

Engineering Safety- and Security-Related Requirements for Software-Intensive Systems

Presented at SSTC 2010

Software Engineering Institute
Carnegie Mellon University
Pittsburgh, PA 15213

Donald Firesmith, Terry Roberts &
Stephen Blanchette, Jr.

27 April 2010

Report Documentation Page

Form Approved
OMB No. 0704-0188

Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

1. REPORT DATE 27 APR 2010		2. REPORT TYPE		3. DATES COVERED 00-00-2010 to 00-00-2010	
4. TITLE AND SUBTITLE Engineering Safety- and Security-Related Requirements for Software-Intensive Systems				5a. CONTRACT NUMBER	
				5b. GRANT NUMBER	
				5c. PROGRAM ELEMENT NUMBER	
6. AUTHOR(S)				5d. PROJECT NUMBER	
				5e. TASK NUMBER	
				5f. WORK UNIT NUMBER	
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES) Carnegie Mellon University, Software Engineering Institute, Pittsburgh, PA, 15213				8. PERFORMING ORGANIZATION REPORT NUMBER	
9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES)				10. SPONSOR/MONITOR'S ACRONYM(S)	
				11. SPONSOR/MONITOR'S REPORT NUMBER(S)	
12. DISTRIBUTION/AVAILABILITY STATEMENT Approved for public release; distribution unlimited					
13. SUPPLEMENTARY NOTES Presented at the 22nd Systems and Software Technology Conference (SSTC), 26-29 April 2010, Salt Lake City, UT. Sponsored in part by the USAF. U.S. Government or Federal Rights License					
14. ABSTRACT					
15. SUBJECT TERMS					
16. SECURITY CLASSIFICATION OF:			17. LIMITATION OF ABSTRACT Same as Report (SAR)	18. NUMBER OF PAGES 48	19a. NAME OF RESPONSIBLE PERSON
a. REPORT unclassified	b. ABSTRACT unclassified	c. THIS PAGE unclassified			

This work was created in the performance of Federal Government Contract Number FA8721-05-C-0003 with Carnegie Mellon University for the operation of the Software Engineering Institute, a federally funded research and development center. The Government of the United States has a royalty-free government-purpose license to use, duplicate, or disclose the work, in whole or in part and in any manner, and to have or permit others to do so, for government purposes pursuant to the copyright license under the clause at 252.227-7013.

This Presentation may be reproduced in its entirety, without modification, and freely distributed in written or electronic form without requesting formal permission. Permission is required for any other use. Requests for permission should be directed to the Software Engineering Institute at permission@sei.cmu.edu.

Three Disciplines

Challenges

Fundamental Concepts

Safety- and Security-Related Requirements

Collaboratively Engineering Safety- & Security-Related Requirements

Conclusion

Three Disciplines:

*Requirements, Safety, and Security
Engineering*

Three Related Disciplines

Safety Engineering

the engineering discipline within systems engineering concerned with lowering the risk of *unintentional unauthorized* harm to valuable assets to a level that is acceptable to the system's stakeholders by preventing, detecting, and reacting to such harm, mishaps (i.e., accidents and incidents), hazards, vulnerabilities, and safety risks

Security Engineering

the engineering discipline within systems engineering concerned with lowering the risk of *intentional unauthorized* harm to valuable assets to a level that is acceptable to the system's stakeholders by preventing, detecting, and reacting to such harm, misuses (i.e., attacks and incidents), threats, vulnerabilities, and security risks

Requirements Engineering

the engineering discipline within systems/software engineering concerned with identifying, analyzing, reusing, specifying, managing, verifying, and validating goals and requirements (including safety- and security-related requirements)

Challenges:

Combining Requirements, Safety, and Security Engineering

Challenges₁

Requirements engineering, safety engineering, and security engineering have different:

- *Communities*
- *Disciplines* with different training, books, journals, and conferences
- *Professions* with different *job titles*
- Fundamental underlying *concepts* and *terminologies*
- *Tasks, techniques, and tools*

Safety and security engineering are:

- Typically treated as *secondary specialty engineering* disciplines
- Performed separately from, largely Independently of, and lagging behind the primary engineering workflow:
(requirements, architecture, design, etc.)

Challenges₂

Current separate methods for performing requirements, safety, and security engineering are inefficient and ineffective.

Separation of requirements engineering, safety engineering, and security engineering:

- Causes *poor* safety- and security-related requirements that are often:
 - Vague/unverifiable/unfeasible architectural and design constraints
 - Capabilities or goals rather than requirements
 - Inadequate and too late to drive architecture development and test planning
- Makes it unnecessarily difficult to achieve certification and accreditation for safe/secure operations

Challenges₃

Poor requirements are a primary cause of more than half of all project failures (defined in terms of):

- Major Cost Overruns
- Major Schedule Overruns
- Major Functionality not delivered
- Cancelled Projects
- Delivered Systems that are never used

Poor requirements are a major root cause of many (or most) accidents involving software-intensive systems.

Security 'requirements' often mandated (e.g., Industry Best Practices, Security Functions)

- Often, these are not derived into meaningful requirements at the engineering level

Challenges₄

Constant tension: How safe and secure is safe and secure *enough*?

What is needed:

- Better consistency between safety and security engineering
 - More consistent concepts and terminology
 - Reuse of techniques across disciplines
 - Less unnecessary overlap and avoidance of redundant work
- Better collaboration:
 - Between safety and security engineering
 - With requirements engineering
- Better safety- and security-related requirements

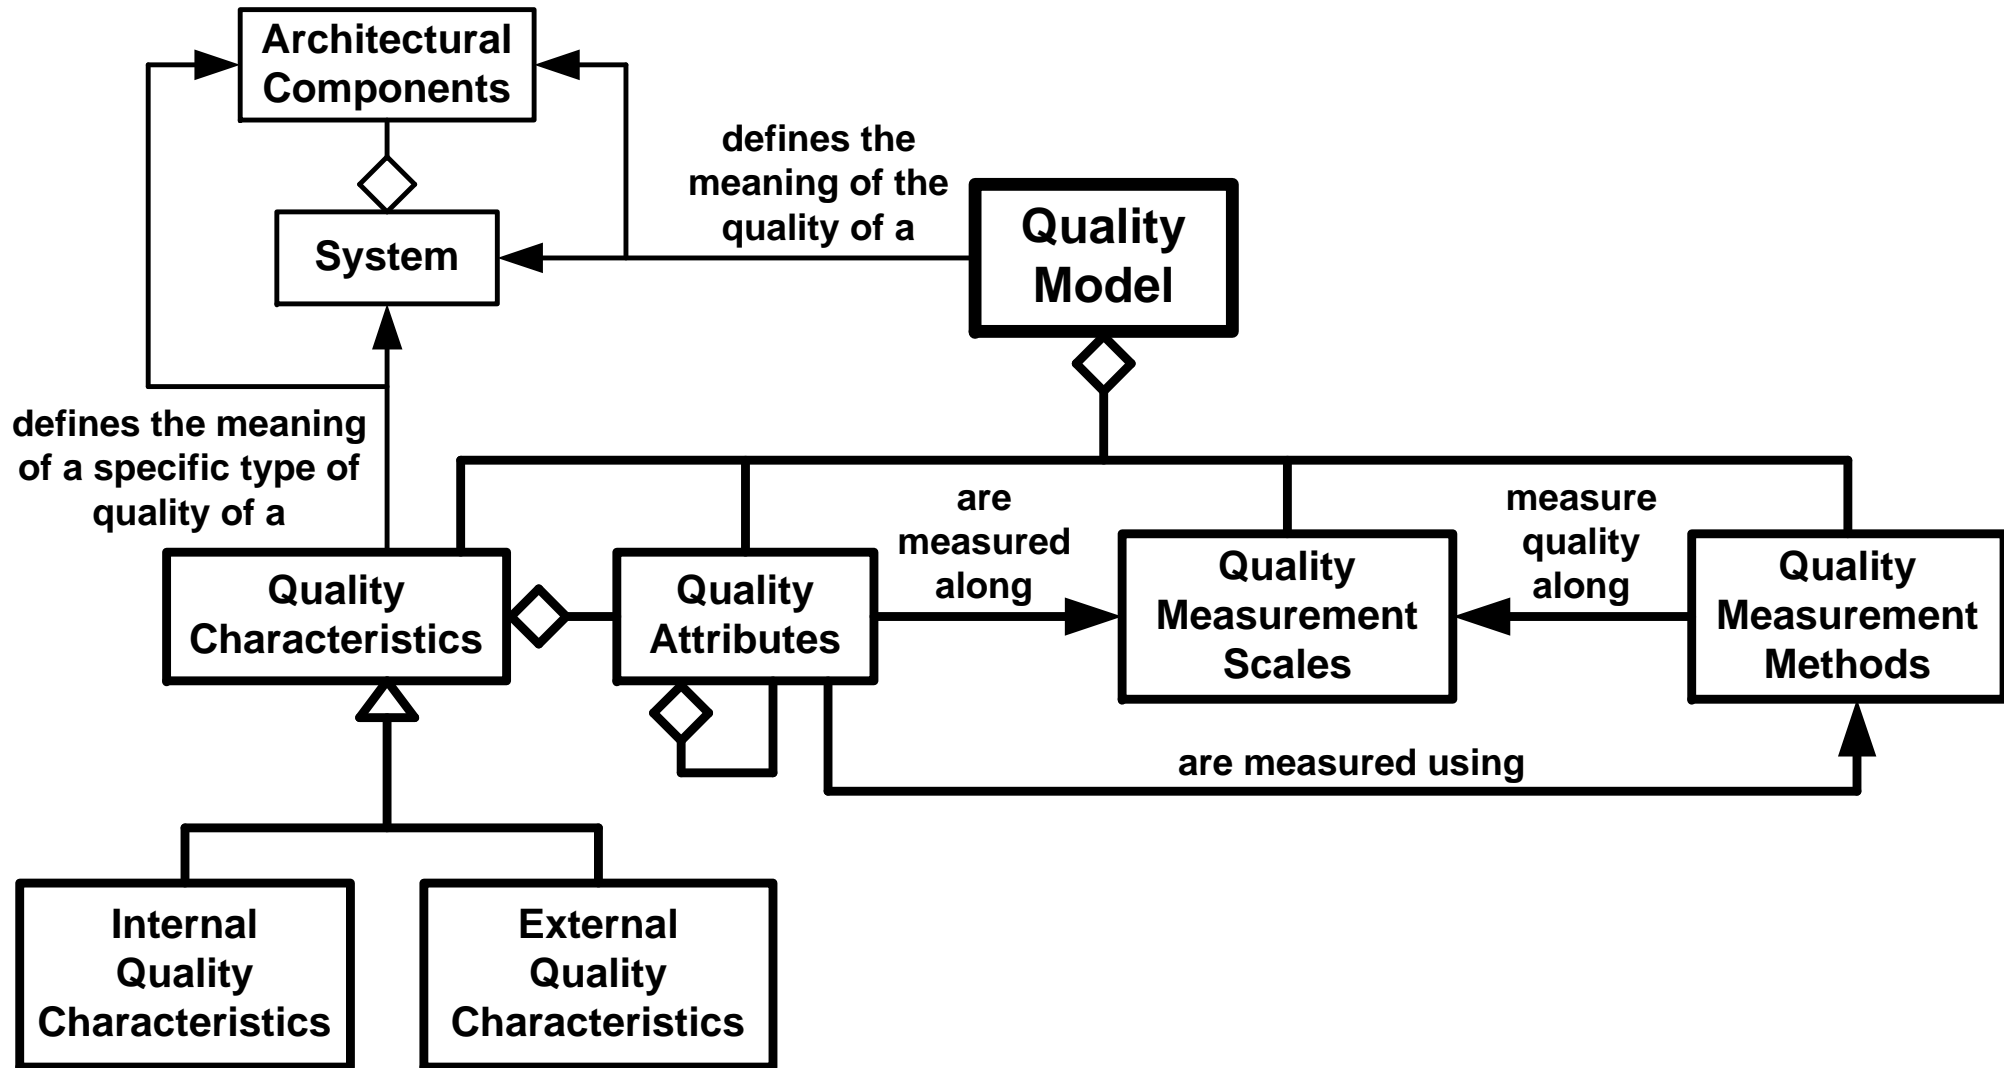

Fundamental Concepts:

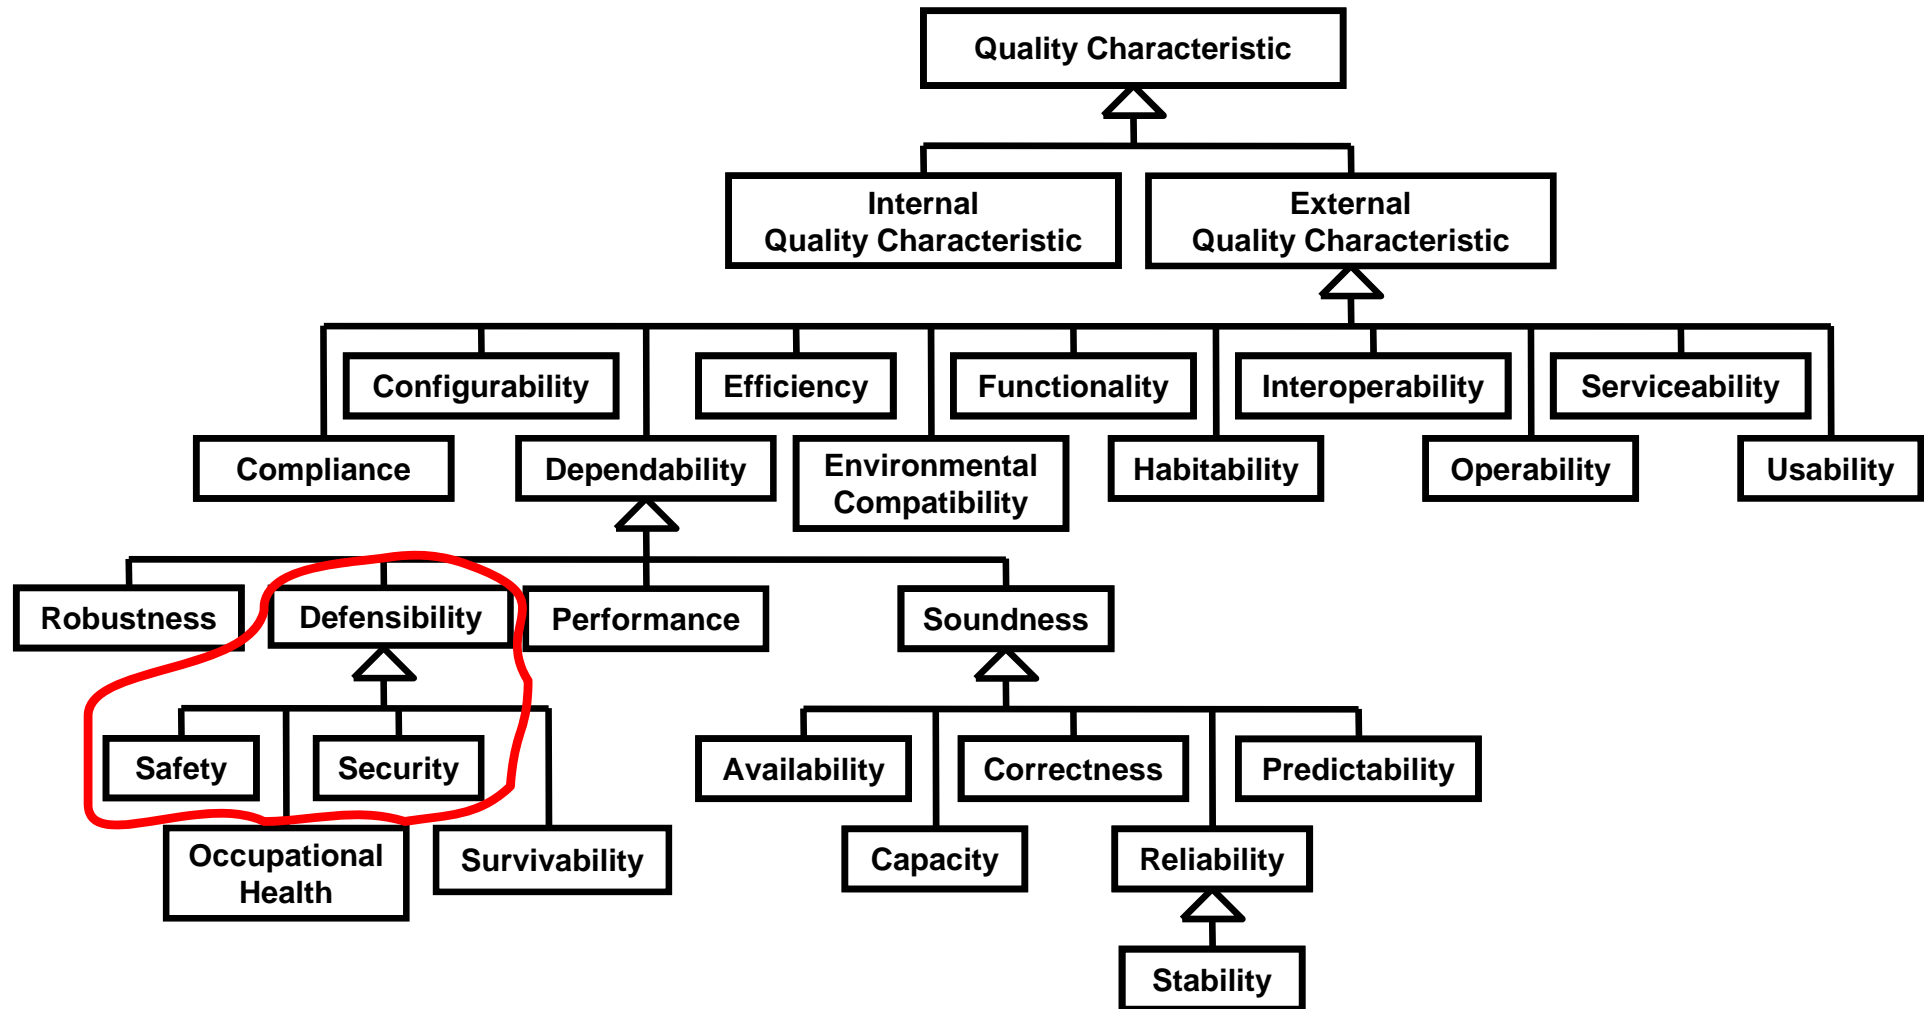

A Foundation for Understanding

Quality Model

Quality Characteristics (External)

Defensibility₁

Defensibility

the quality characteristic capturing the degree to which the system:

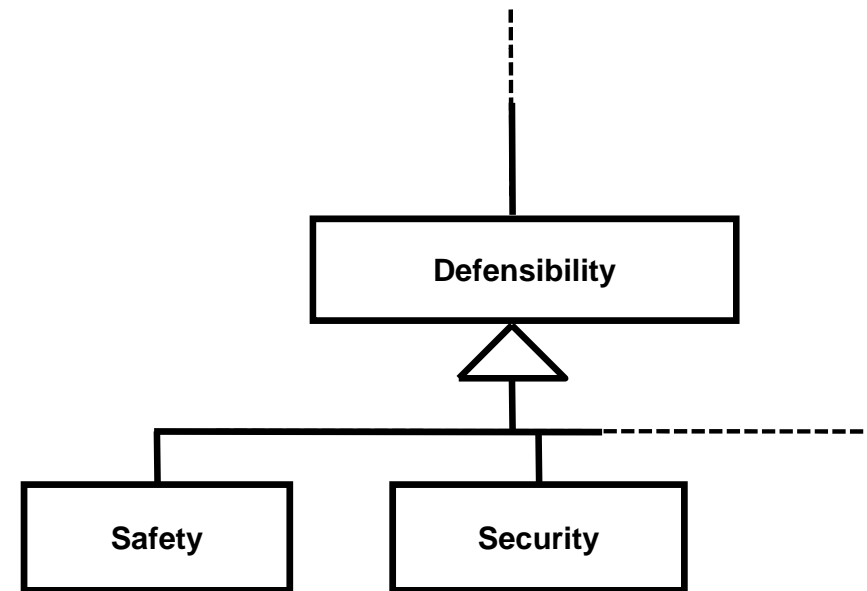

- Properly prevents, detects, reacts to, and adapts to:
 - Unintended and unauthorized *harm* to *valuable assets* due to the occurrence of
 - *Abuses* enabled by the existence of
 - *Dangers*
- Has *defensibility risks* that are acceptably low to its *stakeholders*
- Valuable Assets may be people, organizations, property, services, or environments
- Harm may be direct or indirect, intentional or unintentional, authorized or unauthorized

Defensibility₂

Safety and security aspects of defensibility are defined in a similar manner by replacing:

- Abuse with either mishap (safety) or misuse (security)
- Danger with either hazard (safety) or threat (security)
- Defensibility risks with safety risks and security risks

Safety- and Security-Related Requirements

There's More Than One Type

Too often, only a single type of requirements is considered when there are many types that need consideration:

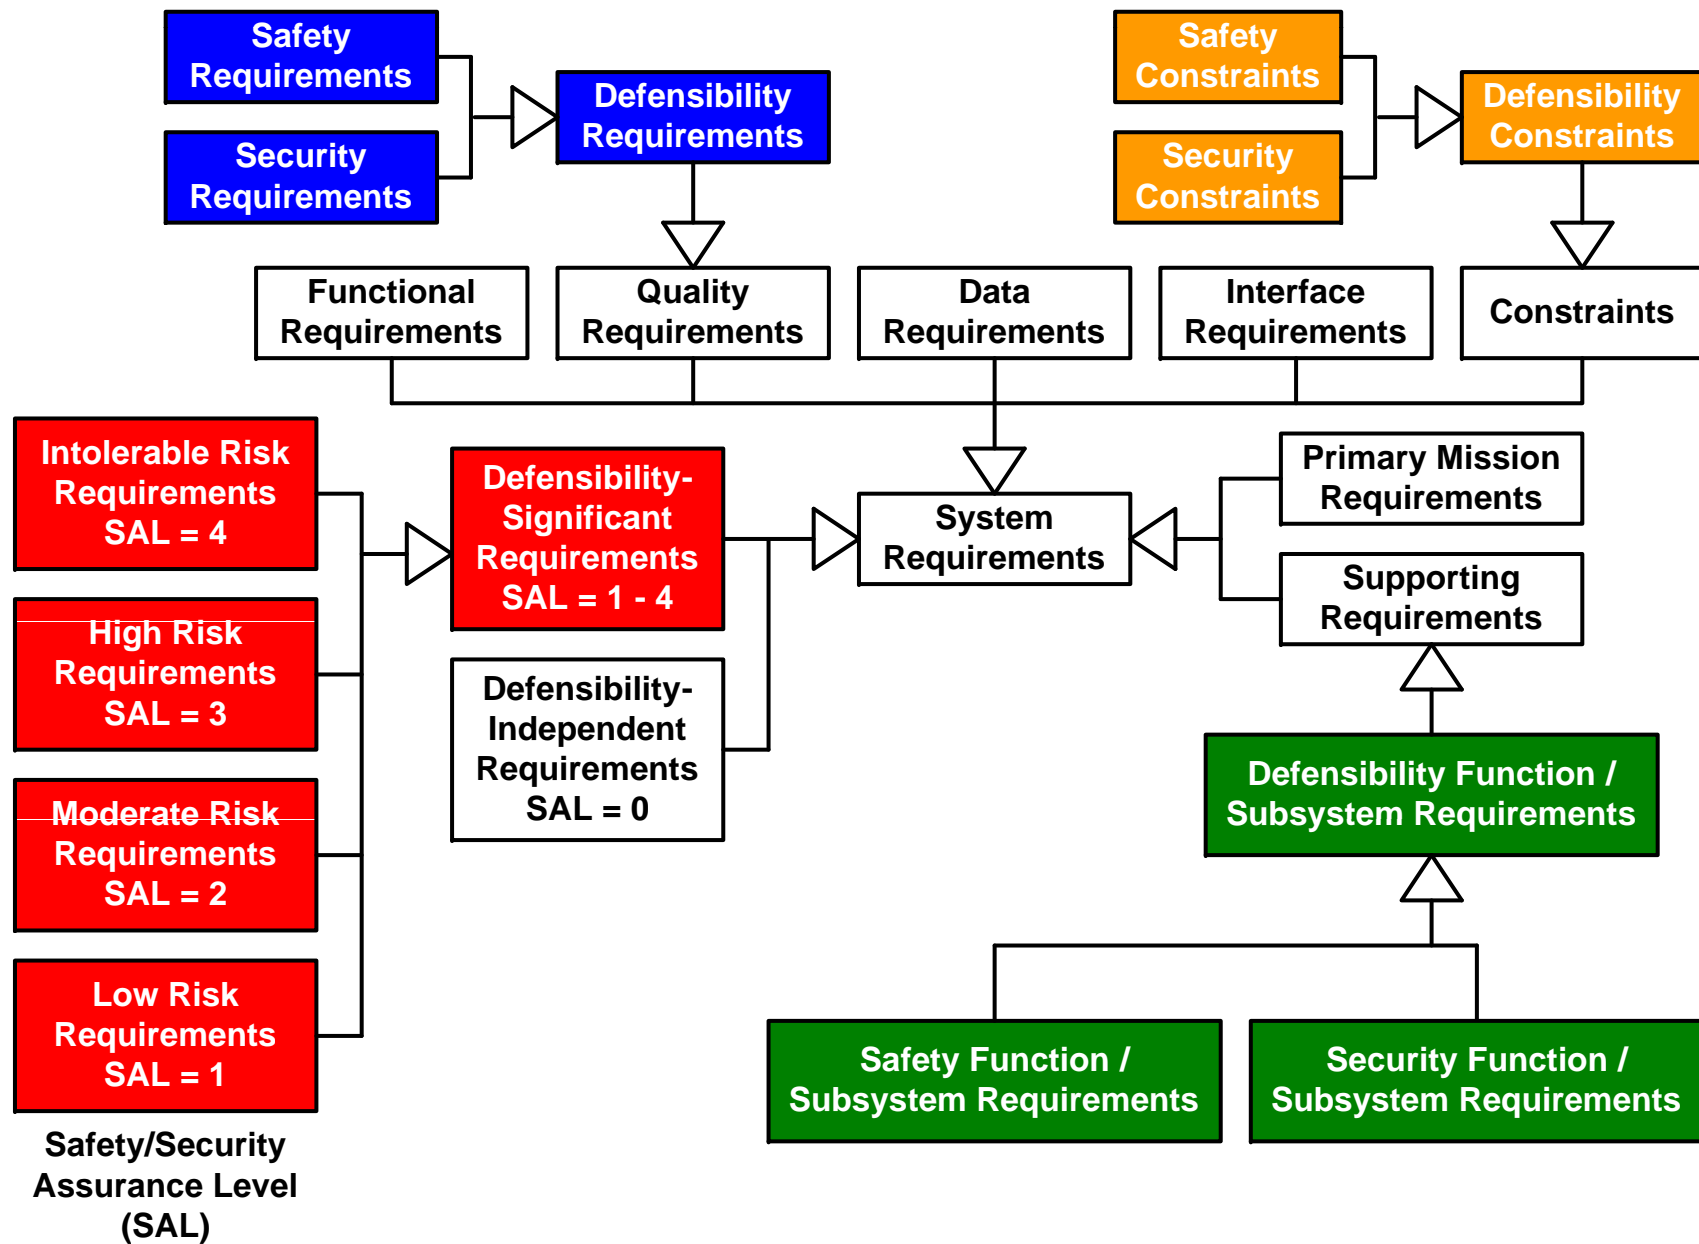

- Special non-functional requirements:
 - Safety and security requirements *are* quality requirements
- Safety- and security-*significant* requirements (functional, data, and interface)
- Safety and security functions/subsystems requirements
- Safety and security *constraints*:
 - Architectural and design constraints
 - Mandated defensibility controls (i.e., safeguards and countermeasures)

Separation of safety/security/requirements engineering almost assures gaps in requirements

Gaps in Requirements Lead to Shortcomings in Delivered Systems

Four Types of Defensibility-Related Requirements

Example Safety- and Security-Related Requirements

Safety / Security Requirement

“When in mode V, the system shall limit the occurrence of *accidental harm* of type W to valuable assets of type X to an average rate of no more than Y asset value per Z time duration.”

“When in mode X, the system shall *detect misuses* of type Y an average of at least Z percent of the time.”

Safety / Security Significant Requirement

“The system shall automatically transport passengers between stations.”

“The system shall enable users to update their personal information.”

Safety / Security Function / Subsystem Requirement

“The system shall include a fire detection and suppression subsystem.”

“The system shall support the encryption/decryption of sensitive data.”

Safety / Security Constraint

“The system shall not contain any of the hazardous materials in Table X.”

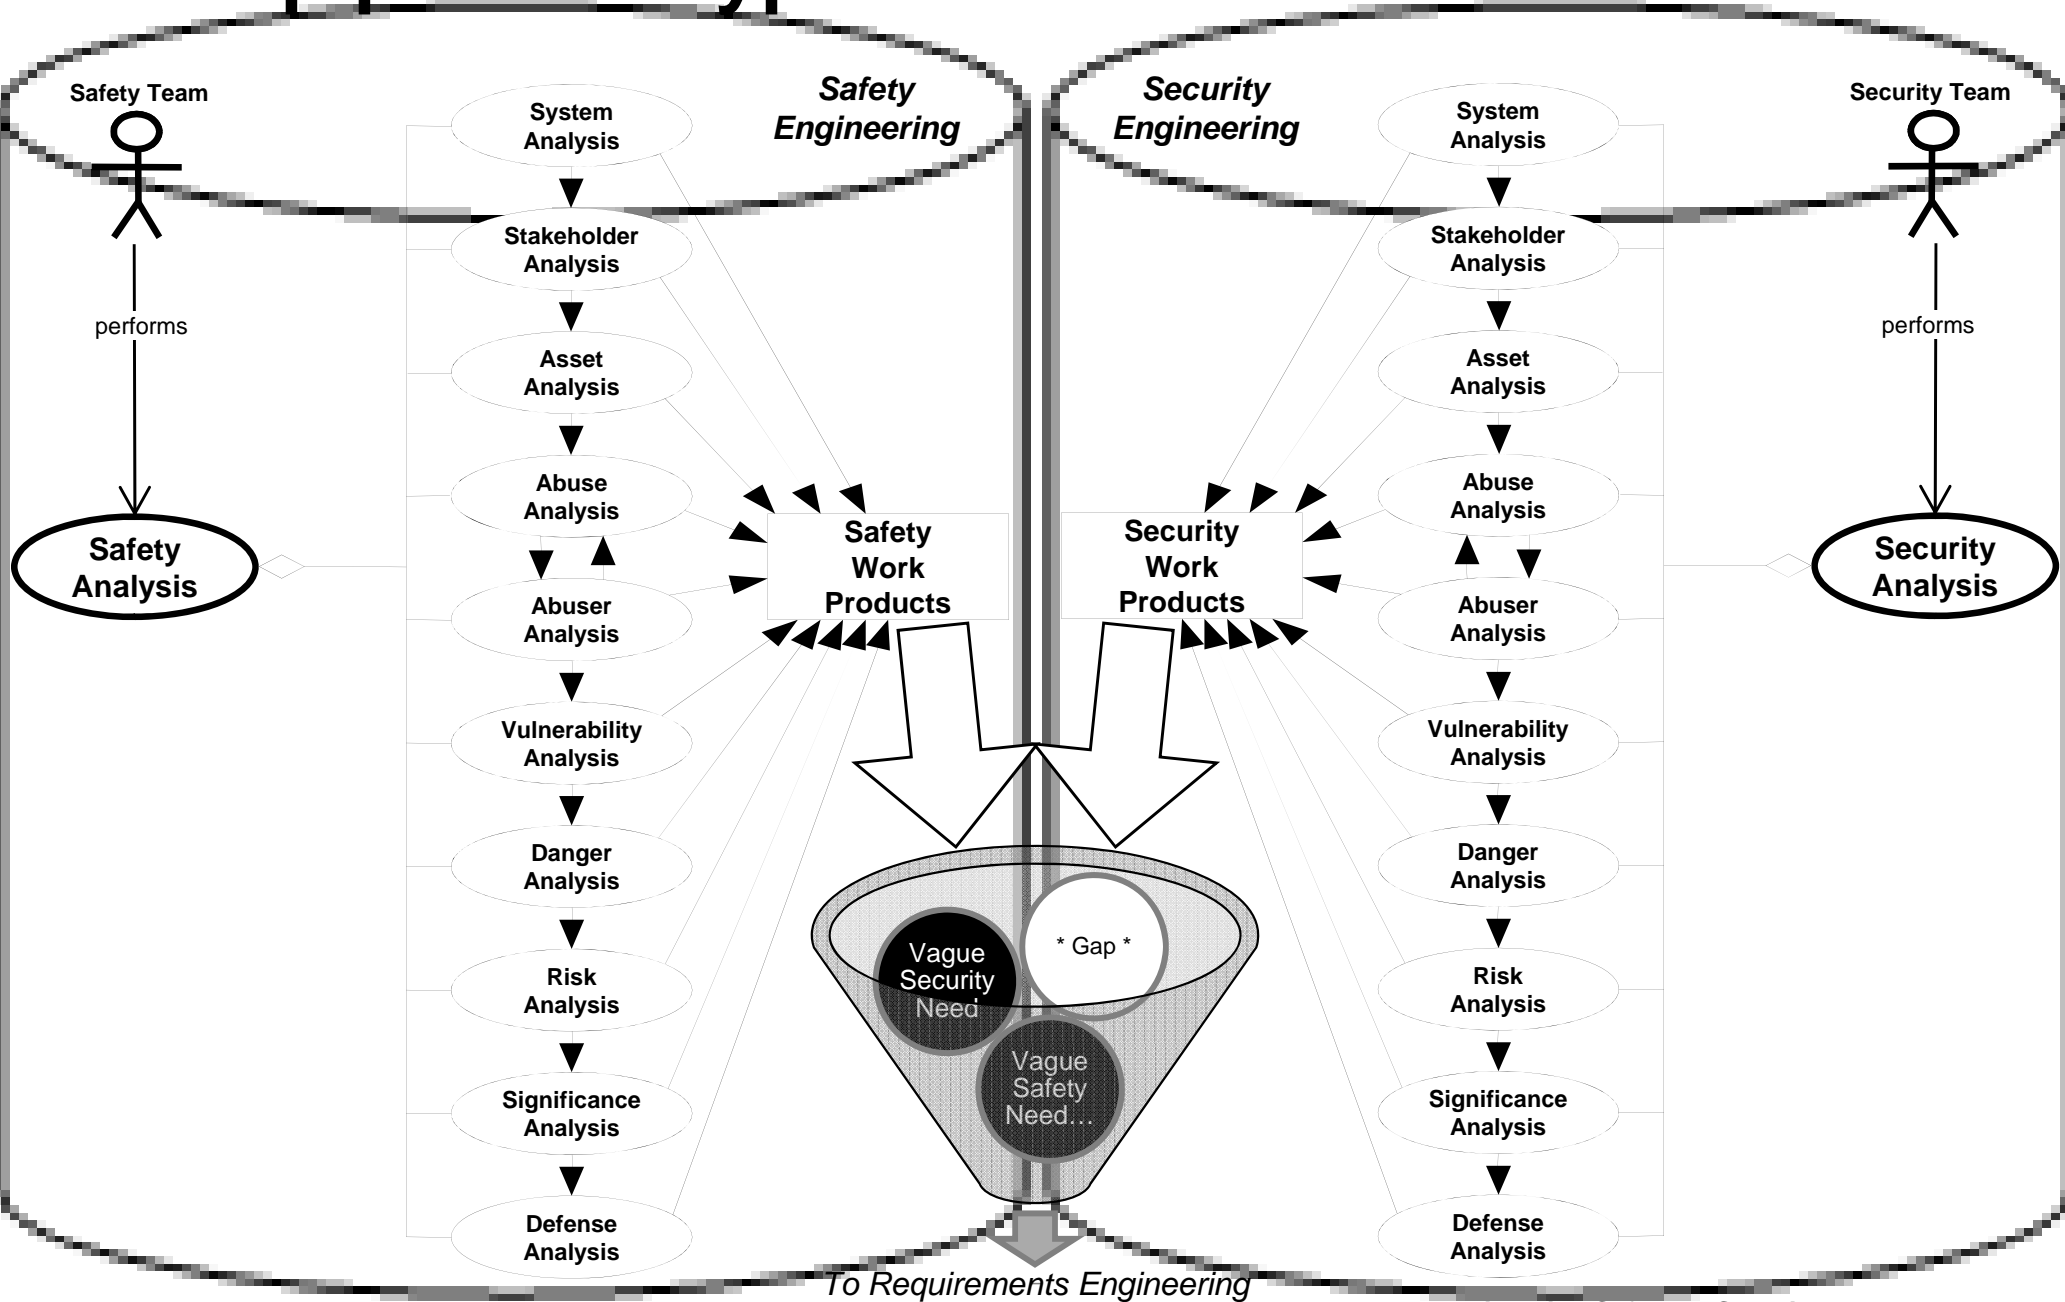

“The system shall use passwords for user authentication.”

Collaboratively Engineering Safety- & Security-Related Requirements

Stovepipes are Typical...

A Better Way

Ensure close collaboration among Safety, Security, and Requirements Teams

Better Integrate Safety and Security Methods:

- Concepts and Terminology
- Techniques and Work Products
- Provide Cross Training

Better Integrate Safety and Security Methods with Requirements Methods:

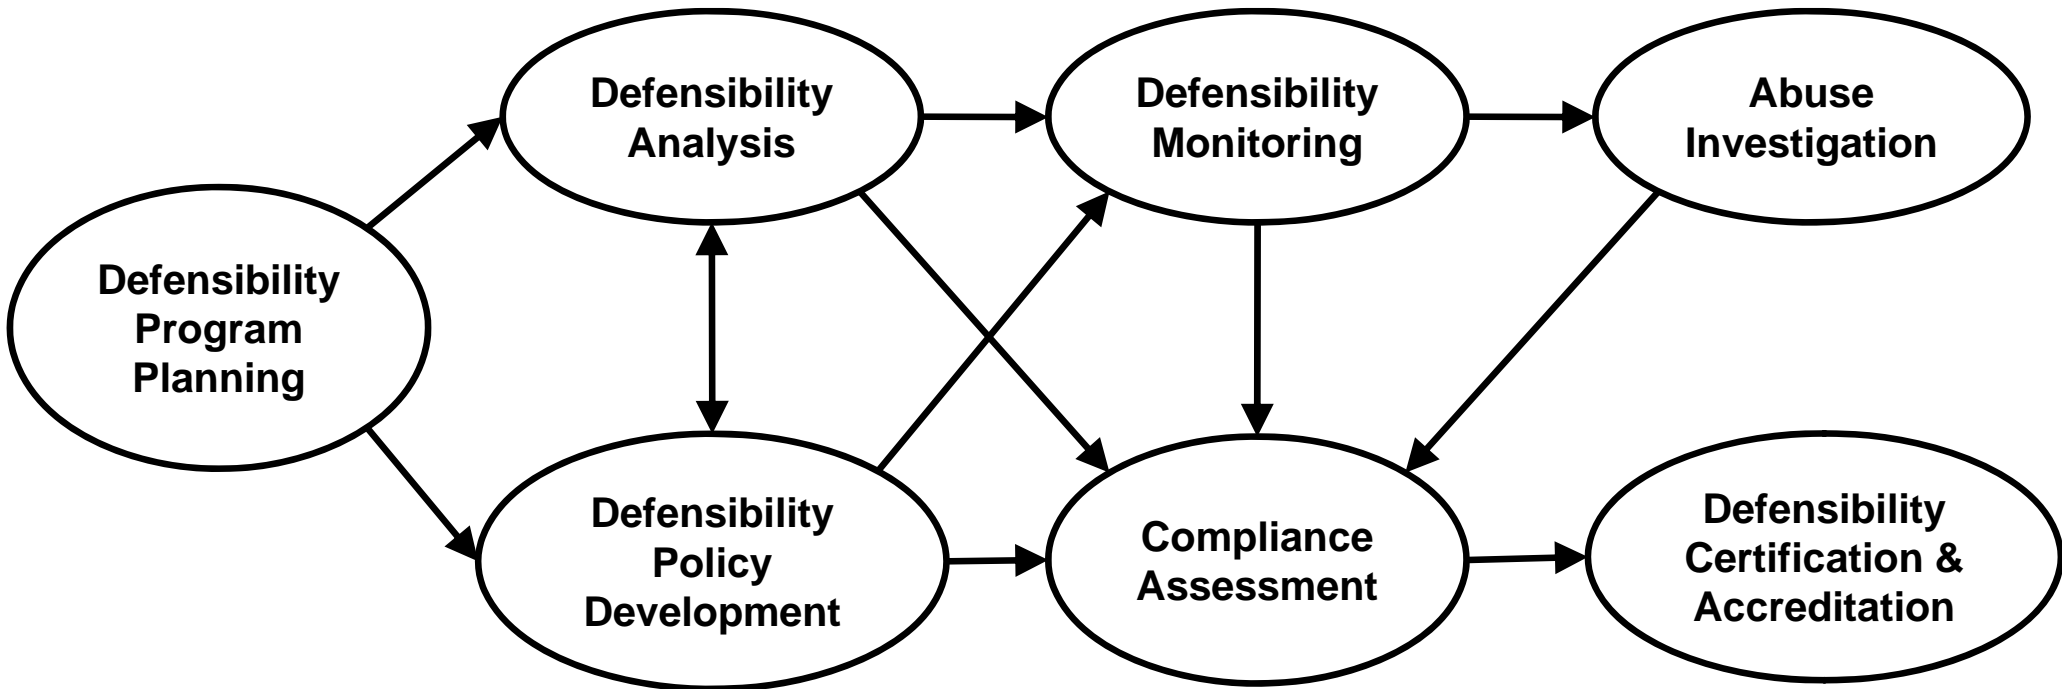

- Early during Development Cycle
- Clearly define Team Responsibilities
- Provide Cross Training

Develop all types of Safety- and Security-related Requirements

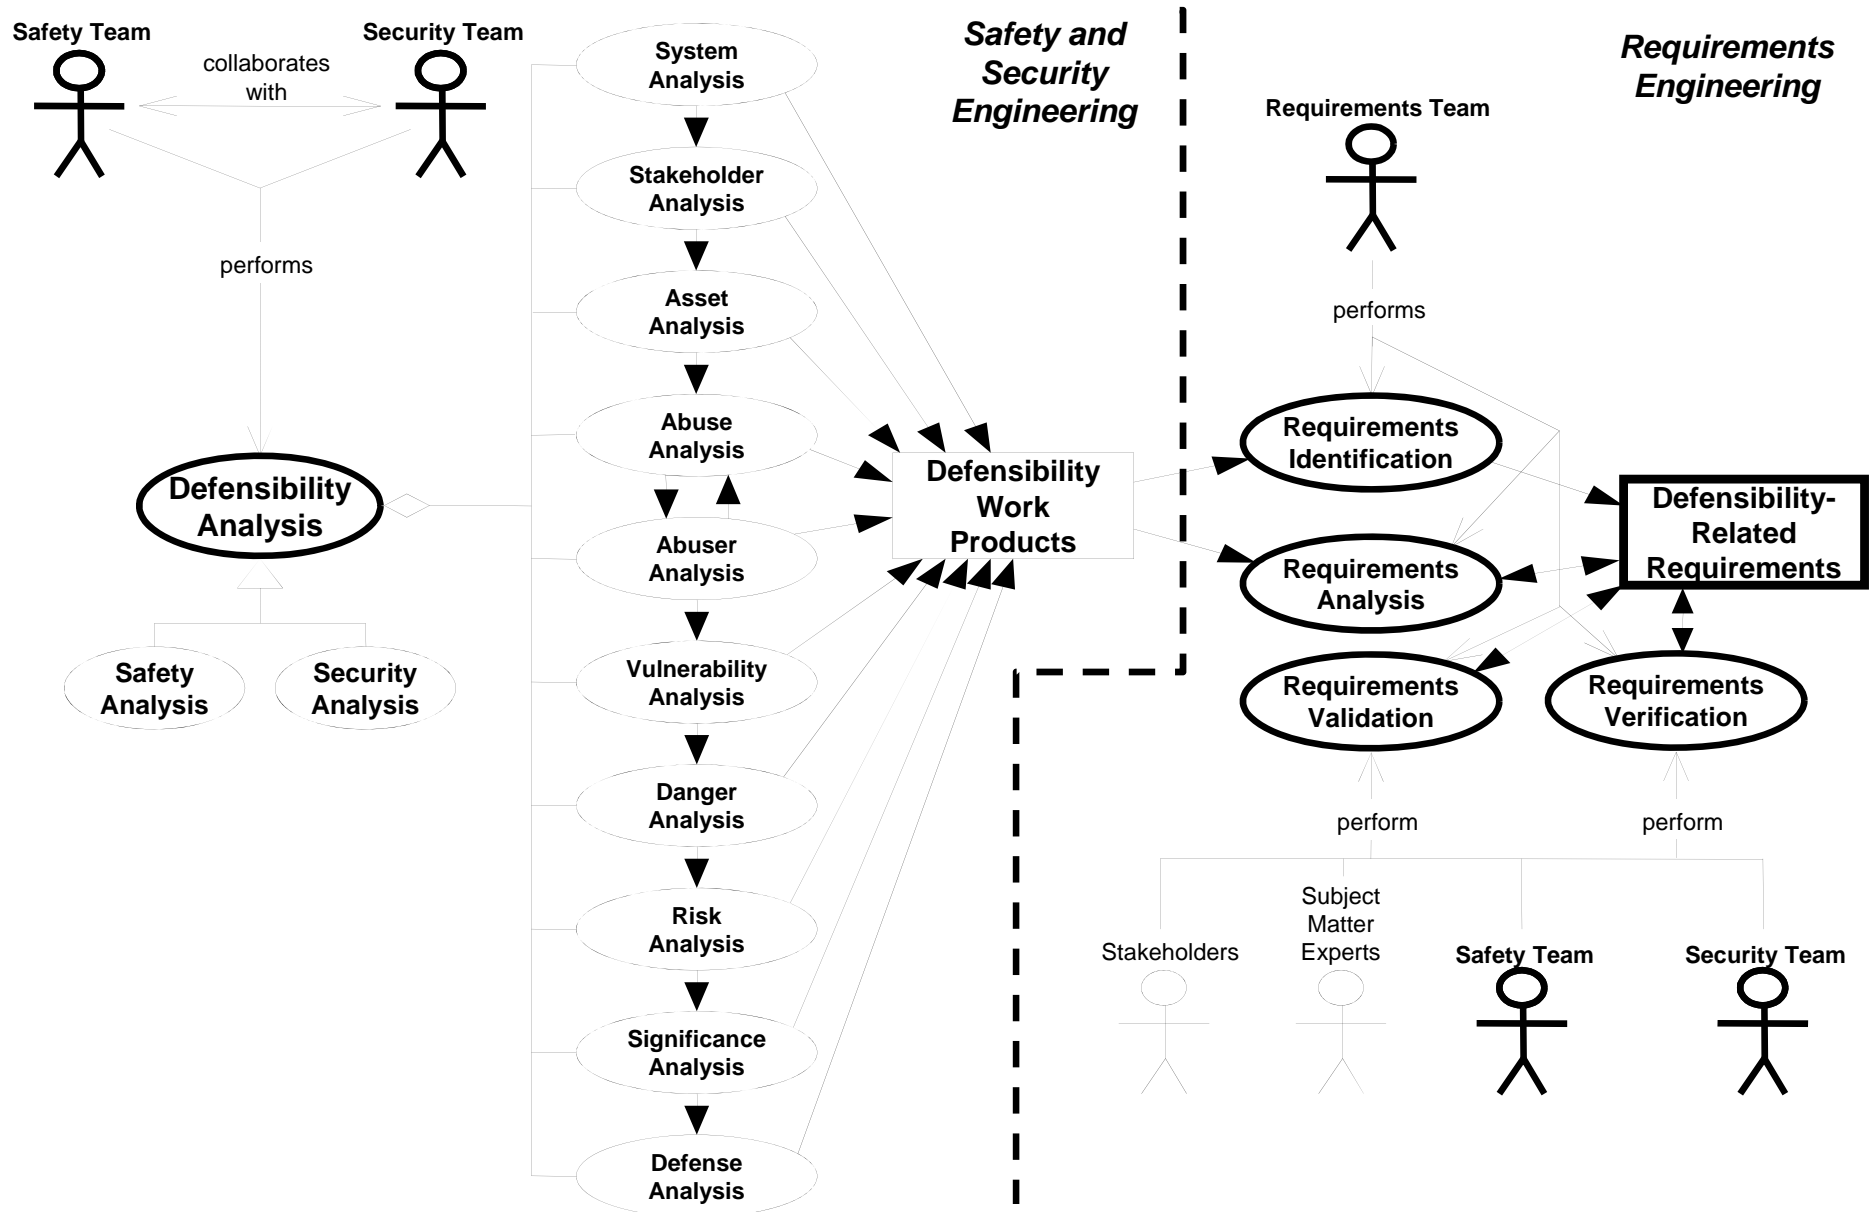

Ensure that these Requirements have appropriate Properties

An Overall Defensibility Engineering Method

Defensibility Analysis → Reqts Engineering

Conclusion

Summary

Engineering safety- and security-related requirements requires appropriate
Concepts / Methods / Techniques & Tools / Expertise

These must come from the respective experts in:

- Requirements engineering (safety- and security-related requirements)
- Safety engineering (analysis and safety goals)
- Security engineering (analysis and security goals)

BUT, Requirements/Safety/Security Engineering need to be:

- Properly interwoven.
- Consistent with each other.
- Performed collaboratively and in parallel (i.e., overlapping in time).

A collaborative process will advance Safety and Security Engineering to 1st class efforts

Ultimately, collaboration will improve the safety and security aspects of delivered systems
