

# **The Commitment to Recover**

The national commitment to recover, especially from terrorist incidents, may involve planning that is outside of normal processes and plans that are mostly response-centered

#### **Report Documentation Page**

Form Approved OMB No. 0704-0188

Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

# WARRP RDD Scenario – Radiological Waste Source, Generation, and Handling

Bill Steuteville, Homeland Security Coordinator U.S. Environmental Protection Agency Region 3

WARRP Radiological Waste Sampling Workshop Denver, Colorado August 14, 2012

2

#### WARRP RDD Scenario - Overview (Continued)

- Terrorists obtain approx. 2,300 curies of cesium-137 (CsCl) and 1.5 tons of ANFO and make 3000 pound truck bomb
- Terrorists detonate truck bomb containing the 2,300 curies of cesium outside the U.S. Mint in the downtown business district
- The explosion collapses the front of one building and causes severe damage to three others and blows out window of 5 other buildings
- Second explosion in Aurora a short time later outside Children's Hospital

- Two Radiological Dispersal Device (RDD) attacks: U.S. Mint (downtown Denver)
  - Anschutz Medical Campus (Aurora).
  - Tana of the year do of near la symposial huma
- Tens of thousands of people exposed, hundreds dead
  - Died of trauma from blast not radiation
- Evacuations/Displaced Persons
  - 10,000 evacuated to shelters in safe areas (decontamination required prior to entering shelters)
  - 25,000 in each city are given shelter-in-place instructions
  - Hundreds of thousands self-evacuate from major urban areas in anticipation of future attacks

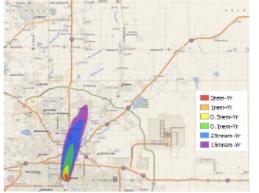

#### WARRP RDD Scenario – Overview Downtown Release

Most radioactive fallout is within tens of miles of blast, some may be carried up to hundreds of miles

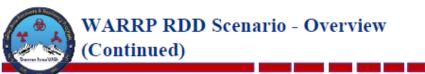

- Hundreds of buildings contaminated
- · Basic services affected
- · Local businesses affected
- Government operations relocated
- Mass Transit (East-West rail line) affected
- Local military installations affected

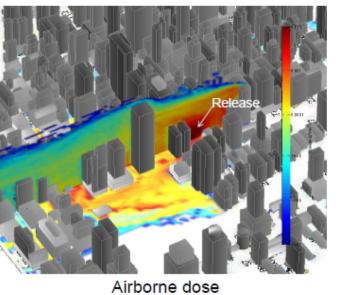

<section-header><section-header><figure><figure>

6

- RDD Waste Estimation Support Tool (WEST) Building Stock and Outdoor Areas
  - Decon and Demolition Waste
- I-WASTE Tool
  - Building Contents
- Bio-response Operational Testing and Evaluation (BOTE) Program Personnel Decontamination Waste Generation Data
- Tested by Exercise Players at Liberty RadEx

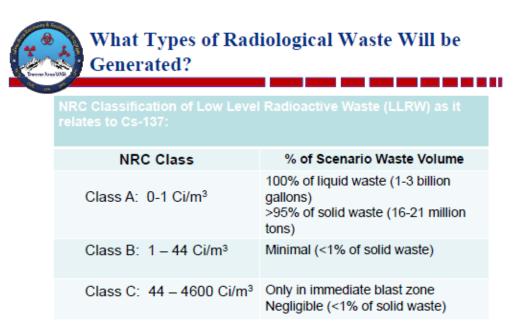

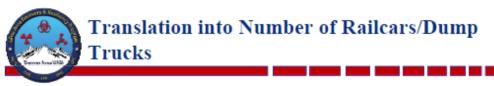

- 1. Class A Low Level Radioactive Waste (LLRW).
- Class B/C LLRW (higher activity levels from blast zone or onsite concentration efforts)
- LLRW with Asbestos (i.e., old steam pipes from demo buildings)
- LLRW with PCB's (i.e., PCB transformer oils coating demolished building exteriors)
- Low Level Mixed Waste (LLMW) (RCRA hazardous waste and low level radioactive waste)

- Personal Protective Equipment (PPE) waste
- Sludge from onsite decontamination efforts
- Sludge from WWTPs
- Laboratory samples
- Contaminated clothing from offsite health facilities
- 11. Non-radiological solid or hazardous waste for disposal in RCRA C or D landfills

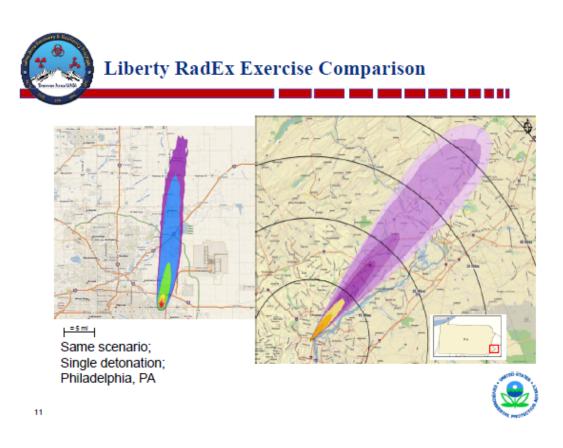

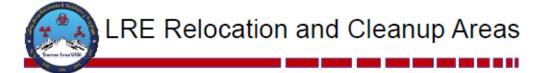

- Liquid Waste (Total ≈ 1.5 3 billion gallons) 50,000 to 100,000 railroad tank cars (30,000 gallon capacity)
  - 275,000, to 550,000 tanker trucks (5,500 gallon capacity)
- Solid Waste (Total ≈ 16-21 million tons)
  - 160,000 to 210,000 Railroad hopper cars (100 ton capacity)
  - 400,000, to 525,000 semi-trailer (64,000 pound net capacity)
  - 500,000 to 656,000 tri-axel dump trucks
    - · Put end to end 3700 miles long! (LA to NY to Atlanta and some...)

140,000 Temporarily Displaced

200,000 Must Have Property Cleaned

#### Current Decontamination Technologies:

- Cleaning agents, acids, foams:
- Reduce radiation; do not eliminate radiation
- Most effective on nonporous surfaces or areas of marginal contamination and/or short-term exposures
- Quickly Clean and reopen CI/KR

13

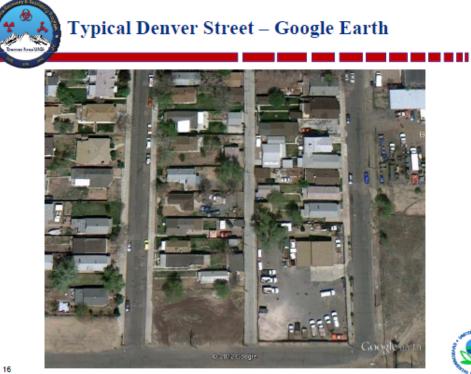

#### Most Effective Wide-Area Cleanup Strategies:

- a) Roof Replacement
- b) Soil Removal
- c) Street and Sidewalk Surface Removal
- d) Interior: dispose carpets, furnishings, possessions, drywall
- e) Building demolition if higher contamination

 Except for immediate area of bomb (1 block radius), RDD wastes should be highly homogenous

- Remove cars, swing sets, bird baths: anything not fixed
- Remove trees & shrubs
- Empty building contents
- Remove tanks, drums, transformers, other hazardous waste
- Remove roof & siding (option if building is being saved)
- Demolish & remove buildings
- Excavate soils
   Remove or scarify concrete & asphalt
- This generates uniform homogenous waste streams
- This how EPA cleans Superfund sites
- Makes waste characterization & disposal easier

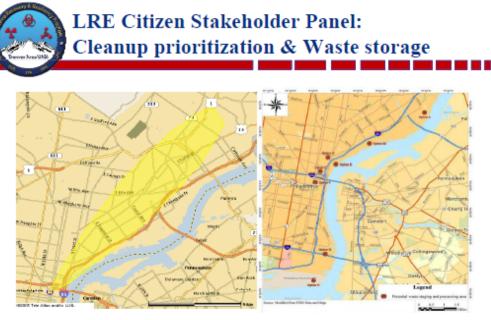

- Day One: Begin generating solid and liquid wastes Responder, public, & hospital PPE & decon
- First Week: Begin generating significant liquid and solid wastes with CI/KR decontamination activities
  - Temporary storage locations
- First Month: Begin generating huge volumes of liquid and solid wastes with initial cleanup operations
  - Soils, demolition wastes, furnishings, office materials, etc.
  - Roofing materials, asphalt & concrete scarification
  - Need long-term storage locations and/or permanent disposal
- Cleanup can not proceed without waste handling options
- Cleanup will be prohibitively costly and snail-pace slow without local waste solutions

Philadelphia citizens had no difficulty with concepts of cleanup prioritization, local storage and disposal, and difficult choices

## Waste Management Organizational Structure

Eugene Jablonowski U.S. EPA Region 5 Emergency Response

U.S. Environmental Protection Agency and U.S. Department of Homeland Security WARRP Decon-13 Subject Matter Expert Meeting Waste Screening and Waste Minimization Methodologies Project August 14 – 15, 2012 Denver, Colorado

## Incident Command System ICS Overview

ICS is a standardized, on-scene, all-hazards incident management approach that:

- Allows for the integration of facilities, equipment, personnel, procedures, and communications, to operate within a common organizational structure.
- Enables a coordinated response among various jurisdictions and agencies, public and private.
- Establishes common processes for planning and managing resources.

ICS is flexible and can be used for incidents of any type, scope and complexity.

#### Incident Command System **ICS** Overview

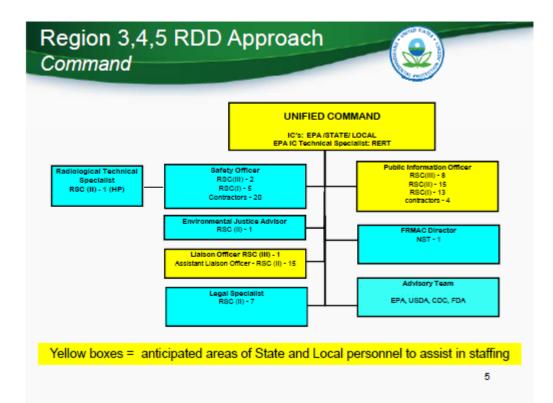

- ICS allows its users to adopt an integrated organizational structure to match the complexities and demands of single or multiple incidents.
- ICS is typically structured to facilitate activities in five major functional areas: Command, Operations, Planning, Logistics, and Finance/Administration.
- Intelligence/Investigations is an optional sixth functional area.
- · Federal, State and local agencies are represented in the IC/UC in accordance with NIMS principles regarding: jurisdictional authorities, functional responsibilities, and resources provided.

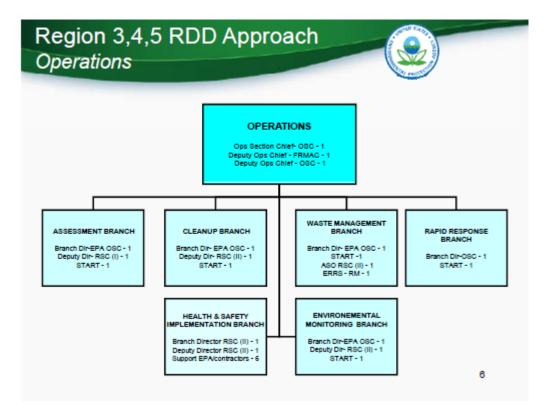

## Region 3,4,5 Plan Approach to RDD Response

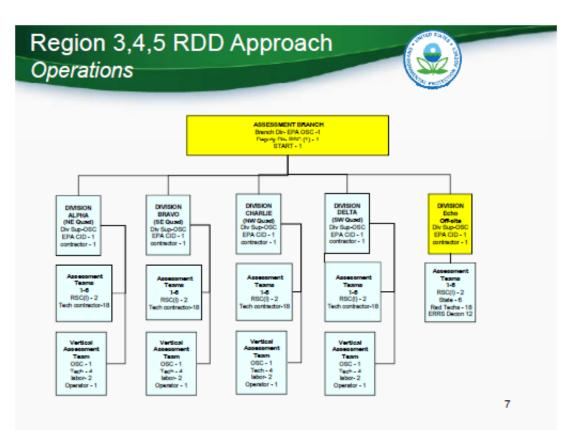

- EPA Regions 3, 4 & 5 developed an approach to RDD response
- · Part of a national planning exercise to meet national homeland security goals.
- ID-ed necessary EPA resources, resource "gaps," and other issues requiring further development, both regionally and nationally.
- Improves EPA's preparedness to respond to a RDD event and multiple "incidences of national significance."
- · Approach exercised at "Liberty Rad-Ex."

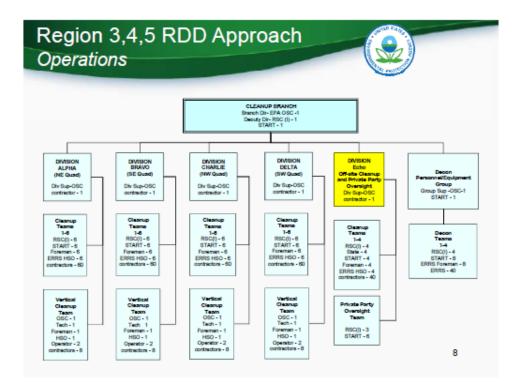

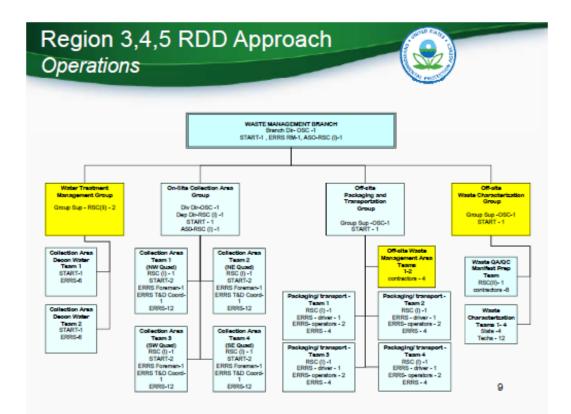

## Region 3,4,5 RDD Approach Waste Management Branch

- The Waste Management Branch is responsible for collection, storage, characterization, documentation, shipping, and/or treatment of all wastes generated or collected on-site during ESF-10 activities including:
  - radiological waste,
  - solid wastes,
  - liquid wastes, and
  - other hazardous materials and non-hazardous wastes generated by field activities.

#### Region 3,4,5 RDD Approach Waste Management Branch

The Waste Management Branch includes four groups:

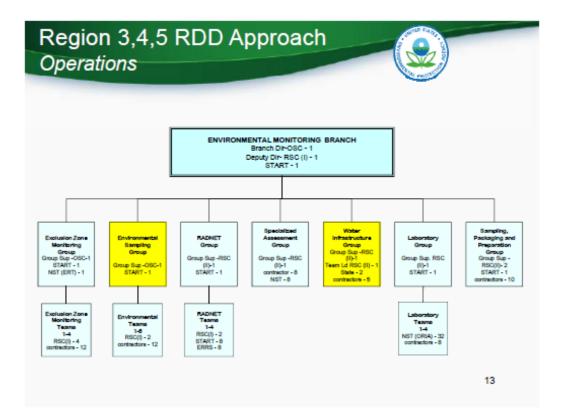

- Waste Water Treatment and Handling Team is responsible for storing, treating and shipping waste water, including personnel decon water, collected during field response activities.
- On-site Collection Team is responsible for collecting wastes from cleanup operations, and transporting the wastes to on-site collection areas where it is grossly characterized and containerized for storage.

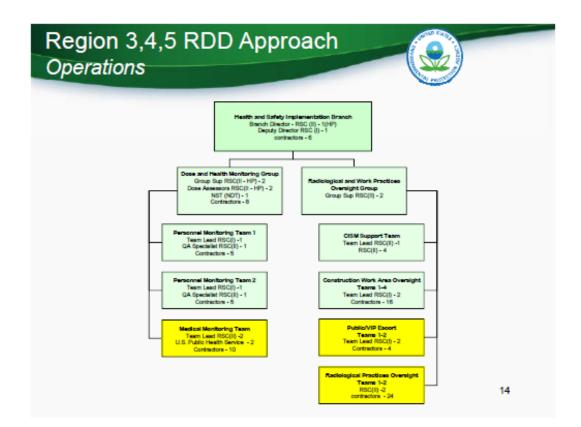

## Region 3,4,5 RDD Approach Waste Management Branch

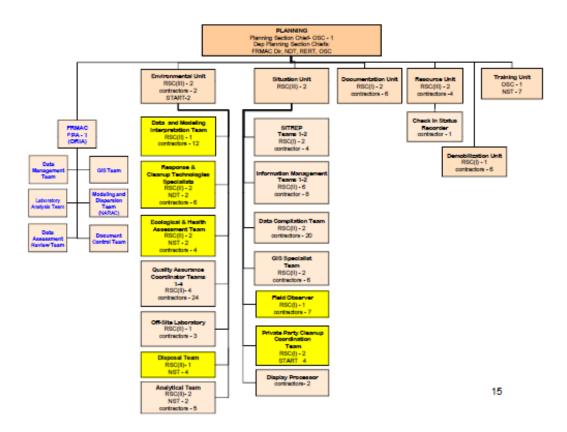

Waste Management Branch (continued)...

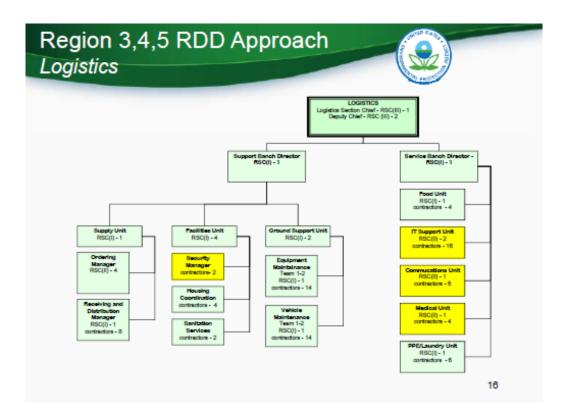

- Near-site Packaging and Transportation Team is responsible for collecting wastes from the on-site collection areas transporting it to the central storage area, where the wastes are characterized and packaged for off-site transportation, manifested and shipped for final off-site treatment and/or disposal.
- Off-Site Characterization Team is responsible for characterization and manifesting the wastes for offsite treatment and final disposal.

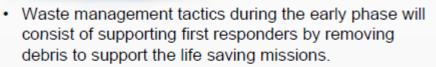

#### Region 3,4,5 RDD Approach Waste Management Tactics

- · Removal of this debris will be critical for dose control.
- Quick identification of interim sites to temporarily store contaminated waste and debris may be necessary.
- Early identification/determination of disposal facilities.
- Determining and establishing waste acceptance criteria (WAC) for disposal facilities.
- Facility-specific WAC info would be used to plan for waste sampling/characterization, packaging, transportation, etc.

17

#### Region 3,4,5 RDD Approach Potential Disposal Options

- All options would need to be addressed with the impacted state and the receiving states, if different.
- Balanced approach to waste disposal:
  - Smaller volumes of higher activity waste are disposed at a federal disposal site, or one of the commercial licensed/permitted disposal facilities.
  - Larger volumes of lower activity waste are managed at a RCRA Subtitle C facility near the site, or at an incident-specific Comprehensive Environmental Response, Compensation and Liability Act ("CERCLA") disposal facility that would meet the design criteria of RCRA Subtitle C and NRC 10 CFR 61.

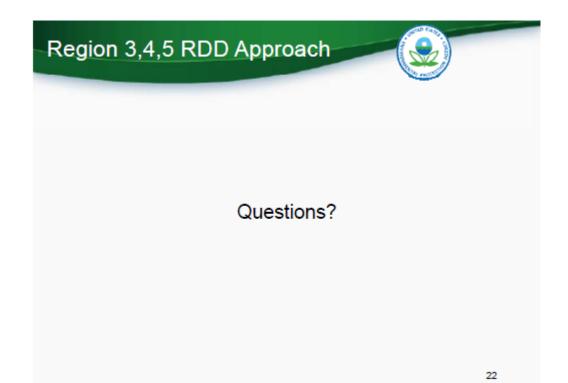

#### Region 3,4,5 RDD Approach Potential Disposal Options

- Recognition that some sort of hazardous and mixed waste management may be needed depending on the incident location and impacted buildings/areas (e.g., radiation- contaminated asbestos containing material (ACM) for example).
- Characterization is performed on a bulk ISO-container level or through waste stream knowledge, where uncertainties are compensated by disposal facility design.
- Allowances are made for temporary storage near the site or off-site while permanent disposal capacity is being prepared.

#### 19

## Region 3,4,5 RDD Approach Other Issues

- Waste Packaging. Procedures need to be developed specifying how wastes will be packaged, acceptable types of packaging, segregation of prohibited items, and documentation required to demonstrate traceability of waste from the point of generation through package certification.
- Waste Certification. (DOE Disposal Only) Procedures will be required specifying roles, responsibilities, and controls in place to ensure that radioactive waste is generated, packaged, characterized, and certified in a manner that preserves the requirements for off-site DOE disposal.

# **RDD** Case Studies Japan, Chernobyl, Goiania

Waste Screening Workshop

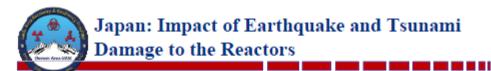

August 14, 2012

Edward A. Tupin Center for Radiological Emergency Response Radiation Protection Division Office of Radiation and Indoor Air US EPA

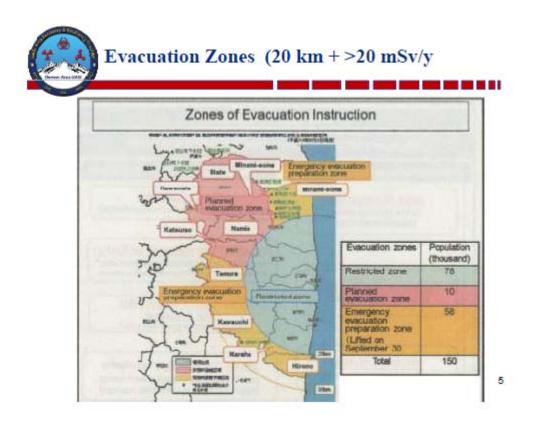

#### Level 7 - "Major Accident" on International Nuclear Event Scale

- "A major release of radioactive material with widespread health and environmental effects requiring implementation of planned and extended countermeasures"
- Loss of Cooling
- Damage to Secondary Containment Vessels
- Fuel Meltdown (partial or complete – three of six units)
- Hydrogen Explosions units 1, 2 and 4.

- Early evacuation decisions driven by release and deposition of
  - lodine-131 (8-day half-life)
  - Cesium-134 (2-year half-life)
  - Cesium-137 (30-year half-life)
- · Evacuation out to 20 km, restricted entry to 30 km
  - >150,000 people evacuated, ~100,000 still displaced, many will not be able to return for years
  - Zones extended beyond 20 km in highly affected areas to northwest

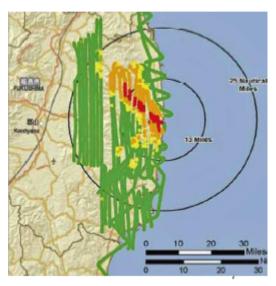

- Two radionuclides are driving long-term cleanup Cesium-137 (30-year half-life)
  - Cesium-134 (2-year half-life)
- Some reports of Strontium-90 (29-year half-life) and Plutonium outside boundaries of nuclear plants
  - Tiny quantities
  - Few locations
- [Note: lodine-131 (8-day half-life)]
  - Driver for initial protective actions
  - not a concern in the long term (short half life, decayed away)

#### Japan: Impact of Earthquake and Tsunami: Releases of Radiation to the Environment

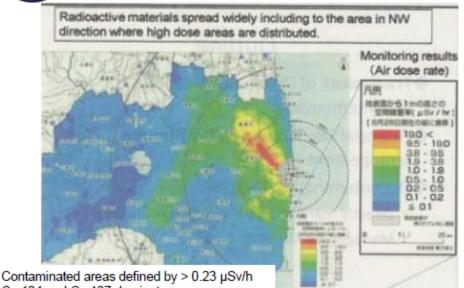

- Air Releases intentional venting, containment breach & hydrogen explosions
  - ~150 PBq of <sup>131</sup>I
  - ~10 PBq of <sup>137</sup>Cs
- Ocean Releases intentional release of cooling water & leakage
- <sup>131</sup>I equivalent activity release of ~500 PBq,
- Total release ~10% 20% of releases from Chernobyl

(37 PBq = 1,000,000 Curies)

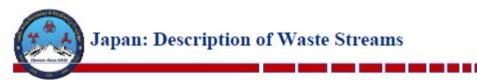

8

## Wide Area Contamination MEXT data as of September 15, 2011

Cs-134 and Cs-137 dominate

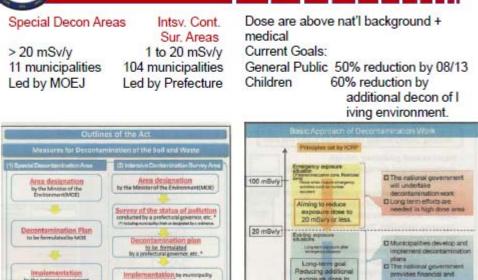

- Management of radioactive waste significantly complicated by aftermath of earthquake and tsunami
  - Buildings destroyed
  - Infrastructure damaged
  - Agricultural areas flooded and contaminated
  - Mixtures of toxic and hazardous substances widespread
  - Accumulation of wastes from treating power plant effluents
  - Significant ocean releases could lead to re-contamination
  - "Hot spots" found across the country
  - Might be considered comparable to nuclear device damage
- · Japan relies heavily on incineration of solid waste
  - Precautions to avoid re-suspension of radioactive material

Concentration of radioactive material in ash

- Government of Japan has spoken of adopting international reference levels of 1 to 20 mSv per year (100 mrem to 2 rem/yr) as a benchmark for restoration
  - Prioritize cleanup of areas up to 50 mSv/yr (5 rem/yr) to allow return of residents by March 2014 (>5 rem/yr may be deferred)
    - · Schools and other child-sensitive areas
    - Agricultural production areas
      - Restrictions on planting in highly-contaminated areas
      - Research on effects on different plant types
  - Iterative process to reach 100 mrem/yr or lower will take years
    - Localities responsible for areas <100 mrem/yr</li>
  - 70,000 square meters of seabed to be covered (cement & clay)
  - Next slide shows extent of contamination and significant areas above 20 mSv per year (bright green and above)

1 mil

**Decon Roadmap for Special Decon Areas** 

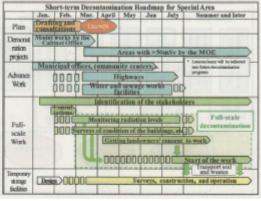

Source: OHMURA presentation, May 19, 2012

 Plan developed by March 2012

Institutal and prefectural government implement work in lands they manage

(20 km + > 20 mSv/y)

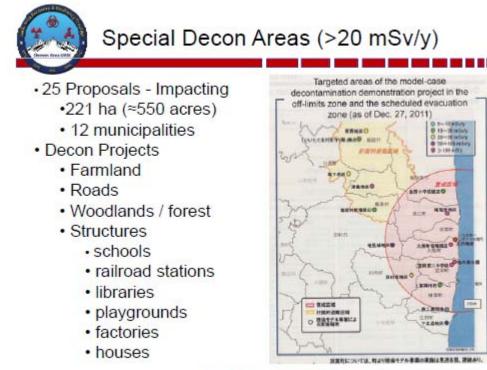

- Advance decon work for • public facilities (city and town halls) and infrastructures (highway, water facilities)
- Priority given to > 20 mSv/y ٠ and 20 to 50 mSv/y with an aim of returning evacuees.
- > 50 mSv/y used for Decon • projects
- Policy : focus on areas with highest exposures first

Source: OHMURA presentation, May 19, 2012

Local interim storage capacity sought to facilitate cleanup Facility to be capable of storing ~280 million tons by 2015 Resistance from local communities/officials Want assurance that facilities will not be permanent

17

### Japan: Waste Management Issues and Lessons Learned

- Early estimates from Government of Japan
  - ~30 million tons of soil to be removed in Fukushima Prefecture
  - ~13% of land area in the prefecture
    - · Estimated to reach cleanup level of 5 mSv/yr
  - ~11,000 square kilometers nationally contaminated >1 mSv/yr
    - · 3% of land area in Japan
  - Storage capacity sought for ~90 million cubic meters of soil
    - ~3 billion cubic feet
    - ~20% of volume landfilled annually in US
  - Incinerator ash up to 8 Bq/g (216 pCi/g) allowed to be landfilled
- Local interim storage capacity sought to facilitate cleanup
  - Facility to be capable of storing ~280 million tons by 2015
  - Resistance from local communities/officials

- 18
- Want assurance that facilities will not be permanent

- Restrictions on distribution of Fukushima products Meat, milk, rice, fish, other
  - Fund of >40 billion yen (~\$500 million) to restore confidence
  - Building materials (e.g., lumber, stone, aggregate)
    - One quarry found highly contaminated
- · Atypical waste streams/vectors
  - Leaves from forested areas piling up (incineration concerns)
  - Wastewater treatment sludge and ash accumulating at facilities
  - River transport of contaminated sediments
  - Local citizens (not trained workers) doing cleanup/ad hoc disposal
- · Uncertain future of contaminated areas
  - Power plants likely to be left in place for some period
  - Youngest evacuees considered least likely to return

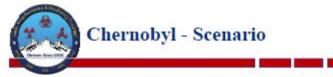

19

- Mixed Reaction Over Plan for Fukushima County to Store Radioactive Waste (Mainichi Daily News, March 12, 2012)
- Three Towns Near Fukushima No. 1 Asked to Store Radioactive Soil, Waste (Japan Times, March 11, 2012)
- Disposal Sites Refuse to Accept 140,000 Tons of Tainted Waste (Yomiuri Shinbun, March 4, 2012)
- 86% of Municipalities Reluctant to Accept Debris from March Disasters (Mainichi Daily News, March 4, 2012)
- 6,800 Tons of Radiation-Tainted Straw Left Lying in 8 Prefectures (Mainichi Daily News, March 3, 2012)
- Radiation Fears Behind Debris Refusal (Yomiuri Shinbun, November 4, 2011)
- No-Go Zone Soil To Be Moved in 2-1/2 Years (Yomiuri Shinbun, October 12, 2011)

- While the scale of the Fukushima accident likely exceeds the impacts from an RDD, several aspects are relevant:
  - Cleanup goals will affect the volumes of waste generated
  - Decontamination strategies will also affect waste volumes
  - Likely to be public pressure to accelerate cleanup
    - · Desire to return to affected area to live or work
    - Prioritizing certain areas/functions (e.g., schools)
  - Federal, state, and local roles and responsibilities for decisionmaking on cleanup and waste management may create tension
    - · Local management of waste will be expected
  - Initial focus on waste staging, temporary and longer-term interim storage – disposal likely will take more time

- On April 26, 1986, Unit 4 of the Chernobyl Nuclear Power Plant suffered catastrophic failure (Level 7 on the International Nuclear Event Scale)
  - Explosion and fire breached containment and spread radioactivity into the atmosphere and around the world
    - Estimated releases up to 8 EBq (8 x 10<sup>18</sup> Bq) (excluding noble gases)
  - Fuel meltdown
  - Several dozen emergency "liquidators" working to put out the fire died from the effects of radiation

 Several zones defined for "contaminated areas" (those exceeding 1 Curie per square kilometer of Cs-137)

- Exclusion Zone
   2040 km<sup>2</sup> Ukraine
  - 2100 km<sup>2</sup> Belarus
  - 170 km<sup>2</sup> Russia
  - ~4300 km<sup>2</sup> total
- Contaminated area (>1 Ci/km<sup>2</sup> of Cs-137) totals ~140,000 km<sup>2</sup>
- ~8,000 km<sup>2</sup> of agricultural land, ~7,000 km<sup>2</sup> of timber land out of production

- As of 2000, ~350,000 people had been resettled ~4.5 million living in contaminated areas
  - Initial annual dose target of 500 mrem/yr, later changed to 100
  - Estimated costs of 100s of billions in U.S. dollars

Table 3.2. Average individual doses received 1986-1995 by population of affected territories in relation to current density of contamination by <sup>137</sup>Cs

| Land<br>contamination by<br><sup>137</sup> Cs, Ci/km <sup>2</sup> | Average individual doses* received in 1986-95 by residents of affected territories, $mS\nu$ |        |         |  |  |  |  |  |
|---|---|--------|---------|--|--|--|--|--|

Source: derived from UNSCEAR 2000. Note: \* • excluding doses to thyroid Table shows cumulative doses. 1 mSv = 100 mrem

- Limited effort to decontaminate except to support reactor decommissioning (even in populated areas)
  - >1 million m<sup>3</sup> of waste generated from rubble, debris, soil
  - Trees bulldozed and buried
  - ~800 burial areas in Ukraine exclusion zone, largely without characterization or segregation
    - "These facilities were established without proper design documentation and engineered barriers and do not meet contemporary waste disposal safety requirements" - Chernobyl Forum
    - Vector site to provide upgraded treatment, sorting, packaging, and disposal capabilities for long- and short-lived waste
  - Reactor shelter (sarcophagus) also being upgraded
  - Belarus reviewing disposal areas for potential upgrades

#### Gioania - Scenario

- On September 13, 1987, an abandoned teletherapy source was removed for sale as scrap metal

   1,375 Curies of Cs-137
- The source was breached and resulted in contamination of people and property
  - Four deaths, 28 radiation burns, multiple others exposed
  - Radiation measured at 0.4 Sv/h (40 rem/h) at 1 meter

- Authorities moved quickly to contain the incident
  - 85 houses found to be contaminated, 41 evacuated
  - 45 public places found to be contaminated
  - Demolished seven residences and numerous other buildings
  - Topsoil removed from large areas
  - Total waste generated ~3,500 m<sup>3</sup> about 150,00 times the volume of the original source
  - The source was placed in a sack on a chair, which was then encased in concrete and packed in a special container
- Authorities screened many people who were not exposed
  - 112,000 people monitored, 249 found with some contamination
  - Widespread fear and stigma associated with the incident

 Waste from the incident was categorized and segregated for disposal (time for Cs-137 to reach 87 Bq/g) Table D.6. Waste from Golánia Accident

- Two near-surface repositories were constructed ~23 km from Goiania, near the temporary storage site
  - Great Capacity Container for Group I (short-lived) waste
    - · About 40% of the total volume
    - · Group I waste could have been released as solid waste
  - Goiania Repository for Groups II V
    - · More extensive engineered barriers
  - Site selected after extensive study
    - · 189 "preliminary areas" identified
    - · Narrowed to 18 "potential areas"
    - · 3 candidate sites selected for final decision
  - Repositories opened in 1995

### Wide Area Recovery & Resiliency Program (WARRP)

Pete Van Voris, Ph.D. Consultant & Advisor to WAARP

Chemical and Biological Defense Division Science and Technology Directorate DEPARTMENT OF HOMELAND SECURITY

#### Goal:

Working with interagency partners, including federal /state / local / tribal governments, military, private industry and non-profit organizations, develop solutions to reduce the time and resources required to recover wide urban areas, military installations, and other critical infrastructures following a catastrophic chemical, biological, or radiological (CBR) incident.

 Develop/refine guidance, plans, and decision frameworks for long term recovery that can be leveraged and transitioned to other parts of the United States and internationally as applicable.

2.Identify, develop/refine, demonstrate, and transition

technologies/standards that support recovery prioritization, planning and operations.

 Better understand the public health strategies and challenges related to long term recovery and recommend changes as needed to public health guidance and/or plans.

4.Exercise programmatic solutions for CBR re∞very

 Enhance long-term formal coordination between DOD, DHS, DOE, EPA, and HHS that will be optimized for stakeholder use at the state, regional, and local levels.

DHS (S&T) sponsored program

Coordination & partnership with the Denver, CO region

WARRP Problem Statement

- Collaborative program with the Denver Urban Area Security Initiative (UASI) and State of Colorado
  - Goal: Develop solutions to reduce the time and resources required to recover wide urban areas, military installations, and other critical infrastructures following a catastrophic chemical, biological, or radiological (CBR) incident.
  - Stakeholders: Interagency partners, including federal /state / local / tribal governments, military, private industry and non-profit organizations
- WARRP Resiliency through Partnership
  - Program Alignment:
    - National Security Strategy goal to "strengthen security and resilience at home" against the all hazards threat (May 2010)
    - FEMA 2011-2014 Strategic Plan to build the Nation's capacity to stabilize and recover from a catastrophic event through "Whole Community" approach
  - S&T Development:
    - Enhanced capabilities for wide area urban recovery from a large-scale CBR incident
    - Solutions aligned with Interagency validated gaps list
    - Capability Areas: Characterization, Remediation, Clearance, Public Health

Security Interagency Biological Restoration Demonstration

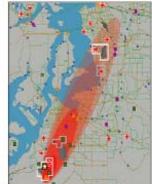

<u>Goal</u>: Working with interagency partners, including state, regional & local, to reduce time and resources required to recover and restore wide urban areas, military installations, and other critical infrastructures following a biological incident

#### Objectives:

- Study social, economic & operational interdependencies
- Establish civilian and military coordination
- Develop guidance and decision frameworks
- Identify & demonstrate technologies that support operations
- Exercise activities & available technology solutions

DOD (DTRA) & DHS (S&T) cosponsored program

Coordination & partnership with the Seattle, WA region

### BioNet Program

#### Vision

Effectively manage the consequences of a biological attack

#### Objectives

- · Develop interoperable military and civilian concepts of operation
- Integrate military and civilian capabilities to detect and characterize a biological event
- Provide common situational awareness to ensure timely, effective, and consistent response actions

For official use only

### San Diego stakeholders are engaged

.

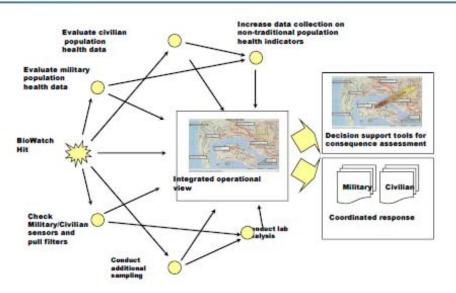

#### Military

- Navy Region Southwest
  - North Island
  - 3rd Fleet
  - Navy Shipyard
  - Emergency Response Coordinator
  - Operational Medicine (EPMU-05)
- Naval Health Research Center
- Camp Pendleton Marine Corps Base
- Miramar Field
- NORTHCOM

#### Civilian

- City of San Diego
- Director of Homeland Security
- Fire and Life Safety Services
- Police Department
- County of San Diego
  - Office of Emergency Services
  - Department of Public Health
- US Coast Guard
  - Joint Harbor Operations
- FBI
- San Diego Regional Network for Homeland Security
- California Office of Emergency Services
- California State Department of Public Health

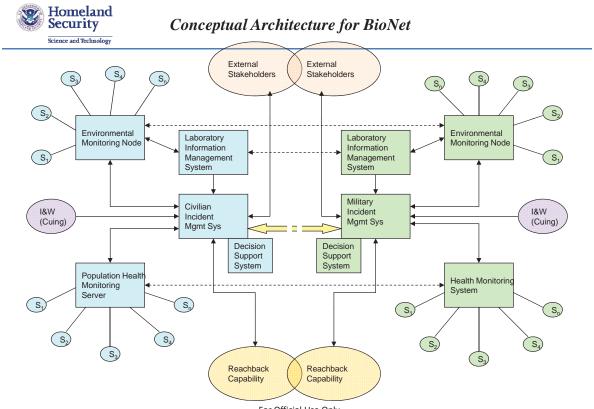

BioNet will yield significant benefits through well defined deliverables

| Area                    | Deliverable  | Approach   |
|-------------------------|--|--|
| ConOps                  | Integrated military/civilian Concepts of<br>Operation for detection and characterization | Build on BioWatch (ICAP) and JSIPP ConOps, evaluate through table-top and command post exercises   |
| Area Monitoring         | Enhanced operational test and evaluation<br>environment for area monitoring              | Integrate military and civilian area monitoring networks,<br>conduct OT&E of new sensors, model optimum sensor<br>placement  |
| Laboratory              | Advanced high-throughput laboratory<br>capabilities, common assays                       | Conduct side-by-side testing of military and civilian assays,<br>implement high-throughput lab for surge requirements  |
| Health<br>Monitoring    | Integrated military and civilian health monitoring system                                | Integrate de-identified population health data and analysis<br>tools for military and civilian users, optimize use in conjunction<br>with area monitoring and other data types       |
| Information<br>Products | Common operating picture for military and civilian users                                 | Leverage existing incident management hardware and<br>software to generate views for diverse users, provide access<br>to cost effective decision support tools, including reach-back |
| System Studies          | Cost benefit studies of alternative urban<br>biosurveillance architectures               | Define key architecture questions and evaluate using real-<br>world (San Diego) and simulated systems  |
| Mobile Detection        | Trade-study on fixed vs. mobile detection, including costs                               | Conduct benchmark study of alternative approaches using<br>nationally-recognized panel   |
|                         |  |  |

### WARRP Operational Context

Metric: Reduce the time and resources required for recovery following a catastrophic CBR incident Goal: Recovery in 6 months (Current Estimates 18+ Years prior to IBRD and WARRP)

| Operational Context - Wide Area CBR Incident   | Existing Capability Gap   |  |  |  |  |  |  |
|--|---|--|--|--|--|--|--|
| PLANNING - Technical Planning Guidance for FEMA, Colorado Department of Emergency Management |   |  |  |  |  |  |  |
| National Preparedness  | Insufficient processes to:<br>2.1 Balance economic & public health concerns<br>2.2 Provide timely, unified messaging during incident<br>2.4 Manage and share data in wide area recovery<br>2.6 Coordinate between federal, state and local stakeholders<br>2.8 Rapidly reconstitute CIKR lifelines<br>3.2 Establish regional multi-jurisdictional recovery organizational structure   |  |  |  |  |  |  |
| SAMPLING and DECONTAN  | AINATION- Tools and Technologies Transitions to EPA and DoD   |  |  |  |  |  |  |
| Environmental Remediation  | <ol> <li>Waste minimization policies, processes, and technologies</li> <li>Lack of sensitive and/or rapid screening technologies</li> <li>Safe procedures for owner-occupant property decontamination</li> <li>Effective, scalable options for indoor or outdoor decontamination</li> <li>Insufficient knowledge of decontaminant efficacy and break-down products on<br/>urban surfaces</li> <li>Insufficient accepted sampling methods for urban contaminated materials</li> <li>Lack of process-based decontamination verification method to reduce sampling<br/>and clearance requirements</li> </ol> |  |  |  |  |  |  |
| PUBLIC HEALTH SURVEILLANCE - Co  | llaborative Information Management System Transition to CDC and DoD   |  |  |  |  |  |  |
| Public Health Monitoring and Surveillance  | 2.4 Insufficient methods for data management and sharing in wide-area recovery  |  |  |  |  |  |  |

#### Impact Metrics "Why It Matters"

Efficiency Impacts

- Significant cost savings (\$M-\$B) for wide area environmental remediation of CBR
  - More effective, scalable technologies for sampling and decontamination
  - More efficient methodologies for technology selection and operation
  - Improved waste management practices

#### Capability Impact

- Risk reduction for wide area recovery planning
  - Improved technical planning guidance for CBR incidents
  - · Improved coordination amongst federal, state, and local stakeholders
- Increased performance for the rapid recovery of critical infrastructure
  - Improved decision support tools for prioritization and technology selection
  - · More effective, scalable technologies for sampling and decontamination

#### · Return on Investment (ROI) Impact - Customer viewpoint

- Remediation Products (materiel and non-materiel):
  - ROI immediate in case of wide area incident Tools and Products are required nationwide through FEMA and states by end FY13
  - Otherwise, ROI relatively short through enhanced all hazards planning, coordination, and
    operations
- Planning Guidance:
  - · ROI relatively short through enhanced all hazards planning, coordination, and operations
- Public Health Monitoring and Surveillance:
  - ROI relatively short through enhanced computing environment for data management, analysis, and sharing

### Scenarios

- Medical Waste Spill of larger proportion
- Source Release an accident
- Transportation accident of larger proportion
- · Terrorist focused on "dirty bomb"
- Terrorist focused on "small device"
- · Reactor accident Chernobyl or Fukushima
- · Terrorist focused on a Waste Containment system
  - Storage for spent fuel
  - Hanford Tanks
- Terrorist Delivery of a full yield "Loose Nuke"
- Worst nightmare

# Radiological Dispersal Device Debris Response

Waste Segregation Issues August 14 2012

- RDD Device
  - Stolen Seed Irradiator
  - 2300 Curies Cesium chloride
  - 3,000 pounds prilled ammonium nitrate and 6% fuel oil
  - Pentaerythritol tetranitrate (PETN) booster
  - Stolen detonator cord

- Cesium Complicates Management of Debris
  - Most electropositive element
    - Loses single valence electron
  - Forms electrovalent bonds easily
  - Combines with nearly all inorganic and organic anions
  - Replaces potassium in tissues and cells
  - Radiation destroys rapidly dividing cells

- RDD Device
  - Explosion near Denver Mint
  - Significant debris
  - Damaged structures no fire
  - Elevated levels of radiation (up to 5 REM) extending several hundred feet from explosion

- Hazard Assessment
  - Residual hazard from contamination of
    - Buildings
    - Debris
    - Turf and trees
    - Vehicles
    - White goods

- Likely Issues of Cesium Contaminated Debris
  - Handling large volume of collected vegetation and building debris and other
  - Waste storage of collected contaminated debris
  - Waste volume reduction
  - Waste treatment of cesium-contaminants
    - Soil
    - Water
    - Other
  - Waste Storage/Disposal

- Expected Remediation Methods
  - Remove ground cover and top few inches soil
  - · Wash roofs, walls and attempt to contain water
    - Remove dissolved cesium by zeolite?
  - Remove contaminated debris to temporary debris sites
  - Institutional controls for RDD site
    - Evacuate people (>0.2mRem)
  - Repair of structures/infrastructure damaged by RDD

- Denver's Experience with hazardous debris
  - Asbestos in soil and buildings
    - Parallels to cesium contaminated debris
      - Containment of contaminated material
      - Emphasis on avoiding air-borne dispersal
      - Stringent requirements for transportation and disposal
      - Need for PPE, personal air monitoring and environmental testing

- Denver's Experience with Hazardous Debris (cont)
  - Denver Radium Sites
    - Removal of radium tailings from Denver streets
    - Road base excavated and transported to Grandview, Idaho, Clive, Utah, and Deer Trail, Colorado
    - Approximately five miles of Denver streets remediated
    - Cleanup level (exceeding 2 pCi/g background) of <5 pCi/g Ra-226 surface; and 15 pCi/g Ra-226
    - Institutional controls impossible

# **RDD** Debris Response

Asbestos Removal Techniques

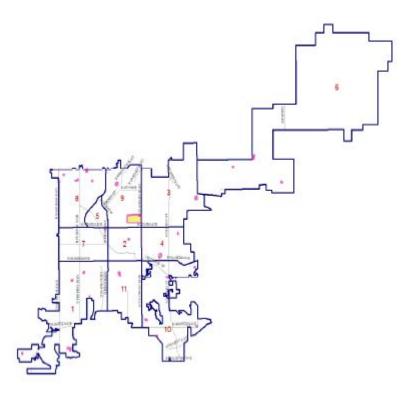

- Radium Streets Legacy
  - Local (Denver) resources
    - 12 B-25 boxes available for transportation of debris
    - 200 Super Sacks available for debris handling
    - DEH rad monitoring capabilities/equipment
      - 2 Ludlum 12 meters
      - 3 Ludlum 17 meters
      - 3 Ludlum 19 meters
      - 2 Ludlum 2241-2 survey meters
      - 24 personal dosimeters
      - 4 high volume air samplers

- Denver's Temporary Debris Management Sites
  - 25 locations typically Denver Parks
  - Envisioned for catastrophic debris generating event
  - Selected for "conventional debris"
  - Limited space available for segregation of waste streams
  - One likely site having paved surface
    - Facilitate post operations cleanup
    - Separated from residential
- Final Disposal at DADS

- Site Stabilization and Debris Removal Assumptions
  - Rely on local resources for initial reconnaissance and assessment
  - Use contractors for debris containment and removal under Federal supervision with local input/guidance
  - Limit first responder missions/contractor cleanup missions to radiation dose of no more than 5 rem

- Debris Storage and Disposal- Concerns
  - Denver's Debris Management Plan is silent on RDDs
    - Soluble nature of cesium complicates cleanup
    - Small number of local experienced personnel
    - Cleanup of private property will require/assistance oversight
  - Temporary Storage of Debris
    - Limited capacity for storage and segregation
    - Presence of contaminated debris encumbers Denver facilities
    - Likely would result in long-term environmental contamination
    - Resident opposition for temporary storage of radioactive debris

# **RDD** Response

- Debris Storage and Disposal- Concerns (cont)
  - Temporary Storage of Debris
    - Local activists
    - Environmental justice for residents in likely temporary disposal areas
- Debris Storage and Disposal
  - No local capacity for permanent disposal of contaminated debris
    - Likely mixed wastes (RCRA, petroleum etc) complicating disposal options
    - Agreement with Utah for radioactive waste disposal
    - Expensive to implement and transportation difficult

### Waste Segregation Methodologies

#### US EPA WARRP Workshop

Rick Demmer Nuclear Materials Characterization Battelle Energy Alliance Idaho National Laboratory

## Objectives

- Introduce our scenario (i.e. what was Rick thinking about?)
- Introduce the 4 major methods of large scale characterization/remediation
- Basically develop a common ground about the technologies
- · Discuss the pros and cons of those methods
- Stimulate discussion about other methods (recategorize new methods if possible)

### Thoughts on RDD Contamination

Based on DHS Scenario 11, Radiological Attack (RDD)

- Cs-137 source (2300 Ci), ANFO yield of about 3000 lbs TNT(?)
- 36 city blocks (20 acres) of contamination ~5-50 uCi/m2
  - EPA's Tests at INL are 42 uCi/m2 Cs-137
  - Converts to about 3.5 to 35 Bq/g (1 inch deep)
  - Target of ~0.01 Bq/g? (30 yr occupational dose)
- Remediation begins more than a month later (and precipitation is likely)

# **Five Cases Describing Technologies**

- Idaho Chemical Processing Plant (black flakes)
   Small Event
- Painesville, OH Radioactive Scrap Recycling
  - Small Area
- Goiania, Brazil
  - A Neighborhood
- Johnson Atoll Fallout Contamination
  - A Small Island
- Chernobyl (countryside), Ukraine
  - Several Countries

Idaho National Laboratory

## **INTEC Contamination Case**

## Remediation of INTEC Contamination

- Used Available Eberline 2A instruments
- Carried HEPA vacs from hotspot to hotspot
- Covered about 50 acres in 2 weeks
- Probably 100 people involved
- · Several tons of waste

Idaho National Laboratory

### SNL (& INL) Variation of Manual Surveys

- · SNL characterization (in-situ) of DU projectiles (lots of fragments)
- Global positioning
- Nal and LaBr Gamma Nuclide ID
- Computer generated mapping (GIS)
- Unmanned vehicles

# Large Area Gamma-Spec System (LAGS)

- SNL developed
- Takes survey out of the field (ex-situ)
- 33'X33' X-Y table, 3" deep, 10 yd
- · About 30 min. count.

### Painesville, OH – Diamond Magnesium

- Recycled radioactive scrap 1951-1953
- Processing areas and uncovered lay-down yards
- 30 Acre site
- 9,400 cu yd of soil removed, perhaps 25,000 yds more because increase in contaminated area.
- Typical contamination about 50 Bq/g, up to 500 Bq/g (U-238)

#### Painesville, OH – Diamond Magnesium

- USACE, 2007 (excavation)
- · Segmented Gate System (SGS) for Segregation

#### Goiania, Brazil

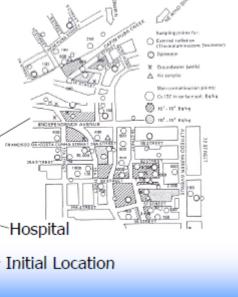

- · 9/13/1987
- Scrapyard workers break open CsCl capsule
- · 6 died (including 6 yr old)
- 249 people significantly Contaminated.

**Goiania City** 

Idaho National Laboratory

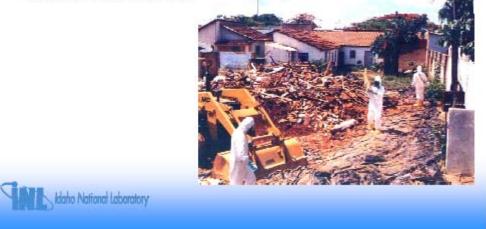

OPPORTOOT DATE.

SUULINUES SAME

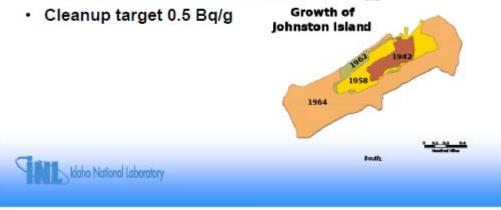

# Goiania, Brazil Remediation

- · Personal items deconned
- Everything else from neighborhood knocked down, dug up and removed

### **Johnston Atoll Fallout Contamination**

- · 24 acre Pu-239 & Am-241 contaminated area
- Contaminated intentional destruction of a nuclear missile (not detonation)
- Contamination up to 5000 Bq/g

# **Johnston Atoll Fallout Contamination**

- Used Segmented Gate System 1990-1998
- Contaminated soil diverted to water wash system (fines continued disposal)
- Overall efficiency of 98%
- SGS + equipment (incl front loader) \$1.2M

# Chernobyl (countryside), Ukraine

- · 4/26/1986
- Released 20 tBq contam.
- Areas in red are ~1 uCi/m2

   ~1.5 Bq/g (Cs-137, Propagated over 1")

Idaho National Laboratory

# Chernobyl (countryside), Ukraine

Typical remediation is either "triple" dig, or plow

# **Chernobyl Typical Technologies**

| <u> </u>                                |                          |                      |  |  |  |  |

Idaho National Laboratory

### The Technologies

| Alternative          | Cost     | Safety   | Effectiveness | Throughput        |  |
|----------------------|----------|----------|---------------|-------------------|--|
| Manual Survey/Vacuum | \$200K   | Moderate | Moderate      | tons/wk           |  |
| Automated Survey     | \$500K   | Moderate | Moderate      | 10-100 tons/wk    |  |
| LAGS                 | \$300K   | Moderate | Good          | 10 tons/day       |  |
| SGS                  | \$1,000K | High     | Good          | up to 500 ton/day |  |
| Dig/Plow             | \$?      | Low      | Moderate      | tons/day          |  |
| Baseline Dig/Haul    | \$1,000K | High     | Good          | 1000 ton/day      |  |
| Soil Washing         | \$300K   | High     | Good          | 20 ton/day        |  |

### Costs/Savings Add Up With SGS/CVL

# UMTRA Remediation

- Radioactive Uranium ore tailings used in many areas
- 8 Uranium Mill Tailing sites excavated and removed to off-site disposal cells
- · 1 (Melba, Co) excavated and used on-site cell
- >4000 properties were remediated
- \$75M initial

Idaho National Laboratory

# A Word From Our Sponsors

- BMI/INL have a terrific basis for testing technologies
  - Urban RDD Decon (TTEP)
    - · EPA, DHS, Environment Canada, etc
  - o IND fallout testing
  - BOTE (biological decon)
- INL is developing a depth profile system (lacking funds, looking for support)
  - Uses highly collimated gamma detectors/ modeling

#### RDD Soil Cleanup Criteria

# US EPA WARRP Workshop, August 14-15, 2012

Rick Demmer Nuclear Materials Characterization Battelle Energy Alliance Idaho National Laboratory

### What are Criteria About?

- Everything we do involves identifying and weighing criteria
  - Taking a new job
    - Is salary the most important thing, location, schools, church?
  - · Buying a new car
    - · Fuel mileage, acceleration, color?
- Engineering analyses were new to this Analytical Chemist until 1991.
  - · I've come to know and love(?) them

# Impacts on Criteria

- Type of contaminant (radionuclide, chemical nature and physical form)
- Type of substrate (which building material and configuration)
- Weather conditions
- Desired endpoint levels

# **General About Criteria**

- · Criteria can be subjective or objective
  - · We can have some discussion
- Gut checks are OK, but need to be based on a criteria

#### Criteria for Underwater Coatings

- Easy to apply
- Adhere well to the four surfaces of interest
- Can not change or have a negative impact on water chemistry or clarity
- Can not be hazardous in final applied form
- Proven in other underwater applications.
- High pigment or high cross-link density to prevent radiation damage

Idaho National Laboratory

#### Wash Water Minimization Criteria

18.1 Functions Neutralize hazards Maximize byproduct removal Minimize waste Minimize risk Demonstrate on metal contamination Remove reactivity Locate remaining sodium Define waste streams Manage expectations with regulator Determine final reactor end-state (negotiations with DOE) Passivate the primary tank after cleaning

Minimize waste volume Minimize cost Regulatory acceptance Minimize impact to future D&D. (Short-term activities or RCRA closure activities don't impact future D&D success.) Technical maturity Ease of demonstrating RCRA clean Minimize tisk

Idaho National Laboratory

18.2 Criteria "Wants" Minimize radiation dose Minimize hazards

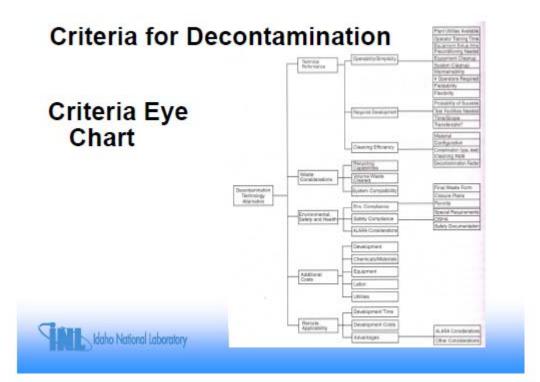

# Wash Water Minimization Criteria

| Iternative            | Cost | Schedule | Dose | Effectiveness | Future Impact |
|-----------------------|------|----------|------|---------------|---------------|
| eighting of Criteria  | 26   | 11.5     | 31   | 19            | 12.5          |

Scored 1-25 for each criteria

Multiplied by weight

# **Criteria for Decontamination**

- Main Criteria
  - Performance
  - Waste Considerations
  - Environmental/Safety/Health
  - · Costs
  - · Remote usefulness

Idaho National Laboratory

#### Drilling Down on Performance Criteria - 1

- Performance
  - · Operability/Simplicity
    - · Utilities availability
    - · Training requirements
    - · Setup time
    - Preconditioning
    - Cleanup time
    - · Maintenance requirements
    - Labor required(#)
    - Flexibility

Idaho National Laboratory

# Drilling Down on Performance Criteria - 2

- Performance
  - Development Necessary
    - Success Probability
    - Necessary Test Facilities
    - Times Required
    - · Ability to Patent/License

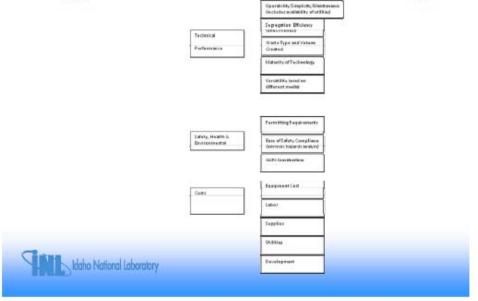

### Drilling Down on Performance Criteria - 3

- Performance
  - Efficiency
    - Rate
    - · Effectiveness (Df, or percent removal)
    - Versatility (high levels/low levels, different media)

#### Suggested Criteria for RDD Cleanup

### **RDD Cleanup Criteria - 1**

- Technical Performance
  - · Operability/Simplicity/Maintenance (L)
  - Separation Efficiency (H)
  - · Waste Type and Secondary Volume (WAC-H, L)
  - Maturity
  - · Versatility for Different Media (H)

# **RDD Cleanup Criteria - 2**

- Safety/Health/Environmental
  - Permitting Requirements (L)
  - Intrinsic Safety Analysis (L)
    - PPE vs Engineered controls
  - ALARA Considerations (L)
    - Reduced dose/exposure

# **RDD Cleanup Criteria - 3**

- Costs
  - · Equipment/Capital Costs (L)
  - · Labor (L)
  - Supplies (L)
  - Utilities (L)
  - · Development/Modification (maturity for use) (L)

# RDD Cleanup Criteria – 4 simplified

- Cost
- Throughput
- Expected removal
- · Overall hazard mitigation

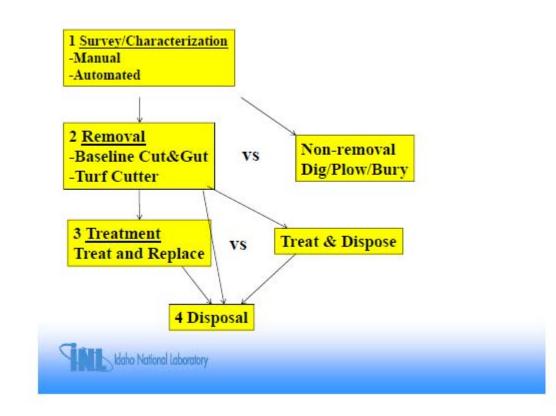

#### **Better Slice and Dice**

| Alternative             | Safety, Health &<br>Environmental | Time to<br>Implement | Technical<br>Performance | Availability | Costs |

# How to perform weighting

- EPA Weighted Sum Method
- Used in waste min evaluation
- Uses Low/Medium/High
  - Low little impact on effectiveness, difficult to use, high cost
  - Medium moderate impact on effectiveness, moderate difficulty, medium cost
  - · High high impact, little difficulty, low cost

### How to perform weighting

- Maximum score of 30 (highly desirable impact)
- H 30, M 20, L 10
- We will use different colored dots that Rachel will hand out.
- Scores will be normalize to 100% for each "criteria set"

# Standard Operational Guideline and Discussion of Path Forward

Rachel Sell, Battelle

Waste Screening and Waste Minimization Methodologies Project

SME Meeting August 14 – 15, 2012

#### Standard Operational Guideline (SOG)

- Describes the use of the selected waste screening technologies, techniques, and regulations to facilitate waste minimization activities to rapidly screen and segregate radiologically-contaminated waste and debris that is moved from the hot zone of an RDD incident into a waste staging area.
  - Resulting SOG will be included in WARRP planning documentation
- Goal is to give guidance, without being too prescriptive
- Have examples (1) Missouri DA Carcass Disposal and (2) Delaware/Contagious Disease Containment Measures Plan

**Battelle** 

#### **SOG - Preliminary Content Areas**

#### Envisioned Content/Outline

- Purpose (to provide guidelines)
- Planning Assumptions (for an RDD event)
- Agencies Roles and Responsibilities/Direction and Control
- Health and Safety
- Training
- Staging
- Equipment to be used
- Disposal
- Communication
- Quality Assurance/Quality Control
- Public Information
- Mental Health Services

#### **Discussion of Path Forward**

Battelle
