Phi F_n$ with $F_n = neutron$ kerma factor
- Neutron dose D = K = ΦF_n under conditions of CPE
- Dose effect from neutrons enhanced in living systems

Linear Energy Transfer (LET)

- Recall collisional and radiative stopping power dT/dx = dT/dx_c + dT/dx_R
- LET equates to a restricted collisional stopping power with energy transfers ≤ a specified value of Δ
- $L_{\Delta} = (-dT/dx)_{C}$ with $E \leq \Delta$

250 kV_P x-rays: LET = 2 keV/ μ m

 60 Co γ rays: LET = 0.3 keV/μm

6 to 50 MeV e⁻: LET ≈ 0.2 keV/µm

14 MeV n: LET = 12 keV/ μ m

> 100 MeV p⁺: LET = 0.5 keV/ μ m \rightarrow 100 keV/ μ m

50 MeV π^- : LET = 0.3 keV/μm \rightarrow 100 keV/μm

Sievert - SI Unit of Dose Equivalent

- Sievert: H = DQN
- D= absorbed dose (Gy)
- Q = quality factor
- N = product of all other dose-modifying factors
 eg: spatial dose distribution or rate of delivery
- 1 Sv = 1 J/kg (1 rem = 1 x 10^{-2} J/kg = 100 cSv) 250 kV_P x-rays: Q = 1
 - 60 Co γ rays: Q = 1
 - 6 to 50 MeV e^{-1} : Q = 1
 - 14 MeV n: Q = 10 if ≥ 10 keV & Q = 3 if < 10 keV
 - > 100 MeV p⁺: Q = 1 to > 10 as a function of keV
 - 50 MeV π^- : Q = 1 to > 10 as a function of keV

Thank you for your attention
