16. Abstract Introduction. The annual Aerospace Medical Certification Statistical Handbook reports descriptive characteristics of all active U.S. civil aviation airmen and the aviation medical examiners (AMEs) that perform the required medical examinations. This information has not been published since 1998, so in response to recent need, we reinstated the annual report. The 2010 annual handbook documents the most recent and most widely relevant data on active civil aviation airmen and AMEs. Methods. Medical certification records from 2006-2010 were selected from the Document Imaging Workflow System (DIWS) which is the FAA medical certification database. All medical data were abstracted from the most recent medical examinations with the exception of medical conditions which were historical and current. Only those with a non-expired medical certificate remained in the dataset. AME records were selected from the Aviation Medical Examiner Information System (AMEIS). The current status of each AME was determined for each year of the study period from 2008-2010, retaining only those with an active status. Airman variables include age, issued and effective medical classes, height, weight, BMI, gender, select medical conditions, special issuances, and FAA region of residence. AME variables include AME type, age, gender, medical specialty, pilot license status, senior examiner status, and region. Results. Airmen: As of December 31, 2010, there were 598,642 medically certified airmen age 16 and older, and 30.9%, 22.1%, and 47.0% were issued a Class 1, Class 2, and Class 3 medical certificate, respectively. Across all medical classes, the average age was 44 years and 93.5% of the airmen were male. The mean BMI for both females and males was 24.2 and 27.3 respectively. Six percent of issued certificates required a special issuance. The most commonly reported medical condition was <i>hypertension with medication</i>, at 11%. AMEs: Of the 3,651 active AMEs, 93% were civilian, 2.4% federal, and 4.6% military. Nearly 50% reported their medical specialty as family practice. Their average age was 59.4 years; the majority (52%) did not hold a pilot license, and 82% were male. Summary. This report contains widely requested data on the active U.S. civil airmen population that has not been readily accessible since 1998. This report will be updated annually and will be used by the aerospace community, including FAA leadership, aerospace researchers, advocacy groups, legislative staff, and the general public.

Section I. Aviation Medical Examiners

This section characterizes the aviation medical examiners during 2010 with some comparative data from 2008 and 2009. All analyses represent data through December 31, 2010 unless otherwise noted.

An aviation medical examiner (AME) is a physician authorized by the Federal Aviation Administration (FAA) to perform airmen physical examinations for issuance of FAA medical certificates. These physicians are designated according to the geographical distribution of airmen. There are also military facilities (installations) designated to perform FAA airmen examinations of military personnel for issuance of second- and third-class certificates.

AME seminars are held in each region and at Oklahoma City's Civil Aerospace Medical Institute to acquaint these physicians with the regulations and procedures governing the issuance of FAA medical certificates.

Section II. Airman Medical Certification

The Aerospace Medical Certification Division is the central screening facility and repository within the Federal Aviation Administration for collection, investigation, adjudication, and analysis of medical data.

Activities of the Aerospace Medical Certification Division are presented in this section. Data are presented by calendar year and represent the most recent medical examination data for all active civil aviation airmen in the United States and its territories as of December 31, 2010.

Class issued represents the medical class certificate that was issued at the time of the examination. As of July 24, 2008, if the airman is under 40, first- and second-class certificates are valid for 1 year and third-class certificates are valid for 5 years. If the airman is 40 and older, first-class certificates are valid for 6 months, second-class for 1 year, and third-class for 2 years. The length of certificate validity varies for those requiring a special issuance.

Effective medical class is determined by class issued, the age of the airman, time since exam, and whether the airman had a time limited certificate. A certificate can be issued as a higher class (i.e. first-class) and become valid as a lower class certificate (i.e. third-class) as the validity period expires for each higher class.

All medical data were abstracted from the most recent medical examinations with the exception of medical conditions. Medical conditions are determined by whether the airman has ever reported the condition on any past or current medical examination. Body mass index (BMI) classifications are as follows: Underweight (less than 18.5), Normal (18.5 to 24.9), Overweight (25 to 29.9), and Obese (greater than or equal to 30).
